The nobility of Poland aſſume great ſtate upon all occaſions, particularly in their equipages and manner of living. It is no unuſual thing for the lady of a Poliſh grandee, on a common viſit, to be attended by a coach and ſix, and a great number of domeſtics, among which are an old gentleman-uſher, an old governante, and a dwarf of each ſex to hold up her train: if it happens to be an evening viſit, the grandeur of the ſcene is augmented by the number of flambeaux which ſurround her coach. When they ſit down to table, a number of gentlemen wait upon them with the greateſt reſpect, and theſe are uſually ſome of the poor nobility, who, not daring to demean themſelves by trade, are glad to earn a ſubſiſtence by thus ſervilely waiting on their equals in birth, though ſuperiors in fortune. It generally happens, however, that this mode of life is rendered very eaſy to them, for their patron uſually treats them with the greateſt civility; permitting the oldeſt among them to ſit down, with his cap off, at the ſame table with him, and giving the reſt part of his meat, which they eat ſtanding: they likewiſe all drink out of his cup, and have each a peaſant boy kept to wait on them. At a Poliſh entertainment there are neither knives, forks, or ſpoons laid upon the table, but every gueſt brings them with him. When the company are all ſeated, the doors are ſhut, and not opened again till they have done eating; and the whole time of the repaſt, they are entertained with muſic, of which every nobleman keeps a band. Bumpers are as much the faſhion in Poland as in Ireland; and a ſtranger will find it as difficult to return ſober from a feaſt in one country as the other.

The Poliſh dreſs is pretty remarkable. They cut the hair of their heads ſhort, and ſhave their beards, leaving only large whiſkers. They wear a veſt which reaches down to the middle of the leg, and a kind of gown over it lined with fur, and girded with a ſaſh, but the ſleeves fit as cloſe to their arms as a waiſtcoat. Their breeches are wide, and make but one piece with their ſtockings. They wear a fur cap or bonnet; their ſhirts are without collar or wriſtbands, and they wear neither

neither ſtock nor neckcloths. Inſtead of ſhoes, they wear Turkey leather boots, with thin ſoles and deep iron heels, bent like a half-moon. They carry a pole-axe and a ſabre or cutlaſs by their ſides. When they appear on horſeback, they wear over all a ſhort cloak, which is commonly covered with furs, both within and without. The people of faſhion wear ſables, and others the ſkins of tygers, leopards, &c. Some of them have 50 ſuits of clothes, exceeding rich, which deſcend from father to ſon. The habit of the women very much reſembles that of the men, being a ſimple Polonaiſe, or long robe edged with fur; but ſome people of faſhion, of both ſexes, affect the French or Engliſh modes. The peaſants, in winter, wear a ſheep-ſkin with the wool inwards, and in ſummer a thick coarſe cloth; but they wear no linen. Their boots are the rinds of trees wrapped about their legs, with the thicker parts to guard the ſoles of their feet. The women have a watchful eye over their daughters; and in the diſtrict of Samogitia, that they may know where they are, and what they are doing, make them wear little bells before and behind.

The houſes in Poland conſiſt entirely of a ground-floor, and the apartments are not joined to each other, but rather form a ſquare court, on one ſide of which is the kitchen, the ſtable on the other, the dwelling-houſe on the third, and the gate in front. The inns of this country are nothing more than long ſtables built with boards, and covered with ſtraw, without windows or furniture. At one end there is a chamber, which uſually ſwarms with fleas and other vermin; ſo that travellers rather chooſe to lodge among the horſes than go into it. They are obliged to carry proviſions with them, and when foreigners want a ſupply, they inform the lord of the village, who immediately provides them with neceſſaries.

The uſual diverſions of the Poles are vaulting, dancing, hunting, ſkaiting, bull and bear-baiting, and riding; of which exerciſe they are ſo exceedingly fond, that they will not ſtir a hundred yards without their horſes. They are ſo extremely hardy, that, if by chance they are benighted, they ſleep upon the ground, in froſt and ſnow, without any covering, except their uſual clothing.

The eſtabliſhed religion in Poland is that of the church of Rome, carried to the higheſt pitch of enthuſiaſm; the Poliſh clergy being moſt illiterate bigots, and the monks ſome of the moſt profligate of mankind; and it is chiefly owing to the conduct and influence of the Popiſh clergy, that the peaſants of Poland are ſo miſerable. The monaſteries in Poland are ſaid to amount to 576, and the nunneries to 117, beſides 246 ſeminaries or colleges, and 31 abbies. There are in this country, great numbers of Lutherans, Calviniſts, and members of the Greek church, who are all diſtinguiſhed by the common name of diſſidents, and, by the laws of that kingdom, are entitled to toleration and protection; but, owing to the bigotted ſpirit of the Popiſh clergy, who inſtil the ſame ſentiments into their deluded followers, they live in a ſtate of continual perſecution. In the year 1724, a public maſſacre was made of the Proteſtants at Thorn, in open defiance of a treaty concluded at Oliva in 1660, and guaranteed by the principal powers in Europe, for which no ſatisfaction has been as yet obtained, and ſeveral other ſtipulations, made in their favour at different times, have been regarded with the ſame inattention: ſo that they have often ſuffered the moſt cruel outrages, while Jews, Turks, and other infidels, have been tolerated and encouraged. The Jews particularly are indulged with great privileges, and are ſo numerous, that their poll-tax is ſaid to amount to near fifty-ſeven thouſand rix-dollars annually. The principles of Socinus made a very early and conſiderable progreſs in Poland; which is no wonder, as before his time, it is computed, 32 congregations denied the doctrine of the Trinity. It is at length reſolved, that all diſſidents ſhall be tolerated, but to have no ſeat in the diet, ſenate, or permanent council, though they may ſit in the inferior courts of juſtice.

The Poliſh language is a dialect of the Sclavonic, being neither copious nor harmonious, but abounds in conſonants, and many of the words have not a ſingle vowel in them. The Lithuanians and Livonians talk a language peculiar to themſelves, among which are found ſeveral corrupted Latin words; but the Ruſſian and German tongues are underſtood in the provinces bordering on thoſe countries. The High Dutch and Latin are frequently ſpoke here, but very incorrectly.

In Poland are two archbiſhoprics, viz. Gneſna and Lemburg. The former of theſe is always a cardinal, and, during an interregnum, prince regent, or interrex of the kingdom. Gneſna has for its ſuffragans the biſhops of Cracow, Cujavia, Culin, Liuke, Mednick, Poſna, Ploſko, and Wilna; and thoſe of Lemburg are the biſhops of Cholm, Kaminieck, and Prenyzil.

There were three univerſities here, viz. Cracow, Poſna or Poſen, and Wilna, but they are now almoſt entirely neglected. The firſt conſiſts of eleven colleges, and has the ſuperviſorſhip of fourteen grammar-ſchools, which are diſperſed through that city: in 1778, the number of ſtudents amounted to 600. That of Poſna is rather a Jeſuits college than an univerſity; Wilna was under the ſuperintendence of the Jeſuits; but ſince their ſuppreſſion, the king hath eſtabliſhed a committee of education, who appoint profeſſors, and direct their ſalaries and ſtudies.

Learning in Poland is in a very low ſtate, notwithſtanding ſeveral efforts have been made to raiſe it. The clergy, we have already obſerved, are illiterate bigots, conſequently averſe to the light of learning. The nobility deſpiſe it, placing their chief importance in the privileges of their rank; and the lower claſs are too wretched ever to think of ſtudy: of late, however, a taſte for ſcience has begun to ſpread itſelf among the nobles, and begins to be regarded as an accompliſhment. This kingdom has formerly produced ſeveral great geniuſes, particularly Copernicus, Vorſtius, and ſome Proteſtant divines, who are highly received by the literati of Europe.

The natural curioſities of Poland are more numerous than the artificial. Under the mountains adjoining to Kiow, in the deſerts of Podolia, are ſeveral grottoes containing a great number of human bodies, which, notwithſtanding the time they muſt have lain there, are ſtill entire: and among them are two princes in the habits they uſed to wear. Theſe bodies are neither ſo hard nor ſo black as the Egyptian mummies, and no art having to all appearance been uſed for their preſervation, this phænomenon is attributed to the nature of the ſoil, which in that part is dry and ſandy. The ſalt mines may be juſtly placed among the natural curioſities of Poland.

A modern traveller has given us the following accurate deſcription of thoſe at Wielitſka, which are ſituated within eight miles of Cracow: "Theſe mines," ſays he, "are excavated on a ridge of hills at the northern extremity of the chain which joins to the Carpathian mountains: they take their appellation from the ſmall village of Wielitſka; but are ſometimes called, in foreign countries, the mines of Cracow, from their vicinity to that city.

"Upon our arrival at Weilitſka, we repaired to the mouth of the mine; having faſtened three ſeparate hammocks in a circle round the great rope that is uſed in drawing up the ſalt, we ſeated ourſelves in a commodious manner, and were let down gently, without the leaſt apprehenſion of danger, about 160 yards below the firſt layer of ſalt: quitting our hammocks, we paſſed a long and gradual deſcent, ſometimes through broad paſſages or galleries capable of admitting ſeveral carriages abreaſt; ſometimes down ſteps cut in the ſolid ſalt, which had the grandeur and commodiouſneſs of the ſtaircaſe in a palace. We each of us carried a light, and ſeveral guides preceded

us

us with lamps in their hands; the reflection of those lights upon the glittering sides of the mine was extremely beautiful, but did not cast that luminous splendour which some writers have compared to the lustre of precious stones.

"The salt dug from this mine is called ziebna, or green salt, for what reason I cannot determine; for its colour is an iron grey: when pounded, it has a dirty ash colour, like what we call brown salt: the quality improves in proportion to the depth of a mine; towards the sides and surface it is mixed with earthy or stony particles; lower down it is said to be perfectly pure, and requires no other process before it is used than to be pounded. The finest of this grey salt, however, is of a weak quality, when compared with our common sea salt; it is therefore, undoubtedly, by no means perfectly pure, but is blended with extraneous mixtures, though it serves very well for common purposes. Being almost as hard as stone, the miners hough it with pick-axes and hatchets, by a tedious operation, into large blocks, many of which weigh seven or eight hundred pounds: those large masses are raised by a windlass, but the smaller pieces are carried up by horses along a winding gallery, which reaches to the surface of the earth.

"Beside grey salt, the miners sometimes discover small cubes of white salt, as transparent as crystal, but not in any considerable quantity: they find likewise, occasionally, pieces of coal and petrified wood buried in the salt.

"The mine appears to be inexhaustible, as may easily be conceived from the following account of its dimensions: its known breadth is 1115 feet, its length 6691, and depth 743; and the best judges on the spot suppose, with the greatest appearance of probability, this solid body of salt to branch into various directions, the extent of which cannot be known: of that part which has been perforated, the depth is only calculated as far as they have hitherto dug; and who can tell how much further it may descend? The revenue arising from these and other salt-mines is very considerable, and formed part of the royal revenue before seized by Austria: the aunual average profit of those of Wielitska was about 98,000l. sterling.

"Our guide did not omit pointing out to us what he considered as one of the most remarkable curiosities of the place—several small chapels excavated in the salt, in which mass is said on certain days of the year: one of those chapels is thirty feet long, and twenty-five broad; the altar, the crucifix, the ornaments of the church, the statues of the saints, are all carved out of the salt.

"Many of the excavations, or chambers, from whence the salt has been dug, are of an immense size; some are supported with timber, others by vast pillars of salt, which are left standing for that purpose; several of vast dimensions are without any support in the middle. I remarked one of this latter sort in particular, which was certainly eight feet in height, and so extremely long and broad, as almost to appear amid the subterraneous gloom without limits. The roofs of those vaults are not arched, but flat. The immense size of the chambers, with the chapels abovementioned, and a few sheds built for the horses, which are foddered below, probably may rise to the exaggerated accounts of some travellers, that those mines contain several villages, inhabited by colonies of miners, who never see the light. It is certain that there is room sufficient for such purposes; but the fact is, that the miners have no dwelling under ground, none of them remaining below more than eight hours at a time, when they are relieved by others from above. In truth, those mines are of a most stupendous extent and depth, and are sufficiently wonderful without the least exaggeration. We found them as dry as a room, without the least damp, or moisture; observing only in our whole progress one small spring of water, which is impregnated with salt, as it runs through the mine.

"Such an enormous mass of salt exhibits a wonderful phenomenon in the natural history of this globe. Monsieur Guetard, who visited these mines with great attention, and who has published a treatise upon the subject, informs us, that the uppermost bed of earth at the surface immediately over the mines is sand; the second clay, occasionally mixed with sand and gravel, and containing petrifactions of marine bodies; the third, calcareous stone: from all those circumstances, he conjectures that this spot was formerly covered by the sea, and that the salt is a gradual deposit formed by the evaporation of its waters."

In the centre of the mountain called the Wonderful, frequently mentioned by modern geographers, is a spring of very clear water, which rises with a remarkable noise and vibration; and its ebullition or swelling increases or decreases with the moon. This spring, which is called by the inhabitants, Ignis Fatuus, never freezes by any degree of cold; and by holding a lighted torch over it, it immediately flames like spirits of wine, when the only way of extinguishing this fire is by brushing the surface of the water with brooms. Some years ago this fountain was set on fire by lightning, and the people neglecting to extinguish the flame, it communicated itself through subterraneous cataracts to a neighbouring wood, great part of which it destroyed by burning the roots of the trees, and it was three years before this conflagration entirely ceased; since which time watchmen have been appointed to prevent a repetition of this accident. The water itself, and the slime which it deposits, are said to be highly beneficial in most disorders of the human body, and that, owing to them alone, the people who reside near this spring are seldom ill, and are remarkable for their longevity, few of them dying before they arrive at the age of an hundred, or an hundred and fifty. There have been found in the woods, both of Poland and Germany, certain beings which seemed divested of almost all the properties of humanity but the form. When taken, they generally went on all-fours, and were dumb; but some of them, it is said, by proper management, have attained to the use of speech. Probably, when the Tartars, and other barbarous nations, made inroads into Poland, the women were sometimes forced to leave their children exposed in the woods, where they might be nursed by bears and other wild beasts, otherwise it is difficult to account for their subsistence.

The most considerable cities in Poland are the following, viz.

Warsaw, the capital of Poland, situated 154 miles south-east of Dantzick, on the river Vistula, and nearly in the centre of the kingdom. This city is large, populous, tolerably well fortified, and contains a considerable number of churches, palaces, and convents. The chief church, dedicated to St. John the Baptist, is very fine; as also many other public buildings. The streets are spacious, but ill paved; and the greatest part of the houses, particularly in the suburbs, are mean wooden hovels. The king usually kept his court here, in a noble palace which forms a large square, surrounded with elegant gardens and groves. Here were likewise held the general diets, to which such multitudes of people resorted, that great numbers were obliged to reside in tents. The ordinary diets were held at the royal palace; but during the interregnum, in a field, not far from the city, near the village of Wola. In the year 1746, count Zaluski's library was opened, which is said to contain 200,000 volumes. Goods are brought to the city, by the Vistula and other rivers, and sent from thence to Dantzick; but has little commerce. It is said to contain 70,000 inhabitants.

Cracow, situated on the conflux of the Vistula and Radawa, is very populous, and the largest and best built

built town in Poland, and was formerly the capital: the houſes are of free-ſtone, four or five ſtories high, and covered with boards cut in the form of tiles. The public buildings are magnificent; among which are the cathedral of St. Staniſlaus, the church of St. Mary, and 50 other churches, 17 religious houſes in the caſtle, city, and ſuburbs, with the noble and well-built monaſteries of the Jeſuits and Dominicans. The ſuburbs occupy a vaſt ſpace of ground. Near the city are ſome admirable ſalt mines, diſcovered in 1548; it is defended by walls, towers, and baſtions; the garriſon conſiſts of 600 Ruſſians. The commerce is inconſiderable.

Grodno, the largeſt town in Lithuania, next to Wilna, is ſituated on the river Niemen, 160 miles north-eaſt of Warſaw. Here is a fine palace, a caſtle, a college, a Jews ſynagogue, a Carmelite nunnery, three Greek, and nine Roman Catholic churches. Beſides theſe, here are two other palaces, the one belonging to prince Radzivil, and the other to the Sapietian family. Very few of the ſtreets of this city are paved; and a great part of the town was conſumed by fire in the year 1753. It is a place of good trade, has a provincial diet, a court of judicature, &c. In 1776, the king eſtabliſhed here ſeveral new manufactures of cloths, camblets, linen, cotton, &c. and alſo an academy of phyſic and ſurgery, which, but for the late unfortunate troubles, bid fair to become of conſiderable conſequence to the country. The number of inhabitants is eſtimated at 7000.

Dantzick, the capital of Poliſh Pruſſia, is ſituated on the Viſtula, and conſiſts of the old and new town, with their ſuburbs. It is large, populous, and rich, and may well be conſidered as the chief mart and magazine of Poland, and one of the greateſt granaries in the world; for ſo conſiderable is the trade of this city, that a whole fleet come hither every year to load with corn alone; and it is computed that 365,000 laſts of Poliſh wheat are ſhipped from hence one year with another. Its houſes are generally five ſtories high; and many of its ſtreets are planted with cheſnut trees. It has a fine harbour, and is ſtill a moſt eminent commercial city, though it ſeems to be ſomewhat paſt its meridian glory, its trade getting into other channels, and daily diminiſhing. It is a republic, claiming a ſmall adjacent territory, about 40 miles round it, which were under the protection of the king and republic of Poland. Its magiſtracy, and the majority of the inhabitants, are Lutherans; although the Romaniſts and Calviniſts are equally tolerated in it. This city is rich, contains 26 pariſhes, with ſeveral public buildings, convents, and hoſpitals. The inhabitants are computed at 150,000: they have often changed their maſters, and have ſometimes been under the protection of the Engliſh and Dutch; but have generally ſhewn a peculiar regard for the kingdom and republic of Poland, as being leſs likely to rival them in their trade, or abridge them of their valuable privileges, among which are thoſe of coining money, gathering amber, and ſending repreſentatives to the general diet of Poland and the Pruſſian ſenate. Though ſtrongly fortified, and poſſeſſed of 150 large braſs cannon, it could not, through its ſituation, ſtand a regular ſiege, being ſurrounded with eminences. This city, as well as Thorn and Elbing, enjoy large and ample privileges, both civil and religious, very different from thoſe of the reſt of Poland, which they were permitted to retain when they put themſelves under the protection of that kingdom, not being able any longer to endure the tyranny of the Teutonic knights.

The king of Pruſſia exempted this city, and that of Thorn, from the claims he had lately made in the neighbouring countries; notwithſtanding which, he ſoon after thought proper to ſeize on the territory belonging to Dantzick, under pretence of their having formerly belonged to Poliſh Pruſſia. He next proceeded to poſſeſs himſelf of the port duties belonging to that city, and erected a cuſtom-houſe in the harbour, where he laid arbitrary and inſupportable duties upon goods exported or imported. Not ſatisfied with theſe oppreſſions, he cauſed cuſtom-houſes to be erected at the very gates of Dantzick, ſo that no perſons could go in or out of the town, without undergoing a ſtrict ſearch. So lately as in 1784, it was blockaded by his troops, on various pretences; but by the interpoſition of the empreſs of Ruſſia, and the king of Poland, they were withdrawn, and a negociation carried on by deputies at Warſaw, and concluded on the 7th of September, by which it was agreed, that the place and trade of the city ſhould be reſtored to its former ſtability.

Thorn, an ancient city in Poliſh Pruſſia, is alſo ſituated on the Viſtula. This town is defended by a double wall and moats, and is ſaid to be the handſomeſt and beſt built in this country. The ſtreets are broader, and the houſes more elegant, than thoſe at Dantzick. This city has ſhared the fate of that above-mentioned, and is now added to the dominion of the king of Pruſſia.

Commerce, in this country, is chiefly confined to the city of Dantzick, and the other towns on the Viſtula and Baltic: ſome linen and woollen cloths, and hard-wares, are their principal manufactures, which are carried on in the interior parts.

Concerning the form of government in Poland, it is to be obſerved, that the Poles live under one head, who bears the title, and lives in the ſplendor becoming a king; but if you conſider his power, as it is circumſcribed within very narrow bounds, he is in effect no more than the prime or chief regent in a free commonwealth; ſince he can do nothing without the bounds of that authority which the laws of the land have given him, and the nobles take care to maintain.

The people elect the king on horſeback; and in caſe there ſhould be a refractory minority, the majority has no controul over them, but to cut them in pieces with their ſabres; but if the minority are ſufficiently ſtrong, a civil war enſues. The king, immediately after his election, ſigns the *pacta conventa*, by which he engages to introduce no foreigners into the kingdom or government; ſo that in fact, he is no more than preſident of the ſenate, which is compoſed of the primate, the archbiſhop of Lemburg, fifteen biſhops, and 130 laymen, conſiſting of the great officers of ſtate, the Palatines, and the Caſtellans, in all, 147.

The Poliſh diets are of two kinds, viz. either ordinary or extraordinary. The ordinary diets meet every ſecond year, but the extraordinary diets only upon particular occaſions when ſummoned by the king. They ſit but ſix weeks, and the diſſenting voice impedes the paſſing of any law, or coming to any final reſolution concerning what had been propoſed by the throne. Here are not only general diets, but dietines or provincial diets, and when the nobility enter into an aſſociation, either during an interregnum, or while the king is living, it is termed a confederacy. Indeed, to the great misfortune of the country, confederacies have been too frequent, as anarchy and confuſion are uſually their certain conſequences.

The chief ſecular ſenators are in number 36, viz. 32 palatines, who are, properly, governors of provinces; three caſtellans, viz. of Cracow, Wilna, and Troki; and the ſtaroſt of Samogitia. It is obſerved, that though the quality of caſtellan and ſtaroſta is inferior to that of palatine, theſe four laſt mentioned, poſſeſs almoſt the firſt rank among the lay ſenators.

The office of a palatine is, to lead the troops of his palatinate to the army, to preſide in the aſſemblies of the nobility in his province, to ſet a price upon goods and merchandize, to ſee that the weights and meaſures be not altered, and to judge and defend the Jews. He has a vice-palatine under him, who muſt take

take an oath to him, and who ought to have an eſtate in land, which they call Poſſeſſionatus.

The caſtellans are the next in dignity to the palatines, and there are two ſorts of them in the kingdom, who are uſually diſtinguiſhed by the title of great caſtellans, and petty or ſub-caſtellans. The number of the former, both in the kingdom, and duchy, amount to 32, and that of the latter to 49; and they are all ſenators, lieutenants, or deputies of the palatines, and heads of the nobility in their reſpective juriſdictions.

A king of Poland may nominate the great officers of ſtate, but they are accountable only to the ſenate; neither can he diſplace them when once appointed; he alſo makes archbiſhops, biſhops, &c. appoints judges and magiſtrates of provinces; and upon invaſions or rebellions, can ſummon the nobility to his ſtandard; he has all power to remit fines and capital puniſhments: but he can neither marry, nor divorce a wife, without conſent of the republic; and if he marries after his coronation, the queen cannot be crowned without his aſking their conſent, nor even then, unleſs ſhe be a Roman Catholic.

From the imperfect ſketch above given of this motley conſtitution, we may diſcern the great outlines of a noble and free government. The precautions taken to limit the king's power, and yet inveſt him with an ample prerogative, are worthy of a wiſe people. The inſtitutions of the diet and dietines, are favourable to the public liberty, as are many other proviſions in the common-wealth: but even in its beſt ſtate, it has laboured under incurable diſorders. The exerciſe of the *veto*, or negative veſted in each member of the aſſembly, muſt nevertheleſs be deſtructive of order, and embarraſſing to government; and appears to be founded upon Gothic principles, and that unlimited juriſdiction which the great lords, in former ages, uſed to enjoy all over Europe. The government of Poland cannot be otherwiſe improved than by the introduction of arts, manufactures, and commerce, which would in a ſhort time render the common people independent on the nobility; and prevent the latter from having it in their power to annoy their ſovereign, and to maintain thoſe unequal privileges which are ſo prejudicial to the community.

Beſides diſmembering the beſt provinces of Poland, the partitioning powers have proceeded to change and fix the conſtitution and government, under pretence of amending it; confirming all its defects, and endeavouring to perpetuate the principles of anarchy and confuſion.

This change of the conſtitution was intended by the partitioning powers to give a large ſcope to influence and faction over that part of the kingdom they had not ſeized, in order the more effectually to ſerve their own ſiniſter purpoſes.

The revenue of the king of Poland was clear to himſelf, and ſufficient to maintain him and his houſehold with great ſplendour; for he pays no troops, not even his own body-guards; all the public expences being provided for by the ſenate; and all the officers of the houſehold are Poliſh gentlemen, who ſerve without ſalary, in expectation of ſome office. The late king had one million and a half of florins (at 3s. 6d. each) ſettled upon him by the commiſſion of ſtate; and the income of his predeceſſors generally amounted to 140,000l. ſterling. The public revenues were collected chiefly from the crown-lands, the ſalt-mines in the palatinate of Cracow, now in Auſtrian Poland, which alone amounted to nearly 100,000l. ſterling; the rents of Marienburg, Dirſhau, and Rogenhus, and of the government of Cracow, and diſtrict of Niepoliomiez, beſides ancient tolls and cuſtoms, particularly thoſe of Elbing and Dantzick.

The greateſt loſs to Poland was Weſtern Pruſſia, as by the diſmemberment of that province the navigation of the Viſtula depends entirely upon the king of Pruſſia. This was a fatal blow to the trade of Poland, ſince Pruſſia has laid ſuch heavy duties on the merchandize paſſing to Dantzick, as greatly to diminiſh the trade of that town, and to tranſfer a conſiderable part of it to Memel and Koningſburgh, ſo that Poland having, by the diſmemberment, loſt near half her annual income, it became neceſſary to new-model and increaſe the taxes, in order to ſupply this deficiency.

All the imports in 1775 amounted to 323,012l. the nett revenue of the king (which ariſes from his royal demeſnes, ſtaroſties, and 74,074l. out of the treaſury) is 194,500l. out of which he only pays his houſehold expences and menial ſervants. The whole revenue is 443,938l. out of which if we deduct 194,500l. for the king's privy purſe, there will remain the ſum of 249,438l. for army, ſtate officers, and all other charges.

Reſpecting the military ſtrength of Poland, we have already obſerved, that the innate pride of the Poliſh nobility is ſo great, that they always appear in the field on horſeback, and hence the principal force of the kingdom conſiſts in cavalry; indeed, the infantry, which are generally hired from Germany, and ſoon diſmiſſed, are ſeldom conſidered as any part of the Poliſh army. The nobility who have ſeized the reins of government, together with all the honours and emoluments of the ſtate, have alſo undertaken to defend it, leaving all the reſt of the nation to cultivate the lands. Hence the Poliſh cavalry are all gentlemen; and it is ſaid that Poland can raiſe 100,000, and Lithuania 70,000 of ſuch horſemen, including their ſervants, who always attend their maſters on horſeback in the field. This combined army, or rather two armies, conſiſting of Poliſh and Lithuanian cavalry, have each their grand general, entirely independent of each other. It has been already obſerved that the office of grand-marſhal is the ſecond in dignity, but the grand-general is ſuperior in power, being confined only by the limits he preſcribes to himſelf, nor is this authority ever ſuſpended but when the king commands the army in perſon.

Beſides theſe, there is a third army, called the poſpolite, conſiſting of all the nobility and their followers in the kingdom, except the ſtaroſts and generals of the frontier places. This army can be ſummoned by the king on extraordinary occaſions; but he cannot keep them above ſix weeks in arms, nor are they obliged to march above three leagues beyond the frontiers of the kingdom.

A fourth army has been for ſome time maintained in Poland, conſiſting of infantry and light horſe, generally called huſſars. The latter are reckoned the fineſt and moſt ſhowy body of troops in Europe. They wear defenſive armour, and their horſes are remarkably ſwift, ſo that they greatly haraſs the army of an enemy. But want of diſcipline has rendered the Poliſh troops, notwithſtanding all their bravery, very incapable of facing an army of veterans belonging to the other powers of Europe in the field. Formerly indeed, eſpecially under the command of the famous John Sobieſki, they made a noble figure againſt the Turks, and proved the bulwark of Europe againſt all the attacks of the infidels: but the Saxon princes, who ſucceeded that hero, did not think it prudent to encourage the martial ſpirit of the Poles. On the contrary, they perpetually over-awed them with their electoral troops. At the ſame time they neglected to introduce any reformation among them, either civil or military: the ignorance of the Poles ſuited better with their plan of ſubordination. This neglect, which was not felt for many years, has now been ſeverely felt in this devoted kingdom.

A great variety of coins have been ſtruck in Poland; but the following only are at preſent current in that kingdom, viz. the gold ducat of Poland, valued at 9s. 3d. the old ſilver dollar of Dantzick, 4s. 6d. the old rix-dollar of Thorn, 4s. 5d. the rix-dollar of Sigiſmund III. and Uladiſlaus IV. 4s. 6d.

The Poles never had any order of knighthood before

fore that of the Immaculate Conception, erected by Sigiſmund III. with ſome privileges above the reſt of the gentry, who ſo much deſpiſed it, that the order ſoon came to nothing. King Auguſtus, in 1705, revived the order of the White Eagle, in remembrance of his happily meeting the diet in Lithuania, when the Swedes and Staniſlaus thought to have intercepted him. This order was firſt inſtituted by Uladiſlaus, in the year 1325. The badge is a white eagle, crowned with diamonds. He conferred it on ſeveral lords, but the ſenators are diſtinguiſhed by wearing a golden croſs, with a badge in the middle of it: the motto is, *pro fide rege, et lege*; "for the faith, the king, and the law."—His late majeſty, on the 26th of September 1736 (which was the anniverſary of his birth) created eight knights of a new order, in honour of St. Henry, of which he aſſumed the title of grand-maſter. The badge of this order is a red ſtar with eight points, in the middle of which there is a repreſentation of the emperor Henry, and upon each ray or point appears the electoral ſword of Saxony. The ſtar is appendent, by a ſilver ſtring, to a ribband of crimſon velvet. The preſent king, ſoon after his election to the crown in 1765, inſtituted the order of St. Staniſlaus. The badge is a gold croſs enamelled red, and in the centre of it a medallion with the image of St. Staniſlaus enamelled in proper colours. It is worn pendent to a red ribband edged with white. The ſtar of the order is ſilver, and in the centre is a cypher of S. A. R. (Staniſlaus Auguſtus Rex) encircled with the motto, *Premendo incitat*; "he ſtirs up by oppreſſing."

HISTORY OF POLAND.

THIS kingdom was originally inhabited by the Sarmatians, who were expelled by the Ruſs and Tartars. The government was, in proceſs of time, divided between twelve palatines, who were ſovereigns of ſo many diſtricts, and independent of each other. About the year 700, one Cracus, either by force, or by conſent of theſe petty princes, became ſovereign of the whole, and he it was that built the city of Cracow. The line of Cracus being extinct, Poland was again governed by twelve palatines, who agreed, in the year 760, to elect Leſcus their ſovereign, with the title of duke, which was retained till the year 999, when Boleſlaus firſt aſſumed the title of king; and, about this time, Chriſtianity was firſt eſtabliſhed in Poland; ſince which it appears to have been an hereditary monarchy, his poſterity ſucceeding to the throne for ſeveral generations, among whom was Caſſimir I. Boleſlaus II. marrying Viciſlava, the daughter and heireſs of Red Ruſſia, that province was united to Poland anno 1059. The kings of Poland, among whom was Caſſimir III. were abſolute ſovereigns until the reign of Lewis, anno 1370, but then the Poles inſiſted on limiting the prerogative, probably becauſe Lewis was king alſo of Hungary, and they ſuſpected he would favour his native country to their prejudice. Lewis being ſucceeded by his daughter and heireſs, Hedwigis, anno 1382, ſhe married Uladiſlaus V. great duke of Lithuania, on condition he ſhould become a Chriſtian, and their iſſue ſhould ſucceed both to the crown of Poland and the duchy of Lithuania, which have been united ever ſince. Uladiſlaus, their ſon, ſucceeded them, who was alſo king of Hungary. This prince was killed in a battle with Amurath, the Turkiſh emperor, and, leaving no iſſue, was ſucceeded by his brother Caſſimir IV. between whom and the knights of the Teutonic order, who had been placed in Pruſſia by the pope, there were continual wars, until it was agreed, that the knights ſhould remain poſſeſſed of Eaſtern or Ducal Pruſſia, the grand-maſter taking an oath of fealty to the king of Poland. In the reign of Sigiſmund II. the Ruſſians invaded Livonia, then poſſeſſed by the Teutonic knights, who called in the Poles to their aſſiſtance; other provinces called in the Swedes, and theſe three powers contended for the dominion of Livonia many years. Henry of Valois, duke of Anjou, was elected king of Poland anno 1574; but his brother Charles, the French king, dying, he quitted Poland, and ſucceeded to the crown of France anno 1577. Stephen Batory, prince of Tranſylvania, was elected king of Poland on the abdication of Henry. In his reign the ſupreme courts of juſtice were firſt erected, before which time the king and council were the laſt reſort in caſes of appeal. Sigiſmund III. ſon of John, king of Sweden, was elected king on his renouncing Lutheraniſm, anno 1587. Uladiſlaus, his ſon, ſucceeded him, anno 1632, and invading Ruſſia, took the capital city of Moſcow, and, in a treaty that enſued, he obliged the Ruſſians to confirm the provinces of Smolenſko and Zernigoff to Poland. Uladiſlaus, leaving no iſſue, was ſucceeded by his brother John Caſſimir, anno 1648, though he was then a cardinal. In this reign, the old Coſſacks, being diſobliged, renounced their allegiance to the Poles, and became ſubjects to the Ruſſians and Turks. Charles Guſtavus, king of Sweden, conquered Poland, but loſt it again in ſix months; after which, John Caſſimir introduced an army of 30,000 Germans to defend the kingdom againſt the Swedes; but the Poles, ſuſpecting he intended to render himſelf abſolute, depoſed him; whereupon he retired into France, and was made abbot of the abbey of St. Germain. Michael Wiſnoweſki being elected in 1670, the Turks conquered Podolia in his reign, but were defeated by John Sobieſki, who was elected king on the death of Wiſnoweiſki. This prince died after a glorious reign, in the year 1697, and the greateſt anarchy and confuſion ſucceeded. Confederacies were formed in ſupport of different candidates, and the moſt horrid ravages were committed on the territories of each party. In the mean time, Poland was inſulted by the Tartars, and its crown in a manner offered to the higheſt bidder. In 1603, Frederic Auguſtus, elector of Saxony, was placed on the throne, in oppoſition to the prince of Conti, who had been proclaimed king by the French faction; but, being unable to ſupport his pretenſions againſt the armies of Auguſtus, he retired into France; but it was not till the year 1712 that Auguſtus was fully confirmed on the throne, which he held upon precarious and diſagreeable terms. The year after his acceſſion, the Turks, by the peace of Carlowitz, reſtored the province of Podolia to Poland.

Auguſtus was not ſo fortunate in his alliances againſt Charles XII. of Sweden. He was defeated in ſeveral battles, and afterwards depoſed by that monarch, who placed Staniſlaus Leſczinſki on the throne of Poland in 1704. That prince continued to enjoy the royal dignity till the year 1709, when Charles XII. being totally defeated at the battle of Pultowa, and obliged to take refuge among the Turks, Auguſtus was replaced on the throne of Poland by Peter the Great. The Poles, were, however, ſo ſtrongly attached to the intereſt of their countryman Staniſlaus, that Auguſtus was obliged to maintain his authority by means of his Saxon forces. In the year 1725, his natural ſon prince Maurice, afterwards the famous count Saxe, was elected duke of Courland; but Auguſtus was not able to ſupport him in his new dignity.

Auguſtus died in 1733, after doing every thing in his power to inſure the ſucceſſion of the throne of Poland to his ſon Auguſtus II. but Staniſlaus being elected by a conſiderable party, with the primate at their head, Auguſtus found it neceſſary to ſupport his pretenſions with the ſword. This brought on a war, in which the intereſt of Staniſlaus was ſupported by the French. But Auguſtus entering Poland at the head of a powerful army, compoſed of Saxons and

Ruſſians,

Ruſſians, Staniſlaus was obliged to retreat to Dantzick from whence he afterwards, with great difficulty, eſcaped into France. Auguſtus, however, could not acquire the affections of his Poliſh ſubjects: ſo that when he was driven from his electorate by his Pruſſian majeſty, he could obtain nothing more than ſhelter for himſelf and his friends; the Poles abſolutely refuſing to take any part in the war. Auguſtus died at Dreſden in 1763, when count Staniſlaus Poniatowſki was unanimouſly choſen king by the name of Staniſlaus Auguſtus. He was born in 1732, and crowned king of Poland in 1764. While a private nobleman, he reſided ſome time in London, and is a member of the Royal Society. As he was peculiarly favoured by the empreſs of Ruſſia and ſome Proteſtant powers, the papers which he ſigned, at the time of his election, were deemed too favourable to the Proteſtants in general, and the Greeks in particular. Hence the army, which the empreſs of Ruſſia had in Poland, gave a pretence for various confederacies to be formed againſt the king by the Roman Catholics; and the conſpiring nobles at length were ſo unnatural as to throw off all allegiance to the ſovereign, and to put themſelves under the protection of the grand ſeignior. This mad ſtep of ſome of the Poliſh nobles occaſioned the Ottoman Porte to declare war againſt Ruſſia, and to invade Poland with a powerful army. Since which time, that unhappy country has been a ſcene of confuſion, rapine, horror, oppreſſion, and bloodſhed. Hurried on either by blind zeal, or miſtaken bigotry, the confederates precipitated the ruin of their devoted country, and ſome of the neighbouring powers, invited by their incautions enthuſiaſm, took an advantage of this abſurd civil war, and, under the maſk of friendſhip, diſmembered this once powerful kingdom.

So far was diſſimulation uſed in the diſmemberment, or partitioning of Poland, as the powers concerned think proper to term it, that they all expreſsly deny having had the leaſt intention to ſeize any of the Poliſh provinces, or in any wiſe to divide that country. In the act of renunciation tranſmitted to the court of Warſaw in the year 1764, and ſealed with the ſeal of the Ruſſian empire, the empreſs of Ruſſia ſays, "She did by no means arrogate, either to herſelf, her heirs and ſucceſſors, or to her empire, any right or claim to the diſtricts or territories which were actually in poſſeſſion or ſubject to the authority of the kingdom of Poland, or great duchy of Lithuania; but that, on the contrary, her ſaid majeſty would guarantee to the ſaid kingdom of Poland and duchy of Lithuania all the immunities, lands, territories, and diſtricts, which the ſaid kingdom and duchy ought by right to poſſeſs, or did now actually poſſeſs; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, againſt the attempts of all and every perſon or perſons who ſhould at any time, or on any pretext, endeavour to diſpoſſeſs them of the ſame."

The king of Pruſſia, in the ſame year, ſigned an act, in which he declared, "That he had no claims, formed no pretenſions on Poland, or any part thereof; and that he renounced all claims on that kingdom, either as king of Pruſſia, elector of Brandenburg, or duke of Pomerania." In the ſame inſtrument, he guarantees the rights and territories of Poland againſt every other power whatever. The empreſs-queen of Hungary, likewiſe, in the year 1771, wrote a letter, with her own hand, to the king of Poland, in which ſhe gave him the ſtrongeſt aſſurances, "That her friendſhip for him and the republic was firm and unalterable; that the motion of her troops ought not to alarm him, that ſhe had never entertained a thought of ſeizing any part of his dominions, nor would even ſuffer any other power to do it." Yet theſe very ſovereigns, ſo liberal in their proteſtations of protection, and warm in their profeſſions of friendſhip, are the perſons who have jointly invaded the unhappy kingdom of Poland, diſtreſſed its inhabitants, ſeized on its moſt valuable revenues, diſmembered its palatinates, duchies, &c. and partitioned out ſome of its richeſt cities and provinces among themſelves.

Since theſe illuſive declarations and fallacious proteſtations were made and given, the partitioning powers publiſhed each a manifeſto, in which they reſpectively laid claim to certain of the Poliſh territories. In theſe pretenſions the king of Pruſſia ſhewed himſelf a deep politician, by contriving to lay claim to the moſt valuable ſhare, and thereby obtaining the richeſt, moſt populous, and moſt commercial parts. It was in the year 1770 that theſe falſe and pretended friends threw off the maſk, and began to avow their intentions. The Pruſſian conſul, having received his political leſſon, took occaſion to quarrel with the magiſtrates of Dantzick, and having been palpably the aggreſſor, was, according to his inſtructions, the firſt to complain. The king of Pruſſia pretended to be highly offended: but inſtead of coming to an explanation, or hearing both parties, he determined to be at once judge, jury, and executioner; he, therefore, to make a deciſion, not by the ſword of juſtice, but by the ſword military, ſuddenly ſurprized the city with a ſtrong body of troops, fined the magiſtrates 100,000 ducats for what he termed their inſolence, ſeized upon 1000 men to recruit his army, and, having thus executed his intentions firſt, he began very calmly to argue the matter with the magiſtrates afterwards; and having coolly remonſtrated with them on their imprudence, as he called it, told them to do ſo no more, and he would freely forgive them. Amazing condeſcenſion, and truly characteriſtic of the moderation of an arbitrary prince!

This, however, was a trifling prelude to what was to follow; for in the enſuing year, 1771, the Pruſſian troops entered Great Poland, and carried off from that province and its neighbourhood above 12,000 families; and, about the latter end of the ſame year, his Pruſſian majeſty publiſhed an edict, commanding, under the moſt ſevere penalties, that all perſons ſhould take in payment for forage, proviſions, corn, horſes, &c. the money offered by his troops and commiſſaries. This money was either ſilver bearing the impreſſion of Poland, and worth only one-third of its nominal value, or ducats ſtruck in imitation of Dutch ducats, but above ſeventeen per cent. inferior in value to the real ducats of Holland. With this very baſe money he bought up a ſufficient quantity of forage and proviſions to ſtock his magazines and ſupply his army for two years: and the poor inhabitants, after having been thus obliged to part from their property much below its value, were, through neceſſity, compelled to come to repurchaſe corn from thoſe magazines, and to pay good ſubſtantial money for it; for the Pruſſian commiſſaries abſolutely refuſed to receive again the ſame coin which they had paid: from this curious, though not very honeſt manœuvre, the king of Pruſſia cleared 7,000,000 of dollars. The country being thus ſtripped of money and proviſions, the next plan of his Pruſſian majeſty was, to clear it of its inhabitants. To increaſe the population of his own dominions, at the expence of Poland, had long been his aim. To this end he enacted, that every city, town, village, &c. in the places which his troops poſſeſſed, ſhould furniſh a certain number of marriageable young women, and the parents were ordered to give, as a portion, a feather bed, four pillows, a cow, two hogs, and three ducats in gold. This cruel order was rigorouſly executed. The parents were ſtripped, in the moſt tyrannical and oppreſſive manner, to ſupply extorted portions for the children raviſhed from their arms. The young women were inhumanly dragged from their parents, their friends, and their connections; and, being bound hand and foot, like criminals, were carried off, in ſpite of the lamentations of themſelves and relations, in carts, waggons, &c. After this horrid exertion of arbitrary power, the exactions from the abbeys, convents, cathedrals,

nobles, &c. were ſo great and unreaſonable, that the people of fortune fled from their eſtates, and retired into foreign countries, and the prieſts abandoned their churches. Theſe exactions continued with unabated rigour, from the year 1771, to the time the treaty of partition was declared, and poſſeſſion taken of the provinces wreſted from Poland; when Poliſh Pruſſia, and ſome diſtricts bordering upon Brandenburg, were allotted to the king of Pruſſia; almoſt all the ſouth-eaſtern parts of the kingdom, with the rich ſalt-works of the crown, fell to the empreſs-queen of Hungary: and the empreſs of Ruſſia took poſſeſſion of a large territory about Mohilow.

Every perſon of good ſenſe, moderation, and equity, will certainly conſider the violent diſmemberment and partition of Poland as the firſt great breach in the modern political ſyſtem of Europe; and notwithſtanding the deſtruction of a great kingdom, with the conſequent diſarrangement of power, dominion, and commerce, has been beheld by the other nations of Europe with the moſt aſtoniſhing indifference and unconcern, yet future ages will regard this unjuſtifiable meaſure with the greateſt indignation; thoſe who projected it with horror; and thoſe who acquieſced in it with contempt. The courts of London, Paris, Stockholm, and Copenhagen, remonſtrated againſt the uſurpations, but made no attempt to oppoſe them; ſo that Poland was forced to ſubmit, and the partition was ratified by their diet, held under the bribes and threats of the three powers. There was a majority of ſix in the ſenate; but, in the lower houſe, the aſſembly of nuncios, there was a balance of but one vote in favour of the meaſure, fifty-four againſt fifty-three. This is a very alarming circumſtance, and ſhews that a moſt important, though not happy change, has taken place in that general ſyſtem of policy, and arrangement of power and dominion, which had been for ſome ages an object of unremitting attention with moſt of the ſtates of Europe.

REVOLUTION IN POLAND,

Which took place in 1791.

Every perſon, whoſe attention has at all been directed to political events, muſt recollect the diſmemberment of Poland in the year 1773. From that period the republic has been reduced to a moſt humiliating ſtate of ſervitude and dependence upon Ruſſia. Notwithſtanding the advances of Pruſſia were favourably received by the nation during Ruſſia's conteſt with the Porte; yet the enlightened part of the Poliſh patriots flattered themſelves with no advantages from Pruſſia, which were not to be paid by ſacrificing the beſt intereſts of the republic; they determined, therefore, to make a wiſer uſe of the interval of relief from foreign oppreſſion, which they now enjoyed; and they found themſelves warmly ſeconded in their views by the greateſt part of the nation, when it appeared that the ceſſion of Thorn and Dantzick to Pruſſia was the immediate object of that inſatiable court.

Every nation muſt find its own ſupport within itſelf; ſince, by depending on a foreign power, it will ever find its proſperity precarious, and its government contemptible. Poland wanted not induſtry nor valour; but what ſhe ſtood moſt in need of was unity, a conſtitution, an active and efficient government. Happily for her, ſhe was at this time poſſeſſed of ſome men of the moſt rational abilities, and apparently of the moſt exalted patriotiſm. The king had indeed been elected by the Ruſſian intereſt; but he has ſhewn that foreign obligations have not been able to eradicate from his breaſt an attachment to his country.

During the ſeſſion of the diet many excellent decrees had been paſſed in favour of general liberty, and calculated to attach the citizens to the intereſts of their country: that of the 18th of April, 1791, in particular, which ſecured to the freemen the rights which had been previouſly confined to the order of nobles, and which opened the door of nobility to the inferior orders, was a conſiderable advance in favour of human nature, in a nation which had ſo long been devoted to the ſlaviſh principles of the feudal ſyſtem. The minds of the public were alſo prepared for the change, by the apprehenſions which the deſigns of Pruſſia upon Thorn and Dantzick had excited, and by the juſt alarms, which agitated the people, of a future diviſion of their territory. The new conſtitution, however, was digeſted and prepared with the utmoſt ſecreſy and caution; and but few were entruſted with the projected deſign.

On the memorable 3d of May, 1791, at three o'clock in the morning, a ſelect body of patriots aſſembled in the royal chamber; there, in preſence of the king, they ſolemnly engaged never to ſeparate till the intended revolution ſhould be happily accompliſhed. The galleries of the hall, in which the diet was held, were crowded at an early hour, as if in expectation of ſome important event.

The ſeſſion was opened by the king in perſon, inſtead of the marſhal; and inſtead of recurring to the order of the day, which was a report on the finances, his majeſty addreſſed the aſſembly on the general ſtate of the nation; and obſerved, that "whatever aſſurances foreign powers might amuſe them with, he had undoubted proofs that the alarming rumours which had been ſpread concerning a freſh diſmemberment of the territories of the republic, reſted upon too ſure a foundation; and that the contending powers were about to terminate their differences at the expence of Poland. That one way remained, and but one, to ſecure the poſſeſſions of the republic, and to preſerve the ſtate from ruin; and that was, to give it ſuch a conſtitution as might impart unity to its government, and attach the people to its ſupport.—That, with this view, a conſtitution had been prepared, principally founded on the Engliſh and American conſtitutions, and adapted as much as poſſible to the circumſtances of the country: and he truſted that they would adopt this conſtitution."

A tumultuous debate enſued, after the reading of the conſtitution. The nuncios of Volhynia and Podolia proteſted againſt the proceeding. M. Suchorzowſky, who has been the author of the decree in favour of the citizens, threw himſelf at the feet of the throne, aud beſought his majeſty, that he would not perſiſt in his intention to make the crown hereditary. Others referred to the inſtructions of their conſtituents, and intreated that the further conſideration of this buſineſs ſhould be deferred to a future day; but this propoſal did not meet with the ſentiments of the majority. The king then, riſing from his ſeat, reſpectfully called the biſhop of Cracovia, and took a ſolemn oath to maintain the conſtitution: "He that loves his country," exclaimed his majeſty, "let him follow me to the church, and repeat this oath at the foot of the altar." The king was attended to the church by all the nuncios, except between thirty and forty. Te Deum was ſung; all the deputies preſent took the oath; and the new conſtitution was announced to the people by the firing of 200 pieces of cannon. It was reported that, on the preceding day, a foreign miniſter had diſtributed the ſum of 50,000 ducats for the purpoſe of obſtructing the revolution. The attempt, however, proved abortive; the moſt perfect tranquillity prevailed; and nothing but exclamations of joy was heard throughout Warſaw. Thus without bloodſhed, and even without tumult, was effected a revolution honourable to thoſe who projected it, and promiſing to be eſſentially conducive to the happineſs of the people.

General

General Outlines of the New Conſtitution.

"By this new conſtitution, a full and free toleration is permitted to all ſects and religions; the peaſants, who were formerly in a ſtate of the moſt abject vaſſalage, or rather ſlavery, are received under the protection of national law and government, and all contracts between the lords and vaſſals are declared equally binding. The ſovereignty is declared to reſide altogether in the will of the people; and three diſtinct powers are eſtabliſhed in the government—the legiſlative, the executive, and the judicial. With reſpect to the firſt of theſe powers, the diet or legiſlature is to be elected every two years from the order of nobles, and is divided into two houſes, namely, the houſe of nuncios, and the ſenate; the former, however, poſſeſſes the pre-eminence, and every law which paſſes in it is immediately to be ſent to the ſenate, where, if it is accepted, it becomes a law in full force: if ſuperſeded, it muſt be reſumed at the next diet; and if a ſecond time, it paſſes the houſe of nuncios, the ſenate muſt ſubmit to it.

"With reſpect to individuals the crown of Poland is hereditary, and elective as to families; and the houſe of Saxony is the family now (1791) choſen for the vacancy. To the king and his council is entruſted the execution of laws. The king's perſon is inviolable. He may pardon all criminals but ſtate priſoners: he commands the forces, appoints commanders, patentees, officers, biſhops, ſenators, miniſters. But no miniſter or ſenator can ſit in the houſe of nuncios.

"The judiciary power is thus divided: firſt, primary courts in each diſtrict or palatinate; ſecond, courts of appeal in each of the three provinces. There are ſome other local inferior courts, and a comitial tribunal for the trial of crimes againſt the ſtate.

"Citizens in general are empowered to purchaſe landed eſtates; and, whoever purchaſes a village or townſhip, paying 200 florins land-tax, is ennobled. Thirty citizens are alſo ennobled at every diet. The army, the law, and the church, are all thrown open to the citizens. Perfect and entire liberty is proclaimed to all new ſettlers, whether foreigners, or emigrants returned from foreign parts."

The oppoſition which at firſt was made to the conſtitution, chiefly on account of the hereditary ſucceſſion, ſoon began to ſubſide. Count Braniki, grand-general of the kingdom, who at firſt had declared againſt the conſtitution, acceded to it, and ſigned it at the diet on the 5th; and the celebrated friend of liberty, Malackowſky, great chancellor of the crown, who on that event had reſigned the ſeals, re-accepted them at the requiſition of the diet, and accepted the office of miniſter of juſtice, and for the interior department. On the 17th M. Goltz, charge des affaires from the court of Berlin, announced his Pruſſian majeſty's approbation of the new arrangement.

The ready concurrence of the king of Poland in a meaſure adapted to promote the welfare of his people, and the animated ſupport which he gave to the new conſtitution, evinced the goodneſs of his heart, and the liberality of his principles. But here our commendation muſt end; we cannot give to his Poliſh majeſty the praiſe of political ſagacity, of foreſight, of activity, or even of courage. Lulled into a fatal ſecurity by the inſidious profeſſions of a court, noted for its perfidy, as well as for its verſatile and ſelfiſh politics; a court which appeared to promote the revolution, while it meditated ſecretly the diſmemberment of Poland; the unfortunate monarch appears to have neglected every means of defence; nor was even the heſitating and undecided conduct of Saxony ſufficient to excite his vigilance. No alliances were formed, no preparations made for ſupporting with vigour the infant conſtitution. This neglect, great as it was, was even exceeded by the indifference of the king as to the means of internal defence. While the diſcontented nobles, who from perſonal reſentment, or diſappointed ambition, manifeſted the moſt earneſt hoſtility to the conſtitution; while theſe were openly received and encouraged at Peterſburg, neither the ſtanding force of Poland was properly organized, nor the militia embodied. Not a magazine was erected, nor an intrenchment thrown up to oppoſe the entrance of the enemy. It was all a dead calm, and the Ruſſians appeared upon their frontiers before the diet had recovered from its ſurpriſe at the firſt hoſtile declaration of the empreſs.

On the 21ſt of April, 1792, the diet received the firſt notification from the king, of the inimical and unjuſt intentions of Ruſſia. He informed them, that without the ſhadow of pretence, this avowed enemy of the rights of mankind had determined to invade the territory of the republic with an army of 60,000 men. This formidable banditti, commanded by generals Soltikow, Michelſon, and Koſakowſki, was afterwards to be ſupported by a corps of 20,000, and by the troops then acting in Moldavia, amounting to 70,000. The king, however, profeſſed that he was not diſcouraged, and declared his readineſs to put himſelf at the head of the national troops, and to terminate his exiſtence in a glorious conteſt for the liberties of his country. Then, and not before, the diet decreed the organization of the army, and its augmentation to 100,000. The king and the council of inſpection were inveſted with unlimited authority in every thing that regarded the defence of the kingdom. Magazines were ordered to be conſtructed, when it was too late, and quarters to be provided for the army.

In conſequence of theſe preparations, the diet and the nation roſe, as one man, to maintain their independence. All private animoſities were obliterated, all private intereſts were ſacrificed; the greateſt encouragements were held forth to volunteers to enrol themſelves under the national ſtandard, and it was unanimouſly decreed by the diet, that all private loſſes ſhould be compenſated out of the public treaſury.

In 1792, Ruſſia, ſeeing war declared between Auſtria and France, and finding herſelf likely to be called upon to fulfil her engagements with the former of thoſe powers, avowed her intentions, in the month of May, to overturn the preſent conſtitution of Poland, and give it a form of government which might beſt ſuit herſelf. An official declaration was accordingly delivered to the Poliſh government on this ſubject, dated the 18th of May, and filling twelve pages, in the Poliſh, French, and Ruſſian languages: it announces the entrance of the Ruſſian troops on the territory of Poland, and the formation of a new confederacy. When the declaration of the court of Ruſſia was read at the diet, the king immediately roſe, and explained to the members how far he thought the republic menaced, and its independence wounded; and declared he thought there were but two ways left for the republic to chooſe out of, viz. whether they ſhould go to war, or endeavour to keep the republic at peace by means of negotiation; if the laſt is reſolved upon, the kings of Hungary and Pruſſia, and the elector of Saxony, ſhould be requeſted to uſe their good offices. His majeſty ſaid, that with reſpect to himſelf, he ſhould always be found, wherever he could, either by council or perſonally, to render moſt ſervice to his country, without any regard to his own life. The king ſaid, what hurt him moſt was, that for their critical ſituation they were indebted to Polanders by birth, who miſrepreſented every thing to the empreſs of Ruſſia, and concluded by recommending the neceſſary arrangements to be immediately taken.

With reſpect to the declaration itſelf, it was in general conſidered as a tiſſue of falſehood and hypocriſy. It aſſerted, that this wanton invaſion, which was evidently againſt the ſenſe of almoſt every individual Polander, was meant entirely for the good of the republic.

public. It cenſured the precipitancy with which the new conſtitution was adopted, and aſcribed the ready conſent of the diet to the influence of the Warſaw mob. It repreſented the conſtitution as a violation of the principles on which the Poliſh republic was founded—complained of the licentiouſneſs with which the ſacred name of the empreſs was treated, in ſome ſpeeches of the members; and concluded, by profeſſing, that on theſe accounts and in behalf of the emigrant Poles, her Imperial majeſty had ordered her troops to enter the territories of the republic.

This declaration was no ſooner delivered to the diet, than the Ruſſian troops, accompanied by counts Potocki, Rzewuſki, Branicki, and a few Poliſh apoſtates, appeared upon the frontiers, and entered the territories of the republic, in ſeveral columns, before the cloſe of the month. The ſpirit manifeſted by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzivil engaged voluntarily to furniſh 10,000 ſtand of arms, and another a train of artillery. The courage of the new and haſtily embodied ſoldiers, correſponded with the patriotiſm of their nobles. Prince Poniatowſki, nephew to the king, was appointed commander in chief, and though his force was greatly inferior to the enemy, it muſt be confeſſed that he made a noble ſtand. On the 24th of May, the enemy's coſſacks were repulſed, and purſued by the patroles of the republic to the very entrenchments. On the 26th, about one o'clock, the picquets of the republic diſcovered a large body of Don Coſſacks approaching the outpoſts; and a ſquadron of cavalry, commanded by lieutenant Kwaſniewſki, ſupported by lieutenant Golejowſki, with two ſquadrons more, in all about 300, marched out to meet them. They attacked the Coſſacks with ſucceſs, but purſued them with more valour than prudence, to the ſide of a wood, where they found themſelves drawn into an ambuſcade, and ſurrounded by 2000 horſe, two battalions of chaſſeurs, and ſix pieces of cannon. The intrepid Poles bravely fought their way through the Ruſſian line, and killed upwards of 200 of the enemy. The Poles, in this engagement, loſt 100 men, and two officers; one of whom, lieutenant Kwaſniewſki, was wounded, and made priſoner. The remainder of the detachment reached their quarters in ſafety.

The hiſtory of man can ſcarcely furniſh an inſtance of perfidy, meanneſs, and duplicity, equal to that which was manifeſted by Pruſſia on this occaſion. By the treaty of defenſive alliance, ſolemnly contracted between the republic of Poland and the king of Pruſſia, and ratified on the 23d of April, 1790, it is expreſsly ſtipulated, "That the contracting parties ſhall do all in their power to guarantee and preſerve to each other reciprocally the whole of the territories which they reſpectively poſſeſs. That, in caſe of menace or invaſion from any foreign power, they ſhall aſſiſt each other with their whole force, if neceſſary;" and by the 6th article, it is further ſtipulated, "that if any foreign power whatever ſhall preſume to interfere in the internal affairs of Poland, his Pruſſian majeſty ſhall conſider this as a caſe falling within the meaning of the alliance, and ſhall aſſiſt the republic according to the tenor of the 4th article," that is, with his whole force. Poſterity will ſcarcely believe, or will believe with indignation after this, that on application to the court of Berlin, for the ſuccours thus ſolemnly contracted for, the only anſwer they received, was—"That the treaty was dated previous to the new conſtitution, and that conſtitution eſtabliſhing a new order of things, his Pruſſian majeſty held himſelf abſolved from his engagements." Of ſuch value are treaties in the eyes of deſpotic princes! But what enhances the treachery, is this, that it is confidently aſſerted, that moſt of the obnoxious acts, of which the empreſs complained in her declaration againſt the Poles, were done by the influence and advice of Pruſſia; that the king of Pruſſia, when the conſtitution was propoſed, never gave the ſmalleſt intimation that "the new order of things" would diſſolve the alliance; and that ſo far from this being the caſe, our readers will find, that "on the 17th of May, 1791, M. Goltz, charge des affaires from the court of Berlin, formally announced his Pruſſian majeſty's approbation of the new arrangement."

The great ſcene of action, in the beginning of the war, was the duchy of Lithuania; but the Ruſſians had made little progreſs before the middle of the month of June. On the 10th of that month, general Judycki, who commanded a detachment of the Poliſh troops, between Mire and Swierzna, was attacked by the Ruſſians; but, after a combat of ſome hours, he obliged them to retire with the loſs of 500 men dead on the field; the general was deſirous of profiting by this advantage, by purſuing the enemy, but was prevented by a moſt violent fall of rain. On the ſucceeding day, the Ruſſians rallied again to the attack; and it then too fatally appeared, that the Poles were too young and undiſciplined to contend with an inferior force againſt experienced troops and able generals. By a maſterly manœuvre, the Ruſſians contrived to ſurround their antagoniſts, at a moment when the Poliſh general ſuppoſed that he had obliged the enemy to retreat; and though the field was conteſted with the utmoſt valour by the troops of the republic, they were at length compelled to give way, and to retire towards Nieſwieſz.

Another engagement took place on the 14th near Lubar, on the banks of the river Sluez, between a detachment of the Ruſſian grand army, and a party of the Poliſh cavalry, diſpatched by prince Joſeph Poniatowſki, to intercept the enemy. The patriotic bravery of the Poles was victorious in this conteſt; but upon reconnoitring the force of the enemy, the prince found himſelf incapable of making a ſucceſsful ſtand againſt ſuch ſuperior numbers. He therefore gave orders to ſtrike the camp at Lubar, and commenced a precipitate retreat. During their march, the Poliſh rear was haraſſed by a body of 4000 Ruſſians, till arriving at Boruſkowee, the wooden bridge unfortunately gave way, under the weight of the cavalry. The enemy, in the mean time, brought their artillery to play upon the rear of the fugitives, who loſt upwards of 250 men. The Poliſh army next directed its courſe toward Zielime, where meeting, on the 17th, with a reinforcement from Zaſlow, it halted to give battle to the enemy. The Ruſſians were upwards of 17,000 ſtrong, with twenty-four pieces of cannon, and the force of the republic much inferior. After a furious conteſt from ſeven in the morning till five in the afternoon, the Ruſſians were at length obliged to retreat, and leave the field of battle in poſſeſſion of the patriots. The Ruſſians were computed to have loſt 4000 men in this engagement, and the Poles about 1100.

The Poles, notwithſtanding theſe exertions, were obliged gradually to retire before their numerous and diſciplined enemies. Nieſwieſz, Wilna, Minſk, and ſeveral other places of leſs conſequence, fell into their hands one after another. On a truce being propoſed to the Ruſſian general Kochowſki, the propoſal was haughtily rejected; while the deſertion of vice brigadier Rudnicki, and ſome others, who preferred diſhonour to perſonal danger, proclaimed a tottering cauſe. The progreſs of the armies of Catharine was marked with devaſtation and cruelty, while, ſuch was the averſion of the people both to the cauſe and the manner of conducting it, that, as they approached, the country all around became a wilderneſs, and ſcarcely a human being was to be ſeen.

A ſeries of little defeats happening in the mean time, to which the inexperience of the commanders, and the intemperate valour of new raiſed troops, appear to have greatly contributed, ſerved at once to diſtreſs and to diſpirit theſe defenders of their country. Prince Poniatowſki continued to retreat, and on the 17th

17th of July, his rear being attacked by a very ſuperior force, it ſuffered a conſiderable loſs, though the ſkill and courage of general Koſciuſko enabled him to make a moſt reſpectable defence. On the 18th, a general engagement took place between the two armies. The Ruſſian line extended oppoſite Dubienka, along the river Bug, as far as Opalin. The principal column, conſiſting of 14,000 men, was chiefly againſt the diviſion of general Koſciuſko, which conſiſted of 5000 men only. After a moſt vigorous reſiſtance, in which the Ruſſians loſt upwards of 4000 men, and the troops of the republic only ſome hundreds, the latter was compelled to give way before the ſuperior numbers of the enemy, and to retire further into the country. Thus was this unequal conteſt at length prematurely terminated.

The king, whoſe benevolent intentions were, perhaps, overpowered by his mental imbecility, and whoſe age and infirmities, probably, rendered him unequal to the difficulties and dangers which muſt attend a protracted war, inſtead of putting himſelf, according to his firſt reſolve, at the head of his army, determined, at once, to ſurrender at diſcretion. On the 23d of July, he ſummoned a council of all the deputies at that moment in Warſaw. He laid before them the laſt diſpatches from the empreſs, which inſiſted upon total and unreſerved ſubmiſſion. He pointed out the danger of a diſmemberment of the republic, ſhould they delay to throw themſelves upon the clemency of the empreſs, and to entreat her protection. He mentioned the fatal union of Auſtria and Pruſſia with Ruſſia; and the diſgraceful ſupineneſs manifeſted by every other court of Europe.

The intrepid and patriotic Malachowſki, the princes Sapieha, Radzivil, and Soltan, were the four citizens who vehemently proteſted againſt theſe proceedings; and the following evening a company of gentlemen, from the different provinces, aſſembled for the ſame purpoſe. The aſſembly waited immediately on theſe four diſtinguiſhed patriots, and returned them their acknowledgments for the ſpirit and firmneſs with which they had reſiſted the uſurpations of deſpotiſm. The ſubmiſſion of the king to the deſigns of Ruſſia was no ſooner made known, than Poland was bereft of all her beſt and moſt reſpectable citizens. Malachowſki, as marſhal of the diet, and prince Sapieha, grand-marſhal of Lithuania, entered ſtrong proteſts on the journals of the diet againſt theſe hoſtile proceedings, and declared ſolemnly that the diet legally aſſembled in 1788 was not diſſolved.

On the 20th of December, 1794, a curier arrived from the empreſs, demanding the arreſtation of count Ignatius Potocki, and ſeveral of the other patriots, whom ſhe ordered to be ſent to Peterſburg. The ſame meſſenger brought a command from the empreſs to the unhappy monarch of Poland to repair to Grodno, who, in obedience to the ſummons, ſet off from his capital on the 7th of January 1795.

The unfortunate king has ſince removed to Peterſburg, where he at preſent remains, and has a palace and a ſuitable penſion aſſigned him.

CHAP. XXIII.

SWITZERLAND;

AND THE COUNTRIES OF THE ALLIES OF THE SWITZERS.

Situation, Extent, Boundaries, Towns, Climate, Produce, Mountains, Inhabitants, Religion, Curioſities, Government, Hiſtory, &c.

THIS country is ſituated between the 6th and 11th deg. eaſt long. and between the 45th and 48th of north lat. being about 260 miles in length, and 100 in breadth. It is bounded on the weſt, by France; on the ſouth, by Italy; on the eaſt, by the lake of Conſtance, Tirol, and Trent; and, on the north, by Alſace and Suabia, in Germany. The whole is divided into thirteen cantons; viz. Zurich, Berne, Lucerne, Uri, Schweitz, Underwalden, Zug, Glaris, Baſil, Fribourg, Soleure, Schaffhauſen, Appenzel.

The following are the names of the principal towns of each canton in Switzerland:

Countries Names.		Chief Towns.
Calviniſts	Berne	Berne.
	Zurich	Zurich.
	Schaffhauſen	Schaffhauſen.
	Baſil	Baſil.
Papiſts	Lucerne	Lucerne.
	Underwalden	Stantz.
	Uri	Alborf.
	Suiſſe	Suiſſe.
	Fribourg	Fribourg.
	Zug	Zug.
	Soleure	Soleure, or Soloturn.
Calviniſts and Papiſts	Appenzel	Appenzel.
	Glaris	Glaris.
Subjects of the Switzers, Calviniſts and Papiſts	Baden	Baden.
	Bremgarten	Bremgarten.
	Mellingen	Mellingen.
	Rheinthall	Rheinſick.
	Thurgau	Frowanfield.
	Lugano	Lugano.
	Locarno	Locarno.
	Mendris	Mendris.
	Maggia	Maggia.

The names of the principal towns of each canton belonging to the allies of Switzers.

Calviniſts	Griſons	Coire.
Calviniſts and Papiſts	Chiavanna	Chiavanna.
	Bormio and Valtcline	Sondrio.
Calviniſts	Tocklenburg	Liechtenſteg.
	Geneva	Geneva.
	Neufchatel	Neufchatel.
Papiſts	Valais	Sion.
	Baſle	Delſperg.
	St. Gall	St. Gall.

To theſe, Mulhauſen in Alſace is alſo united.

Switzerland enjoys in general a healthy climate. The air, in winter, is exceedingly cold, both in the vallies and on the mountains; but during the ſummer it is delightfully cool in the latter, though ſultry hot in the former. The inequality of the ſoil renders the ſame province very unequal in its ſeaſons: ſometimes the north ſide of a mountain will be clothed in all the horrors of winter, while the oppoſite is decked in the cheerful robes of ſummer: on one ſide of the mountains the inhabitants are often reaping, while they are ſowing on another. The vallies are, however, warm, fruitful, and well-cultivated, and the ſummer months in this charming country are extremely delightful. The water is generally excellent.

The principal rivers are the Rhine, the Aar, the Ruſs, the Inn, the Rhone, the Teſin, the Oglio, and the Lutſchinen.

A very curious phænomenon preſents itſelf to our obſervation with reſpect to the dangerous bridge over the laſt mentioned river Lutſchinen, in the bailliage of Iterlacken, and canton of Berne, in Switzerland. This river is formed by the junction of two ſtreams: the one, called the Weiſs Lutſchinen, flowing through the valley of Lauterbrunnen; and the other called the Schwartz Lutſchinen, which comes from the valley of Grindelwalde. Having left the fertile plains of Giſteig, and paſſed the village of Wilderſwyl, the breadth of the valley leſſens, and continues to grow ſo narrow, that the ſtream of the Lutſchinen can hardly

public. It cenſured the precipitancy with which the new conſtitution was adopted, and aſcribed the ready conſent of the diet to the influence of the Warſaw mob. It repreſented the conſtitution as a violation of the principles on which the Poliſh republic was founded—complained of the licentiouſneſs with which the ſacred name of the empreſs was treated, in ſome ſpeeches of the members; and concluded, by profeſſing, that on theſe accounts and in behalf of the emigrant Poles, her Imperial majeſty had ordered her troops to enter the territories of the republic.

This declaration was no ſooner delivered to the diet, than the Ruſſian troops, accompanied by counts Potocki, Rzewuſki, Branicki, and a few Poliſh apoſtates, appeared upon the frontiers, and entered the territories of the republic, in ſeveral columns, before the cloſe of the month. The ſpirit manifeſted by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzivil engaged voluntarily to furniſh 10,000 ſtand of arms, and another a train of artillery. The courage of the new and haſtily embodied ſoldiers, correſponded with the patriotiſm of their nobles. Prince Poniatowſki, nephew to the king, was appointed commander in chief, and though his force was greatly inferior to the enemy, it muſt be confeſſed that he made a noble ſtand. On the 24th of May, the enemy's coſſacks were repulſed, and purſued by the patroles of the republic to the very entrenchments. On the 26th, about one o'clock, the picquets of the republic diſcovered a large body of Don Coſſacks approaching the outpoſts; and a ſquadron of cavalry, commanded by lieutenant Kwaſniewſki, ſupported by lieutenant Golejowſki, with two ſquadrons more, in all about 300, marched out to meet them. They attacked the Coſſacks with ſucceſs, but purſued them with more valour than prudence, to the ſide of a wood, where they found themſelves drawn into an ambuſcade, and ſurrounded by 2000 horſe, two battalions of chaſſeurs, and ſix pieces of cannon. The intrepid Poles bravely fought their way through the Ruſſian line, and killed upwards of 200 of the enemy. The Poles, in this engagement, loſt 100 men, and two officers; one of whom, lieutenant Kwaſniewſki, was wounded, and made priſoner. The remainder of the detachment reached their quarters in ſafety.

The hiſtory of man can ſcarcely furniſh an inſtance of perfidy, meanneſs, and duplicity, equal to that which was manifeſted by Pruſſia on this occaſion. By the treaty of defenſive alliance, ſolemnly contracted between the republic of Poland and the king of Pruſſia, and ratified on the 23d of April, 1790, it is expreſsly ſtipulated, "That the contracting parties ſhall do all in their power to guarantee and preſerve to each other reciprocally the whole of the territories which they reſpectively poſſeſs. That, in caſe of menace or invaſion from any foreign power, they ſhall aſſiſt each other with their whole force, if neceſſary;" and by the 6th article, it is further ſtipulated, "that if any foreign power whatever ſhall preſume to interfere in the internal affairs of Poland, his Pruſſian majeſty ſhall conſider this as a caſe falling within the meaning of the alliance, and ſhall aſſiſt the republic according to the tenor of the 4th article," that is, with his whole force. Poſterity will ſcarcely believe, or will believe with indignation after this, that on application to the court of Berlin, for the ſuccours thus ſolemnly contracted for, the only anſwer they received, was—"That the treaty was dated previous to the new conſtitution, and that conſtitution eſtabliſhing a new order of things, his Pruſſian majeſty held himſelf abſolved from his engagements." Of ſuch value are treaties in the eyes of deſpotic princes! But what enhances the treachery, is this, that it is confidently aſſerted, that moſt of the obnoxious acts, of which the empreſs complained in her declaration againſt the Poles, were done by the influence and advice of Pruſſia; that the king of Pruſſia, when the conſtitution was propoſed, never gave the ſmalleſt intimation that "the new order of things" would diſſolve the alliance; and that ſo far from this being the caſe, our readers will find, that "on the 17th of May, 1791, M. Goltz, charge des affaires from the court of Berlin, formally announced his Pruſſian majeſty's approbation of the new arrangement."

The great ſcene of action, in the beginning of the war, was the duchy of Lithuania; but the Ruſſians had made little progreſs before the middle of the month of June. On the 10th of that month, general Judycki, who commanded a detachment of the Poliſh troops, between Mire and Swierzna, was attacked by the Ruſſians; but, after a combat of ſome hours, he obliged them to retire with the loſs of 500 men dead on the field; the general was deſirous of profiting by this advantage, by purſuing the enemy, but was prevented by a moſt violent fall of rain. On the ſucceeding day, the Ruſſians rallied again to the attack; and it then too fatally appeared, that the Poles were too young and undiſciplined to contend with an inferior force againſt experienced troops and able generals. To theſe, Mulhauſen in Alſace is alſo united.

Switzerland enjoys in general a healthy climate. The air, in winter, is exceedingly cold, both in the vallies and on the mountains; but during the ſummer it is delightfully cool in the latter, though ſultry hot in the former. The inequality of the ſoil renders the ſame province very unequal in its ſeaſons: ſometimes the north ſide of a mountain will be clothed in all the horrors of winter, while the oppoſite is decked in the cheerful robes of ſummer: on one ſide of the mountains the inhabitants are often reaping, while they are ſowing on another. The vallies are, however, warm, fruitful, and well-cultivated, and the ſummer months in this charming country are extremely delightful. The water is generally excellent.

The principal rivers are the Rhine, the Aar, the Ruſs, the Inn, the Rhone, the Teſin, the Oglio, and the Lutſchinen.

A very curious phænomenon preſents itſelf to our obſervation with reſpect to the dangerous bridge over the laſt mentioned river Lutſchinen, in the bailliage of Iterlacken, and canton of Berne, in Switzerland. This river is formed by the junction of two ſtreams: the one, called the Weiſs Lutſchinen, flowing through the valley of Lauterbrunnen; and the other called the Schwartz Lutſchinen, which comes from the valley of Grindelwalde. Having left the fertile plains of Giſteig, and paſſed the village of Wilderſwyl, the breadth of the valley leſſens, and continues to grow ſo narrow, that the ſtream of the Lutſchinen can hardly

force a paſſage. In the rainy ſeaſon, the river forms a torrent, which ruſhes impetuouſly through the great maſſes of rock that obſtruct its courſe, and, with inconceivable violence, forces from their beds the moſt enormous fragments. The road to Twey-Lutſchinen and Lauterbrunnen is over this river, by a kind of bridge, which, to a ſtranger to the country, exhibits a very terrific appearance. Suſpended over a roaring torrent, and fixed againſt the ſides of rocks that are almoſt in a leaning poſition, it exhibits the idea of a double danger. A huge vertical ſtone, raiſed in the middle of the river, ſupports ſome thick planks, ſo badly joined as to be neither ſteady nor ſolid; and theſe form a wretched inſecure bridge, over which the country people daily paſs, with a firm ſtep and undaunted eye; a paſſage, which the traveller, unaccuſtomed to ſuch ſtrange communications, would tremble to attempt. From this place the river flows till it falls into the lake of Brientz.

The chief lakes are thoſe of Geneva, Conſtance, Neufchatel, Biel, Brin, Thun, Zurich, Lucerne, and Brientz.

In the mountains are mines of iron, marble of various colours, cryſtal, ſpar, common gypſum, ſlate, ſand-ſtones, chalk, mundic, terra ſigillata, ſulphur, ſalt-petre, rock-ſalt, and pit-coal.

The cattle and ſheep in Switzerland are very numerous; and they have an exceeding good breed of horſes. On the mountains are white and yellow foxes; hares, which turn white in winter; marmouſets, and the Alpine mice, which are in reality a ſpecies of badger. Here are alſo the bouquetin and the chamois, whoſe activity in ſcouring along the ſteep and craggy rocks, and in leaping over the precipices, is hardly conceivable. The blood of both theſe animals is of ſo hot a nature that the inhabitants of ſome of theſe mountains, who are much ſubject to pleuriſies, take a few drops of it, mixed with water, as a remedy for that diſorder: the fleſh of the chamois is eſteemed very delicious. Tame and wild fowl are very plentiful here; among the latter is a very large kind of eagle; and the rivers and lakes are ſtored with fiſh. The mountains produce good timber and paſture; and in the vallies there are vaſt quantities of wheat, barley, oats, rye, ſpelt, flax, and hemp; alſo apples, pears, nuts, cherries, plums, and cheſnuts; the parts towards Italy abound in peaches, almonds, figs, citrons, pomegranates, and grapes; in other parts, ſaffron is cultivated with good ſucceſs. In a word, Switzerland produces ſufficient for the ſubſiſtence of its inhabitants; and in order to provide againſt the ſcarcity which would be felt, if, from the ſudden rains and tempeſts, to which the country is ſubject, or any other cauſe, the crops ſhould fail, public granaries, well ſupplied with corn, are eſtabliſhed in various places.

The mountains in Switzerland are many and ſtupendous: they not only divide almoſt every canton from each other, but the whole country is ſeparated from Italy by a long chain of them, called the Alps, which muſt be croſſed in order to paſs from one place to the other; and accordingly there are four beaten roads over them, which in many parts will allow of no other method of travelling than on horſes, aſſes, or mules. The feet of the mountains, and ſometimes alſo the very ſummits, are covered with vineyards, corn-fields, meadows, and paſture-grounds. In winter, prodigious maſſes of ice and ſnow fall from theſe mountains, which is generally attended with conſiderable damage to the inhabitants.

There are ſeveral mineral waters and baths in this country; but the moſt excellent baths are thoſe at Baden, which, Tacitus obſerves, were known even in the time of our Saviour: they are uſed for drinking as well as bathing, and are recommended for the cure of ſeveral diſorders: the town of Baden owes its riches and grandeur to this bath, which is much reſorted to by the gentry, from all parts of Switzerland.

At the diſtance of two leagues north from the town of Le Valais are the celebrated baths of Leuk, ſituated at the foot of Mount Gemmi, in a narrow profound vale, cloſed in on all ſides by high mountains, leaving only a ſmall entrance through a wood to the ſouth. In the vale are five ſprings of warm mineral water, which are conveyed to divers baths in convenient houſes for the uſe of the ſick.

Theſe baths are greatly frequented in ſummer: the water is clear, and without any colour; yet ſome of the ſprings are ſo hot, that they will boil an egg, or ſcald the feathers from a fowl. From the pretty village containing theſe baths, there is a way to paſs to the canton of Berne, by aſcending mount Gemmi; but it is uncommonly ſteep, and the declivity remarkably rugged: in ſhort, if it had not been for facilitating the acceſs to the baths for the inhabitants of Berne, no mortal could have thought of making this mount paſſable. The deep ſighs that are occaſioned by the fatigue of aſcending it, have given its name to this rocky mountain. Little ſerpentine narrow roads, cut into the rock, in ſome places defended by walls, in others by beams faſtened croſs-ways, to keep paſſengers from falling over, render travelling this way very dangerous, and impracticable for thoſe who are ſubject to giddineſs, or bleeding at the noſe; who, upon fainting, would be liable to fall down a ſteep craggy road at the peril of life. An engineer meaſured the aſcent of this mount, and found it to be one million and ten feet

The thirteen cantons of Switzerland, according to the beſt computation, are ſuppoſed to contain about two millions of inhabitants. The men are generally tall, robuſt, well made, with bad complexions, owing chiefly to their laborious way of life, which expoſes them to tempeſtuous and ſtormy weather. The women are uſually handſome, well-ſhaped, ſenſible, and modeſt, yet frank and eaſy in their converſation and behaviour. They are a brave, honeſt, hoſpitable, induſtrious, hardy people; very friendly and humane, and always ſtedfaſt to their engagements. The gentry are much improved of late years, both in their converſation and behaviour; but they are generally haughty, and value themſelves very highly on their privileges as citizens, or ſharers in the government, and diſdain the profeſſion of trade and manufactures, for it is very difficult for a man to render himſelf of any conſequence among them, either as an adept in his profeſſion, or by poſſeſſing a ſuperior genius. The merchants have great privileges, and many of them are very rich. The peaſants, equally inured to arms and agriculture, are brave and laborious, making at once excellent ſoldiers and huſbandmen. The ſtate of matrimony is held in the higheſt eſteem among the Switzers, and ſerval privileges belong to ſuch as enter into it. The women are generally very fruitful, and their country being but narrow, parents are obliged to ſend their ſons to ſeek a ſupport in foreign climates, and as they are uſually of a martial ſpirit, and accuſtomed to arms from their youth, they moſt commonly enter into foreign ſervice; thoſe of the Popiſh cantons into the French and Spaniſh, and thoſe of the Proteſtant into the pay of the States General, and of the Proteſtant princes in Germany. They are ſo tenacious of their rights and privileges, that they diſcourage foreigners from ſettling among them, which is a great detriment to the arts and manufactures. Sumptuary laws are in force in ſome parts, by which ſuperb clothes, and ornaments of lace, gold, ſilver, and jewels, are prohibited both ſexes; but, of late years, they have made ſome alterations in the ancient ſimplicity of their dreſs, in which they now conform more to the French taſte: moſt of the men wear their own hair, and whiſkers. Their diverſions are of the warlike and active kind, of which hunting ſeems to be that they moſt delight in. As to plays, gaming, and even balls, except at weddings, the magiſtrates of moſt of the cantons have thought proper

per to impoſe fines upon them, as tending towards an introduction of extravagance and luxury into the country.

The Switzers are in general a very enlightened nation; their common people are far more intelligent than the ſame rank of men in moſt other countries; a taſte for literature is very prevalent among thoſe who are in better circumſtances, and even among many of the lower rank; and a genuine and unartful good-breeding is extremely conſpicuous in the Swiſs gentry. On the firſt entrance into this country, a traveller cannot but obſerve the air of content and ſatisfaction which appears in the countenances of the inhabitants: a general ſimplicity of manners, an open and unaffected frankneſs, joined with an invincible ſpirit of freedom, are their diſtinguiſhed characteriſtics. With reſpect to domeſtic œconomy, the cleanlineſs of the houſes and of the people is peculiarly ſtriking; in ſhort, in all their manners, behaviour, and dreſs, ſome ſtrong outlines may be traced which diſtinguiſh this happy people from the neighbouring nations, who labour under the oppreſſions of deſpotic government.

The two eſtabliſhed religions in Switzerland are Calviniſm and Popery, which differences formerly occaſioned great commotions, but at preſent they are entirely ſubſided. Proteſtantiſm was introduced into this country by Zuing, or Zuinglius, and is profeſſed in the cantons of Zurich and Berne, the towns of St. Gall, Geneva, Mulhauſen, and Biel, the principality of Neufchatel, the greater part of Baſil, Schaffhauſen, the country of the Griſons, the Thurgau, Toggenburg, Glaris, and the Rhine valley, the frontiers of Appenzel, with a ſmall part of Solothurn, and ſome places in the countries of Baden and Sargans. All the other parts of Switzerland profeſs the tenets of the church of Rome.

Several languages are ſpoken in Switzerland, but the moſt common is the German, and in that all public affairs are tranſacted. In the cantons bordering on Italy, the inhabitants ſpeak a corrupted Latin, or Italian.

The Swiſs are not celebrated for their extenſive learning or deep erudition, though there are among them many learned men, but their knowledge is generally confined to divinity and law. Rouſſeau, whoſe works have been much admired in the preſent age, and who gave a ſurpriſing force to the French language, was a native of Geneva, where the laws inſtituted by Calvin for that city are held in high eſteem. M. Bonnet, and Meſſ. de Sauſſure and de Luc will alſo be mentioned with applauſe to the lateſt poſterity. Some Switzers have alſo diſtinguiſhed themſelves in the fine arts, particularly painting and engraving.

The only univerſity in Switzerland, is that of Baſil; it was founded in 1459, and has a curious phyſic-garden, well ſtocked with choice exotics. The library and muſeum belonging to it are very noble, and contain ſome valuable manuſcripts, with an excellent collection of medals and paintings. In the cabinets of Eraſmus and Amerbach, which alſo belong to this univerſity, there are no leſs than 20 original pieces of Holbein; for one of which, repreſenting Chriſt, 1000 ducats have been offered. The colleges are thoſe of Zurich, Berne, Lauſanne, and Geneva; beſides which, there are gymnaſiums, and ſcholæ illuſtres, in moſt of the cantons: they have alſo ſome ſocieties for the improvement of the German language, and the ſciences.

The natural curioſities of Switzerland are very numerous, but none are more deſerving of notice than the glacieres, or ice-vallies, which, notwithſtanding this appellation, are ſituated a conſiderable height above the contiguous rivers and lakes. The aſcent to them is very ſteep, craggy, and ſlippery. Theſe vallies are only frequented in July and Auguſt, when the ice is found to be eight feet thick, and in ſome places of ſuch a height, that it ſeems to have been accumulating ever ſince the creation. There are alſo ſeveral wonderful hermitages in Switzerland, eſpecially one, about two leagues from Fribourg, among woods and rocks, which conſpire to form a moſt beautiful ſolitude. It conſiſts of a chapel, oratory, ſteeple, hall, refectory, kitchen, rooms, ſtairs, cellar, well, and other conveniences, all hewn out of a rock, even to the chimney and ſteeple, though the latter is fifty-four feet in height. The aſtoniſhment, which this of itſelf may excite, will not be a little increaſed, when it is known to have been the labour only of a ſingle man and a boy. Nature had indeed provided a fine ſpring, but the induſtrious architect had hewn little channels for bringing the water of the rock into ſmall ciſterns; and of earth brought from other places, he made a ſmall kitchen-garden.—This edifice it is impoſſible to view without pleaſure, but likewiſe a mixture of concern for the fate of its owner, a man of ſuch contrivance and induſtry: in the year 1708, in carrying back ſome young people who came to viſit him on the conſecration of his chapel, he was drowned in the river Sane, running by the hermitage, on which river he uſed once a week to fetch neceſſaries from the town in a little boat.

At Lauffen, on the north-eaſt part of the canton of Zurich, is a wonderful cataract of the Rhine, which falls from a height of between 40 and 50 cubits, with a noiſe that, in a calm night, may be heard at the diſtance of two leagues. And in the bailiwick of Interlacken and canton of Berne, in Switzerland, is Lauterbrunnen, a village, or rather collection of cottages, ſprinkled, like thoſe of Grindelwald, about the valley and acceſſible parts of the hills. Near the clergyman's houſe is the celebrated cataract of Stuabbach, to view which is almoſt the only motive that induces a great number of travellers, every ſummer, to viſit the valley of Lauterbrunnen. "This torrent," ſays Mr. Coxe, "rolls perpendicularly from ſo conſiderable a height, as to reſolve itſelf into a fine ſpray; the greateſt part of it falls clear of the over-hanging mountain, during its whole deſcent: but the remainder daſhes about half way againſt a projection from the rock, and flies off with great violence. The clergyman meaſured, a ſhort time ago, its perpendicular height, and found it nine hundred and thirty feet. The ſun ſhining in an oppoſite direction, a miniature rainbow was reflected toward the bottom of the fall: while I ſtood at ſome diſtance, the rainbow aſſumed a ſemicircular figure; as I approached, the extreme points gradully coincided, and formed a complete circle of the moſt lively and brilliant colours. In order to have a ſtill finer view, I ventured nearer and nearer; the circle at the ſame time becoming ſmaller and ſmaller; and as I ſtood quite under the fall, it ſuddenly diſappeared. When I looked up to the torrent, in this ſituation, it reſembled a cloud of duſt: and from this circumſtance indeed it takes its name; Staubbach ſignifying, in the German language, a ſpring of duſt. I paid for my curioſity, by being extremely wet; but then I had the ſatisfaction, at the ſame time, of ſeeing a rainbow in miniature: no uncommon phænomenon, as it may be obſerved in any caſcade, upon which the ſun ſhines directly in a certain poſition. In the preſent inſtance, however, it was ſome conſolation to me, that the object happened to be peculiarly ſtriking."

With ſuch impetuous violence the torrent ruſhes down a precipice upwards of one hundred feet high, that its waters, in a manner, leave near two thirds of the rock dry, and do not reach, but at this diſtance, the lower projecting rocks which it covers with froth, ruſhing with a roaring noiſe into the baſon below; accompanied by a tempeſt, occaſioned by the violent agitation of the air, excited by the rapidity of this fall. The circular hillock, near the rainbow, at the foot of the rock, from the top of which we may contemplate this beautiful phænomenon, forms one of the ſides of the reſervoir. Above the great torrent, is

ſeen another ſmaller fall, floating in the air, at the pleaſure of the winds. This brook is named the Kupferbacklein, or Rivulet of Copper. The ſide of the rock, beyond that of Staubbach, is called Schnepff. At the extremity of it, which is almoſt perpendicular, a maſs of rock overhangs, and from which ruſhes a conſiderable brook. On the oppoſite part of the landſcape, is ſeen, at the extremity of the mount of the Virgin, an inſolated conical point, called the Monk, from its exact reſemblance to a monk's hood. In the diſtance appear mountains of ſnow and glaciers.

Among the other natural curioſities of this country may be reckoned two wells, one of which ebbs and flows once a day; and another which flows three months, and is dry the other three; and alſo the marcaſites, falſe diamonds, which are pieces of the pureſt cryſtal, and other ſtones, found in the mountains.

Berne, though it holds the ſecond in rank, may be deemed, in power and extent, the firſt canton of Switzerland, as it comprehends about a third of the country, and its population is a fourth of the whole. It is 60 leagues in length. The reformation was introduced here in 1528. The city of Berne, which gives name to the whole canton, and is the capital, is almoſt ſurrounded by the river Aar. The houſes are moſtly built of white free-ſtone, and, in the principal ſtreets, have piazzas, or arches, under them, for the convenience of walking dry in wet weather. Here are a college, public library, muſeum, granary, guild-hall, arſenal, ſeveral hoſpitals, a handſome ſtone bridge, and a platform with a fine proſpect. The city of Berne is ſovereign of the whole canton, and the ſovereignty reſts entirely in the great council, compoſed of 200 counſellors, and 99 aſſeſſors. The ſonale, or little council, compoſed of 27 members, have the executive power.

Lauſanne, capital of the Pais de Vaud, conſiſts of ſteep aſcents and deſcents; at the eaſt ſide is a pleaſant walk, with a beautiful view of the city, and of the country round, which is a delightful variety of hills, vallies, corn-fields, meadows, vineyards, and woods. The great church, ſaid to have been 200 years in building, is a noble Gothic ſtructure.

Bale, the largeſt city in Switzerland. Its environs are beautiful, conſiſting of a fine level track of fields and meadows. The city is divided into two parts by the Rhine, over which there is a handſome bridge. It is fortified with walls, moats, towers, and baſtions, and contains ſeveral churches, beſides the cathedral, which is an elegant Gothic ſtructure; a commandery of the order of St. John, and another of the Teutonic order; a public granary, an arſenal, a ſtately town-houſe, an univerſity, a gymnaſium, a ſtately palace belonging to the margrave of Baden-Dourlach, beſides a chamber of curioſities, ſeveral hoſpitals, &c. In the arſenal is ſhewn the armour in which Charles the Bold loſt his life, with the furniture of his horſe, and the kettle-drums and trumpets of his army. On the ſtair-caſe of the council-houſe is a picture of the Laſt Judgment. Over-againſt the French church, on a long covered wall, is painted the dance of Death. St. Peter's-ſquare, planted with elm and lime trees, forms a pleaſant walk; but a ſpot regularly planted with trees, cloſe by the river, and near the minſter, makes a finer, as commanding a moſt beautiful and extenſive proſpect. The celebrated Eraſmus died here in 1536, in the 70th year of his age, and was buried in the great church. Some of the merchants here are opulent; but the ſumptuary laws are ſtrict, and a ſimplicity of manners ſtill prevails at Baſil. A ſtrange cuſtom prevails here, that the town clocks are always an hour too faſt; ſo that when it is really noon, it is one o'clock at Bale, and ſo on. Several reaſons are aſſigned for this ſingularity; which the magiſtrate cannot yet perſuade the common people to alter. Trade flouriſhes here, eſpecially in ſilk, ribbons, and wines; and the police is under excellent regulations. The two Buxtorffs, father and ſon, and the famous painter Holbein, were natives of this place.

Zurich is far leſs conſiderable than Berne. The ſtreets are neat, and houſes well built, but not magnificent In the arſenal is ſhewn the bow of the famous William Tell, with the croſs-bow from which he ſtruck the apple from his child's head; and in the library is a manuſcript of excellent letters written by the unfortunate lady Jane Gray to the judicious reformer Bullinger, in elegant Latin and German. This town is is fortified in the modern way, and has wide ditches faced with free-ſtone The ſumptuary laws are obſerved here.

Baden is an ancient town, ſituated on the Limmot; it is famous for its hot-baths: here are ſeveral churches and convents, and a council houſe.

Geneva is pleaſantly ſituated on the banks of the river Rhone, juſt where it emerges from the lake. The ſtreets are, in general, wide, clean, and well paved. The houſes are moſtly built of free-ſtone, with lime-ſtone baſements. The Maiſon de Ville, or town-houſe, is a large, plain, ancient building, with great rooms for the council to aſſemble in, and for public entertainments. In one of them there is a weekly concert by ſubſcription, during the winter ſeaſon. There are five churches here, beſides French, Italian, and German chapels. The academy has about 600 ſcholars, and eleven profeſſors. Small medals are annually diſtributed to thoſe who have diſtinguiſhed themſelves in each claſs. The public library has near 40,000 volumes of printed books, beſides a good collection of manuſcripts. The citizens have the liberty both of reſorting here, and borrowing books. The arſenal is in good order, and furniſhed with arms for 12,000 men. The hoſpital is a large handſome building. The public founta ns are ſupplied by an hydraulic engine. The fortifications are in the modern ſtile on the ſide of Savoy, but are commanded by ſome of the neighbouring ground. On the ſide of France, they are old faſhioned. They are calculated rather to prevent a ſurpriſe, than to ſuſtain a regular ſiege. They have three gates towards France, Savoy, and Switzerland. All acceſs by the lake is barred by a double jetty and chain. The garriſon conſiſts of 720 men, Swiſs or Germans. The inhabitants are computed at 24,000, chiefly Calviniſts.

The ſovereign power reſides in the general aſſembly of citizens and burgeſſes, who have attained the age of 25 years. The executive power, and adminiſtration of juſtice, are entruſted, 1. to the council of 25, called the ſenate, or little council. 2. The council of 60. 3. The council of 200, comprehending the other two, and conſiſting now of 250 members. The ſupreme magiſtrates are four ſyndics, elected annually by the general aſſembly. Other officers are, 1. The lieutenant, choſen alſo annually. 2. The treaſurer, elected for three years. 3. The procurator-general, alſo for three years. Inferior departments of government and police are managed by committees, called Chambers.

We ſhall here inſert an account of the ſmalleſt republic in Europe. It is the village of Geriſau, which is ſituated on the eaſtern branch of the lake of Schweitz, at the foot of Mount Rigi. Its territory is only ſix miles in length, and three in breadth; ſituated partly on a ſmall neck of land at the edge of the lake, and partly lying upon the rapid declivity of the Rigi. It contains about 1200 inhabitants. They have their general aſſembly of burgeſſes, their landamman, their council of regency, their courts of juſtice, and their militia: but there is not a ſingle horſe in the whole territory of the republic, as indeed may well be ſuppoſed; for the only way of arriving at the town is by water, excepting a narrow path down the ſteep ſides of the mountain, which is almoſt impaſſable. Geriſau is compoſed entirely of ſcattered houſes and cottages, of a very neat and picturesque appearance. Each dwelling

dwelling is provided with a field or ſmall garden. The inhabitants are much employed in preparing ſilk for the manufactures of Baſle. This little republic is under the protection of the four cantons of Lucerne, Uri, Schweitz, and Underwaldew; and, in caſe of war, furniſhes its quota of men. To the ambitious politician, who judges of government by extent of dominion and power, ſuch a diminutive republic, thrown into an obſcure corner, and ſcarcely known out of its own contracted territory, muſt appear unworthy of notice; but the ſmalleſt ſpot of earth on which true civil freedom is cultivated and flouriſhes, cannot fail to intereſt thoſe who know the real value of liberty and independence, and are convinced that political happineſs does not conſiſt in great opulence and extenſive empire.

With reſpect to manufactures, the principal are ſnuff and tobacco, linen of ſeveral ſorts, lace, thread, ſilk and worſted ſtockings, neckcloths, cotton ſtuffs, gloves, handkerchiefs, ſilks of ſeveral ſorts, gold and ſilver brocades, a variety of woollen manufactures, hats, paper, leather of all ſorts, earthen wares, porcelain, toys, watches, clocks, and other hardwares, &c. The trade of Switzerland is greatly promoted by many navigable lakes and rivers. In ſome of the above manufactures, and in cheeſe, butter, ſheep, horſes, black cattle, hides, and ſkins, the exports are conſiderable; and as the imports are chiefly grain and ſalt, with ſome American and Aſiatic goods, there is probably a large balance in their favour.

Before we give an account of the government and conſtitution of Switzerland, it may not be amiſs to obſerve in general, that there is no part of Europe which contains, within the ſame extent of territory, ſo many independent commonwealths, and ſuch a variety of different governments, as are collected together in this remarkable and delightful country; and yet with ſuch wiſdom was the Helvetic union compoſed, and ſo little have the Swiſs, of late years, been actuated by the ſpirit of conqueſt, that, ſince the firm and complete eſtabliſhment of their general confederacy, they have ſcarcely ever had occaſion to employ their arms againſt a foreign enemy; and have had no hoſtile commotions among themſelves that were not ſoon happily terminated; and, indeed, there is no country in which happineſs and content more univerſally prevail among the people; for, whether the government be ariſtocratical, democratical, or mixed, a general ſpirit of liberty pervades and actuates the ſeveral conſtitutions; ſo that even the oligarchical ſtates, which are uſually the moſt tyrannical, are here peculiarly mild; and the property of the ſubject is ſecurely guarded againſt every kind of violation. A harmony is maintained by the concurrence of their mutual felicity; and their ſumptuary laws, and equal diviſion of their fortunes among their children, ſeem to inſure its continuance. But, to be more particular reſpecting the nature of the Swiſs conſtitution:

In ſome of the cantons the government is ariſtocratical, and in others democratical. The former are thoſe of Zurich, Berne, Lucerne, Baſil, Friburg, Solothurn, and Schaffhauſen; the other ſix are democratical. In the firſt, both the legiſlative and executive power is lodged in the burghers, or citizens of the capital of each canton; and in the latter the legiſlative power is lodged in the whole body of the people; and every male, above ſixteen, whether maſter or ſervant, has a vote in making laws, and in the choice of magiſtrates.

The thirteen cantons are in fact ſo many independent ſtates, only united by ſtrict alliances for their mutual defence. This confederacy, conſidered as a republic, comprehends three diviſions: firſt, the Switzers, properly ſo called; ſecondly, the Griſons, or the ſtates confederated with the Switzers for their common protection; and, thirdly, thoſe prefectures, which, though ſubject to the other two, by purchaſe or otherwiſe, preſerve each its own particular magiſtrates.

In Switzerland, there are two kinds of diets held; general and partial. The general diet, which repreſents the whole Helvetic body, uſually ſits at Baden, and conſiſts of two deputies from each canton; beſides which, the abbot of St. Gall, and the cities of St. Gall and of Bienne, ſend deputies as allies. When any controverſy ariſes that may affect the whole confederacy, it is referred to the general diet, where each canton having a vote, every queſtion is decided by the majority. The general diet aſſembles annually an the feaſt of St. John the Baptiſt, and ſeldom ſits longer than a month. The partial or extraordinary diets are ſummoned according to the will of the reſpective ſtates which conſtitute them.

The revenues of the different cantons cannot eaſily be aſcertained, but it is ſuppoſed that thoſe of Berne, which is the largeſt, amount to 300,000 crowns; thoſe of Zurich to 150,000; and thoſe of the other cantons in proportion to their produce and manufactures. Whatever remains, after the neceſſary expences of government are defrayed, is laid up in the treaſury. The Swiſſes are ſaid be poſſeſſed of 500,000l. ſterling in the Engliſh funds, beſides monies in other banks. Their revenues ariſe chiefly from the profits of the demeſne lands; the tenth of the produce of all the lands in the country, the cuſtoms and duties on merchandize, ſome caſual taxes, and the ſale of ſalt; but this laſt article forms by far the moſt conſiderable part.

The Switzers maintain but few regular troops, and thoſe are employed in the garriſons. Their internal ſtrength (independent of the militia, which is eſteemed the beſt in Europe) conſiſts of 13,400 men, raiſed according to the population and abilities of each canton. Every burgher, peaſant, and ſubject, is obliged to learn the uſe of arms, appear on the days appointed for ſhooting at a mark, furniſh himſelf with proper clothing, accoutrements, powder, and ball; and to be always ready for the defence of his country. The Swiſs engage in the ſervice of foreign princes or ſtates, either as guards or in marching regiments. Such powers as are in alliance with the cantons, are, on paying them an annual ſubſidy, allowed to make levies there, when the inhabitants may enliſt with their own conſent, and with the concurrence of the magiſtracy, for what number of years they pleaſe; at the expiration of which they are always at liberty to return home. Thus the ſervice of foreign princes forms a ſchool for the young recruits of Switzerland, where, having perfectly learnt the art of war, they return to their native country able and experienced officers and ſoldiers, or die nobly in endeavouring to obtain thoſe characters in the ſervice.

The coins of Germany, France, and Italy, paſs current in Switzerland, there being none peculiar to the country.

HISTORY OF SWITZERLAND.

The Switzers and Griſons are the deſcendants of the ancient Helvetii, and were reduced under the Roman yoke by Julius Cæſar, who added their country to the province of Gaul. They continued under the Roman government till the time of Honorius and Valentinian II. when their country was conquered by the Burgundians and Germans; but their government was little more than nominal. About the year 635, part of Switzerland was given to Sigebert, count of Hapſburg, the founder of the houſe of Auſtria: and, in the year 1032, the reſt of this country was given by Rodolph, the laſt king of Burgundy, to Conrad II. emperor of Germany; and, from that period, Switzerland was conſidered as part of that empire. This government continued about 300 years, during

which period the Auſtrian governors exerciſed almoſt every ſpecies of oppreſſion.

Wearied with continual acts of injuſtice, the Switzers applied to Albert I. for redreſs; but this petition was ſo far from procuring the removal of their grievances, that their hardſhips were increaſed. Greſler, the Auſtrian governor, exaſperated at their laying their complaints before the emperor, exerted the moſt wanton tyranny. He even placed a hat upon the top of a pole, commanding the Switzers to pay the ſame reſpect to that mock repreſentation of authority, as to himſelf. William Tell, a native of Berne, and one of the beſt markſmen of the age, beheld this inſtance of Greſler's malice with contempt; he paid no regard to the Auſtrian's ridiculous commands, and frequently paſſed the ſpot without taking the leaſt notice of the hat. Exaſperated at the diſobedience of Tell, the tyrant condemned him to ſuffer death, unleſs he cleft an apple placed on his own ſon's head, who ſtood at a certain diſtance, with an arrow. Tell peformed the taſk with amazing dexterity; and Greſler obſerving another arrow ſtuck in his belt, told him, he imagined a ſingle arrow was all he could want on this occaſion. Tell nobly replied, "That arrow was intended to have pierced your heart, had the firſt unfortunately killed my ſon." Provoked at this reply, Greſler ſent Tell to priſon: but the Swiſs eſcaping from his confinement, watched an opportunity, and ſhot the governor. It appears, however, that a plan had been for ſome time concerted by the principal perſons of this diſtreſſed country, for the recovery of their liberty; and this action of Tell haſtened its execution. They defeated the forces of Auſtria and France, an union of the cantons was formed, and they defended the liberty they had obtained with ſo much valour and intrepidity, that by the treaty of Munſter, often called the treaty of Weſtphalia, concluded in 1648, their confederacy was declared to be a free and independent ſtate.

Their union was effected in the following manner: Zurich, driven by oppreſſion, ſought firſt an alliance with Lucerne, Uri, Suiſſe, and Underwald, on the principles of mutual defence; and the frequent ſucceſſes of their arms againſt Albert, duke of Auſtria, inſenſibly formed the grand Helvetic union. They firſt conquered Glaſis and Zug, and admitted them to an equal participation of their rights. Berne united itſelf in 1353; Friburg and Soleure 130 years after; Baſil and Schaffhauſen in 1501; and, in 1513, Appenzal completed the confederacy, which repeatedly defeated the united powers of France and Germany; till, at the treaty of Weſtphalia in 1648, their mutual alliance was acknowledged as a free and independent ſtate.

Since the year 1707, Neufchatel hath been ſubject to Pruſſia, but the inhabitants are nevertheleſs free to ſerve any prince whatever, and not compellable to take an active part in his wars. The king may recruit among them, and name a governor; but he derives from them a revenue of only 5000l. yearly, great part of which is expended on the roads and other public works.

CHAP. XXV.

SPAIN.

Situation, Extent, Boundaries, Diviſions, Climate, Soil, Animals, Vegetables, Fiſh, Corn, Fruits, Rivers, Bays, People, Learning, Commerce, Religion, Language, Hiſtory.

THIS kingdom, including Portugal, was anciently called Iberia, from the river Iberus; and Heſperia, from its ſituation, being the moſt weſtern part of the continent of Europe. It lies between the 36th and 44th deg. of north lat. and between the 3d of eaſt and 10th deg. of weſt long. Its greateſt length, from eaſt to weſt, is about 700 miles; and its greateſt breadth, from north to ſouth, about 480; being bounded by the Mediterranean on the eaſt; by Portugal and the Atlantic Ocean on the weſt; by the Bay of Biſcay and the Pyrennean-Hills on the north; and by the Streights of Gibraltar on the ſouth.

Spain is now thrown into fourteen grand diviſions, beſides the iſlands belonging to it.

Names of Provinces.	Chief Cities.
Caſtile, New	Madrid.
Andaluſia	Seville.
Caſtile, Old	Burgos.
Arragon	Saragoſſa.
Eſtremadura	Badajos.
Galicia	Compoſtella.
Leon	Leon.
Catalonia	Barcelona.
Granada	Granada.
Valencia	Valencia,
Biſcay and Ipuſcoa	Bilboa.
Aſturia	Oviedo.
Murcia	Murcia.
Upper Navarre	Pampeluna.
Iſlands in the Mediterranean.	
Majorca	Majorca.
Yvica	Yvica.
Minorca	Citadella.

The town and fortreſs of Gibraltar are ſubject to Great-Britain.

The ſubdiviſions of Spain are:

1. *Galicia, Kingdom, N. W.*

Archbiſhopric of Compoſtella; chief town Compoſtella.

Biſhoprics of Mondonedo, chief town Mondonedo; Lugo, chief town Lugo; Ortenſe, chief town Ortenſe.

Territory of Tuy, chief town Tuy.

Other conſiderable towns in this province are, Corunna, Ferrol, Vigo, Betawzes, and Rivadavia.

2. *Aſturia, Principality, N.*

Principality of Aſturia de Oviedo, chief town Oviedo; Aſturia de Santillana; chief town Santillana.

Other conſiderable towns in this province are, Avilles and St. Vincent.

3. *Biſcay, Lordſhip, N. W.*

Biſcay Proper, chief town Bilboa; Guipuſco, chief town Tholoſa; Alva, chief town Vittoria.

Other conſiderable towns in this province are, Fontarabia, St. Andrew, Lacedo, Ordunna, and Placentia.

4. *Navarre, Kingdom, N.*

Majorſhips of Pampeluna, chief town Pampeluna; Olita, chief town Olita, Tudela, chief town Tudela; Eſtella, chief town Eſtella; Sangueſa, chief town Sangueſa.

5. *Arragon, Kingdom, E.*

Archbiſhopric of Saragoſſa, chief town Saragoſſa.

Biſhoprics of Jaca, chief town Jaca; Hueſca, chief town Hueſca; Balbeſtro, chief town Balbeſtro; Taracona, chief town Taracona; Albaraſin, chief town Albaraſin; Teruel, chief town Teruel; Sobarbe, chief town Ainſa.

Other conſiderable towns in this province are, Calataiud, and Boria.

6. *Catalonia, Principality, E.*

Diſtricts of Barcelona, chief town Barcelona; Urgel, chief town Urgel; Balaguer, chief town Balaguer;

guer; Lerida, chief town Lerida; Tortoſa, chief town Tortoſa; Girona, chief town Girona; Tarragona, chief town Tarragona; Lampredun, chief town Roſes; Vich, chief town Vich; Cardonna, chief town Cardonna; Solſonna, chief town Solſonna; Puycerda, chief town Puycerda.

Maureſa, is another conſiderable town in this province.

7. *Valencia, Kingdom, S. E.*

Diſtricts of Xucar, chief town Valencia; Millaros, chief town Villa Hermoſa; Segura, chief town Origuela.

Other principal towns in this province are, Segorbe, Xativa, Alicant, Denia, Gandia, Morviedro, Villareal, Alzira, Altea.

8. *Murcia, Kingdom, S.*

Diſtricts of Murcia Proper, chief town Murcia: Lerea, chief town Lerea; Carthagena, chief town Carthagena.

Caravaca Mula are the other conſiderable towns in this province.

9. *Granada, Kingdom, S.*

Archbiſhopric of Granada, chief town Granada; Malaga, chief town Malaga; Almeria, chief town Almeria, Guadix, chief town Guadix.

Other conſiderable towns in this province are, Renda, Antiquera, Braga, and Loya.

10. *Andaluſia, Province, S. W.*

Archbiſhopric of Seville, chief town Seville.

Biſhoprics of Jaen, chief town Jaen; Corduba, chief town Corduba.

Duchy of Medina Sidonia, chief town Medina Sidonia.

Other conſiderable towns in this province are, Cadiz, Gibraltar, Port St. Mary, Ezeja, Baeza, Oſſuna, St. Lucar, Anduxar, Carmona, Alcalareal, Luena, Arcos, Marchena, Ayamont, Ubeda, and Moguer.

11. *Old Caſtile Province, near the Middle.*

Burgos, chief town Burgos; Rioxa, chief town Rioxa; Calahorra, chief town Calahorra; Soria, chief town Soria; Oſma, chief town Oſma; Valladolid, chief town Valladolid; Segovia, chief town Segovia; Avila, chief town Avila; Siguenſa, chief town Siguenſa.

The other conſiderable towns in this province are, Roa, Aranda, Calzada, Negera, and St. Domingo.

12. *New Caſtile, in the Middle.*

N. of the Tajo, chief town Madrid; Upon the Tajo, chief town Toledo; E. of Toledo, chief town Cuenca; On the Guadiana, chief town Cividad Real; E. of Madrid, chief town Alcalade Henarez; Frontiers of Valencia, chief town Almanza; N. W. of Madrid, chief town Eſcurial; N. E. of Madrid, chief towns Guadalaxara, Brihuega; La Moucha, S. La Sierra, E. On the Guadiana, chief town Calatrava; Frontiers of Valencia, chief town Villena Requena.

13. *Leon, Kingdom, N. E.*

North of Douro, chief towns, Leon, Palencia or Placentia, Toro, Zamora, Aſtorga.

South of Douro, chief towns Salamanca, Alva, Cividad Rodrigo.

14. *Eſtremadura, Province, S. W.*

On the Guadina, chief towns Merida, Badajox; North of the Tago, chief towns Placenia, Coria.

Between the Tajo and Guadina, chief town Truxillo; South of the Guadina, chief town Lerena, or Ellerena; on the Tajo, chief town Alcantara; on the Guadina, chief town Medelin.

Spaniſh Iſlands, E.

Majorco, chief town Majorca; Minorca, chief towns Citadella, Port Mahon; Yvica, chief town Yvica.

The climate and air of Spain vary greatly in different parts. In the ſouth, the heat is exceſſive during the months of June, July, and Auguſt, and would be almoſt inſupportable, were it not for the cool breezes which blow off the mountains, but the remainder of the year is delightful and temperate. In the north, and near the ſea-coaſt, the air in ſummer is much leſs ſultry, and in winter very cold. If the natural luxury of the ſoil in Spain was ſeconded by the induſtry of her inhabitants, it would be the moſt fruitful country in Europe. In many places it produces fruit almoſt ſpontaneouſly, and formerly vaſt quantities of corn grew there, but at preſent there is a great ſcarcity of it, entirely owing to the want of tillage, and not, as ſome have aſſerted, to the barrenneſs of the ſoil: for excepting ſome ſandy deſerts in the ſouth, and the mountains in the north, it is exceeding rich, particularly in the plains and vallies; and were it not for the generous qualities of the ſoil, the vaſt number of inhabitants in this country, who neither toil nor ſpin for their food, could never be maintained.

The Spaniſh wheat is eſteemed the fineſt in Europe; barley is produced there in great quantities, and very good: it is the common food for the horſes and mules, oats and hay being very ſcarce in that kingdom, and there is not much flax or hemp. Beſides the fruits which are produced in England, Spain yields citrons, lemons, oranges, almonds, raiſins, prunes, olives, dates, figs, cheſnuts, pomegranates, and capers. Valencia is famous for the growth of lemons; and in the kingdom of Arragon, the trees bear fruit three, and ſometimes four times in a year. Grapes are cultivated in moſt parts with the greateſt ſucceſs, and produce ſome exceeding rich wines, among which are ſack and ſherry. Dr. Buſchin ſays, that the inhabitants of Malaga, and the neighbouring country, export wines and raiſins to the amount of 268,759l. ſterling annually. Sugar-canes and ſaffron are cultivated in Granada; and the kingdom of Murcia abounds in mulberry-trees, for the ſuſtenance of its ſilk-worms, which are ſaid to produce 200,000l. worth of raw ſilk every year. The mountainous parts yield prodigious quantities of wild thyme, marjoram, and other aromatic herbs, which renders the taſte of their kids and ſheep, that feed on them, of a moſt delicate flavour. Villa Franca produces the herb eſcurzonera, eſteemed by the Spaniards an antidote againſt all ſorts of poiſons, and a certain cure in the plague: likewiſe the herb euſtracia, which being ſoaked in warm wine, and the eyes waſhed with it, is very beneficial to the ſight. Great quantities of the plant eſparto are found on the rocky lands, of which they make ropes and other cordage; and upon the banks of the river Guadina, there grows a very extraordinary ſhrub called the laurel-roſe, from the reſemblance which the flowers bear to a roſe, but the leaves are of ſuch a quality, that all animals die who happen to feed on them.

Spain is much infeſted with locuſts: in 1754, La Mancha was covered with them, and the horrors of famine attacked the fruitful provinces of Andaluſia, Murcia, and Valencia. They have ſometimes appeared in the air in ſuch numbers as to darken the ſky; the clear atmoſphere of Spain has become gloomy; and the fineſt ſummer day of Eſtremadura has been rendered more diſmal than the winter of Holland. Their ſenſe of ſmelling is ſo delicate, that they can ſcent a corn-field or garden at a great diſtance, and which they will ravage almoſt in an inſtant.

Spain is remarkable for a very fine breed of horſes, and thoſe of Andaluſia are eſteemed the handſomeſt in Europe, and at the ſame time exceeding fleet and ſtrong. The Spaniſh mules are very ſerviceable, and the

the aſſes of a prodigious ſize. The wild bulls of this kingdom have long been famous for their fierceneſs, and are chiefly bred in Andaluſia. Chamois and other goats are found in Spain, as are ſtags, many ſpecies of deer, and vaſt quantities of game, but the only beaſts of prey there are wolves. Here are great numbers of black cattle and ſheep, the latter of which produce the fineſt wool in the world. The number of ſhepherds in Spain are computed to be about 40,000, who move regularly with their flocks every ſummer from ſouth to north, along the mountains, which yield a great variety of ſweet herbs and plants, and return again towards the winter. During this progreſs, large quantities of ſalt are diſtributed among the ſheep, and all poſſible care is taken both of their health and fleeces.

Moſt of the feathered race in Spain are birds of paſſage, but two of them are worthy deſcription, viz. the flamencoes, and the ſea-cock. The firſt is about the ſize of a ſtork, but in its form ſeems a compound of the duck and the ſwan; the body is white, and the wings are ſpotted with a beautiful ſcarlet. The colour of the ſea-cock is blue, or ſcarlet and blue, extremely brilliant, with ſcarlet creſts and feet; they fly very ſlow, are good to eat, and, if taken young, may be brought up tame. The tame fowl are of various kinds, and very fine: and at Gorga there is a particular breed of hens of a prodigious ſize.

Fiſh of all kinds, particularly anchovies, is very plenty in the ſeas; there are alſo great quantities in many of their lakes and rivers; and the port of Carthagena, with ſome adjacent places, are noted for large ſhoals of herrings.

Many ſalutiferous ſprings are found in Granada, Seville, and Cordova. All the waters in Spain are poſſeſſed of ſuch healing qualities, that they are outdone by thoſe of no country in Europe; and by incloſing and encouraging a reſort to them, they grow every day more and more in vogue, eſpecially at Alhamar in Granada. The medicinal-waters of Spain are little known.

It would be almoſt impoſſible to particularize all the mountains in Spain, the whole country being interſected by them. The principal, and the higheſt, are the Pyrenees, near 200 miles in length, which extend from the Bay of Biſcay to the Mediterranean, and divide Spain from France. The Aſturian and Biſcayan mountains are a conſiderable chain, which branch out from the Pyrenees, and, running weſtward, form the ſouthern boundary of Biſcay and Aſturias. Near Gibraltar is ſituated the famous mount Calpe, oppoſite to mount Abyla, in Africa: theſe two mountains were called Hercules' Pillars by the ancients. Among the mountains of Spain, Montſerrat is particularly worthy the attention of the curious traveller, being one of the moſt ſingular in the world for ſituation, ſhape, and compoſition. It ſtands in a vaſt plain, about 30 miles from Barcelona, and nearly in the centre of the principality of Catalonia. When this mountain is firſt ſeen at a diſtance, it has the appearance of an infinite number of rocks cut into conical forms, and built one upon another to a prodigious height, or like a pile of grotto-work, or Gothic ſpires. Upon a nearer view, each cove appears of itſelf a mountain, and the whole compoſes an enormous maſs about 14 miles in circumference: the Spaniards compute it to be two leagues in height, but Mr. Swinburne eſtimates its height at only 3,300 feet. This wonderful mountain appears, at a diſtant view, to be the work of man; but on a nearer approach, the obſerver is convinced that it is the production of the God of nature.

The principal rivers in Spain are, the Ebro, the ancient Aberus; the Douro, formerly Durius; the Turo, formerly Guadalaviar; the Guadiana, formerly the Anas; the Tajo, the ancient Tagus; and the Bœtis. Here is alſo the famous river Tinto, the qualities of which are very extraordinary: it riſes in Sierra Morena, and has the name of Tinto given it from the tinge of its waters, which are as yellow as a topaz, hardening and putrifying the ſand, in a moſt ſurpriſing manner. If a ſtone happens to fall in, and reſts upon another, they both become in a year perfectly conglutinated and united. This river withers all the plants on its banks, as well as the roots of trees, which it dyes of the ſame hue as the waters. No kind of verdure will ſpring up where it reaches, nor any fiſh live in its ſtream. It kills worms in cattle when given them to drink; but no animals will drink out of the river, excepting goats, whoſe fleſh has nevertheleſs an excellent flavour. Theſe ſingular properties continue till other rivulets run into it, and alter its nature; for when it paſſes by Niebla, it is not different from other rivers, and falls into the Mediterranean ſea, ſix leagues lower down, near Huelva.

The chief lakes are, 1. Bonaventa, which runs in the middle with ſuch violence, that waves riſe like thoſe in the ſea; it abounds with fiſh, particularly excellent trout. 2. A lake on the top of the Pyrenees, of vaſt depth: it is aſſerted, that a ſtone flung into it, cauſes a prodigious vapour. 3. A lake near Antiquera, the waters of which are by the heat of the ſun made into ſalt.

There are many bays belonging to this country, the chief of which are Biſcay, Ferrol, Corunna, (commonly called the Groyne) Vigo, Cadiz, Gibraltar, Carthagena, Alicant, Altea, Valencia, Roſes, Majorca, and Port Mahon in Minorca.

There were formerly mines of gold and ſilver in this kingdom, and the latter in ſuch plenty, that Strabo obſerves, when the Carthagenians took poſſeſſion of Spain, they found the domeſtic and agricultural utenſils of that metal. There is no doubt, but that theſe mines are ſtill in the country, but they have been entirely neglected ſince the Spaniards have been able to draw ſuch immenſe quantities from America. Here are mines of lead, copper, and iron, the beſt of which is dug from the mountains of Biſcay, and ſent all over Europe, as exceeding any other in goodneſs. Here is alſo great plenty of ſulphur, alum, calamine, vermillion, and quickſilver, of which they ſend large quantities to the Weſt Indies. Near the town of Cardona are mines of ſalt of various colours, which the inhabitants term foſſile ſalt: it is dug out like ſtones, and grows very faſt. At Antiquera, in the dioceſe of Malaga, are excellent ſalt-pits, and the water that runs from them is evaporated into ſalt, by the heat of the ſun. Santa Maria, in the province of Andaluſia, and Mengravica, are likewiſe famous for their mines of white ſalt. Many places in Spain are noted for beautiful marble, alabaſter, granate, cryſtal, jaſper, jet, agate, cornelian, and other ſtones.

The number of inhabitants in Spain has been computed, by one of their own writers, at 9,250,000.—This kingdom was formerly one of the moſt populous in Europe, but has never recovered the blow given to it by the expulſion of the Moors, who, from motives of religion, were baniſhed to the amount of 100,000. Other great cauſes of this depopulation are the great drains of people ſent to America; the indolence of the natives, who do not provide food for their families; and the prodigious numbers of both ſexes, who live in a ſtate of religious celibacy; to which may likewiſe be added, the natural ſterility of the women.

In their perſons, the Spaniards are of a middle ſtature, rather lean, but well made, of an olive complexion, with black gloſſy hair, fine eyes, and expreſſive countenances. They have a natural gravity in their air, great coldneſs and reſerve in their deportment, and are far from being communicative to ſtrangers; but when once they are thoroughly acquainted, and have contracted an intimacy, they are converſable, ſocial, and friendly. They have great probity

probity and integrity of principle, and poſſeſs the higheſt notions of honour, even to exceſs, which is a ſtill viſible effect of their ancient love of chivalry, and was the animating ſpirit of that enthuſiaſm. They perſevere with great fidelity and zeal in their friendſhips; but are warm, vindictive, and implacable in their reſentments. They are generous, liberal, magnificent, charitable, and religious; but their devotion too frequently degenerates into ſuperſtition.

The predominant foible of the people is pride, which at different periods has led them to form the wildeſt chimeras; ſuch as, that the ſun only roſe and ſet in their dominions; that their language was the only one fit to addreſs the Almighty in; that they were the peculiar favourites of heaven; and that wiſdom, glory, power, riches, and dominion, were their ſole monopoly. Though theſe lofty conceits are at preſent in ſome meaſure eradicated, it is owing to them that they are ſtill poſſeſſed with the higheſt notions of nobility, family, and blood; for the mountaineer of Aſturias, though a peaſant, will plume himſelf as much upon his genealogy and deſcent, as the firſt grandee; and the Caſtilian, with his coat-armour, looks upon the Galician with ſovereign contempt. This pride, however ridiculous in itſelf, is certainly productive of the moſt exalted qualities: for it inſpires the poſſeſſors with generous, humane, and virtuous ſentiments; and that a Spaniſh nobleman, gentleman, or trader, has been guilty of a mean action, is a thing ſeldom known. This, however, is not to be underſtood of the people that live on the coaſts, who too often partake of all the bad qualities that are to be found in the refuſe of other nations: for in theſe places there is an aſſemblage of French, Ruſſians, Iriſh adventurers, and Engliſh ſmugglers, who being unable to live in their reſpective countries, mingle with the Spaniards, where they engage in all illicit practices, or enter into the Iriſh and Walloon guards in the Spaniſh ſervice; and, during a war, many of them follow privateering with great ſucceſs.

The Spaniards take great delight in the profeſſion of arms, and to this darling paſſion, commerce, manufactures, and agriculture, have been always ſacrificed. They bear all hardſhips with the moſt unremitting patience, and can endure heat, cold, and even hunger, with ſome degree of chearfulneſs. They have courage and conſtancy for the moſt hazardous undertakings, and though naturally ſlow, yet, when once put in action, purſue their object with great warmth and perſeverance; and as the inhabitants of ſeveral of the provinces, particularly Galicia, Granada, and Andaluſia, have thrown aſide their indolence, and employed themſelves aſſiduouſly in agriculture and manufactures, it is to be hoped their example will be followed by all their countrymen; as induſtry is the only thing wanting to render Spain the moſt fruitful and opulent kingdom in Europe. The Spaniards have a natural turn for politics, ſtudy, and thoroughly underſtand the natural intereſts of their own country; and even the common peaſants will ſometimes make reflections on public tranſactions, which would have done honour to a ſenator.

The Spaniſh ladies are in general exceedingly handſome, but are more famed for their wit, vivacity, and politeneſs, than for their beauty. They are ſmall and ſlender in their perſons, on which they beſtow a profuſion of art, not only painting their faces, but likewiſe their necks, arms, and hands; and there is not a defect in nature, which they have not the ſecret of hiding, or at leaſt of palliating; but theſe artifices ſhrivel their ſkin, and give them the appearance of old age long before they have attained it. The paſſion of jealouſy, for which the men of this nation were formerly ſo remarkable, ſeems to be totally eradicated, or at leaſt confined to very narrow bounds; for every married lady has her profeſſed lover, who attends her with impunity.

The Spaniards formerly wore black cloaks, ſhort jerkins, ſtraight breeches, long Toledo ſwords, and muſtachoes; but this dreſs is now chiefly confined to the lower ranks, that of the French court being introduced among the nobility, &c. They are very abſtemious in eating and drinking; and their breakfaſt, which is uſually chocolate, they frequently take in bed. Their dinners generally conſiſt of beef, mutton, veal, pork, bacon, greens, &c. all boiled together; and they are very fond of garlic, chives, ſalads, and radiſhes. The men drink very little wine, and the women uſe water, or chocolate. They always take their ſieſto, or afternoon's ſleep.

In this nation gallantry is a ruling paſſion, and they omit no expence in the gratification of it. A lover will frequently paſs the night under the windows of his miſtreſs, ſerenading her with the fineſt muſic in Spain; and to this paſſion may be attributed the amazing courage and agility which they exhibit at their bull-feaſts, where the ladies are always preſent, and by their looks animate their admirers to the moſt deſperate acts of valour. This diverſion, which is of Mooriſh original, is attended with infinite danger to the cavalier, who always attacks the bull on horſeback, with a lance, and endeavours to ſubdue him; but if the animal defends himſelf ſo long that the ſpectators are tired, they bait him with dogs, and ham-ſtring him. The dexterity with which the combatants manage their horſes and arms is incredible, keeping ſometimes a whole hour within a foot of the beaſt, without being touched; but if the bull inſults him, by forcing his lance out of his hand, throwing off his hat, wounding his horſe, or any of the company, he is obliged, by the rules of honour, to wound the beaſt in return, or die in the attempt, which is too often the caſe; for if his horſe, terrified at the bull, refuſes to advance, he muſt quit him, and engage on foot, in which ſituation he is ſtill more expoſed to the fury of the animal. If he is happy enough to come off conqueror, he receives the loudeſt acclamations of applauſe, and ſometimes a reward from the hands of his favourite lady. The bulls uſed on theſe occaſions are the wild ones, already mentioned to be bred in Andaluſia, and kept for ſome time in ſtables, and fed for this purpoſe.

A very favourite diverſion in Spain is dancing, from which even old age is not exempted; for it is no uncommon thing to ſee the grandmother, mother, and daughter, join in the ſame dance: but the continual round is commonly maſs in the morning, dinner at noon, and an airing in the evening. When they take theſe airings on gala or court days, all their attendants are dreſſed in laced liveries, with plumes of feathers in their hats. The number of ſervants kept by the grandees and perſons of the firſt faſhion in Spain, almoſt exceed credibility, for it is aſſerted, that they ſometimes amount to four hundred. The theatrical diverſions of this kingdom are very poor and inſipid. The prompter is placed underneath the ſtage, with his head peeping through a trap-toor, and he always performs his office loud enough to be heard by the audience. Their tragedies are for the moſt part ridiculous bombaſt, and the comedies are a jumble of religion and buffoonery, mingled together in a moſt whimſical inconſiſtent manner.

It is pretended by the Spaniards, that Chriſtianity was introduced into their country by St. James the apoſtle, four years after the death of our Saviour; and that St. Paul preached there in perſon. Admitting theſe aſſertions to be true, they have been ſo much the longer degenerating from the tenets delivered to them by thoſe great pillars of the primitive church; and at this time, the religion is that of Rome. It is computed, that there are now, in the kingdom of Spain, 54,000 friars, 34,000 nuns, and 20,000 ſecular clergy, but as to real devotion and morality, they are no where

leſs found than in Spain; ridiculous pomp and farcical parade having been long ſince ſubſtituted in its place. The churches are magnificently decorated, and, though the reſt of the nation is poor, the clergy are immenſely rich. Their avarice, which is inſatiable, is gratified by every indulgence that could be granted them; their eſtates are exempt from all public burdens, and their commerce, which is very conſiderable, is free from all duties and impoſts.

Before we conclude this article reſpecting the people of Spain, it may be proper to take notice of an agreeable piece of intelligence received in Nov. 1793, from one of their ſettlements in the Weſt-Indies; which is thus expreſſed:

"The following regulations have been recently adopted by the Spaniards at the Havannah, and other places, for the gradual enfranchiſement of ſlaves:

"As ſoon as the ſlaves is landed, his name, age, price, &c. are inſerted in a public regiſter; and the maſter is obliged by law to allow him one working-day in every week to himſelf, beſides Sunday; ſo that if the ſlave chooſes to work for his maſter on that day, he receives the wages of a freeman for it; and whatever he gains by his labour on that day is ſo ſecured to him by law, that the maſter cannot deprive him of it.

"When the ſlave is able to purchaſe another working-day, the maſter is obliged to ſell it to him at a proportionable price, namely, one fifth part of his original coſt, and ſo likewiſe the remaining four days at the ſame rate, when the black is able to redeem them; after which he is to be abſolutely free."

There are eight archbiſhoprics in Spain, viz. Toledo, Burgos, Compoſtella, Granada, Seville, Saragoſſa, Tarragoua, and Valencia. Toledo has eight ſuffragan biſhops; Burgos, four; Compoſtella, fourteen; Grenada, two; Seville, two, and the Canary iſlands; Saragoſſa, ſix; Tarragona, ſeven; and Valencia, two. The archbiſhop of Toledo is ſtyled the primate of Spain, is great chancellor of Caſtile, and hath a revenue of 100,000l. ſterling per ann. but the Spaniſh court has now leſſened the revenues of the church, by taxing them with penſions, donations to hoſpitals, premiums to ſocieties of agriculture, &c.

The language of the Spaniards, like that of the Italians, is a corruption of the Latin, to which it very nearly approaches; but it is mixed with Arabic words and terminations introduced by the Goths and Moors. In ſome provinces they uſe a dialect of the old French or Gaſcon; and in Biſcay, the language is ſaid to be a dialect of the Gothic or Celtic, and to have ſome analogy with the Welſh and Iriſh. The Spaniſh language, however, has nearly retained its purity for upwards of 200 years, and is at preſent moſt majeſtic and expreſſive: it has been obſerved, that foreigners, who underſtand it the leaſt, prize it the moſt; though it makes but a poor figure even in the beſt tranſlations. Its affinity to the Latin may be ſeen by the following ſpecimen of the Lord's prayer: Padre nueſtro, que eſtas en el cielo, ſanctificado ſe el tu nombre; venga a nos al tu reyna; hageſe tu voluntad, aſſien la tierra como en el cielo; el pan nueſtro de cada dia da nos le oy; y perdona nos nueſtras deudas paſſi como nos otros pardonamos a nueſtros deudores; no nos dexes cair en la tentacion, mas libra nos de mal, porque tao es le reyno, y la potencia, y la gloria, per los ſiglos. Amen."

Bigotry and indolence have been very prejudicial to the Spaniards, not only in religion, but in the arts and ſciences, and have greatly retarded their improvement in literature; for to theſe only can be attributed the few learned men ſo extenſive a kingdom has produced; eſpecially as the Spaniards in general are poſſeſſed of excellent natural capacities. Among the men of literature, natives of Spain, the following are the principal: Iſidore, biſhop of Seville, and cardinal Ximenes. Calderoni and Lopez de Vega, dramatic writers. Herrera, and de Solis, hiſtorians and antiquarians. Toſtatus a divine, whoſe works are exceeding voluminous, and have long been neglected: and that excellent ſatiriſt, Cervantes, who, by his Don Quixote, in a great degree, eradicated the ridiculous ſpirit of knight-errantry out of his country. The author of this moral and humourous ſatire was born at Madrid in 1549, liſted in a ſtation little ſuperior to that of a common ſoldier, and died neglected, after fighting bravely for his country at the battle of Lepanto, in which he loſt his left hand. Quevedo, as a poet, excelled both in the ſerious and burleſque ſtyle, and was happy in a turn of humour ſimilar to that which we admire in Butler and Swift: beſides his merit as a poet, he was well verſed in the oriental languages, and poſſed great erudition. He was born at Madrid in the year 1570. The Saracens introduced oriental poetry into Spain at a very early period; and the Spaniſh Jews afterwards made a conſiderable figure in literature; particularly in 967, Rabbi Moſes, and Rabbi Enoch, his ſon; likewiſe Rabbi Ezekias, who was put to death at Babylon in 1039. To theſe Jews the Spaniards are indebted for a curious verſion of the Hebrew books of the Old Teſtament, printed at Ferrara, in 1553, in a Gothic Spaniſh letter.

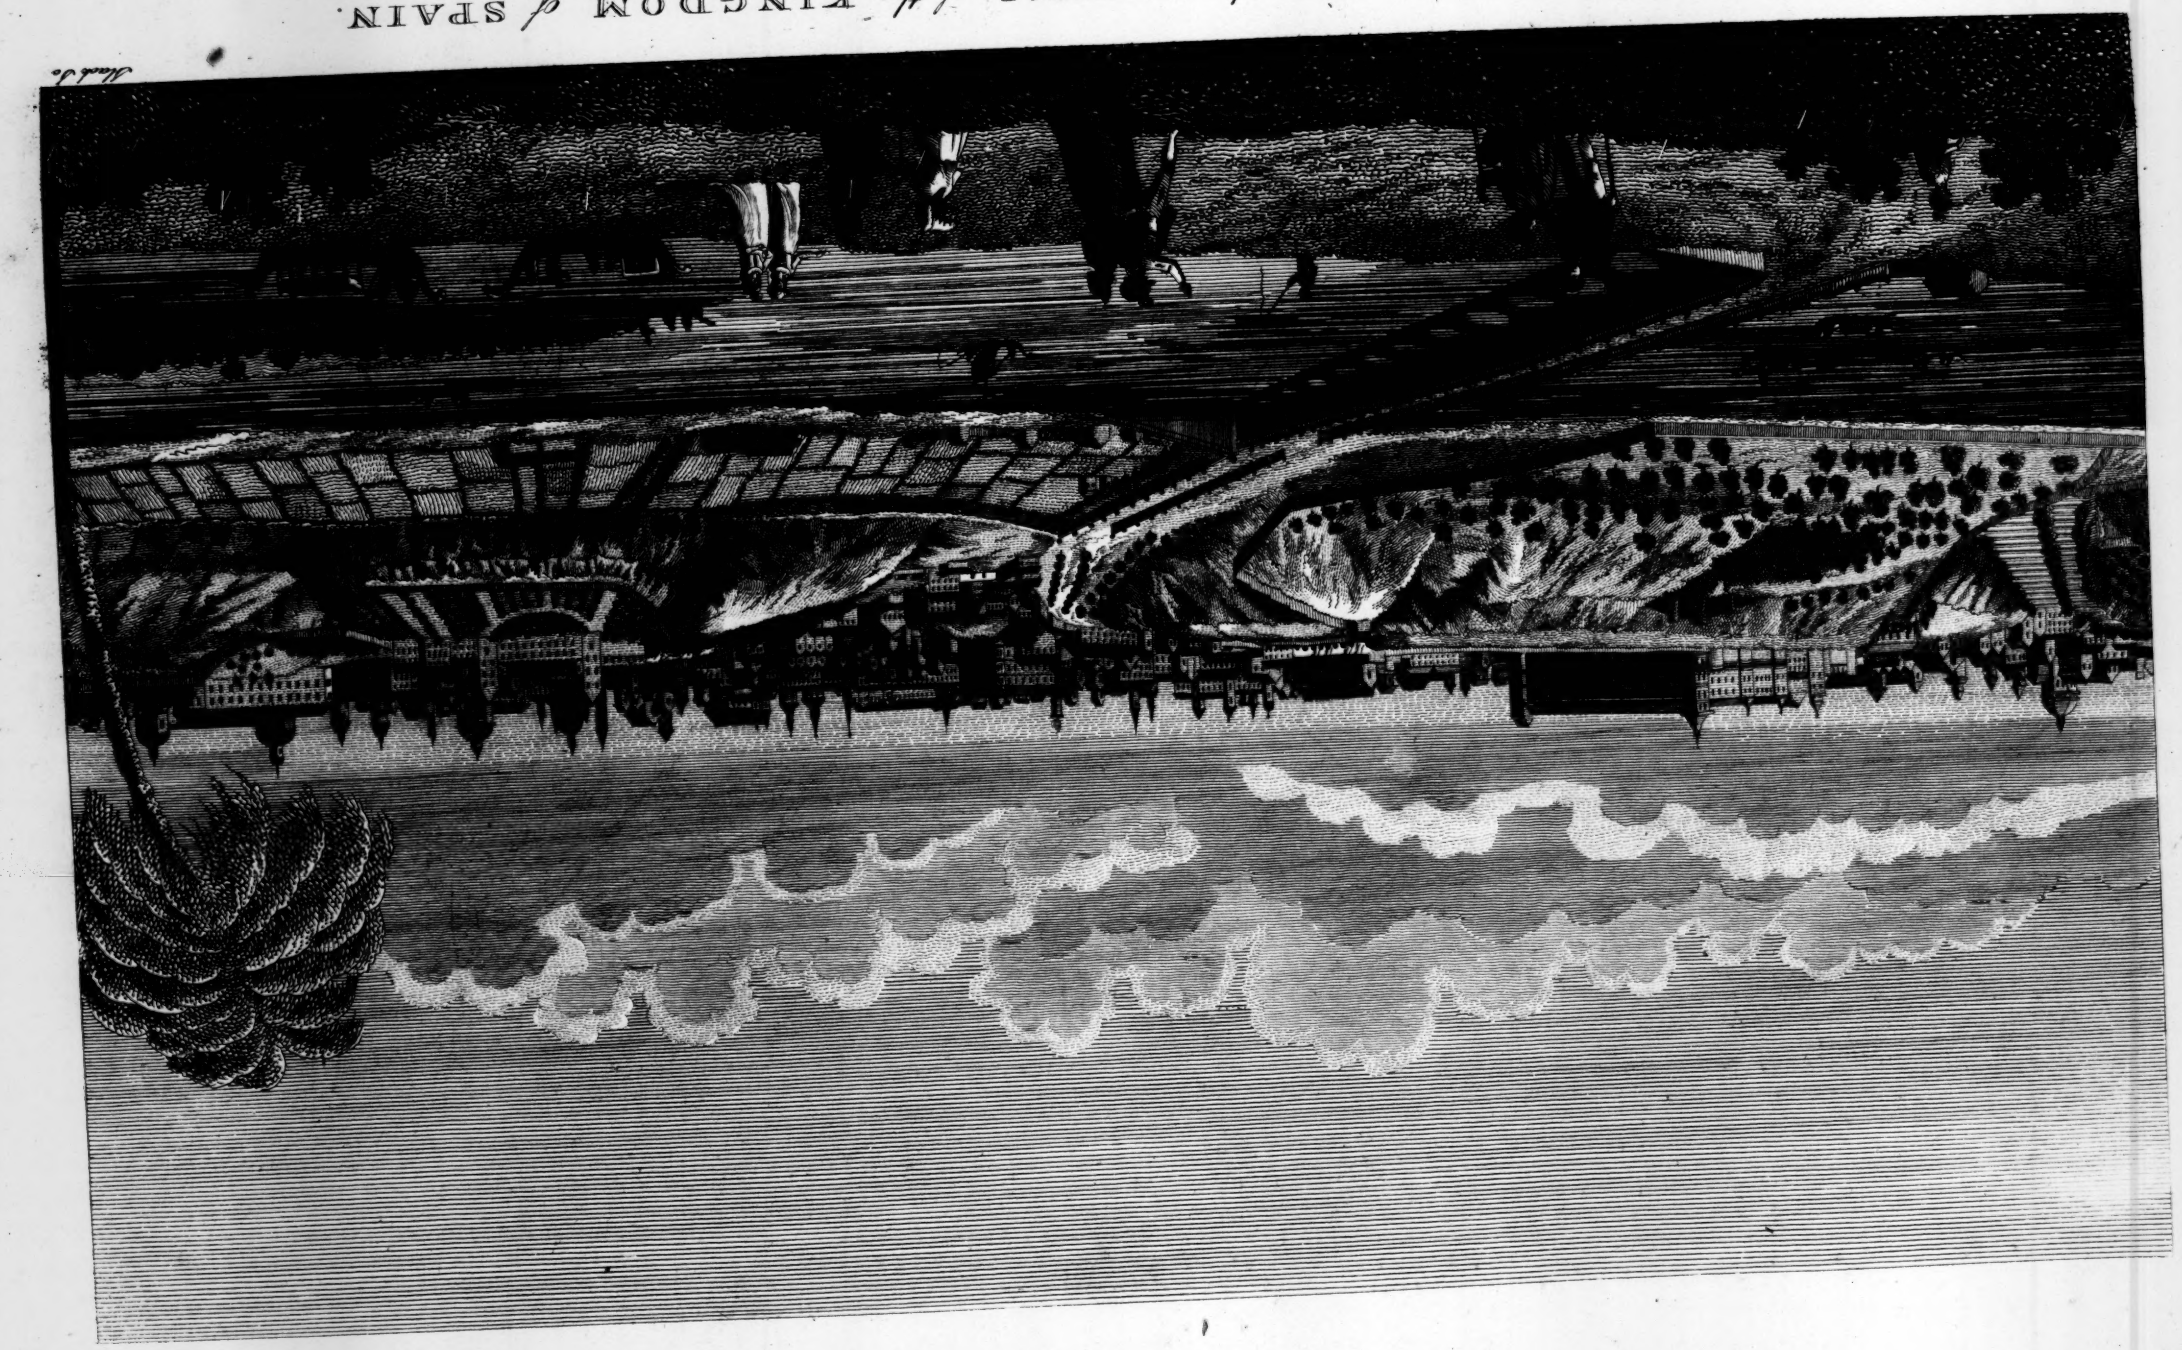
The palaces, particularly the Eſcurial, and other public buildings, do honour to the Spaniards as architects and ſculptors. Murillo has diſtinguiſhed himſelf by his paintings; and here are others that excel in the polite arts, whoſe names have not reached this part of Europe.

In Spain there are twenty-four univerſities, of which the chief is that of Salamanca, founded by Alphonſus IX. king of Leon, in the year 1200. It contains twenty-one colleges, moſt of which are well endowed, and very magnificent, particularly the public ſchools. In Marineus's time this univerſity was ſuppoſed to have 7000 ſtudents, and always maintained 75 profeſſors, who have noble ſalaries. Moſt of the noblemen in Spain ſend their ſons to be educated at this univerſity. The other 23 are thoſe of Seville, Granada, Compoſtella, Toledo, Valladolid, Alcala, Siguenza, Valencia, Lerida, Hueſca, Saragoſſa, Tortoſa, Oſſuna, Onata, Gandia, Barcelona, Murcia, Tarragona, Baeza, Avila, Oriuela, Oviedo, and Palencia.

The principal cities and towns, &c. in Spain are the following:

Madrid, the capital of this kingdom, is ſituated in the centre of a large plain, on the banks of the little river Manzanares, ſurrounded with mountains, and in the heart of Spain. The ſtreets are wide, ſtraight, and handſome; the houſes in general are lofty, and built with brick; but the windows are of lattice, except thoſe of the nobility, which are of glaſs. The royal palace ſtands on an eminence, on the weſt ſide of the city, it is a ſpacious magnificent ſtructure, conſiſting of three courts, and commands a very fine proſpect. Beſides this, there are ſeveral noble palaces. Madrid alſo contains a great number of churches, convents, and hoſpitals: among the laſt is one open for patients of all nations and diſtempers, ſupported by a large revenue. Here are three royal academies, one for the improvement of the Spaniſh language, another for hiſtory, and another for medicine. There are two ſtately bridges over the Manzanares; and round the Placa-mayor, or grand ſquare, are piazzas, with houſes all uniform, and a continued line of balconies, for viewing the bull-fights and other public ſhews exhibited there. At the eaſt end of the city is the Strado, a delightful plain, planted with regular rows of poplar trees, and watered with a great many fountains; here the nobility and gentry take the air on horſeback, or in their coaches, and the common people on foot. The compaſs of the whole city is computed at about nine miles, and contains about 200,000 inhabitants. It is well ſupplied with proviſions of all kinds, at reaſonable rates; and the court, with the reſidence of the quality, and the high colleges

A View of MADRID the CAPITAL of the KINGDOM of SPAIN.



colleges and offices that are kept there, occaſion a briſk trade.

The environs are very pleaſant, and contain ſeveral royal ſeats, among which, the moſt magnificent is the Eſcurial, which takes its name from a village in the neighbourhood, above 22 miles north-weſt from Madrid. It is a ſpacious ſtructure, built of curious white ſpeckled ſtone, with ornaments of various ſorts of marble, jaſper, &c. It is ſaid to have about 11,000 windows, and contains, beſides the royal appartments and offices, a moſt ſplendid church, in which are forty chapels, and as many altars, exceedingly rich; a convent of Jeromites, a college, ſeveral hoſpitals or infirmaries, and a noble library, containing a large and choice collection of books in all languages and faculties. Here is likewiſe the burial-place of the kings and queens of Spain, called the Pantheon. In ſhort, the whole forms ſo amazing an edifice, that it reſembles more a town than a palace. The apartments are decorated with an aſtoniſhing variety of paintings, ſculpture, tapeſtry, ornaments of gold and ſilver, marble, jaſper, gems, and other curious ſtones, ſurpaſſing all imagination. Aranjuez, which is ſituated on the Tagus, about thirty miles ſouth of Madrid, is another royal palace, which is greatly admired, particularly for its noble gardens and ſurpriſing water-works.

Toledo is ſituated on the Tagus, about 36 miles ſouth of Madrid. It is an ancient, large, and well-fortified city. Here are many ſtately edifices, ſquares, convents, churches, and hoſpitals: the cathedral is a noble ſtructure, built of a beautiful white ſtone, enriched with ſculpture; the roof of it is ſupported by eighty-eight ſtately columns, and it has eight large beautiful gates of braſs, with above thirty chapels, ſome of them large enough to paſs for churches. The treaſure of this cathedral is of ineſtimable value, and the annual revenue of about one hundred thouſand ducats. The juriſdiction, power, and grandeur of this ſee, is inferior only to that of Rome. Here is alſo an univerſity, a royal palace, and a court of inquiſition. There are three noble bridges over the river; and without the walls, on the north ſide, are ſtill to be ſeen the ruins of a Roman amphitheatre; and under the city is a large common-ſewer, which is alſo ſaid to be a Roman work.

Seville, the capital, ſituated on the river Guadalquiver, 200 miles ſouth-weſt from Madrid, was anciently the capital of Bœtia; and from Julius Cæſar, who beautified and enlarged it, was called Julia Romula; but ſubſequent to this, it was the reſidence of ſeveral Gothic and Mooriſh kings. There is a bridge of boats here over the river Guadalquiver, which is navigable for large veſſels 40 miles from its mouth. The compaſs of the city walls is eight miles, and the number of its inhabitants is computed at about 120,000. It contains a great number of convents, churches, ſquares, hoſpitals, a mint, an exchange, a cuſtom-houſe, an univerſity, and a cathedral, the largeſt and fineſt in Spain. The archbiſhop has a very large income. Here are many ſecular and eccleſiaſtical courts, particularly a court of inquiſition. This city carries on a great trade, and has various manufactories. Along the river are a great many commodious quays; near which is alſo a ſtately tower, called the Golden Tower, which entirely commands the river, city, and ſuburbs. The court for the regulation of every thing relating to the Weſt-India trade and company is held here. The adjacent country is very fruitful and pleaſant, and particularly noted for fine oranges. The greateſt inconvenience to which the city is expoſed is the overflowing of the river, which ſometimes makes dreadful havock. There is a Mooriſh aqueduct in the neighbourhood worth ſeeing.

The city of Salamanca is of a circular form, built on three hills and two vallies, and on every ſide ſurrounded with proſpects of fine houſes, noble ſeats, gardens, orchards, fields, and diſtant villages; and is ancient, large, rich, and populous. There are ten gates to this city, and it contains twenty-five churches, twenty-five convents of friars, and the ſame number of nunneries. The moſt beautiful part of this city is the great ſquare, built about forty years ago. The houſes are of three ſtories, and all of equal height and exact ſymmetry, with iron balconies, and a ſtone baluſtrade on the top of them: the lower part is arched, which forms a piazza all round the ſquare, which extends two hundred and ninety-three feet on each ſide. Over ſome of the arches are medallions, with buſts of the kings of Spain, and of ſeveral eminent men, in ſtone baſſo relievo, among which are thoſe of Ferdinando Cortez, Francis Pizarro, Davila, and Cid Ruy. In this ſquare the bull-fights are exhibited, for three days only, in the month of June. The river Tormes runs by the city, and has a bridge over it of twenty-five arches, built by the Romans, and yet entire.

Cadiz, which is ſuppoſed to have been built by the Tyrians, ſtands on an iſland, and is joined to the main land by means of the bridge Suaco, which is defended at both ends by redoubts, and other works thrown up of earth. The iſland, from Fort St. Catalina to the iſland of St. Pedro, is five miles long, and from the ſouth point near the latter to the north point, juſt by the above-mentioned bridge, almoſt two miles broad. Moſt of the ſtreets are narrow, crooked, indifferently paved, and dirty. The houſes are in general four ſtories high, handſomely built, and have each a quadrangular area. This city is computed to contain about 5000 houſes, one pariſh church, twelve convents, and a Jeſuits college, ſuppoſed, at the time it was inhabited by that order, to be the fineſt in all Andaluſia. The population is eſtimated at upwards of 100,000 inhabitants, of which 12,000 are French, and as many Italians. Here is the royal audience of the Indies, or the Indian board of trade, which was formerly held at Seville. The adjacent country is extremely rural and pleaſant.

The harbour and bay of Cadiz are very fine and ſpacious: the entrance is defended by Fort Matagorda, and Fort Pontal, the latter of which is ſituated oppoſite to it, upon a point of the neck of land on which the city is built. The entrance into the harbour is about five hundred fathoms broad, and the harbour itſelf about ten leagues in circuit, but, at ebb tide, great part of it lies dry. The only ſafe landing-place is on the ſouth-weſt ſide, which is defended by a ſmall fort called St. Catalina. The number of foreigners in Cadiz are ſaid to amount to 50,000, who reſide there for the ſake of trade, and its common inhabitants are computed at 40,000.

Barcelona is ſituated on the Mediterranean, between the rivers Llobregat and Beſos, at the foot of the mountain Monjouy, on which are ſeveral forts, commanding the town and harbour. The city itſelf is well fortified, the ſtreets ſpacious, in which are 15,000 houſes, beſides churches, colleges, hoſpitals, fountains, gardens, convents, an univerſity, an academy of arts and ſciences, founded in 1752, a court of inquiſition, and the court of royal audience for Catalonia. The cathedral is a large and magnificent edifice, and there are a number of antiquities about the town, which prove it to have been a conſiderable place in the time of the Romans, when it was called Faventia. This city was formerly the reſidence of ſeveral Gothic kings, and was afterwards ſubject for a long time to counts of its own. It carries on a conſiderable trade, and the country around is very fertile and delightful. The number of inhabitants is ſuppoſed to be nearly 150,000.

Valencia, 180 miles ſouth-eaſt from Madrid, is ſituated on, and has five bridges over the Guadalquiver. It is a large, handſome, populous, trading city, and has a port within two miles of it. It is the ſee of an archbiſhop, whoſe income amounts to 40,000l. ſterling a year, and contains a tribunal or inquiſition, a ſovereign court of judicature, an univerſity,

ſity, and a flouriſhing woollen manufactory. Prieſts, nuns, and friars, of every garb, ſwarm in this city, whoſe inhabitants are reckoned to be 80,000.

Carthagena is a famed ſea-port in the province of Murica, in Spain, on the Mediterranean, at the mouth of the river Guadalentin, near Cape Palos, and about one hundred and eighty miles ſouth-weſt from Madrid. Its harbour is defended by forty pieces of cannon; being one of the fineſt ports in the Mediterranean, and one of the three royal marine departments; the other two are Cadiz and Ferrol. It is a city, and the ſee of a biſhop, who is ſuffragan to the archbiſhop of Toledo, and has a revenue of twenty-four thouſand ducats per annum.

Carthagena is a large city, but has few good ſtreets, and ſtill fewer grand or remarkable buildings. The hoſpital is a large ſquare houſe, round two courts, three ſtories high towards the ſea, and only one towards the land: the architecture and method of laying out the plan are good; but the ſtone is of ſo ſoft and friable a contexture, that the ſea air has corroded it, and cauſed much of it to crumble away. Further eaſt, at the foot of the ſummer-evening walk, is a ſmall church, erected in honour of St. James, the patron of Spain, who is piouſly believed to have landed here when he came from Paleſtine to convert this country to Chriſtianity. Carthagena much reſembles Plymouth: there are two dry docks, which were conſtructed by the late Don Jorge Juan. Here are two public walks: that of the Almeda is very long, and planted with double rows of white elms; that of Santa Lucia is near the harbour. The town is chiefly inhabited by officers of the army and navy, who are always obliged to wear their uniform; and none under the degree of captain are permitted to carry a cane. The port of Carthagena is the beſt in the kingdom, and not much inferior to any one in Europe. It is ſeated at the bottom of a ſmall bay, five hundred paces in length, and about ſix or ſeven hundred at the mouth. The anchoring is very good: the bay abounds in fiſh, particularly mackerel. The air here is temperate in ſummer, and ſo mild in winter, that the roſes blow as fine at Chriſtmas as they do in England at Midſummer. Great quantities of fine wool are exported from this city.

Malaga, an ancient, large, well built, well fortified, and populous city, with a fine harbour on the Mediterranean, is 260 miles ſouth of Madrid, and 75 ſouth-weſt from Granada. The city is of a circular form, encompaſſed with a double wall, and defended by two caſtles; the houſes are ſolid and lofty, and the ſtreets well paved and level. So great is the exportation of wines, raiſins, almonds, figs, lemons, oranges, and other fruits, from hence, beſides wool and oil, that the duties on them are ſaid to yield the king 800,000 ducats per annum. The harbour runs up into the town 530 common paces, with a good breadth, and four ſtairs to take water at, and 24 pillars of jaſper ſtone to faſten the ſhips to. The city is ſuppoſed to have been founded by the Phœnicians. The biſhop is ſubject to the archbiſhop of Seville, and has a revenue of 20,000 ducats per annum.

Granada is ſituated at the conflux of the Xenil and Dauro, 180 miles ſouth of Madrid. It ſtands in the midſt of a fruitful country, has a fine air, is capacious and populous, being one of the largeſt cities in Spain, and containing upwards of 90,000 inhabitants. It is divided into four quarters, and has 12 gates, which are always open. It is an archbiſhopric, and contains 24 pariſhes, and 29 convents, with a church to each, 11 hoſpitals, and four colleges. The ſtreets are narrow, crooked, and badly paved, and the houſes in general mean: here is an univerſity, and a royal chancery. The amphitheatre, for bull feaſts, is built of ſtone, and one of the beſt in Spain, and the environs of the city are ſtill pleaſing and healthful. Of 50,000 inhabitants, only 18,000 are reckoned uſeful; the ſurplus being made of clergy, lawyers, children, and beggars.

Bilboa is ſituated on the banks of the river Ybaizabal, and is about two leagues from the ſea. It contains about eight hundred houſes, with a large ſquare by the water ſide, well ſhaded with pleaſant walks, which extend to the outlets, on the banks of the river; where there are great numbers of houſes and gardens, which form a moſt pleaſing proſpect, particularly in ſailing up the river; for, beſides the beautiful verdure, numerous objects open gradually to the eye, and the town appears as an amphitheatre, which enlivens the landſcape, and completes the ſcenery. The houſes are ſolid and lofty, the ſtreets well paved and level, and the water is ſo conveyed into the ſtreets, that they may be waſhed at pleaſure; which renders Bilboa one of the neateſt towns in Europe.

Burgos, the capital of Old Caſtile, is ſituated by the river Arlancon, 120 miles north of Madrid. It is a large, but not a fine city. The cathedral, built in the Gothic ſtyle, is one of the nobleſt and richeſt in Spain: the archbiſhop has a revenue of 40,000 ducats per annum, and the king is always the firſt of the canons. Among other convents, here is one for ladies of quality, called Las Huelgos, the revenue of which is ſaid to be 80,000 ducats per annum. The abbeſs, who is generally a lady of one of the firſt families in Spain, has 17 other convents, 14 towns, and 50 villages ſubject to her: ſhe has alſo the diſpoſal of 12 commanderies, and takes place of all ladies, except thoſe of the royal family.

Gibraltar being once a celebrated town and fortreſs of Andaluſia, though at preſent in the poſſeſſion of Great Britain, claims our attention here from its ſituation. It was taken from the Spaniards by the confederate fleet of the Engliſh and Dutch, under the command of Sir George Rooke, in the year 1704, and, after many fruitleſs attempts to recover it, was confirmed to the Engliſh by the treaty of Utrecht in 1713; repeated attempts have been ſince made to wreſt it from England, but without ſucceſs: the laſt war made it more famous than ever, when it underwent a long ſiege againſt the united forces of Spain and France by ſea and land, but was gallantly defended by general Elliot and his garriſon, to the great loſs, diſgrace, and diſappointment of the beſiegers; though it muſt be granted, the place is by nature almoſt impregnable. Near 300 pieces of cannon of different bores, and chiefly braſs, which were ſunk before the harbour in the ten floating batteries deſtroyed by the red-hot bullets, have been raiſed, and ſold, and the money ariſing therefrom diſtributed among the garriſon, as a reward for their toil and bravery. It is a commodious port, and formed by nature for commanding the paſſage of the Streights. The town is neither large nor beautiful, yet, on account of its fortifications, is eſteemed the key of Spain, and is always furniſhed with a garriſon, well provided, for its defence. It is built upon a rock, in a peninſula, to which on the land-ſide is only a narrow paſſage between the rock and the ſea, which paſſage is walled and fortified both by art and nature. Acroſs this iſthmus the Spaniards have drawn a fortified line, in order to prevent the garriſon of Gibraltar from having any intercourſe with the country: notwithſtanding which they carry on a clandeſtine trade, particularly in tobacco, of which the Spaniards are exceedingly fond. The garriſon is confined within very narrow limits, and the ground ſcarcely produces any thing, ſo that it is ſupplied with proviſions either from England, or from Ceuta on the Barbary coaſt. Formerly Gibraltar was entirely under military government; but finding that power was carried to an extravagant height, the parliament thought proper to erect it into a body corporate, and the civil power is now lodged in its magiſtrates. —The road of Gibraltar is neither ſafe againſt an enemy

†

enemy nor ſtorms, and is not convenient for refitting of veſſels, though they may be laid on their ſides for careening. The Streights are twenty-four miles long, and about fifteen broad; through which ſets a current from the Atlantic occean into the Mediterranean, and for the ſtemming of it a briſk gale is required.

The principal iſlands of Spain are Majorca, Minorca, and Yvica.

Majorca is ſituated 120 miles eaſtward of Spain, and oppoſite to Valencia; it is about 60 miles in length from eaſt to weſt, and about 56 in breadth from north to ſouth. In ſome parts of it, there are large and ſmall cattle, game, corn, ſaffron, fruits, honey, &c.

Minorca, 33 miles E. N. E. of Majorca, is about 38 miles long, and 15 broad. This iſland produces no corn, but yields wine, oil, and fruit: it alſo feeds a number of ſmall cattle. It was firſt taken by the Engliſh in 1708; from whom the French took it in 1758; was reſtored to the Engliſh at the peace of 1763, from whom the Spaniards took it in 1782, to whom it was ceded by the peace in 1783.

Yvica, ſituated between Majorca and Valencia, is about 40 miles in length, and 22 in breadth. Its chief productions are corn, wine, oil, fruits, and drugs: here are alſo ſalt-rocks and mines.

Among the natural curioſities of Spain is a very deep cavern at Algezira, the deſcent to the entrance of which is by an hundred ſteps; when the ſpectator has attained the mouth, he muſt be very cautious how he proceeds, for the paſſage is very narrow, and on a great declivity for a conſiderable way. This paſſage leads to a ſort of labyrinth, which abounds in cryſtallizations, from whence there is a communication to a much larger cave, filled with an infinite number of various kinds of figures, which reflect the light of the torches in a moſt ſurpriſing manner. It is ſaid that the echo in this cave is ſo great, that if a ſingle piſtol is diſcharged there, the ſound will reverberate for the ſpace of ſeven minutes. In blowing up the rock of Gibraltar, many pieces of bones and teeth have been found incorporated with the ſtone, ſome of which have been brought to England, and depoſited in the Britiſh Muſeum. On the weſt ſide of the mountain is St. Michael's cave, 1110 feet above the horizon. Many pillars of various ſizes, ſome of them two feet in diameter, have been formed in it by the droppings of water, which have petrified in falling.

In ſeveral parts of this country are the remains of Roman and Mooriſh antiquities, conſiſting of Roman ways, aqueducts, theatres, and palaces. Near the city of Salamanca are the remains of a Roman way, paved with large ſtones; it was continued to Merida, and from thence to Seville. This way was repaired by the emperor Adrian, but it is now greatly injured by time, though there are ſtill the ruins of ſome of the columns to be ſeen. Near Segovia is a grand aqueduct, erected by Trajan, which extends over a deep valley, between two hills, and is ſupported by a noble row of 152 arches. Notwithſtanding this aqueduct has ſtood ſo many centuries, it ſtill retains its ſtrength and beauty. Near Murviedro (once the faithful Saguntum, deſtroyed by Hannibal) are the remains of an old Roman theatre, an exact ſemicircle, about 82 yards diameter, ſome of the galleries are cut out of the rock, and 9000 perſons might attend the exhibition without inconvenience: and at Cordova is an edifice, which was formerly a moſque, but is now converted into a church, ſaid to be one of the wonders of the world. It is 600 feet in length, 500 in breadth, and of a proportionable height; the roof, which is amazingly bold and lofty, is ſupported by 850 pillars of fine marble, in ten rows, forming eleven aiſles, in which are 366 altars, and twenty-four gates; every part being enriched and adorned with the moſt noble and coſtly ornaments. At Granada is to be ſeen great part of a moſt magnificent palace called the Alhambra, belonging to the Mooriſh kings. The inſide is overlaid with jaſper and porphyry, and the walls contain many Arabic inſcriptions. The whole edifice is executed in the Gothic taſte. This noble royal ſtructure was built in 1280, by the ſecond Mooriſh king of Granada; and in 1492, in the reign of their eighteenth king, was taken by the Spaniards.

With reſpect to commerce, the articles exported from Spain to other parts of Europe, are wines, fine oil, vinegar, fruits of various kinds, indigo, cochineal, materials for dyeing, kali or barilla, quickſilver, ſome wrought ſilks, balſam of Peru, vanilla, cake-chocolate, ſarſaparilla, ſalt-petre, ſalt, woollen counterpanes, a very fine ſort of blankets, iron, Toledo ſword-blades, gun and piſtol-barrels, vermillion, Seville and Havannah ſnuff, and ſeveral ſorts of roots of Spaniſh and American growth.

The Spaniards import principally from England dried and ſalted fiſh, meat, butter, cheeſe, beer, corn, rice, pepper, warlike and naval ſtores, particularly cables and anchors; cutlery-ware, watches, wrought braſs, and princes metal, mathematical inſtruments, toys, mahogany cabinet-work, wrought and unwrought tin, lead, leather, various kinds of ſilk and woollen ſtuffs, and broad cloths. They import from America gold, ſilver, cochineal, indigo, cocoa or chocolate-nuts, logwood, and other dyeing woods, ſugar, tobacco, ſnuff, and other valuable American productions.

Spain formerly extended the chief part of her foreign European trade to England; but it is now one-third leſs than it was fifty years ago, owing in ſome meaſure to the eſtabliſhment of ſome arts and manufactures in that kingdom ſince the above period. Unhappily, however, for themſelves, they make gold and ſilver the chief branches both for their exports and imports. This trade is chiefly carried on from the port of Cadiz; and to this port other European nations ſend their merchandize to be ſhipped off in Spaniſh bottoms for America, ſecured under the name of Spaniſh factors; for the merchandize properly belonging to Spain forms the leaſt part of the freight which theſe ſhips carry to America.

The merchants of England, Holland, France, &c. have agents and correſpondents at Cadiz, who tranſact this buſineſs for them; and their great care is, to elude the duties laid on foreign merchandize ſent in this manner to America; which, if paid, are ſo exorbitant, that the profits would ſink very low; though at this time they ſeldom amount to leſs than 20 per cent. Spain has ineffectually endeavoured to prevent this contraband trade; but no meaſure taken for that purpoſe can ſucceed, till the inhabitants, by a proper exertion of induſtry, are enabled to ſupply their American poſſeſſions with merchandize of their own manufacture and produce.

The manufactures of Spain conſiſt chiefly of ſilk, wool, copper, and hardware. The firſt of theſe is at preſent ſo greatly encouraged, that, we are told, above a million of people are employed in feeding, gathering, and curing ſilk-worms, and in ſpinning, weaving, and making all kinds of ſilks. Moſt of the laborious works in huſbandry, manufactures, and handicrafts, are performed by the French, eſpecially in the two Caſtiles.

The conſtitution and government of Spain are greatly altered from their ancient form; ſince, from being a free monarchy of hereditary ſucceſſion in males and females, it is now the moſt deſpotic kingdom in Europe; and as, in the adminiſtration of its government, no proper attention is paid to the intereſts and welfare of the people, we may from hence eaſily account for the poverty which is ſo viſible in moſt parts of the country. The cortes, or parliaments, were compoſed of repreſentatives ſent from the cities and towns, and the oldeſt member for Burgos always acted as ſpeaker. The cortes formerly poſſeſſed

great privileges, and the legiſlative authority was ſo equally blended in the king and the eſtates, that no law could be made, repealed, or ſuſpended, nor any money raiſed upon the ſubject, but with their common conſent. But theſe cortes are now aboliſhed, and Spain is become an abſolute monarchy, the whole government being ſolely in the hands of the king, his miniſters, and the councils, which are entirely at the devotion of the two former.

The privy-council is compoſed of a certain number of noblemen, nominated by the king; their buſineſs is, to prepare matters and to digeſt papers for the cabinet council, or junto, the members of which are likewiſe nominated by the king, and conſiſt of the firſt ſecretary of ſtate, and three or four more; and in theſe the direction of all the executive part of government may be ſaid to reſide. The council of war takes cognizance of military affairs only. The Spaniſh monarchs are declared out of their minority on the completion of their fourteenth year; and in regulating the ſucceſſion, after the death of Charles II. a medium was obſerved between the Salic law and the ancient law of Spain, viz. that any male heir, however diſtant, ſhould inherit before a female, who can have no right but after the extinction of every male branch.

The laws of Spain are compounded chiefly of the Roman civil law, the royal edicts, and, probably, certain provincial cuſtoms. The council of Caſtile is the higheſt law tribunal in the kingdom. In Galicia, Seville, Valencia, Barcelona, Saragoſſa, Majorca, and the Canaries, courts, called royal audiences, are eſtabliſhed, who judge primarily in all cauſes within 15 miles of their reſpective cities or capitals, and receive appeals from inferior juriſdictions. Beſides theſe, there are many ſubordinate tribunals for the police, the finances, and other branches of buſineſs.

The tribunal of the Inquiſition is eſtabliſhed at Madrid, but there are inferior ones in the principal cities almoſt all over Spain; and theſe are the great ſtate curbs whereby the people are held in ſuch an implicit religious obedience, and preſerve their boaſted uniformity of the Roman Catholic faith.—This court was erected about the year 1251. Pope Innocent IV. authoriſed the Dominicans perpetual inquiſitors; and, in 1265, Clement IV. confirmed theſe powers, and enlarged their privileges and tribunals. It was eſtabliſhed in Caſtile by Ferdinand and Iſabella, in the year 1557, and ſome time after extended all over Spain. Formerly this office only acknowledged the power of the pope, raiſing itſelf above that of kings, who were often bridled, humbled, and even puniſhed by it. Their Auto da Fé's, or ſolemn acts of faith, uſed commonly to be exhibitted when their princes came of age, or at their acceſſion. But the power of this office is now greatly diminiſhed; the officers belonging to it can carry no ſentence into execution without the royal authority, and there has not been an Auto da Fé at Madrid for ſome years. Add to this, that ſome of the late popes, appear to be in a good degree proteſtantized, and diveſted of the ſuperſtition and zeal of their predeceſſors, there are hopes that the remaining errors of that church will continue to evaporate, and at length give place to the light of reaſon, good ſenſe, and the precepts of divine revelation. The government of Spaniſh America forms a ſyſtem of itſelf, and is delegated to viceroys and other magiſtrates, who are in their reſpective diſtricts almoſt abſolute. The towns of Ceuta, Oran, and Maſulquivir, on the coaſt of Barbary in Africa; and the iſlands of St. Lazaro, the Philippines, and Ladrones in Aſia, are among the foreign poſſeſſions of the crown of Spain.

The revenues ariſing to the crown from Old Spain amount to five millions ſterling per annum, which ariſe chiefly from taxes on all kinds of goods, houſes, lands, timber, and proviſions: beſides which, a fifth of the produce of all the ſilver mines in America belongs to the king, but this part of his revenue is uſually very ill accounted for, and he ſeldom receives it without part having been previouſly embezzled.

The gold coins in Spain are piſtoles or doubloons, worth about 17s. and double and quadruple, half and quarter piſtoles. The ſilver coins are reals de Plata, worth about 6d. of our money; piaſters, or pieces of eight, worth about 4s. 6d. and half and quarter pieces of eight, but theſe are not common. The braſs money conſiſt of quartos and octavos, which anſwer to our halfpence and farthings. The Spaniſh eſcudos, or crowns and ducats, are imaginary coins, and both of the value of about 6s. of our money. There are alſo imaginary piaſters and piſtoles.

The land-forces of Spain, in time of peace, are computed at about 80,000, but in time of war they commonly amount to 100,000, or upwards. The marine of that kingdom has increaſed, owing to the great attention which has been paid to it by the preſent monarch. There are watch-towers from mile to mile, all along the coaſts of Spain: theſe are provided with lights and guards at night, ſo that from Cadiz to Barcelona, and from Bilboa to Ferrol, the whole kingdom, in caſe of an invaſion, may be ſoon alarmed.

The king of Spain formerly enumerated twelve kingdoms, and other places, to the amount of thirty-two, in his royal titles; but this abſurd cuſtom is now only occaſionally contrived, and he is generally contented with the appellation of His Catholic Majeſty. The cuſtom, however, of giving a number of names to the children of the royal family of Spain, is ſtill obſerved, the prince who was born in June 1786, being the ſon of the Infant Don Gabriel, by the Infanta Donna-Mariana Victoria, was baptized by the names of Pedro--Charles--Antonio--Raphael--Joſeph-Janvier--Francis-John-Nepomucene-Thomas-de-Villeneuf-Mark-colin-Vincent--Ferrier--Rainſon--Peter-de-Alcantara-Ferdinand. The Spaniſh king is never crowned, but inaugurated by the delivery of a ſword. His ſignature is, *I the King*. His eldeſt ſon is ſtyled prince of Aſturias, and his younger children of both ſexes are called infants or infanta's, by way of diſtinction.

The arms of the kings of Spain conſiſt of a ſhield, divided into four quarters, the uppermoſt of which on the right hand, and the lowermoſt on the left, contain a caſtle, Or, with three towers, for Caſtile; and in the uppermoſt on the left, and the lowermoſt on the right, are three lions, gules, for Leon; with three lilies in the centre for Anjou. The armorial bearings are loaded with the arms of all the kingdoms.

The higher nobility here conſiſt of counts, marquiſes, and dukes. The grandees, who have precedence of all others, next the king and princes of the blood, are named out of theſe. Like thoſe of Portugal, they have the privilege of being covered in the king's preſence, who ſtyles them in his letters, Illuſtrious; and, in ſpeaking to them, or of them, their Eminences: but there are others, beſides the grandees, who are covered in the king's preſence, as cardinals, nuncios, archbiſhops, the grand prior of Caſtile, and the grand prior of Malta, the generals of the orders of St. Dominic and St. Francis, ambaſſadors of crowned heads, the knights of the golden fleece, and of the three military orders of St. James, Calatrava, and Alcantara, when the king aſſiſts at their reſpective chapters, in quality of grand maſter. No grandee can be apprehended for any crime, but by the expreſs order of the king, and they have many other privileges beſides theſe. The inferior nobility ſtyle themſelves cavalleros and hidalgos. The latter of theſe is applied to thoſe who are unmixed with the Mooriſh blood.

There are ſeven orders of knighthood in Spain; viz.

1. The order of the Golden Fleece, inſtituted in 1430, by Philip the Good, duke of Burgundy, and is common

common now to the kings of Spain and the houſe of Auſtria: it is generally conferred on princes and ſovereign dukes; but the Spaniſh branch of it hath many French and Italian nobility: there are no commanderies or revenues annexed to it.

2. The order of St. James, or St. Jago de Compoſtella, which is the richeſt of all the orders of Spain: it was inſtituted in 1175, by Ferdinand II. kind of Leon. The badge is a croſs of gold enamelled crimſon, edged with gold, and worn round the neck, pendent to a broad ribband; it is charged on the centre with an eſcallop-ſhell white: it is only conferred on perſons of noble families.

3. The order of Calatrava, founded by Sancho III. of Caſtile. Their badge is, a croſs fleuri, red, worn at the breaſt, pendent to a broad ribband, the whole differing only in colour from the badge of Alcantara: the ceremonial mantle is of white ſilk, tied with a curdon and taſſels, like thoſe of the Garter, and on the left arm a croſs fleuri embroidered, gules.

4. The order of Alcantara owes its inſtitution to Ferdinand II. king of Leon. The badge is a gold croſs, fleuri, enamelled green, and worn pendent to a broad ribband on the breaſt. This order is highly eſteemed, and conferred only on perſons of ancient and illuſtrious families. On days of ceremony, they wear a mantle of red ſilk, on the left ſide of which is embroidered in ſilver, a ſtar of five points.

5. The order of the Lady of Mercy, ſaid to have been inſtituted about the year 1218. Women are alſo included in this order: the badge, which is common to both, is a ſhield per feſs, red and gold; in chief, a croſs patée, white; in baſſée, four pallets red, for Arragon, and the ſhield crowned with a ducal coronet.

6. The order of Monteſa, inſtituted at Valencia, at the cloſe of the 13th century, in the place of the Templars, whoſe poſſeſſions they enjoyed. The badge is a plain red croſs, enamelled on gold, worn pendent to a broad red ribband, ſaſh-wiſe, and a plain red croſs embroidered on the left breaſt of the outer garment.

7 The order of Charles III. inſtituted by the late king in 1771, in commemoration of the birth of the infant. The badge is a ſtar of eight points enamelled white, and edged with gold; in the centre of the croſs is the image of the Virgin Mary, veſtment white and blue. On the reverſe, the letters C. C. with the number III. in the centre, and this motto, *Virtuti & Merito*, "To Virtue and Merit." The order is compoſed of four claſſes, variouſly diſtinguiſhed. This order is conferred on none but perſons of noble deſcent.

The hiſtory of Spain will be introduced at the end of our enſuing account of Portugal, as the events relative to both theſe kingdoms are ſo intimately blended and connected together, as not eaſily to admit of a ſeparation with propriety.

CHAP. XXVI.

PORTUGAL.

Situation, Extent, Boundaries, Produce, Mountains, Rivers, Population, Inhabitants, Religion, Language, Learning, Cities and Towns, Curioſities, Commerce and Manufactures, Conſtitution and Government, Revenue, Hiſtory, &c.

THIS kingdom is ſituated between the 7th and 10th degrees of weſt long. and between the 37th and 42d degrees of north lat. being about 300 miles in length and 100 in breadth. It is the moſt Weſtern kingdom on the continent of Europe, being bounded on the ſouth and weſt by the Atlantic ocean, and on the north and eaſt by Spain. This is the Luſitania of the Romans; but the etymology of its preſent name is uncertain.

The kingdom of Portugal is uſually divided into three parts, viz. the northern, middle, and ſouthern provinces.

The North Diviſion contains

Entre Mino, chief town Braga; Douro, chief towns Oporto and Viana; Tra los Montes, chief towns Braganza, Miranda and Villa-Real; containing 6814 ſquare miles.

The Middle Diviſion contains

Beira, chief towns Coimbra, Guarda; Eſtremadura, chief towns Liſbon, Ubes, and Leira: containing 12,640 ſquare miles.

The South Diviſion contains

Entre Tajo, chief town Ebora, or Evora; Guadiana, chief towns Portalegre, Elvas, and Bira; Alentejo, chief town Lagos; Algarva, chief towns Faro, Tavora, and Silves: containing 8397 ſquare miles.

The air in Portugal, eſpecially about Liſbon, is reckoned ſoft and beneficial to conſumptive patients; it is not ſo ſearching as that of Spain, being refreſhed by breezes from the ſea. The ſoil is not in general equal to that of Spain for fertility, eſpecially in corn, which they import from other countries. Some places produce good paſture, but in general it is very coarſe.

The fruits here are the ſame as in Spain, but not ſo highly flavoured. Herbs and flowers are very plentiful, from the odoriferous kind of which great quantities of perfumed waters are diſtilled. They are particularly attentive to the culture of their vineyards, which yield excellent grapes. The cattle in the northern parts are large and fine, but in the ſouthern they are ſmall and lean, and are in general, as well as their poultry, but indifferent eating. Their horſes are briſk and lively, but extremely ſlight. The fiſh on the coaſt are very fine, and the birds reſemble thoſe of Spain. Vaſt quantities of delicious honey are produced in this country. Here are mines, but they are not worked; alſo variety of gems, marbles, and mill-ſtones, and a fine mine of ſalt-petre, near Liſbon.

The principal mountains in Portugal are thoſe which divide Algarva from Alentejo; thoſe in Tra los Montes, and the rock of Liſbon, at the mouth of the Tajo: but they are for the moſt part barren.

The chief rivers of Portugal have been mentioned in the account of Spain. The others are, the Mondego, the Limia, Sadao, Vanga, Leſa, Ave, Cavado, Zezere, Alba, Goa, Laura, Canha, and Caſa. The Tagus, or Tajo, was celebrated for its golden ſand. There are alſo ſeveral remarkable lakes and ſprings in this kingdom; ſome of them will abſorb even the lighteſt ſubſtances, as feathers, cork, &c. ſome are medicinal and ſanative, particularly one about 45 miles from Liſbon; and ſome hot baths are found in the province of Algarva.

The number of inhabitants in Portugal, according to the beſt calculation, amount to about two millions. In 1732, the kingdom contained 3344 pariſhes, 1,742,230 lay perſons, and about 300,000 eccleſiaſtics of both ſexes. The Portugueſe are neither ſo tall, nor ſo well made as the Spaniards. The ladies are of an olive complexon, but, while young, exceedingly handſome; and their eyes, which are black and ſparkling, retain their brilliancy long after their other charms are upon the decline. In their manners they are exceeding lively and witty, but at the ſame time poſſeſs the niceſt ſenſe of female virtue and honour.

The Portugueſe are generally accuſed of being haughty, treacherous, and crafty in their dealings; malicious, cruel, and vindictive in their tempers; much given to avarice and uſury, and the meaner

ſort extremely addicted to thieving. This character, though bad, may in a great meaſure be juſt, but charity obliges us to ſuppoſe that it is not general, and that, among ſuch a number of inhabitants, many may be found, whoſe ſentiments and manners are an honour to their country; for it is certain that no people whatever are leſs beholden to the reports of hiſtorians and travellers than the Portugueſe. We will, however, hope that ſome alteration will be made in their character by the expulſion of the Jeſuits, and the diminution of the papal influence among them. In their manner of living, cuſtoms, and diverſions, they nearly reſemble the Spaniards, but they are, if poſſible, more ſuperſtitious, and affect greater ſtate. They keep an incredible number of domeſtics, for they never diſcharge any who ſurvive after ſerving their anceſtors; but they exact a veneration from them which falls little ſhort of the moſt abject ſlavery; and the ladies, in particular, are treated by them with the ſame homage as is paid to perſons of the blood royal in other countries. The houſes, particularly thoſe of the grandees, are furniſhed in the richeſt and moſt ſuperb taſte; but the poorer ſort have ſcarcely any furniture at all, and ſit always croſs-legged on the ground, like the Moors. Their dreſs, like that of the Spaniards, never uſed to vary till very lately, particularly among the men; but now both ſexes conform greatly to the modes of France. The ladies wear exceeding rich clothes, and when they walk out, put on long veils over their heads, but leave their faces uncovered. Both men and women make great uſe of ſpectacles, and that often not ſo much to aſſiſt their ſight, as to give them an appearance of wiſdom and gravity.

The eſtabliſhed religion in Portugal, and the only one tolerated there, is Popery. Jews, however, are found there in vaſt numbers, but they ſometimes eſcape the ſcrutiny of the inquiſition with great difficulty, and if they are unhappy enough to fall under its cenſure, are treated with the utmoſt cruelty. The Engliſh Proteſtants are permitted the exerciſe of their religion; but they muſt be careful not to redicule that of the country, nor endeavour to make proſelytes. The power of his holineſs, as well as that of the inquiſition in Portugal, have been very much contracted of late.

The only difference between the eccleſiaſtical government of Spain and Portugal is, that about 20 years ago there was erected a patriarchate at Liſbon. The patriarch is always a cardinal, and of the royal family. The archbiſhoprics are thoſe of Liſbon, Braga, and Evora. The firſt of theſe has ten ſuffragan biſhops, including thoſe of the Portugueſe ſettlements abroad; the ſecond has ten; and the laſt two.

The Portugueſe language does not differ materially from that of Spain, only the pronunciation is harſher to the ear. It is ſpoken on all the coaſts of Africa and Aſia, as far as China, but mixed with the language of the ſeveral nations in thoſe diſtant regions.

The anceſtors of the preſent Portugueſe were certainly poſſeſſed of more true knowledge, with regard to aſtronomy, geography, and navigation, about the middle of the 16th century, and for ſome time afterwards, than any other nation in the univerſe; but bigotry has plunged them into a deplorable ſtate of ignorance, from whence ſome weak efforts have of late been made to extricate them; for it is univerſally allowed, that this defect is not owing ſo much to the want of genius as a proper education. It is, however, to be feared, that while the papal power, and that of the eccleſiaſtics continue at ſuch a height, though greatly inferior to what it was, real learning will make but a ſmall progreſs, notwithſtanding the laudable endeavours of a few enlightened minds.

The univerſities are thoſe of Liſbon, Coimbra, and Evora. The firſt of theſe is much inferior to the ſecond which was founded in the year 1291, by king Dennis, and conſiſts of a rector, reformator, or governor, a chancellor, with fifty profeſſors, and other officers. The number of ſtudents are about 2000; and the buildings of the univerſity are very magnificent. The univerſity at Evora was founded in the year 1559, and is well endowed. There is alſo at Liſbon a college, where the young nobility are educated in the ſciences, and every branch of polite learning.

The Portugueſe antiquities chiefly conſiſt in the remains of ſome Mooriſh caſtles, the Roman bridge and aqueduct at Coimbra, and the walls of Santarin, which are likewiſe ſuppoſed to have been built by the Romans. The principal natural curioſities are the lakes and fountains already deſcribed; to which we may add, the diamond the king is poſſeſſed of, which is perhaps the largeſt in the world, and was found at Braſil. The artificial curioſities are, the church and monaſtery near Liſbon where the kings of Portugal are buried, which are inexpreſſibly magnificent; and ſeveral monaſteries in Portugal, dug out of the hard rock. The chapel of St. Roch is thought to be one of the fineſt and richeſt in the world: the paintings are moſaic work, ſo curiouſly wrought with ſtones of all colours, as to aſtoniſh the beholders.

The capital city of Portugal is Liſbon: it ſtands on ſeven hills, on the north ſide of the mouth of the river Tagus; it is the reſidence of its monarchs, the ſeat of the chief tribunals and offices of the metropolitan, the receptacle of the richeſt merchandize both of the Eaſt and Weſt-Indies, and eſteemed the greateſt port in Europe, next to London and Amſterdam. Here is one of the fineſt harbours in the world, having water enough for the largeſt ſhips, and room ſufficient to admit ten thouſand ſail, without being crowded.

The greateſt part of Liſbon, and the chief of the palaces and public buildings, were deſtroyed by a dreadful earthquake, on November 1, 1755. All that part of the city which was demoliſhed, is planned out in the moſt regular and commodious form. Some large ſquares and many ſtreets are already built. The ſtreets form right angles, and are broad and ſpacious. The houſes are lofty, elegant, and uniform; and being built of white ſtone, make a beautiful appearance. The inhabitants of this city, before the earthquake, did not exceed 150,000; but in the year 1790, it was computed to contain 228,612; to theſe are to be added the religious of both ſexes, with their attendants, who dwell in convents and monaſteries, the ſoldiery, the profeſſors and ſtudents of ſeminaries of education, and ſuch labourers as have no fixed dwelling. Here are ſtill remaining ſome noble edifices and fine churches; among the latter, the moſt magnificent is the chapel-royal, the ſplendor of which is amazing. The cathedral is a vaſt Gothic ſtructure, heavy and clumſy; it contains, however, great riches, and is finely adorned within. The king's principal palace is ſpacious and convenient, and ſtands on the river Tagus. The caſtle is large and ancient, has always a garriſon of four regiments of foot, and, from its ſituation, commands the whole city, being in the centre of it upon one of the higheſt hills. Here is a noble univerſity, and a large ſquare, called Roſio, ſurrounded with magnificent buildings.

The city and ſea-port of Oporto is, next to Liſbon, a place of the greateſt opulence and trade in the kingdom. It is ſurrounded with walls and towers, and the ſtreets are narrow and irregular, but well paved, the natural rock making part of the pavement in ſome places, and in others even the walls of the houſes. The buildings, which are gracefully antique, are all of ſtone; and the churches, particularly the cathedral, are ſtately and magnificent. The harbour which is much frequented by Engliſh veſſels, is very commodious, but the entrace to it is rendered dangerous by rocks and ſand-banks, called the Bar. From this place is carried on an extenſive trade, particularly in wine, to England, from thence denominated Port; and the inhabitants of half the ſhops in the city are coopers.

The

A View of the CITY of LISBON the Capital of the KINGDOM of PORTUGAL.

The commerce of Portugal is very conſiderable, but particularly with England, from whence they have moſt of the woollen manufactures, with which they furniſh their ſubjects in Aſia, Africa, and America; and in return for which the Engliſh take the wines, ſalt, and fruit of Portugal. By ſeveral treaties the Britiſh merchants in that kingdom enjoy conſiderable privileges, which of late years have been greatly infringed by the creation of new companies, and other oppreſſive regulations; and, notwithſtanding repeated complaints have been made from our court to that of Portugal, there has never been the leaſt redreſs granted, or conceſſion made.

Portugal, it is ſaid, draws more profit from her Braſils, than Spain from both Mexico and Peru. The articles from thence are gold, diamonds, pearls, indigo, copper, tobacco, ſugar, cocoa nuts, ginger, cotton, hides, gums, drugs, and dyeing woods. The king's fifth of the gold brought from Braſil, notwithſtanding the vaſt contraband trade, is ſaid to amount, one year with another, to about 300,000l. ſterling; and the whole annual produce of that metal in Braſil is computed at near 2,000,000l.

The Portugueſe have alſo very extenſive plantations on the eaſt and weſt coaſt of Africa, from whence they draw gold, ivory, ebony, and ſlaves ſufficient to cultivate their ſugar and tobacco plantations in Brazil.

The Azores, or Weſtern Iſles, the Madeiras, and the Cape de Verd iſlands, likewiſe all belong to Portugal. Goa is their chief ſettlement in the Eaſt-Indies, their other poſſeſſions there are Macao, Daman, Diu, &c.

The manufactures in Portugal conſiſt chiefly of wool and ſilk, both which are inferior in beauty and goodneſs to thoſe of Spain. They alſo make a little linen, a variety of ſtraw work, and preſerve and candy fruits to admiration.

The king of Portugal is abſolute, though the appearance of liberty is ſtill preſerved in the meeting of the cortes, or ſtates, already mentioned in Spain: but they have long ſince ſold their parts in the legiſlature to the crown, and now only ſerve to record ſuch acts of ſtate as the court reſolves upon; to declare the next heir to the crown, when the king is pleaſed to nominate him; or to ratify treaties with ſuch foreign princes as may ſtill deem their conſent of any weight. The ſucceſſion in Portugal may devolve to the female branch; and the late monarch, having no male iſſue, obtained a diſpenſation from the pope, and married his daughter to his brother Don Pedro.

The council of ſtate, in this kingdom, is compoſed of an equal number of the clergy and nobility, with the ſecretary of ſtate, and they diſpoſe of all great preferments, both ſpiritual and temporal. A council of war regulates all military affairs; and the treaſury courts, the finances.

The laws of Portugal are all contained in three ſmall volumes, and are founded on the civil law and their particular cuſtoms. The council of the palace is the higheſt tribunal that can receive appeals; and the Caſa da Supplicacao is a tribunal from which no appeals can be brought. The Inquiſition is eſtabliſhed here, as well as in Spain. They have alſo one of theſe tribunals at Goa, but none at the Braſils; the power of the Portugueſe inquiſitions has, however, been of late greatly circumſcribed.

The revenues of Portugal ſince the diſcovery of the Braſils, have been very conſiderable, and it is computed that they amount to three millions and a half annually. A conſiderable part of this ariſes from the cuſtoms and duties on goods exported and imported, which are uſually farmed out by the crown, and are immenſely high. Foreign merchandize pays twenty-three per cent. on importation, and fiſh from Newfoundland twenty-five per cent. Fiſh taken in the neighbouring ſeas and rivers pay twenty-ſeven per cent. and the tax upon land and cattle which are ſold, is ten per cent. The duty upon ſnuff alone amounts to fifty thouſand crowns; and the king draws a conſiderable revenue from the ſeveral orders of knighthood, of which he is always grand-maſter. The pope alſo, in conſideration of the large ſums he draws out of this kingdom, gives the king the money ariſing from indulgences and licences to eat fleſh at times prohibited, &c.

The nobility of Portugal are not taxed but upon extraordinary emergencies, and then not very high. By the ſuppreſſion of the Jeſuits, and other uſeleſs religious orders and inſtitutions, the king's revenue is greatly increaſed.

The king's titles are, "King of Portugal and the Algraves, on this ſide and the other ſide the ſea of Africa; lord of Guinea, and of the navigation, conqueſts, and commerce, in Ethiopia, Arabia, Perſia, India, &c." The king's eldeſt ſon is ſtyled prince of Braſil. In the year 1749, pope Benedict XIV. dignified the king with the title of his Moſt Faithful Majeſty.

The arms of Portugal are Argent, five eſcutcheons, azure, placed croſs-wiſe, each charged with as many beſants as the firſt, placed ſalter-wiſe and pointed, ſable, for Portugal. The ſhield bordered, gules, charged with ſeven towers, Or, three in chief and two in each flanch. The ſupporters are two winged dragons, with the creſt a dragon, Or, under the two flanches, and the baſe of the ſhield appears at the end of it; two croſſes, the firſt fleur-de-luce, vert, which is for the order of Aviez, and the ſecond patée, gules, for the order of Chriſt; the motto is changeable, each king aſſuming a new one; but it frequently conſiſts of theſe words *Pro Rege et Grege*, "For the King and the People."

His Moſt Faithful Majeſty, Peter III. late king of Portugal, died in July 1786, of an apoplexy, in the 69th year of his age. He was ſucceeded in the throne by his conſort Maria Frances Iſabella.

There are ſeveral orders of knighthood here, viz. 1. The order of Chriſt, founded in 1317, by Dennis I. of Portugal, the badge of which is a red croſs within a white one, and the number of the commanderies 454. 2. The order of St. James, inſtituted in 1310, by the laſt-mentioned prince, the badge of which is a red ſword, in the ſhape of a croſs. A great number of towns and commanderies belong to this order. 3. The order of Aviz, or Aviez, inſtituted by Alphonſus Henriquez king of Portugal, in 1147, as a military and religious order, whoſe badge is a green croſs, in form of a lily, and the number of its commanderies 49. Though theſe three orders are religious, yet the knights are at liberty to marry. 4. The order of St. John, which has alſo ſeveral commanderies.

HISTORY OF SPAIN AND PORTUGAL.

SPAIN, together with Portugal, anciently formed but one kingdom, ſuppoſed to have been firſt peopled from Gaul, to which it is contiguous; or from Africa, from which it is only ſeparated by the narrow ſtreight of Gibraltar. The Phœnicians ſent colonies thither, and built Cadiz and Malaga. Afterwards, upon the riſe of Rome and Carthage, the poſſeſſion of this kingdom became an object of contention between thoſe powerful republics; but at length the Roman arms prevailed, and Spain remained in their poſſeſſion until the fall of that empire, when it became a prey to the Goths. Theſe in their turn were invaded by the Saracens, who about the end of the 7th century had poſſeſſed themſelves of the fineſt kingdoms of Aſia and Africa; and not content with the immenſe regions that formerly compoſed great part of the Aſſyrian, Greek, and Roman empires, they croſſed the Mediterranean, ravaged Spain, and eſtabliſhed themſelves in the ſoutherly provinces of that kingdom.

The firſt Spaniſh prince, mentioned in the hiſtory of this country, was Don Pelago, who diſtinguiſhed himſelf againſt theſe infidels (afterwards known by the name of Moors;) and, about the year 720, took upon himſelf the title of king of Aſturia. His ſucceſſes animated other Chriſtian princes to take arms likewiſe, and the two kingdoms of Spain and Portugal for many ages were perpetually embroiled in bloody wars. In the mean time every adventurer was entitled to the conqueſts he made upon the Moors, till Spain was at laſt divided into twelve kingdoms; and about the year 1095 Henry of Burgundy was declared, by the king of Leon, count of Portugal; but his ſon Alphonſo threw off his dependence on Leon, and declared himſelf king. A ſucceſſion of brave princes gave the Moors repeated overthrows in Spain, till about the year 1475, when all the Spaniſh kingdoms, Portugal excepted, were united by the marriage of Ferdinand king of Arragon, and Iſabella the heireſs and afterwards queen of Caſtile, who took Granada, and expelled the Moors and Jews, to the number of 170,000 families, out of Spain. This expulſion greatly depopulated the country of artiſts, labourers, and manufacturers; and the diſcovery of America (which happened a few years after) not only added to that calamity, but rendered the remaining Spaniards moſt deplorably indolent. To complete their misfortunes, Ferdinand and Iſabella introduced the Popiſh inquiſition, with all its horrors, into their dominions, as a ſafeguard againſt the return of the Moors and Jews.

Ferdinand was ſucceeded by his grandſon Charles V. of the houſe of Auſtria, afterwards emperor of Germany. The extenſive poſſeſſions of the houſe of Auſtria in Europe, Africa, and above all, America, from whence he drew immenſe treaſures, began to alarm the jealouſy of neighbouring princes, but could not ſatisfy the ambition of Charles: he was almoſt conſtantly engaged in foreign wars, or with his Proteſtant ſubjects in Germany, whom he in vain attempted to bring back to the Catholic church. At length, after a long and turbulent reign, he reſolved to withdraw himſelf entirely from any concern in worldly affairs, in order that he might ſpend the remainder of his days in retirement and ſolitude. In conſequence of this reſolution he reſigned Spain and the Netherlands to his ſon Philip II. but could not prevail on the princes of Germany to elect him emperor, which they conferred on Ferdinand, Charles's brother, dividing the power of the houſe of Auſtria with two branches. Spain, with all its poſſeſſions in Africa and the New World, alſo the Netherlands, and ſome Italian ſtates, remained with the elder branch, whilſt the empire, Hungary, and Bohemia, fell to the lot of the younger.

Philip II. inherited all his father's vices, but poſſeſſed few of his good qualities. He was auſtere, haughty, immoderately ambitious, and through his whole life a cruel bigot in the cauſe of Popery. He married Mary queen of England, an unfeeling bigot like himſelf; and after her death he paid his addreſſes to her ſiſter Elizabeth, but without ſucceſs. His reſentment on this occaſion produced very diſadvantageous wars with that princeſs, which occaſioned the revolt and loſs of the United Provinces. But in Portugal he was more ſucceſsful. That kingdom, after being governed by a race of wiſe and brave princes, fell to Sebaſtian about the year 1557. Sebaſtian loſt his life and a fine army, in a headſtrong, unjuſt, and ill-concerted expedition againſt the Moors in Africa; and ſoon after Philip united Portugal to his own dominions, though the Braganza family of Portugal pretended to a prior right. By this acquiſition Spain became poſſeſſed of the Portugueſe ſettlements in India, ſome of which ſhe ſtill retains.

The deſcendants of Philip proved to be very weak princes; but Philip and his father had ſo totally ruined the ancient liberties of Spain, that they reigned almoſt unmoleſted in their own dominions. Their viceroys, however, were at once ſo tyrannical and inſolent over the Portugueſe, that in the year 1640 the nobility of that nation, by a well concerted conſpiracy, expelled their tyrants, and placed the duke of Braganza on the throne, by the title of John IV. almoſt without bloodſhed; and the foreign ſettlements alſo acknowledged him as their ſovereign. A fierce war ſubſiſted for many years between the two kingdoms, and all the efforts of the Spaniards to re-unite them proved vain, ſo that a treaty was concluded in February 1668; by which Portugal was declared to be free and independent, and has ever ſince been a diſtinct kingdom from Spain.

The kings of Spain, of the Auſtrian line, failing in the perſon of Charles II. who left no iſſue, Philip, duke of Anjou, ſecond ſon to the dauphin of France, and grandſon to Lewis XIV. mounted the throne, by virtue of his predeceſſor's will, in the name of Philip V. anno 1701; and after a long and bloody ſtruggle with the German branch of the houſe of Auſtria, ſupported by England, he was confirmed in his dignity at the concluſion of the peace of Utrecht in the year 1713. And Lewis XIV. through a maſterly train of politics, accompliſhed his favourite project of transferring the kingdom of Spain, with all its rich poſſeſſions in America and the Eaſt-Indies, from the houſe of Auſtria to that of his own family of Bourbon; an event which proved fatal to the commerce of Great-Britain; eſpecially in the American ſeas, where a glaring partiality has been ſhewn to the French nation ever ſince, and renders the Engliſh being poſſeſſed of a port in the South-Seas of equal importance to that of Gibraltar, at the entrance of the Mediterranean, which ſerves as a curb on the united ſtrength of France and Spain in Europe.

Philip, after a long and turbulent reign, which was diſturbed by the ambition of his wife, Elizabeth of Parma, died in 1746, and was ſucceeded by his ſon Ferdinand VI. a mild and peaceable prince, who reformed many abuſes, and was deſirous of promoting the commerce and proſperity of his kingdom; but he died in 1759 without iſſue, through grief for the loſs of his wife. Ferdinand was ſucceeded by his brother Charles III. the late reigning monarch of Spain.

The Portugueſe could not have ſupported themſelves under their revolt from Spain, had not the latter power been engaged in wars with England and Holland; and upon the reſtoration of Charles II. of England, that prince having married a princeſs of Portugal, prevailed with the crown of Spain, in 1668, to give up all pretenſions to that kingdom. Alphonſo, ſon to John IV. was their king of Portugal. He had the misfortune to diſagree with his wife and his brother Peter, and they uniting their intereſts, not only forced Alphonſo to reſign his crown, but obtained a diſpenſation from the pope for their marriage, which was actually conſummated. They had a daughter; but Peter, by a ſecond marriage, had ſons, the eldeſt of whom was John, his ſucceſſor, and father to his late Portugueſe majeſty. John, like his father, joined the grand confederacy formed by king William; but neither of them were of much ſervice in humbling the power of France. On the contrary, they had almoſt ruined the allies, by occaſioning the loſs of the great battle of Almanza in 1707.

John died in 1750, and was ſucceeded by his ſon Joſeph, who, in 1760, was attacked by ſome aſſaſſins, and narrowly eſcaped with his life. From this conſpiracy is dated the expulſion of the Jeſuits (who were ſuppoſed to have been deeply concerned in it) from all parts of the Portugueſe dominions. Joſeph having no ſon, his eldeſt daughter was married, by diſpenſation from the pope, to Don Pedro, her own uncle, to prevent the crown falling into a foreign family; and the next year 1761, ſhe was brought to bed of a ſon, called the prince of Beira.

When the war broke out between England and Spain in 1762, the Spaniards, and their allies the French, pretended to force Joſeph into their alliance, and to garriſon his ſea-towns againſt the Engliſh with their troops. The king of Portugal rejected this propoſal, and declared war againſt the Spaniards, who, without reſiſtance, entered Portugal with a conſiderable army, while a whole body of French threatened it from another quarter. But by the aſſiſtance of the Engliſh, an effectual ſtop was put to the invaſion; and a peace was concluded at Fontainbleau in 1763.

Joſeph died on the 24th of February, 1777, and was ſucceeded by his niece Maria Frances Iſabella, one of whoſe firſt acts was, the removing from power the marquis de Pombal, an event which excited univerſal joy throughout the kingdom, ſince his arbitrary and oppreſſive adminiſtration had rendered him odious to the people; though it has been alledged in his favour, that ſeveral of the public meaſures he had adopted were calculated to promote the real intereſts of the country.

On the 10th of March, 1792, the prince of Braſil, as preſumptive heir to the crown, publiſhed an edict, declaring, that as his mother, from her unhappy ſituation, was incapable of managing the affairs of government, he would place his ſignature to public papers, till the return of her health; and that no other change ſhould be made in the forms.

Charles III. of Spain was ſo warmly attached to the family compact concluded with the houſe of Bourbon, that two years after his acceſſion he even hazarded his American dominions to ſupport it. War being declared between him and England, the latter took from him the famous port and city of Havannah, in the iſland of Cuba, and thereby rendered herſelf entirely miſtreſs of the navigation of the Spaniſh plate fleets. Notwithſtanding the ſucceſs of the Engliſh, their miniſtry thought proper haſtily to conclude a peace; in conſequence of which, Havannah was reſtored to Spain.

In 1775 an expedition was concerted againſt Algiers by the Spaniſh miniſtry, which had a moſt unſucceſsful termination. The troops, which amounted to upwards of 24,000, and who were commanded by lieutenant-general Conde de O'Reilly, landed about a league and a half from the city of Algiers; but were diſgracefully beaten back, and obliged to take ſhelter on board their ſhips, having 27 officers killed, and 191 wounded, beſides 501 rank and file killed, and 2088 wounded. In the years 1783 and 1784, they alſo renewed their attacks by ſea to deſtroy the place; but after ſpending much ammunition, and loſing many lives, were forced to retire without effecting their purpoſe.

When the war with Great Britain and her American colonies had ſubſiſted for ſome time, and France had taken part with the latter, the court of Spain was alſo prevailed upon to commence hoſtilities againſt Great Britain. The Spaniards cloſely beſieged Gibraltar, both by ſea and land; it having been always a great mortification to them, that this fortreſs ſhould be poſſeſſed by the Engliſh. The grand attack was on the 13th of September, 1782, under the command of the duke de Crillon, by ten battering ſhips, from 600 to 1400 tons burden, carrying in all 212 braſs guns, entirely new, and diſcharging ſhot of 26 pounds weight. The ſhowers of ſhot and ſhells which were directed from them, from their land-batteries, and on the other hand from the various works of the garriſon, exhibited a ſcene, of which perhaps neither the pen nor the pencil can furniſh a competent idea. It is ſufficient to ſay, that four hundred pieces of the heavieſt artillery were playing at the ſame moment: an inſtance which has ſcarcely occurred in any ſiege ſince the invention of thoſe wonderful engines of deſtruction.

The irreſiſtible impreſſion of the numerous red-hot balls from the garriſon was ſoon conſpicuous; for in the afternoon, ſmoke was perceived to iſſue from the admiral's ſhip and another, and by one in the morning ſeveral were in flames, and numbers of rockets were thrown up from each of their ſhips as ſignals of diſtreſs; and thus ended all the hopes of the Spaniards of reducing the fortreſs of Gibraltar. Some trifling operations continued on the ſide of the Spaniards till the reſtoration of peace in 1783.

In other enterpriſes, however, the Spaniards proved more ſucceſsful. The iſland of Minorca was ſurrendered to them on the 6th of February, 1782, after having been beſieged for 171 days. The garriſon conſiſted of no more than 2692 men, while the forces of the enemy amounted to 16,000, under the command of the duke de Crillon. The Spaniſh commander at firſt attempted to corrupt the governor (general Murray); but this being rejected with indignation, the ſiege was commenced in form; and the garriſon would have ſhewed themſelves equally invincible with thoſe of Gibraltar, had it been poſſible to relieve them in the ſame manner. The ſcurvy ſoon made its appearance, and reduced them to ſuch a deplorable ſituation, that they were at laſt obliged to ſurrender in ſpite of every effort of human fortitude or ſkill; and ſo ſenſible were both parties that this was the true cauſe, that the Spaniſh general allowed them to march out with their arms ſhouldered, drums beating, and colours flying, while the diſconſolate Britiſh ſoldiers proteſted that they ſurrendered their arms to God, and not to the Spaniards.

CHAP. XXVII.

ITALY.

Situation, Extent, Boundaries, Diviſions, Climate, Soil, Produce, Mountains, Seas, Springs, Population, Inhabitants, Religion, Government under the Pope, Curioſities, Italian States, Hiſtory, &c.

THIS country is ſituated between the 7th and 10th deg. of eaſt long. and 37 and 46th deg. of north lat. being about 600 miles in length, and in ſome places near 400 broad; but its form is ſo irregular, that in ſome parts the breadth does not exceed 25 miles. On the north, it is bounded by France, Switzerland, and Germany; on the eaſt, by the gulf of Venice, or Adriatic ſea; and on the ſouth and weſt by the Mediterranean.

The whole of the Italian dominions, including Corſica, Sardinia, the Venetian, and other iſlands; with the chief city in each, are divided in the following manner:

Countries	Names.	Principal Cities.
Papiſts.	Piedmont	Tunis.
	Savoy	Chambery.
Subject to the king of Sardinia.	Montſerrat	Caſſal.
	Aleſſandrine	Alexandria.
	Oneglia	Oneglia.
	Sardinia Iſland	Cagliari.
To the king of Naples.	Naples	Naples.
	Sicily Iſland	Palermo.
Emperor.	Milan	Milan.
	Mantua	Mantua.
	Mirandola	Mirandola.
	Pope's territories	Rome.
Subject to their reſpective princes.	Tuſcany	Florence.
	Maſſa	Maſſa.
	Parma	Parma.
	Modena	Modena.
	Piombino	Piombino.
	Monaco	Monaco.
		Republics.

Countries Names.		Principal Cities.
Republics.	Lucca	Lucca.
	St. Marino	St. Marino.
	Genoa	Genoa.
To France	Corſica Iſland	Baſtia.
Republic of Venice	Venice	Venice.
	Iſtria, P.	Cabo d'Iſtria
	Dalmatia, P.	Zara
	Iſles of Dalmatia	
Iſlands in the Venetian dominions	Cephalonia	Cephalonia.
	Corfu, or Corcyra	Corfu.
	Zant, or Zacynthus	Zant.
	St. Maura	St. Maura.
	Little Cephalonia olim Ithaca.	

The air of Italy is very different, according to the different ſituations of the ſeveral countries contained in it. In thoſe on the north of the Apennines it is more temperate, but in thoſe on the ſouth generally very warm. The air of the Campania of Rome, and of the Ferrareſe, is unhealthful, which is owing to the lands not being duly cultivated, nor the marſhes drained. That of the other parts is generally pure, dry, and healthy. In ſummer the heat is very great in the kingdom of Naples, and would be almoſt intolerable, if it was not ſomewhat alleviated by the ſea-breezes. The ſoil of Italy in general is very fertile, being watered by a great number of rivers. It produces a variety of wines, and the beſt oil in Europe; excellent ſilk in abundance, corn of all ſorts, but not in ſuch plenty as in ſome other countries; oranges, lemons, citrons, pomegranates, almonds, raiſins, ſugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, cheſnuts, &c. Moſt of theſe fruits were at firſt imported by the Romans from Aſia Minor, Greece, Africa, and Syria, and were not the natural products of the ſoil. The tender plants are covered in winter on the north-ſide of the Apennines, but on the ſouth-ſide they have no need of it. This country alſo yields good paſture, and abounds with cattle, ſheep, goats, buffaloes, wild boars, mules, and horſes. The foreſts are well ſtored with game, and the mountains yield not only mines of iron, lead, alum, ſulphur, marble of all ſorts, alabaſter, jaſper, porphyry, &c. but alſo gold and ſilver, with a great variety of aromatic herbs, trees, ſhrubs, and evergreens, as thyme, lavender, laurel and bays, wild olive-trees, tamarinds, juniper, oaks, pines, &c. In fine, Italy well merits the appellation which it has obtained, viz. the Garden of Europe.

The chief mountains of Italy are the Apennines and the Alps; the former run the whole length of the country from north-weſt to ſouth-eaſt; the latter extend from the river Var near Nice, to the Adriatic. The principal river is, the Po, which riſes in Piedmont, and diſembogues itſelf into the Adriatic.

The ſeas of Italy are, the gulf of Venice, or the Adriatic ſea; the ſeas of Naples, Tuſcany, and Genoa; the bays or harbours of Nice, Villa Franca, Oneglia, Final, Savona, Vado, Spezzia, Lucca, Piſa, Leghorn, Piombino, Civita Vecchia, Gaeta, Naples, Salerno, Policaſtro, Rhegio, Quilace, Tarento, Manfredonia, Ravenna, Venice, Trieſte, Iſtria, and Fiume; Cape Spartavento del Alice, Otranto, and Ancona; and the Streight of Meſſina, between Italy and Sicily. The gulfs and bays in the Italian iſlands are thoſe of Fiorenzo, Baſtia, Tolada, Porto Novo, Cape Corſo, Bonifacio, and Ferro in Corſica; and the Streight of Bonifacio between Corſica and Sardinia. The bays of Cagliari and Oriſtagni; Cape de Sardis, Cavello, Monte Santo, and Polo, in Sardinia. The gulfs of Meſſina, Melazzo, Palermo, Mazaro, Syracuſe, and Catania; Cape Faro, Melazzo, Orlando, Gallo, Trapano, Paſſaro, and Aleſſia, in Sicily; and the bays of Porto Feraio, and Porto Longone, in the iſland of Elba. We have thought it neceſſary to give a particular account of the various ſeas, gulfs, and bays in Italy, becauſe, without a competent knowledge of theſe, neither the ancient Roman authors, nor the hiſtory nor geography of the reſpective countries, can be well underſtood.

In many parts of Italy mineral ſprings abound; ſome of them are hot, ſome warm, and many of ſulphurous, chalybeat, and medicinal qualities, of uſe in many diſtempers. Several of the mountains contain mines that produce great quantities of emeralds, jaſper, agate, porphyry, lapis lazuli, and other valuable ſtones; beautiful marble is alſo found all over the kingdom. The ridgy parts of Sardinia yield a great quantity of metals and minerals, as gold, ſilver, lead, iron, ſulphur, and alum; curious cryſtals and coral are found on the coaſt of Corſica. Near Trivoli in Naples, a mill is erected for forging and fabricating iron and copper.

With reſpect to the population of Italy, the number of inhabitants, in the time of Pliny, was computed at 14,000,000. It may therefore not be thought extravagant, if we eſtimate them at 20,000,000. The king of Sardinia's ſubjects are reckoned at 2,300,000; the city of Milan, by the beſt computation, contains 300,000, and the duchy is proportionably populous; and population has no doubt been greatly promoted by the encouragement which has been for ſome time given to agriculture and manufactures of all kinds. In their perſons, the Italians are generally of a middling ſize, well proportioned, with black hair, thin faces, and expreſſive countenances. Their women are well ſhaped, and very amorous; inſomuch that the marriage ties, eſpecially of the better ſort, are ſaid to be very little regarded in Italy. Every wife has been repreſented to have her cicisbeo, or gallant, with whom ſhe keeps company, and ſometimes cohabits, with very little ceremony, and no offence is taken on either ſide: but this practice prevails chiefly at Venice, where parents, to prevent their ſons marrying unſuitably, or contract diſeaſes by promiſcuous amours, hire miſtreſſes for them for a month, or a year, or ſome determined time; and concubinage, in many places of Italy, is an avowed licenced trade: the Italian courtezans, or bona roba's, as they are called, make a kind of profeſſion in all their cities; ſo little do they reflect on the impropriety of this and many other cuſtoms, that are conſidered as criminal in other countries profeſſing Chriſtianity: they are however affable, courteous, ingenious, ſober, and ready-witted: but rather vindictive than brave, and more ſuperſtitious than devout.

The Italians are fond of greens, fruit, and vegetables of all kinds, which contributes to their contentment and ſatisfaction; and an Italian gentleman or peaſant can be luxurious at a ſmall expence, the people being in general temperate both in eating and drinking. Boiled ſnails, ſerved up with oil and pepper, or fried in oil, and the hinder parts of frogs, are eſteemed delicate eating. Kites, jack-daws, hawks, and magpies, are eaten here, even by the better ſort of people; the Italian cooks, however, and the uncleanly manner of ſerving up victuals, which is for the moſt part of a very bad quality, are ſaid to be very diſguſtful to an Engliſhman. In their dreſs, they conform to the faſhions of the countries on which they border, or to which they are ſubject; but in general they affect a medium between the French volibility, and the ſolemnity of the Spaniards. They neither hunt, walk, ride, play at bowls, or take any other manly exerciſe, ſo much have they degenerated from thoſe heroes whoſe deſcendents they without ſhame boaſt themſelves to be, and on that very account look upon the reſt of mankind with contempt.—Maſquerades, operas, and other muſical entertainments, gaming, horſe-races without riders, aſſemblies, and pompous religious exhibitions, are their only amuſements.

We

We muſt not, however, omit a deſcription of the Cocagna, which is a diverſion reliſhed by people of the firſt rank in the poliſhed city of Naples, where they pretend to tell us that the very vagrants in the ſtreets are inſtructed in hiſtory, and the human mind is refined by poetry, ſoftened by muſic, and elevated by religion. The Cocagna is an entertainment given to the people four ſucceeding Sundays during the carnival. Oppoſite to the palace a kind of wooden amphitheatre is erected. This being covered with branches of trees, buſhes, and various plants, real and artificial, has the appearance of a green hill. On this hill are little buildings, ornamented with pillars of loaves of bread, with joints of meat, and dried fiſh, varniſhed and curiouſly arranged by way of capitals. Among the trees and buſhes are ſome oxen, a conſiderable number of calves, ſheep, hogs, and lambs, all alive and tied to poſts. There are, beſides, a great number of living turkies, geeſe, hens, pigeons, and other fowls, nailed by the wings to the ſcaffolding. Certain heathen deities appear alſo occaſionally upon this hill, but not with a deſign to protect it. The guards are drawn up in three ranks, to keep off the populace. The royal family, with all the nobility of the court, crowd the windows and balconies of the palace to enjoy this magnificent ſight. When his majeſty waves his handkerchief, the guards open to the right and left; the rabble pour in from all quarters, and the entertainment commences. You may eaſily conceive what a delightful ſight it muſt be to ſee ſeveral thouſand hungry beggars ruſh in like a torrent, deſtroy the whole fabric of loaves, fiſhes, and joints of meat, overturn the heathen deities for the honour of Chriſtianity, pluck the fowls, at the expence of their wings, from the poſts to which they were nailed; and in the fury of their ſtruggling and fighting for their prey, often tearing the miſerable animals to pieces, and ſometimes ſtabbing one another. It muſt be obſerved, that of late years the larger cattle have been previouſly killed.

The day here is reckoned from ſun-ſet to ſun-ſet, and their clocks are made to ſtrike the 24 hours. The houſes in Italy are far inferior to thoſe in England for convenience, the accommodations at the inns very coarſe and ſlovenly, and, which is the greateſt evil of all, travellers are infeſted day and night with infinite numbers of gnats, fleas, bugs, and lice.

The Roman-Catholic religion is the only one eſtabliſhed in Italy; but all ſects, though not tolerated, are found there, provided they do not ſcoff at or inſult the worſhip of the country.

The moſt ſolid foundations for the temporal power of the Papacy were laid by the famous Matilda, counteſs of Tuſcany, and heireſs to the greateſt part of Italy, who bequeathed a large portion of her dominions to the famous pope Gregory VII. who, before his acceſſion in 1073, was well known by the name of Hildebrand. The ignorance of the laity, and other cauſes, operated to the aggrandiſement of the popes, and the extenſion of their authority, previous to the reformation. Ever ſince that æra, the ſtate of Europe has been ſuch ſuch, that the Roman pontiffs have had more than one great weight in its public affairs, chiefly through the weakneſs and bigotry of temporal princes, who ſeem now to be recovering from their religious deluſions; and the papal influence has received a conſiderable check from the wiſe conduct and moderation of the emperor of Germany.

The chief part of the religion of the Italians conſiſts in an external obſervance and practice of eccleſiaſtical rites, ceremonies, and injuctions. An Italian, not enlightened by reflection and experience, will ſooner commit adultery than eat any fleſh meat on a Friday; but a foreigner, who wiſhes to paſs for a Roman-Catholic, need only to affix to his window an atteſtation, by a phyſician, that his ſtate of health requires a fleſh meat diet; and he may, without any riſk, eat fleſh meat in Lent: ſuch atteſtations may be purchaſed in coffee-houſes in Florence. The eccleſiaſtical government of the Papiſts is centered in the popes and cardinals: the latter ſhould be 70 in number, but it is ſeldom complete. They are always appointed by his holineſs, who takes care to have a majority of Italians among them, that the chair may not be removed from Rome, as it was once to Avignon in France, the then pope being a Frenchman. When foreign prelates are to be promoted to the cardinalſhip, the pope regulates himſelf according to the nomination of the princes who profeſs the tenets of the church of Rome. His chief miniſter is ſtyled the cardinal patron, and is generally a nephew, or ſome other near relation. In the conſiſtory, which is a meeting of the pope and cardinals, the latter pretend to control the former in matters both ſpiritual and temporal, and they have even been known to prevail; but this rarely happens. The conclave is an aſſembly of the cardinals upon urgent occaſions, particularly at the election of a pope; when it has been known, particularly in 1721, that animoſities and diſputes have run ſo high, that, forgetting they were to attend to divine inſpiration in their proceedings, they came to blows with both their hands and feet, and threw the ink-ſtands at each other, thus tranſmuting the conclave, for a time, into a boxing-ſtage. The reign of a pope is ſeldom of long duration, being generally old men at the time of their election.

The pope, on his elevation to the chair, gives in his creed, which, reſpecting the inferior articles, is in ſubſtance as follows: That he firmly admits the apoſtolical and eccleſiaſtical traditions, and the conſtitutions of the church of Rome,—admits the Holy Scriptures in the ſame ſenſe that holy mother church doth,—believes in ſeven ſacraments, as inſtituted by Jeſus Chriſt, and neceſſary to ſalvation, namely, baptiſm, confirmation, euchariſt, penance, extreme unction, orders, and marriage,—embraces all the determinations of the council of Trent, reſpecting original ſin and juſtification,—profeſſes, that in the maſs there is offered to God a propitiatory ſacrifice for quick and dead; that the bread and wine are tranſubſtantiated into the very body and blood of Chriſt,—and that the cup is to be denied to the lay people,—that there is a purgatory,—that departed ſaints are to be worſhipped and prayed to,—that they offer to God the prayers of the faithful, and their relics are to be revered,—that the images of Chriſt, the Virgin Mary, and other ſaints, are to be honoured and had in veneration,—that Chriſt left the power of indulgences, for the benefit of Chriſtian people,—that the holy, catholic, and apoſtolic Roman church, is the mother and miſtreſs of all churches, and that true obedience is to be paid to the biſhop of Rome, as the ſucceſſor of St. Peter, the prince of the apoſtles, and the vicar of Jeſus Chriſt,—believes all that the councils, canons, and holy ſynod of Trent, enjoin, and condemn and reject all other things contrary thereto. The whole of the confeſſion of faith, from which the above articles are extracted, was delivered to the conclave by pope Pius IV. in 1560, previous to his election.

We ſhall conclude this head with an account of an Engliſh traveller, who, ſpeaking of a religious proceſſion ſome years ago at Florence, in Italy, deſcribes it in the following manner: "I had occaſion, ſays he, to ſee a proceſſion, where all the nobleſſe of the city attended in their coaches. It was the anniverſary of a charitable inſtitution in favour of poor maidens, a certain number of whom are portioned every year. About 200 of theſe virgins walked in proceſſion, two and two together. They were preceded and followed by an irregular mob of penitents, in ſackcloth, with lighted tapers, and monks with crucifixes, bawling and bellowing the litanies: but the greateſt object was the figure of the Virgin Mary, as big as the life, ſtanding within a gilt frame, dreſſed in a gold ſtuff, with a large hoop, a great quantity of falſe jewels,

her face painted and patched, and her hair frizzled and curled in the very extremity of the faſhion. Very little regard had been paid to the image of our Saviour on the croſs; but when the Lady Mother appeared on the ſhoulders of three or four luſty friars, the whole populace fell upon their knees in the dirt."

The Inquiſition in Italy is little more than a ſound. The papal power, as we have already hinted, is now evidently at a low ebb. The order of Jeſuits, who are not improperly called its Janiſſaries, has been exterminated out of France, Spain, Naples, and Portugal; and is but juſt tolerated in other Popiſh countries. The pope himſelf is treated by Roman-Catholic princes with very little more ceremony than is due to him as biſhop of Rome, and poſſeſſed of a temporal principality. This humiliation, it is reaſonable to believe, will terminate in a total ſeparation from the holy ſee of all its foreign emoluments, which even, ſince the beginning of the preſent century, were immenſe, and to the reducing his holineſs to the exerciſe of his eccleſiaſtical functions as firſt biſhop of Chriſtendom.

In Italy, there are thirty-eight archbiſhoprics, but the number of ſuffragans, though very great, cannot be aſcertained, as the creation or ſuppreſſion of them depends entirely on the pleaſure of the pope.

The Italian language, which in the preſent age is ſo much admired for its ſoftneſs, and ſpoken by the accompliſhed in moſt parts of Europe, is originally the old Latin, blended and corrupted with the jargons of the northern nations that over-ran this country after the declenſion of the Roman empire; but poliſhed, refined, and improved ſo, as to render it ſoft, ſmooth, harmonious, and the beſt adapted to poetry and muſic of any in the world. Almoſt every ſtate in Italy has a different dialect: the Tuſcan ſtyle and dialect is moſt in requeſt at preſent. The affinity between the Italian and the ancient Latin, will appear by the following ſpecimen of their Lord's prayer: "Padre noſtro, che ſei nel cielo, ſia ſanctificato ill tuo nome; ill tuo regno venga; la tua volunta ſia ſatta ſic come in cielo coſi anche in terra; dacci oggi ill noſtro pane cotidiana; e rimettici i noſtri debita, ſic come noi ancora rimettiamo a' noſtri debitori; e non inducici in tentatione, ma liberaci dal maligno; perchiochè tuo è il regno, è la potenza, è la gloria in ſempiterno. Amen."

With reſpect to learning and learned men, no country has produced better hiſtorians and poets, both ancient and modern, than Italy. Among the former of theſe, are Cicero, Virgil, Horace, Livy, Tacitus, and Lucretius. After the reduction of the Roman empire, learning ſuffered a total eclipſe; but ſince the revival of it, ſome Italians have ſucceeded in controverſial learning, though they are chiefly celebrated by bigots of their own perſuaſion. Galileo, Torricelli, Malpighi, Borelli, and ſeveral others, have ſhone in the mathematics and natural philoſophy. Strada, Fra, Paoli, Guicciardin, Bentivoglio, Davila, and Machiavel, have all been celebrated as excellent hiſtorians; and the latter yields the palm to few of his ſucceſſors, either as a political or comic writer. Boccace has been eſteemed as one of the moſt pure and correct writers with reſpect to ſtyle: he was a very natural painter of life and manners, but wrote in too licentious a ſpirit. Metaſtaſio has acquired great reputation by his dramatic pieces ſet to muſic. Sannazarius, Fracaſtorius Bembo, Vida, and ſome others, have diſtinguiſhed themſelves by the elegance, correctneſs, and ſpirit of their Latin poetry; as Taſſo and Arioſto have for their Italian.

The painters, ſculptors, architects, and muſicians of Italy, have never yet been equalled by thoſe of any other nation. Raphael, Titian, Julio Romano, Correggio, Caraccio, Veroneſe, and many more, remain unrivalled in the firſt of theſe arts, as Michael Angelo does in all three. Bramante, Bernini, with ſeveral more of their countrymen, carried ſculpture and architecture to an amazing degree of perfection. Their profeſſors of muſic, at the head of which ſtands Corelli, are almoſt innumerable, and moſt of them inimitable.

The univerſities in Italy are thoſe at Rome, Venice, Florence, Mantua, Padua, Parma, Verona, Milan, Pavia, Bologna, Ferrara, Piſa, Naples, Salerno, and Peruſia. Piſa hath forty-ſix profeſſors.

The natural and artificial curioſities of Italy, both in ancient and modern times, are alike ſtupendous, great, and beautiful. Mount Veſuvius, five miles diſtant from Naples, is remarkable for its eruptions of fire from the top. Its height has been computed to be 3900 feet above the ſurface of the ſea. The younger Pliny, who was a witneſs to what he wrote, has given a ſtriking deſcription of its ravages in the year 79. In 1631 it broke out with great fury, and ſpread deſolation for ſeveral miles around. There was a ſtill greater eruption in 1694, which continued near a month, when burning matter was thrown out with ſo much force, that ſome of it extended thirty miles, and a vaſt quantity of melted minerals, mixed with other matter, ran down like a river for three miles, carrying every thing before it. In 1707 another eruption happened, when ſuch quantities of cinders and aſhes were thrown out, that it was dark at Naples at noon-day. A violent eruption in 1767, when the aſhes, or rather ſmall cinders, ſhowered down ſo faſt at Naples, that the people in the ſtreets were obliged to uſe umbrellas, or other coverings, to guard themſelves from hurt. The tops of the houſes, and the balconies, were covered with theſe cinders; and ſhips at ſea, twenty leagues from Naples, were alſo covered with them, to the great aſtoniſhment of the ſailors. This is reckoned to be the twenty-ſeventh eruption from that which deſtroyed Herculaneum in the time of Titus. The principal eruptions of modern times, which have been recorded, happened in the years 1766, 1767, 1779, and 1794; of theſe, the laſt in 1794, appears to have been the moſt tremendous, and wonderful, and the miſchief conſiderable; the lava covered, and totally deſtroyed, 5000 acres of rich vineyards and cultivated land, and drove the inhabitants of Torre del Greco from the town, moſt of the houſes being either buried, or ſo injured, as to be uninhabitable: the damage done to the vineyards by the aſhes, likewiſe was immenſe. The declivity of this mountain, towards the ſea, is every-where planted with vines and fruit-trees; and it has been obſerved, that the ſulphureous and nitrous manure, which proceeds from this raging volcano, and the heat of its ſubterraneous fires, contribute not a little to the uncommon fertility of the circumjacent country, and to the profuſion of fruits and herbage with which it is every-where covered.

The other remarkable burning mountain is that of Ætna, in Sicily, of a circular form, and terminates in a cone: it is 10,954 feet in height, and has been computed to be ſixty miles in compaſs. Its fiery eruptions have always rendered it celebrated in hiſtory: in one of theſe, which happened in 1669, fourteen towns and villages were deſtroyed, and there have been ſeveral terrible eruptions ſince that time. An earthquake, very deſtructive in its effects, commonly precedes the erruption from this mountain. In 1693, the port-town of Catania was overturned, and 18,000 people periſhed. The lower parts of the mountain are very fruitful in corn and ſugar-canes; the middle abounds with woods, olive-trees, and vines; and the upper part is almoſt the whole year covered with ſnow. Mount Ætna is by the Italians called Monte Gibello, or Mongibello: it is ſo high, that it harbours many wild beaſts.

The valley of Soltafara, between the lakes Agnano and Puzzeli, is remarkable for the vaſt quantities of ſulphur that are continually forced out of the clifts by ſubterraneous fires. The grotto del Cani is alſo noted

noted for its poiſonous ſtreams, and is ſo called from their killing dogs that enter it, if forced to remain there. Scorpions, vipers, and ſerpents, are ſaid to be very numerous in Apulia. To the natural curioſities of Italy, we may likewiſe add thoſe vaſt bodies of ſnow and ice called glaciers and ice-vallies. Of theſe there are five, which reach almoſt to the plain of the vale of Chomouny, and are ſeparated by wild foreſts, corn fields, and rich meadows; the whole affording a very romantic and ſtriking appearance. Theſe ſeveral vallies of ice, which lie chiefly in the hollows of the mountains, and are ſome leagues in length unite together at the foot of Mount Blanc; the higheſt mountain in Europe, and probably of the ancient world; its height, above the level of the ſea, being 2391¼ French toiſes, or 15,303 Engliſh feet.

A great variety of artificial curioſities, and monuments of antiquity, are to be found in the city of Rome only; among which are, the acqueducts and fountains; the vatican, and the other palaces; the marble monument of the emperor Alexander Severus; marble buſts of the emperors and their conſorts; three brick arches of the temple of Peace, built by the emperor Veſpaſian, and that of Concord; the Coliſeo, or amphitheatre, built by the emperor Veſpaſian, in the conſtruction of which 12,000 Jewiſh captives were employed; it is ſaid to have contained 87,000 ſpectators ſeated, and 20,000 ſtanding; Indeed it muſt be allowed, that no city in the univerſe equals Rome for the multiplicity of fine fountains, noble edifices, antiquities, curioſities, paintings, ſtatues, ſculptures, &c. The cloacæ or catacombs, in the neighbourhood of Rome and Naples, were places where the Chriſtians who never burned their dead, and ſuch of the Pagan Romans as could not afford the expence of burning, were buried; they are long narrow alleys, ſcarcely broad enough for two perſons to go abreaſt, but ſufficiently high for the talleſt man to ſtand upright. They extend a prodigious way under ground. On each ſide are three holes or cavities, each of which will contain the coffin of a full-grown perſon. The cave of Pauſilippo is a broad, ſtraight, ſubterraneous road, hewn through a mountain. Two holes on each ſide admit air and light. This cave is, at the entrance, 100 feet high, but diminiſhes; and the whole, which is paved with broad ſtones, is about half a mile long.

An inexhauſtible mine of curioſities are daily dug out of the ruins of Herculaneum, a city lying between Naples and Veſuvius, which, in the reign of Nero, was almoſt totally deſtroyed by an earthquake; and afterwards, in the firſt year of the reign of Titus Veſpaſian, overwhelmed by a ſtream of the lava of Veſuvius. The ſtreets and houſes, in ſome places, were filled up with the melted lava to the height of ſixty feet above the tops of the latter, and in others 110 feet. This lava, which is now of a very hard conſiſtency, is compoſed of bituminous particles mixed with cinders, minerals, metallics, and vitrified ſandy ſubſtances, which form a cloſe and heavy maſs. In 1713, upon digging into theſe parts, ſomewhat of this unfortunate city was diſcovered, and many antiquities were dug out; but the people of Italy being for the moſt part indifferent about objects of antiquity, the ſearch was diſcontinued till the year 1736, when the king of Naples employed men to dig perpendicularly eighty feet, whereupon not only the city made its appearance, but alſo the river which ran through it. The temple of Jupiter was then diſcovered, and the whole of the theatre. In the temple was found a ſtatue of gold, and the inſcription that decorated the great door of entrance. In the theatre, the fragments of a gilt chariot of bronze, with horſes of the ſame metal, likewiſe gilt: this had been placed over the principal door of entrance. Multitudes of ſtatues, buſtoes, pillars, paintings, manuſcripts, furniture, and various utenſils, were likewiſe found among the ruins of this city. The ſtreets appear to have been quite ſtraight and regular, the houſes well built and uniform; ſome of the rooms were paved with moſaic, others with fine marbles, others again with bricks three feet long and ſix inches thick. The town of Pompia was deſtroyed by the ſame eruption of Mount Veſuvius, which occaſioned the deſtruction of Herculaneum; but the ruins were not diſcovered till near forty years after thoſe of Herculaneum.

Each city and town of Italy contains many rarities in architecture, painting, and ſculpture. St. Peter's church at Rome is thought to be the moſt aſtoniſhing, bold, and regular fabric in the univerſe. The height, from the pavement of the church to the top of the croſs, is 432 feet. In this church is a ſuperb white marble monument of the counteſs Matilda. The houſe and chapel of Loretto is rich beyond imagination, notwithſtanding the ridiculous romance which compoſes its hiſtory. The name Loretto is derived from Laurita, the lady in whoſe field the ſanta caſa was pitched before the reformation; the number of pilgrims, who viſited the holy houſe in a year, is ſaid to have amounted to 200,000; but now they ſeldom exceed 40, or 50,000.

Every Italian ſtate having a diſtinct form of govèrnment, trade, and intereſt, that the reader may be the better enabled to form an idea of the whole, we ſhall take a diſtinct view of each.

The king of Sardinia, as duke of Savoy and prince of Piedmont, has always been conſidered as a powerful prince in Italy, of which he is called the Janus, or keeper, againſt the French. Turin, his capital city, contains 110 churches or chapels, ſeveral hoſpitals, and about 65,000 inhabitants. The approach to it is magnificent, and the environs beautiful, though thick fogs from the two rivers are frequent in autumn and winter; ſo that the air of Turin is then very thick and moiſt. The four gates are highly ornamental; the ſtreets in the New Town are wide, ſtraight, clean, having plenty of water running through them, well built, in a good taſte, chiefly of brick ſtuccoed, and generally terminating in ſome agreeable object. No inhabitant can rebuild or repair his houſe but on an uniform plan, laid down by government, for the improvement of the city. The fortifications of Turin are regular, and kept in excellent repair. The citadel is a regular pentagon, conſiſting of five ſtrong baſtions, and is reputed one of the ſtrongeſt in Europe. At the end next the new gate is the arſenal, which beſides the armories found in ſuch places, contains a cabinet of minerals, a good chemical laboratory, a library of books in mineralogy and metallurgy, and furnaces for caſting cannon: here, alſo, are mathematical, mechanical, and other maſters, for the inſtruction of engineers, miners, &c. The garriſon of Turin is always changed at the end of two years, and then there is a general review. The univerſity was founded firſt in the year 1405, and conſiſts of ſchools, wherein twenty-four profeſſors read lectures, from the 3d of November to the 24th of June; of the royal library, wherein are about 50,000 volumes of printed books, beſides manuſcripts: this is open every day, except holidays, both morning and afternoon. The royal muſeum has a good cabinet of medals, and a collection of antiquities, found chiefly in Piedmont or Sardinia, and elegantly arranged: alſo of natural hiſtory, as ſhells, and Engliſh minerals, poliſhed marbles, and hard ſtones, petrifactions, corals, zoophytes, and ſome minerals, collected by Donati, in the Adriatic; alſo, ſome cheſts of natural curioſities, which Donati, during his travels in Egypt and Arabia, ſent from Goa. In the military academy, young gentlemen, both natives and ſtrangers, may be inſtructed in the exerciſes at a moderate expence, the king defraying a part of the charge attending this inſtitution. The king's palace is in a ſimple and noble ſtyle of architecture. The apartments are handſomely fitted up and furniſhed: the ceilings painted by Daniele di Sancterre and others. They

contain

contain a great collection of pictures, among which are many good ones. The king's theatre, or great opera-houſe, is reckoned one of the fineſt in Europe. The buildings which are moſt eſteemed in point of architecture, are, the palace of the duke of Savoy, called Caſtello Reale, by Filippo Giuvara; the Carignano palace, by Guarini; the buildings of the univerſity, and the town-houſe. There is a literary ſociety at Turin, who have publiſhed memoirs, under the title of *Miſcellanea Philoſophico-Mathematica*. The chief trade of the city and country is in thrown ſilk, which is ſent to England and Lyons; they manufacture, however, ſome of it into excellent ſtockings, and good ſilk for furniture. In the year 1536, Turin was taken by the French, and again in the year 1640, after a long ſiege. In the year 1706, the ſame enemy made another attempt, but after beſieging it upwards of three months, under the conduct of the duke of Orleans, they were driven away, with great loſs, by the duke of Savoy and Prince Eugene. The king's ordinary revenue, beſides his own family provinces, amounts to 500,000l. ſterling at leaſt, out of which he maintains 15,000 men in time of peace; but, during a war, when aſſiſted by foreign ſubſidies, he can bring 40,000 men into the field. This prince has long been an ally of Great Britain, for the preſervation of the balance of power in Europe, and to that circumſtance, in which alſo his natural intereſt conſiſts, he principally owes his aggrandizement.—The king being abſolute, can levy what monies he pleaſes upon his ſubjects.

The Milaneſe, in the poſſeſſion of the houſe of Auſtria, is a very formidable ſtate; and formerly, when governed by its own dukes, gave law, to Italy.—Milan, its capital, is fortified with a wall and rampart; and has a citadel, in which is a foundery for cannon, and an arſenal furniſhed with arms for 12,000 men. The environs are very pleaſant, being adorned with beautiful ſeats, gardens, orchards, &c. Here are 22 gates, 230 churches, of which 96 are parochial, 90 convents, 100 religious fraternities, 120 ſchools, and about 250,000 inhabitants. The nobility are very numerous, and few places can claim ſuch a freedom of living and acting as one pleaſes. It is the ſee of an archbiſhop. The cathedral, dedicated to St. Maria and Thecla, is more remarkable for its largeneſs than its grandeur; at leaſt this grandeur wants order, the church being a vaſt pile of marble, which, with the ſtatues, alſo of marble, is diſpoſed without taſte or regularity. Its treaſury, of great value, contains, among other precious things, the almoſt invaluable coffin of rock cryſtal, wherein the body of St. Charles Boromeo, cardinal and archbiſhop of Milan, is depoſited. The chief church for antiquity is that of St. Ambroſe, where lie the bodies of that father, and the kings Pepin and Bernard. The Ambroſian college, in the centre of the town, is a foundation of Frederic Boromeo, where ſixteen profeſſors teach gratis. He alſo began to build a fine library, which cardinal Gilbert Boromeo finiſhed, with many large additions It is ſaid to contain upwards of 40,000 printed volumes, and ſome thouſands of manuſcripts. In this college is alſo an academy of painting, and a muſeum. The ſeminary for ſciences, where the ſtudents are both taught and maintained, and the college of the nobles, are ſtately buildings; but inferior to the Helvetian college, founded for a certain number of Switzers. Here is alſo a mathematical academy. The large lazaret is only made uſe of in time of any reigning contagious diſorder. The great hoſpital is a very fine building, and very liberally endowed by duke Francis Sforția IV. Its income is ſaid to be between ninety and 100,000 rix-dollars. And into it are admitted, not only ſick perſons, but alſo foundlings and lunatics. Here are alſo ſeveral other receptacles for the poor and diſtreſſed. The large hoſpital has ſix ſmaller depending on it. In the Dominican convent, near the church of Madonna della gratia, is held the court of inquiſition. Among the civil buildings is the old and ſpacious regency-houſe, near the cathedral, now the uſual reſidence of the governor-general; alſo the new and ſtately town-houſe, where ſtands an equeſtrian ſtatue of Philip II. This city, which was built by the Gauls, in the three hundred and ninety-fifth year after the foundation of Rome, was ſince beſieged forty times, taken twenty times, and four times almoſt totally demoliſhed; to which may be added, a multiplicity of other misfortunes it had been involved in, but out of which it always recovered. Here are manufacturers, artificers, and handicraftſmen of all kinds; beſides ſeveral rivers and many canals, all which are very inſtrumental to promote and increaſe its trade. The annual revenue of the duchy is above 300,000l. by which an army of 30,000 men is maintained. The beggars here aſk alms by holding out a diſh, in which is placed a human ſkull. The duchy of Mantua being now incorporated with the Milaneſe, the name of Auſtrian Lombardy is given to the whole province.

Genoa was once a very powerful republic, but is now greatly degenerated both in ſtrength and opulence, though the ſpirit of trade ſtill continues among all ranks. The capital is about ten miles in circumference, and defended towards the land by a double wall. Several baſtions are erected along the ſea ſhore, on rocks which riſe above the water. The ſtreets are in general narrow, but clean and well paved; two, called the Strada Nuova and Strada Balbi, are filled with magnificent palaces, fronted with marble. It is the ſee of an archbiſhop. The cathedral is built in the Gothic ſtyle, and paved with black and white marble, in the treaſury of which is preſerved a curious hexagon diſh, ſaid to be of a ſingle emerald, found at Ceſarea in the time of the cruſades, which the Genoeſe received as their ſhare of the plunder. Beſides the cathedral, it contains thirty-two pariſh churches, many of which are magnificent, and adorned with ſculptures and pictures by the beſt maſters. The doge's palace is large, without decoration, except two ſtatues of John Andrew Doria and Andrew Doria, larger than life, at the entrance. The arſenal contains arms for 24,000 men, machines, models for bridges, the armour worn by a number of Genoeſe women in the cruſades, a ſhield containing 120 piſtols, made by Julius Ceſar Vacche, for the purpoſe of aſſaſſinating the doge and ſenate at one time, &c. Other public buildings are the Albergo, which ſerves as a poor-houſe and houſe of correction; a large hoſpital for the ſick of all nations and religions; the Conſervatory, for educating and portioning 300 poor girls; and a great number of palaces belonging to the nobility. They reckon at Genoa ſixty-nine convents of men and women. The number of inhabitants is eſtimated 150,000. The chief ſafety of this republic conſiſts in the jealouſy of other European powers, becauſe it would be a moſt valuable acquiſition to any of them. Its maritime power is dwindled down to ſix gallies. The government of this country is ariſtocratical, being veſted in the nobility: the chief perſon is called the doge, or duke, to which dignity no one can be promoted till he is fifty years of age. The doge gives audience to ambaſſadors; all orders of government are iſſued in his name, and he is allowed a body guard of 200 Germans. Every two years a new doge is elected, and the former is deemed incapable of holding the ſame poſt again till after five years. The empire of the ſea was for many years diſputed between this ſtate and that of Venice.

The republic of Venice is one of the moſt celebrated in the world, on account of its conſtitution and the power it once poſſeſſed. It contains ſeveral fine provinces on the continent of Italy, ſome iſlands in the Adriatic, and part of Dalmatia. The conſtitution was originally democratical, the magiſtrates being choſen by a general aſſembly of the people, and continued thus for 150 years; but, after various changes, a body of hereditary legiſlative nobility was formed, and a complete ariſtocracy at length eſtabliſhed

A View of FLORENCE on the RIVER ARNO the Capital of TUSCANY in ITALY.

liſhed. The nobility are divided into ſix claſſes, amounting in the whole to 2500, each of whom, at 25 years of age, has a right to be a member of the grand council. Theſe elect a doge, or chief magiſtrate, in a peculiar manner, by ballot. The doge is inveſted with great ſtate, and with the emblems of ſupreme authority. He annually, on Aſcenſion-day, eſpouſes the Adriatic ſea, by dropping into it a ring from his bucentaur, or ſtate-barge, attended by thoſe of all the nobility. But notwithſtanding the inſignia of royalty with which the doge is inveſted, he enjoys very little power, and is ſhut up in the city as a priſoner, while the government and laws are managed by different councils and nobles. The college, or ſeignory, is the ſupreme cabinet council of the ſtate, and alſo the repreſentative of the republic: its power is very extenſive. The council of ten takes cognizance of ſtate crimes. But the tribunal of ſtate inquiſitors, which conſiſts only of three members, and which is in the higheſt degree arbitrary in its method of proceeding, has the power of deciding without appeal on the lives of every citizen belonging to the Venetian ſtate; the higheſt of the nobility, not excepting even the doge himſelf: they may ſeize ſuſpected perſons, and try and execute thoſe whom they think worthy of puniſhment, when they think proper. Having keys to every apartment of the palace, they have liberty to penetrate into the very bed-chamber of the doge, open his cabinet, and examine his papers; and, of courſe, may command acceſs to the houſe of every individual in the ſtate. They continue in office only one year, but are not afterwards reſponſible for their conduct while in authority.

The city of Venice is ſituated on 72 iſlands at the bottom of the north end of the Adriatic ſea, and is ſeparated from the continent by a marſhy lake of five Italian miles in breadth, too ſhallow for large ſhips to navigate, which forms its chief ſtrength. This city contains 70 pariſh churches, beſides others; 54 convents of monks, 26 nunneries, 17 rich hoſpitals, 18 oratories, 40 religious fraternities, with their chapels: 53 ſquares, 165 marble, and 20 half ſtatues. The buildings, indeed, are all of ſtone; but the greater part make ſo mean a figure, that this city, in point of beauty and elegance, can in no wiſe ſtand the teſt with many others. St. Mark's ſquare is very fine, and ſo are the ſeveral ſtately marble palaces that border upon the great canal, though moſt of them are of Gothic architecture. They have had, however, lately, ſome ſpirited differences with the court of Rome, and ſeem diſpoſed to throw off their obedience to its head. The grandeur and convenience of the city, particularly the public places, the treaſury, and the arſenal, are beyond expreſſion. Over the ſeveral canals of Venice are laid near 590 bridges, moſt of which are of ſtone. All the orders of Venetian nobility are dreſſed in black gowns, large wigs, and caps which they hold in their hands.

With reſpect to their perſons, the Venetians are in general tall and well made, and many fine manly countenances are ſeen in the ſtreets of Venice; they are alſo a lively, ingenious people, extravagantly fond of public amuſements, with an uncommon reliſh for humour. The women are of a fine ſtyle of countenance, with expreſſive features, and are of an eaſy addreſs. The common people are remarkably ſober, obliging to ſtrangers, and gentle in their intercourſe with each other. The diverſions of the Venetians are chiefly maſquerading, eſpecially during the carnivals, and other feſtivals, when debauchery, riot, and licentiouſneſs are ſaid to be carried to their greateſt height; but this opinion ſeems to exceed the truth: they have alſo ridottos, operas, and plays, which are commonly wretched performances. There are eight or nine theatres here, including the opera houſes. Great numbers of ſtrangers viſit Venice during the time of the carnival. The grand ſcene of all the ſhews and follies during the feſtivals, is the ſquare of St Mark, in which bulls are ſometimes baited, and where, at ſuch times, 15,000 people, it is ſaid, often aſſemble. The inhabitants, who are computed at 200,000, walk on foot, except the principal ladies of faſhion, who are carried in chairs, the ſtreets being too narrow, ſteep, and crooked, to admit of wheel carriages.

The Venetians have ſtill ſome manufactures in ſcarlet cloth, gold and ſilver ſtuffs, and, above all, fine looking glaſſes, all which bring in a conſiderable revenue to the owners; that of the ſard annually is ſaid to amount to 8,000,000 of Italian ducats, each valued at 20d. of our money: out of this are defrayed the expences of the ſtate, and the pay of the army, which, in time of peace, conſiſts of 16,000 regular troops, under the command of a foreign general, and 10,000 militia. Their fleet, which is but ſmall, principally conſiſts of gallies, for curbing the inſolencies of the piratical ſtates of Barbary. The Venetians are, however, ſtill reckoned the greateſt naval power in Italy.

Here are two patriarchs, which preſide over eccleſiaſtical matters; the authority of one reaches over all the provinces, but neither of them have much power; and both of them are choſen by the ſenate: every religious ſect, even the Mahometan and Pagan, excepting Proteſtants, are tolerated here in the free exerciſe of their religion. The inquiſition is under great reſtrictions here.

The Venetian dominions conſiſt of a conſiderable part of Dalmatia, of four towns in Greece, and of the iſlands of Corfu, Pachſu, Antipachſu, Santa Maura, Curzolari, Val di Compare, Cephalonia, and Zante. Their territories in Italy contain, beſides the duchy of Venice, the Paduaneſe, the peninſula of Rovigo, the Veroneſe, the territories of Vicenza and Breſcia, the diſtricts of Bergamo, Cremaſco, and the Marca Trurgiana, with part of the country of Friuli. The ſubjects of the Venetian republic are not oppreſſed; the ſenate being ſenſible, that mild and gentle treatment conduce more effectually than ſeverity to the welfare of the ſtate and the happineſs of individuals. One of the ſmalleſt pieces of money at Venice is called gazetta; and the firſt news-papers publiſhed there, on a ſingle leaf, having been ſold for that apiece, news-papers were from thence ſtyled gazettes.

The grand duchy of Tuſcany is now poſſeſſed by a younger branch of the houſe of Auſtria, under the title of grand duke of Tuſcany. Its annual revenues are, at preſent, computed at 550,000l. ſterling; and it is thought that the duchy of Tuſcany can bring 30,000 men into the field. The inhabitants affect great ſtate, but do not eſteem trade as beneath the firſt nobleman. Accordingly, it is not uncommon for the gentry, and even ſome of the nobility, to ſell wine by retail from their cellars. But the principal trade of this duchy is carried on at Leghorn, a handſome town, and a free-port, ſituated in the territories of Piſa, about thirty-five miles ſouth-weſt of Florence. The number of inhabitants in Leghorn are ſaid to be about 40,000, among whom are reckoned 20,000 Jews, who live in a particular quarter of the city, have a handſome ſynagogue, and, though ſubject to very heavy taxes, are in a thriving condition, the greateſt part of the commerce of this city being carried on by theſe people.

Florence, the capital of Tuſcany, is ſituated on the river Arno, over which are four ſtone bridges, and defended by a good citadel. The ſtreets, in general, are very narrow and crooked, are paved with a greyiſh ſtone, and are tolerably clean. There are a great number of palaces, churches, convents, and hoſpitals: the cathedral is a very noble edifice, the outſide is entirely built with poliſhed marble, and enriched with exquiſite architecture and ſculpture; and from the ball over the cupola, there is a delightful proſpect of all the palaces, churches, monaſteries, &c. within the walls, and of near two thouſand villas without. By

the church ſtands the much celebrated Campanile, or ſquare ſteeple, which is one hundred and eighty feet high, all of fine marble, of ſeveral colours, and curiouſly wrought. The baptiſtery, or fount, where all the children of the city are baptized, is well worthy attention. The reſt of the churches in general are very beautiful, and contain many fine paintings and other pieces of art. This city was long poſſeſſed by the illuſtrious houſe of Medicis, who made it the repoſitory of all that was valuable, rich, and maſterly in architecture, literature, and arts, eſpecially thoſe of painting and ſculpture. The celebrated Venus of Medicis, which has long been conſidered as the ſtandard of taſte in female beauty and proportion, ſtands in a room called the Tribunal, in a group of other ancient ſtatues, ſome of which are ſaid to be the works of Praxiteles, and other Greek maſters. It is of white marble, and appears, from an inſcription on the baſe of the ſtatue, to have been the performance of Cleomenes, an Athenian, the ſon of Apollodorus. The duke has alſo ſeveral noble country ſeats, enriched and adorned in the ſame magnificent manner. The arſenal is a ſtately building, and well furniſhed with all ſorts of weapons of war. Florence is adorned with ſeven fountains, ſix columns, two pyramids, and about an hundred and ſixty public ſtatues. The great piazza, or ſquare, is very ſpacious and magnificent, with a noble fountain in the centre of it. The city is thought to contain 70,000 inhabitants. They deal, beſides wine and fruits, in gold and ſilver ſtuffs. The inhabitants boaſt of the improvements they have made in the Italian tongue, by means of their Academia della Cruſca: ſeveral other academies are now eſtabliſhed in Florence. Since the acceſſion of the archduke Leopold, brother of the preſent emperor, to this duchy, a great reformation has been introduced, both into the government and manufactures, to the great benefit of the finances. The other principal towns of Tuſcany are Piſa, and Sienna, which are now much decayed.

Lucca is a ſmall republic, under the protection of the emperor, and ſituated on the Tuſcan ſea, in a moſt delightful plain. It is not above thirty Italian miles in circumference, but exceeding fruitful and populous. The inhabitants, who are ſaid to amount to upwards of 120,000, are remarkable for their induſtry and love of liberty: being in full poſſeſſion of freedom, they appear with an air of cheerfulneſs and plenty, ſeldom to be met with among their neighbours. They have improved their country into a beautiful garden, ſo that the annual revenue of the ſtate amounts to 80,000l. ſterling. They are under the protection of the houſe of Auſtria. Their capital, Lucca, is an ancient city about three Italian miles in circumference. The houſes, in general, are well built, the ſtreets broad and well paved, but irregular, and the number of inhabitants about 40,000. Several manufactures, eſpecially thoſe of ſilk, are carried on here; and the fineſt oil of any in Italy is made in this republic.

St. Marino may be conſidered as a geographical curioſity, conſiſting only of a ſingle mountain, and a few hillocks ſcattered round the bottom of it. The founder of this republic was a Dalmatian maſon, called Marino, who, about the year 460, turned hermit, and choſe this mnuntain for the place of his abode. His devotion and auſterity ſoon gained him a great reputation for ſanctity, and the princeſs of that country made him a preſent of the mountain. Many, out of veneration for the ſaint, ſettled there, and laid the foundation of a republic which ſtill ſubſiſts, and bears the name of the ſaint. The town is ſituated on the ſummit of the mountain, and can be approached by one path only. It is under the protection of the pope, and the number of inhabitants are computed at 5000. The manners of this people are very inoffenſive, and the government is in the hands of a council, compoſed of half nobles and half plebeians.

Parma, Placentia, and Guaſtalla, form at preſent one of the moſt flouriſhing ſtates in Italy, for its extent. The preſent duke is a prince of the houſe of Bourbon, and ſon to the late Don Philip, the king of Spain's younger brother. The ſoil is remarkably fertile, produces the fineſt fruits and richeſt paſturage, and the country contains conſiderable manufactures of ſilk. The annual revenues are computed at 100,000l. ſterling. Parma is ſuppoſed to contain 50,000 inhabitants, and Placentia about 28,000. Here is a biſhop's ſee and an univerſity; and ſome of its magnificent churches are painted by the famous Correggio. The cities of Parma and Placentia are enriched with magnificent buildings: but his Catholic majeſty, on his acceſſion to the throne of Naples, carried away with him many of the moſt remarkable pictures and moveable curioſities. The duke's court is thought to be the politeſt of any in Italy. This country was for ſome years paſt the ſeat of a bloody war between the Auſtrians, Spaniards, and Neapolitans.

Mantua is about fifty miles in length, and thirty-five in breadth. The Po runs through the midſt of it, and it is alſo watered by other rivers, as the Oglio, Mincio, Secchia, &c. all of which empty themſelves into the Po. The land abounds in corn, fruits, and legumes, with ſome wine, great quantities of flax, and a number of good horſes. By an order of the emperor in 1785, this duchy is incorporated with that of Milan into one province, and is now to be called Auſtrian Lombardy. It formerly brought to its own dukes 500,000 crowns a year. This city is divided by the water into two almoſt equal parts, which have a communication with each other over ſix bridges. The greater part of the ſtreets are long, broad, and ſtraight, with handſome ſtone houſes, fine ſquares, and ſtately churches. Here are, in all, four collegiate churches, twenty-one parochial, fourteen other churches and alms-houſes, eleven oratories, forty convents; and without the city three pariſh churches, two other churches, and ſeven convents. The Jews, of whom there are about four or five thouſand, live in a diſtinct quarter. The number of the inhabitants, excluſive of the garriſon, was formerly computed at 50,000. But ſince no court has been kept, the number has ſo dwindled away, that now the inhabitants ſcarcely exceed ſixteen thouſand. In the cathedral, which is a work of Julio Romano, are ſeen paintings of the moſt celebrated maſters.

Modena is ſtill governed by its own duke; he is abſolute within his own dominions; but a vaſſal of the empire, and under the protection of the houſe of Auſtria. The capital, alſo called Modena, is a pretty large and populous city, but the ſtreets are narrow, and the houſes without beauty or ſymmetry. Throughout all parts it has piazzas, but the walks are both low and dark. The churches alſo have little or nothing worth notice. It is the ſee of a biſhop, ſuffragan of the archbiſhop of Bologna. In a chamber under the cathedral tower, the Secchia rapita, ſo much talked of in travels, is ſeen hung up by an iron chain. This Secchia rapita is nothing more than a well-bucket, with iron-hoops, which was taken in a petty war, from the inhabitants of Bologna, at one of their doors, and is here preſerved as a monument of courage and victory. In the college founded by St. Boromeo, ſeventy or eighty young noblemen are maintained and inſtructed. The ducal palace is large and ſplendid. The picture gallery, including the lobby, conſiſts of ſix rooms, all filled with ſelect pieces of the moſt famous maſters. The moſt admired is Corregio's night-piece, repreſenting the birth of Chriſt, with the Virgin Mary and the Shepherds. The city is fortified, and on its ſouth ſide ſtands the citadel.

The Eccleſiaſtical State, of which Rome is the capital, lies in the centre of Italy. Under the ancient Romans this ſpot was a terreſtrial paradiſe. Here moſt of the beautiful villas of antiquity were ſituated, and every part of it cultivated with the moſt

aſſiduous

With a View of the Temple of Vesta. The Imperial Palace. The Fountain of Medicinal Water. The Arch of Trajan. And the Tomb of Oestius.

aſſiduous care; but Popiſh ſuperſtition, bigotry, and oppreſſion, have rendered it thin of people, and ill cultivated; ſo that many of the luxuriant tracts are now become marſhes and quagmires, whoſe putrid effluvia render the capital itſelf very unhealthy at ſome ſeaſons of the year. Several of the popes have endeavoured to improve their country, and revive that ſpirit of induſtry which was ſo prevalent in former times, but their labours have proved abortive. Indeed the diſcouragement of induſtry and agriculture, ſeems to be interwoven in the very conſtitution of the papal government, which is veſted in eccleſiaſtics. This beautiful country is now a mere deſert, and the wretched inhabitants muſt periſh with want, did not the amazing fertility of the ſoil ſpontaneouſly afford them a ſcanty ſubſiſtence.

Though the pope is truly deſpotic, and poſſeſſes one of the moſt fertile countries in the world, the revenues of his territorial poſſeſſions do not amount to more than a million ſterling annually. His accidental income indeed formerly far exceeded that ſum; but this is now greatly diminiſhed by the ſeparation of the Proteſtant powers, and the meaſures lately taken by thoſe that ſtill profeſs the Romiſh religion, to prevent the great remittances of money to Rome; add to this, the almoſt total ſuppreſſion of the order of Jeſuits, from whom he drew vaſt ſupplies; ſo that the taxes upon proviſions and lodgings furniſhed to foreigners, who annually ſpend immenſe ſums in viſiting his dominions, form, at preſent, the greater part of the pope's accidental revenues.

The pope has his guards, or Sbirri, like other princes, and theſe, under proper magiſtrates, take care of the peace of the capital. The Campagna di Roma, in which the capital is ſituated, is under the immediate inſpection of his holineſs; but the other provinces are governed by legates and vice-legates. He monopolizes all the corn in his territories, and has always a ſufficient number of troops to keep the provinces in awe. Few manufactures are carried on in the Eccleſiaſtical State, conſequently its exports are of little value. Formerly all the Chriſtian powers of Europe trembled at the nod of the pope, but affairs have now taken a very different turn; and his power, which, as a temporal prince, has been for ſome years contemptible, may probably be ſtill more abridged. The late pope, Clement XIV. very wiſely diſclaimed all intention of oppoſing the forces of the adjacent princes, with any other arms but thoſe of prayers and ſupplications. The pope's eccleſiaſtical government has been already mentioned.

Rome, the capital of the Eccleſiaſtical State, is ſituated on the Tyber, ten miles from the Tuſcan ſea. In the magnificence of its buildings, the number of its monuments, curioſities, and antiquities, together with the ſingularity and importance of its hiſtorical events, it far ſurpaſſes any city in the world. It is the centre and repoſitory as it were of all that is exquiſite in painting, ſculpture, and architecture. From an account taken in the year 1787, the number of its inhabitants was found to amount to 160,000. The Tyber runs through the city from north to ſouth, forming an iſland.

In external ſplendor, and the magnificence of its temples and palaces, modern Rome is, at leaſt, equal to, if it does not excel, the ancient. The number of the churches are computed at about three hundred, the nobleſt and moſt elegantly beautiful is St. Peter's which for the harmony of its architecture, fineneſs and great variety of carved and gilt works, paintings, ſtatues, &c. cannot be viewed without a pleaſing aſtoniſhment. Before it is a ſpacious and magnificent piazza, in the middle of which is an obeliſk of granate or black marble, brought from Egypt, and reared at a prodigious expence. It is eighty feet high, and the pedeſtal on which it ſtands is thirty; on the top of it is a braſs gilt croſs. The annual revenue belonging to this church is upwards of 20,0000l. The Pantheon, commonly called the Rotunda, though it has loſt much of its priſtine grandeur, is ſtill one of the moſt entire ſtructures of the ancients in Italy. The citizens of Rome are more polite than in any other place in Europe; and are ſaid to be entirely free from that ſpirit of bigotry and perſecution which prevails in other Roman-Catholic countries. Here is plenty of all ſorts of proviſions, and a great variety of excellent wines; but in Rome they are drunk very moderately, and generally mixed with water.

Bologna, the capital of the Bologneſe, is the ſecond city in the Eccleſiaſtical State. The number of its inhabitants is computed at upwards of eighty thouſand. The fortifications are very inconſiderable, being only defended by a ſtrong, high brick wall, adorned with a great number of towers at certain diſtances. There are many fine palaces, convents, churches in Bologna, adorned with a prodigious variety of fine paintings, ſtatues, &c. The palace where the governor reſides, and the courts of juſtice are held, ſtands in the great market-place, and is 208 common paces in length. Here is an univerſity, and a muſeum. The inns at Bologna are the beſt in Italy, and all kinds of proviſions are very plentiful. The inhabitants of Bologna are more induſtrious than in other parts of Italy, and remarkably polite to ſtrangers; the women enjoy a great ſhare of liberty; and the nuns are particularly ingenious in making artificial flowers, and imitating all kinds of fruits.

Ferrara, Ravenna, Rimini, Urbino, Ancona, and many other cities, illuſtrious in former times, now exhibit a melancholy ſcene of ruin and devaſtation.

Loretto, never thought or heard of in times of antiquity, is now the admiration of the world, for the riches it contains, the prodigious reſort of pilgrims, and other devotees, to pay their devotions; it having been induſtriouſly reported by the Romiſh clergy, that the Santa Caſa, or Holy Houſe, in which the Virgin Mary dwelt at Nazareth, was carried hither through the air by angels, towards the end of the thirteenth century, attended with many miraculous circumſtances. The votive pieces and jewels in this holy houſe and treaſury, are of immenſe value, being the offerings of princes, princeſſes, and other great perſonages: the riches contained in the treaſury are valued at nine millions of rix-dollars. Seventeen golden lamps are continually burning before the Virgin, and thirty-ſeven ſilver ones in the other parts of the houſe. The gold chains, rings, jewels, emeralds, pearls, and rubies, wherewith the image of the Holy Mother is, or was loaded, are of ineſtimable value; and the angels of ſolid gold, placed on every ſide, are equally enriched with the moſt precious diamonds. To the ſuperſtition of Roman-Catholic princes, Loretto is chiefly indebted for this maſs of treaſure. The pavement of this houſe is of ſquare pieces of red and white marble, and the whole is caſed on the outſide with the fineſt marble, adorned with ſtatues, ſculptures, and pillars of the Corinthian order; and over all is a fine ſpacious church, to preſerve it from the injuries of the weather. One hundred and twenty-three maſſes are daily ſaid in this church, and the Santa Caſa.

Naples and Sicily, or the Two Sicillies, comprehending the ancient countries of Samnium, Campania, Apulia, Magna-Grecia, and the iſland of Sicily, form the largeſt kingdom in Italy, containing about 32,000 ſquare miles. This country is bounded on all ſides by the Mediterranean and Adriatic, except on the north-weſt, where it terminates on the Eccleſiaſtical State. The ſoil is very fruitful, and much better cultivated than in the Eccleſiaſtical State; and the annual revenues amount to about 750,000l. ſterling. The clergy are very numerous; but their influence and revenues have been lately abridged.

The capital is Naples, ſaid to be the firſt city for ſtrength and neatneſs in Italy. It is moſt advantageouſly

ouſly ſituated, having a delightful country on one ſide, and a noble bay of the Mediterranean on the other; with a ſpacious harbour, which is kept in good repair, and fortified with a mole, extending above a quarter of a mile into the ſea, and having at the extremity a high lantern to direct ſhips ſafely into the harbour during the night. The bay is one of the fineſt in the world, being almoſt of a ſemicircular figure, about thirty miles in diameter, and three parts of it ſheltered by a circuit of woods and mountains. The circumference of the city, including the ſuburbs, is not leſs than 18 Italian miles, and the number of inhabitants about 300,000. The ſtreets are well paved, but they are not lighted at night, and in many places are disfigured by ſtalls, on which proviſions are expoſed to ſale. The houſes are of ſtone, flat-roofed, and generally lofty and uniform; but many of them have balconies, with lattice windows. Naples abounds with fine churches, convents, fountains, and palaces of the nobility, many of whom conſtantly reſide here. The magnificence of many of the churches exceeds all imagination; the cathedral, though of the Gothic order, is a very grand, ſplendid edifice. The palace belonging to the king is very magnificent, and in the beſt ſtyle of architecture. Here is an univerſity and two academies of wits, one of which is called Gli Ardente, and the other Gli Otioſi. The arſenal is thought to contain arms for fifty thouſand men. There are five piazzas, or ſquares, in the city, appropriated to the nobility, viz. Capuana, Nido, Montagna, Porto, and Porta Nova. The inhabitants frequently walk on the tops of their houſes in the evening, to breathe the cool air, after a hot ſultry day; and from ſome of the religious houſes, there are ſeveral delightful proſpects. The climate is ſo mild and warm in winter, that plenty of green peaſe, artichokes, aſparagus, and other vegetables, may be had all the winter: the city is ſupplied with water by means of an aqueduct from the foot of Mount Veſuvius. The people uſe great quantities of ſnow inſtead of ice for cooling their liquors; and certain perſons who farm the monopoly of it from the government, ſupply the city all the year round from a mountain about eighteen miles diſtant.

The kingdom of Naples is a fief of the Eccleſiaſtical State, and his Neapolitan majeſty annually preſents the pope with a palfrey as an acknowledgment of his vaſſalage; but notwithſtanding this cuſtomary homage, his holineſs has no civil power in this kingdom, nor is the inquiſition eſtabliſhed in Naples. The king's preſent revenues amount to above 750,000l. ſterling per annum.

The exports of the kingdom are pulſe, hemp, aniſeed, wool, oil, wine, cheeſe, fiſh, honey, wax, manna, ſaffron, gums, capers, macaroni, ſalt, potaſh, flax, cotton, ſilk, and divers manufactures. The king has a numerous, but generally poor nobility, conſiſting of princes, dukes, marquiſes, and other pompous titles; and his capital, by far the moſt populous in Italy, contains, at leaſt, 350,000 inhabitants; amongſt which are about 30,000 lazaroni, or blackguards, the greateſt part of whom, having no dwelling-houſes, ſleep in ſummer-nights under porticoes, piazzas, or wherever they can find ſhelter; and in the winter ſeaſon, which is generally of ſeveral weeks continuance, and attended with very heavy rains, they reſort to the caves under Capodi Monte, where they ſleep promiſcuouſly like ſheep in a fold: ſuch as have wives and children, live in the ſuburbs of Naples, near Pauſilippo, in huts, or in caves or holes dug out of that mountain. Some of theſe wretched beings gain a livelihood by fiſhing, others by carrying burthens to and from the ſhipping, and many ply in the ſtreets in order to be employed on errands, or perform any labour they are capable of for a very ſmall recompence; but as they do not always meet with employment, and what they gain not being ſufficient for their ſupport, they are in ſome degree relieved at the doors of the convents, by the ſoup and bread diſtributed there.

Notwithſtanding the lower claſs of people are ſo extremely indigent, there is a great appearance of wealth among ſome of the great, many of whom are exceſſively fond of ſplendor and ſhew, brilliant equipages, numerous attendants, rich dreſſes, and high-ſounding titles. A late traveller into theſe parts has made it appear that luxury has within theſe few years advanced with gigantic ſtrides in Naples: Forty years ago, ſays he, the Neapolitan ladies wore nets and ribbands on their heads as the Spaniſh women do to this day, and not twenty of them were poſſeſſed of a cap: but hair plainly dreſſed is a mode now confined to the loweſt order of inhabitants; and all diſtinction of dreſs between the wife of a nobleman and that of a citizen is entirely laid aſide. Expence and extravagance are here in the extreme. The great families are oppreſſed with a load of debt; the working part of the community always ſpend the price of their labour before they receive it: and the citizen is reduced to great parſimony, and almoſt penury, in his houſe-keeping, in order to anſwer theſe demands of external ſhew: ſhort commons at home whet his appetite when invited out to dinner; and it is ſcarcely credible what quantities of victuals he will devour. The nobility in general are well ſerved, and live comfortably, but it is not their cuſtom to admit ſtrangers to their table; the number of poor dependents who dine with them, and cannot properly be introduced into company, prevents the great families from inviting foreigners; another reaſon may be, their ſleeping after dinner in ſo regular a manner as to undreſs and go to bed; no ladies or gentlemen finiſh their toilette till the afternoon, on which account they dine at twelve or one o'clock. The great officers of ſtate, and miniſters, live in a different manner, and keep ſumptuous tables, to which ſtrangers and others have frequent invitations."

The banditti of Naples are very numerous, and enjoy the protection of the people of quality, have a great number of aſylums or places of refuge, and are punctually paid for every murder they commit. But this reward is but a trifle; and often the price fixed upon a man's life, is only a couple of zechins (about 18s.) I myſelf have ſeen ſuch an act of horror. One night, when the opera being ended, the avenues to the theatre were full of people; two perſons, one of them an officer, were the deſtined victims; they were ſuffered very quietly to get into their carriage, and before the coachman could drive off, on account of the great crowds of people, two banditti approached at once the doors of the carriage, aimed and thruſt their daggers into the breaſts of two ſound, unſuſpecting perſons, and made them in a moment two dead corpſes. The day following a report was circulated all over the city, that the profligate and ruthleſs ſon of a great miniſter was the author of this more than ſavage aſſaſſination; yet the deed had no further conſequences.

It would be a miſtake to conſider theſe banditti as monſters. Although they are ſo in our idea, yet they themſelves, juſtified by education, laws, and religious notions, do not regard their *honeſt* profeſſion in ſo black a light. That they ſin in committing murder, they are perfectly ſenſible of, but it is only a ſin of which the next confeſſion-ſeat will clear them. Thus they have nothing to mind but their penitential acts, which the father confeſſors order them to perform; and to calculate the proportion between theſe, which moſtly conſiſt in prayers and the blood-money they have earned. As the greateſt part of theſe crimes remain unpuniſhed, and ſuch as are puniſhed conſiſt only in ſentencing the murderer to row the gallies for two or three years, I do not know what ſhould impreſs the ignorant banditto with a proper ſenſe of his infamous, deteſtable profeſſion. It being a more lucrative than honeſt employ, and the reward being gained

gained by idleneſs, a circumſtance ſo much attended to in this climate, they follow quietly their buſineſs, and continue murdering with the greateſt unconcern. But they never forget to put their roſary in the ſame place which hides the dagger, in order to atone immediately, by muttering ſome Ave Marias for the moſt heinous crimes they have committed. Having done this, the banditti clear themſelves of all ſins, and only wait for freſh opportunities of imbruing their guilty hands with innocent blood.

The great number of thoſe accidents made the people of Naples ſo indifferent about them, that ſtrangers are ſhocked at it. They ſpeak here of a man that has been murdered, nearly in the ſame tone as we do of a perſon who accidentally falls down in our ſtreets. If the murderer is not one of the banditti, but another perſon, who commits the deed for the ſake of his own private intereſt, he may ſurely rely on the pity of the ſurrounding people, who will do every thing to facilitate his eſcape. From all ſides re-echoes the word, *poveretto*, (poor fellow) not to pity the perſon aſſaſſinated, but his aſſaſſin. What an immenſe contraſt with England! where the life of the meaneſt plebeian is an object of general attention, where neither rank nor riches can ſave the murderer, and where even people of quality will hinder him from making his eſcape.

The banditti confeſs very often, go diligently to hear maſs, obſerve moſt ſcrupulouſly their faſts, and invoke daily St. Januarius. A few years ago, a banditto, who had committed many murders, was brought to juſtice: he confeſſed his crimes without being aſked, and added ſeveral other acts of horror, which had been concealed to that very moment. But upon being aſked among other things, whether he had obſerved his faſts, he found himſelf affronted: he thought this queſtion ſuch an outrage, that he aſked the judges with bitterneſs, "whether they did not look upon him as a Chriſtian!"

One of the inſects almoſt peculiar to the kingdom of Naples is the tarantula, or a kind of ſpider, with which it abounds. The perſons bit by this inſect are called by the Italians tarantolati. Few of ſuch unhappy perſons can bear the ſight of black or blue; but ſeem delighted with red and green objects. They are alſo ſeized with an averſion to eating fruit or vegetables. A melancholy ſilence, and a fixed eye, are the firſt ſymptoms by which the bite of the tarantula diſcovers itſelf; and the muſic is immediately called in to rouze the patient to a violent motion, and by that means to promote perſpiration and a copious ſweat. The inſtruments chiefly uſed are the guittar, hautboy, trumpet, violin, and Sicilian kettle drum. The country people, who are more or leſs ſkilled in all theſe inſtruments, enforce the operation of their muſic by grimaces and odd geſticulations. The tarantolati, on their ſide, vigorouſly exert themſelves, regulating their motions according to the muſic, till the venom is quite expelled. This exerciſe and cure ſometimes take up five or ſix days; not that they are kept continually dancing all that time, but when nature ſeems to be exhauſted, the muſic is ſuſpended, and the patient put to bed, well covered, and a ſudorific cordial adminiſtered. It is remarkable, that the patient, on recovery, remembers nothing of what paſſed during the prevalence of the diſorder; and that if the cure be not perfectly effected, and the poiſon entirely expelled, the ſame ſymptoms return the ſucceeding year, eſpecially during the ſummer heats; and ſome have laboured under this terrible diſorder, at intervals, for ten, twenty, or thirty years.

ITALIAN ISLANDS.

SICILY, which forms a part of his Neapolitan majeſty's dominions, was once conſidered as the granary of Italy for corn, and ſtill produces conſiderable quantities; but agriculture is now much neglected, and, in conſequence, its fertility greatly diminiſhed. This iſland is divided from Italy by a narrow channel, called the Streight or Faro of Meſſina. It contains about 500,000 inhabitants, who carry on a very conſiderable trade, particularly in ſilk, both raw and manufactured. There are a great number of fine remains of antiquity here. Some parts of this iſland are remarkable for the beauty of its female inhabitants. Its capital is Palermo, a large, rich, and well-built city, ſituated at the bottom of a gulf of the ſame name. It is decorated with a great number of public ſtructures, finely adorned, and is ſaid to contain near 120,000 inhabitants. The two principal ſtreets, and which croſs each other, are very fine. This town carries on a conſiderable trade, and is ſaid to be the only one in all Italy which is lighted at the public expence.

Meſſina is ſituated at the bottom of a ſpacious harbour, on the ſtreight which ſeparates Sicily from Calabria. The public ſtructures are extremely grand, and the city was full of people till the year 1742, when near two thirds of the inhabitants were ſwept away by a dreadful peſtilence. The ancient capital of Sicily was Syracuſe, which was near twenty-two miles in circumference. It exhibited ſome few remains of its former grandeur, was a large well-built city, and contained many churches and convents, in general elegant ſtructures, and carried on a conſiderable trade, till the earthquake in 1783. By that earthquake, as the account tranſmitted from thence informs us, a great part of the lower diſtrict of the city and of the fort was deſtroyed, and conſiderable damage done to the lofty uniform buildings called the Palazzato, in the ſhape of a creſcent; but the force of the earthquake, though violent, was nothing at Meſſina or Reggio, to what it was in the plain; for of 30,000, the ſuppoſed number of inhabitants in the city, only 700 are ſaid to have periſhed. The greateſt mortality fell upon thoſe towns and countries ſituated in the plain of Calabria Ultra, on the weſtern ſide of the mountains Dejo, Sacro, and Caulone. At Caſal Nuovo, the princeſs Gerace, and upwards of 4000 of the inhabitants, loſt their lives; at Begnara, the number of dead amounted to 3017; at Radicina and Palmi about 3000 each; Terra Nuova, about 1400; Seminari, ſtill more. The ſum total of the mortality in both Calabrias and in Sicily, by the earthquakes alone, according to the returns in the ſecretary of ſtate's office at Naples, is 32,367; but it is believed, that including ſtrangers, the number of lives loſt muſt have been 40,000 at leaſt.

Sardinia, which gives a royal title to the duke of Savoy, is ſituated in the Mediterranean ſea, about 150 miles weſt of Leghorn, and has ſeven cities or towns. It is about 160 miles in length from north to ſouth, and 80 in breadth from eaſt to weſt. The ſoil, where it is properly cultivated, is very fruitful, producing corn, wine, and oil in great plenty, together with very fine fruits of various kinds; but it is in general ſo badly cultivated, that the revenues do not exceed 5000l. ſterling a year. Its capital is Cagliari, the ſeat of a viceroy, an archbiſhop, and an univerſity. The cathedral is very magnificent, but the other buildings have little to boaſt, nor is the trade conſiderable, though the harbour is ſpacious. This iſland was formerly annexed to the crown of Spain; at the peace of Utrecht it was given to the emperor, and ceded to the houſe of Savoy in 1719.

Corſica is ſituated a little to the north of Sardinia, from which it is ſeparated by the ſtreight of Bonifacio, about twenty miles in breadth. It is a very mountainous country, and partly overgrown with wood; but the low lands in ſome of the vallies yield plenty of corn, wine, figs, almonds, olives, oranges, citrons, and other fruits. The ſtrenuous efforts which the natives of this iſland, for a number of years, made for the recovery of their liberty, have rendered them famous, but they were obliged at laſt to ſubmit to the French.

Many of the malecontents, however, are not yet reconciled to the government of their new maſters. The number of inhabitants is about 160,000; but the trade of the iſland is inconſiderable. It has a good breed of cattle and horſes, and the woods and foreſts abound with game; it is alſo plentifully ſupplied, both by ſea and rivers, with fiſh. Baſtia is the capital of the iſland, but has nothing remarkable.

Capri, or Caprea, is much taken notice of for the noble ruins on it, the moſt conſiderable of which are at the very extremity of the eaſtern promontory. It is about four miles long, and one broad, and is ſituated at the entrance of the gulf of Naples, about three miles from the continent. This iſle was the reſidence of the emperor Auguſtus, for ſome time; and afterwards of Tiberius, for many years. What chiefly recommended this iſland to Tiberius was its temperate healthful air, being warm in winter, and cool in ſummer; and the nature of its coaſt, which is ſo very ſteep, that a ſmall number of men may defend it againſt a great army. The ſurface of the iſland was then cut into eaſy aſcents, adorned with the emperor's and other palaces, and planted with a variety of groves and gardens. The rocks alſo underneath were cut into highways, grottoes, galleries, bagnios, and ſubterraneous retirements, which ſuited the brutal pleaſures of that emperor; and were afterwards defaced or demoliſhed by the Romans, in deteſtation of the laſcivious unnatural ſcenes which had been acted there by Tiberius. It contains about 1500 inhabitants, who are exempt from all taxes: and belongs to the province of Lovoro, in the kingdom of Naples. There are ſeveral ſprings of freſh water in it; and in a delightful valley between the mountains, at the two extremities, ſtands a city of the ſame name with the iſland, which is the ſee of a biſhop, whoſe revenue ariſes chiefly from the prodigious flights of quails that come thither at certain ſeaſons, particularly in March, when vaſt quantities of them are ſent to Naples, and ſold for four-pence and five-pence per dozen. On this account, the biſhopric is ſometimes jocoſely ſtyled the biſhopric of Quails.

Iſchia, a ſmall but pleaſant and fertile iſland, lies on the Neapolitan coaſt, about two miles from the Cape of Meſſina, and 25 from Naples. Moſt of it is ſurrounded with high, craggy, and inacceſſible rocks; which ſhelter it from winds, and defend it from invaders. Some parts of it are rich and delightful, yielding all manner of delicious fruits, and excellent wines; but others are as diſmal and barren. It was anciently called Inarime; and was much ſubject to earthquakes, and the poets tell us, Jupiter laid the vanquiſhed Titan or Typhon under it, and that the earthquakes are occaſioned by his efforts to throw off the load. There are ſeveral hot baths and medicinal waters in it, with a number of pleaſant towns and villages.

Elba hath been from time immemorial celebrated for its mines. Virgil and Ariſtotle mention it. The fruits and wine of the iſland are very good; and the tannery, fiſhery, and ſalt produce a good revenue. Its ſituation is about 10 miles ſouth-weſt from Tuſcany, is 80 miles in circumference, and contains 7000 inhabitants; it is divided between the king of Naples (to whom Porto Longone belongs) the great duke of Tuſcany (who is maſter of Porto Ferraio) and the prince of Piombino.

Malta, though not properly one of the Italian iſlands, is generally comprehended, by geographers, in deſcriptions of them. It lies about ſixty miles ſouth of Cape Paſſaro, the ſouthern point of Sicily. It was called Melita by the ancients, and is of an oval figure, twenty miles long, and twelve broad. The air is clear and healthful, but exceſſive hot, when not cooled by the ſea-breezes. The whole iſland is compoſed of a white ſoft rock, covered with a good vegetable earth, about a foot deep. It is exceedingly fertile, producing great quantities of cotton, indigo, oranges, lemons, olives, figs, and orher fruits, and affords plenty of honey, wax, good paſtures, pulſe, roots, herbs, and garden-ſtuff; but not a ſufficient quantity of corn, wine, or wood, to ſupply the conſumption of the inhabitants, who are computed at ſixty thouſand. This iſland was given by Charles V. to the knights of St. John of Jeruſalem, on their being driven out of Rhodes by the Turks, which happened in the year 1530. Soon after their ſettlement in this iſland, they took the name of knights of Malta. The knights conſiſt of eight nations, the chief of which are France, Italy, Spain, England, and Germany. They have commanderies, or eſtates, in moſt of the Roman-Catholic countries, and are ſaid to amount to about three thouſand. They carry on a perpetual war againſt the Turks, and are under vows of celibacy and chaſtity, but obſerve only the former. They are conſidered as the bulwark of Chriſtendom againſt the Turks, on that ſide; nor have they ever degenerated from the military glory of their anceſtors. They are governed by a grand maſter, who is elected for life: on his death, they ſuffer no veſſel to go out of the iſland till another is choſen, to prevent the pope from interfering in the election: he is choſen out of the 16 great croſſes, and his title is, The moſt illuſtrious and moſt reverend prince, the lord friar A. B. great maſter of the hoſpital of St. John of Jeruſalem, prince of Malta and Gaza. They wear croſſes of a particular form, and the grand maſter has a large golden key of the holy ſepulchre pendent at his ſide. They are generally of noble families, and ranked according to their nation.

The capital of the iſland is called Valetta, or Malta: it is a handſome city, ſtrongly fortified, and has an excellent harbour. The palace of the grand maſter, and the cathedral, dedicated to St. John, are ſpacious and elegant ſtructures. The whole iſland, or rather rock, is ſo ſtrongly fortified, that it is conſidered as impregnable by all the forces the Infidels can bring againſt it; and they have accordingly laid aſide all thoughts of making themſelves maſters of the iſland. On the 8th of September there is an annual proceſſion at Malta, in memory of the Turks raiſing the ſiege on that day (1653) after four months aſſault, leaving their artillery, &c. behind them.

HISTORY OF ITALY.

ITALY has been, from the earlieſt ages of hiſtorical narration, either the ſeat of empire, or the theatre of war. When Romulus, the leader of a few lawleſs and wandering banditti, ſettled here, and laid the foundation of Rome, 753 years before the Chriſtian æra, Italy was in the ſame ſituation as at preſent, divided into little kingdoms and ſtates, all living in diſtruſt, at leaſt, if not in open war with one another. The Roman commonwealth changed the face of things, by reducing them all, and making herſelf the head and miſtreſs of Italy. Her empire was extended over the greater part of the known world; but at laſt luxury and effeminacy effected what force had attempted in vain; the Goths, the Vandals, and other barbarous nations of the north broke in, and haſtened her deſtruction. Italy was again divided into ſmall principalities, and continued in the ſame ſtate till the time of Charlemagne. The ſucceſſors of that celebrated prince claimed, and for ſome time poſſeſſed the ſovereignty of Italy: but, engaged in wars abroad, and civil commotions at home, the governors of theſe principalities either aſſumed or purchaſed the ſovereignty of the reſpective ſtates over which they preſided.

After various revolutions and changes of government, Savoy and Piedmont fell to the lot of the counts of Maurienne, the anceſtors of the prince who now enjoys

enjoys the crown of Sardinia, which he obtained by virtue of the quadruple alliance, concluded in 1718.

Genoa, as part of ancient Liguria, continued under the dominion of the Romans, till the ruin of that empire by the Goths, and other northen people; after which it made a part of the kingdom of Lombardy, then of the German empire, and at the length became a ſovereign ſtate. But it owes its preſent form of government entirely to the virtue of Adrew Doria; who, preferring the advantage of his country to his own, refuſed the ſovereignty offered him, and rendered it a free ſtate. There are few inſtances in hiſtory more ſurpriſing than the efforts made by the Genoeſe for the recovery of their liberty, when they drove the Auſtrian troops out of their capital in the year 1747.

Tuſcany, anciently known by the names of Ombria, Tyrrhenia, and Hetruria, was ſubdued by the Romans about 455 years before the chriſtian æra. It was poſſeſſed by the Oſtrogoths in the fifth century, and afterwards by the Lombards, who were expelled by Charlemagne in the year 800. From that period it became ſubject to the German emperors, till the year 1240, when the inhabitants were divided into two powerful parties, diſtinguiſhed by the names of of the Guelphs and Gibellines; the former ſupported the intereſt of the pope, and the latter that of the emperor.—The violence of theſe parties occaſioned a long civil war both in Tuſcany and Germany. At laſt the Florentines, weary with a ſtate of anarchy, formed themſelves into a free ſtate: but, about the middle of the fifteenth century, Coſmo de Medicis, who obtained the glorious title of The Father of his Country, aſſumed the ſupreme power; and his ſon Alexander de Medicis was created duke of Florence by the emperor Charles V. in the year 1531. He was ſucceeded by his couſin Coſmo II. the great patron of the arts, on whom pope Pius V. conferred the title of Grand Duke of Tuſcany, in the year 1570. This prince, under whoſe auſpices the arts were revived in Italy, enriched his capital with the moſt beautiful works of ancient artiſts. Coſmo III. obtained from the emperor the title of royal highneſs; and, after a long and happy reign, died on the 31ſt of October 1723. He was ſucceeded in his dominions by his ſon John Gaſton de Medicis, who dying without iſſue in 1737, was the laſt male heir of that family. Don Carlos, the preſent king of Spain, was therefore declared his ſucceſſor; and, by the conſent of the grand duke, aſſumed the title of hereditary grand prince of Tuſcany. But on the concluſion of the war, by which he acquired the kingdom of the Two Sicilies, it was ſtipulated by the treaty of Vienna, that the grand duchy of Tuſcany ſhould be given to Francis duke of Lorrain, in exchange for his hereditary dominions, which were ceded to France. Thus Tuſcany was transferred from the Medici family to that of Lorrain. Leopold, brother to the emperor Joſeph, was grand duke, under whoſe auſpices commerce again flouriſhed, and improvements in agriculture, and other uſeful arts, have been lately made in that country. All the princes of the houſe of Medici were merchants. Coſmo I. ſhared with the Venetians the immenſe profits of the Indian trade, before the Portugueſe diſcovered a paſſage to Indoſtan, by the Cape of Good Hope. Convinced that commerce is not at all incompatible with nobility, his deſcendents cultivated it with the moſt aſſiduous care; and being always remarkable for their prudent œconomy, they were, beyond compariſon, the richeſt princes in Italy. At the ſame time they were patrons of induſtry and arts, very attentive to what might promote the happineſs of their ſubjects, and omitted nothing that had a tendency to engage foreigners of merit to ſettle among them.

We have already taken occaſion to ſpeak of the riſe and decline of the papal authority; and therefore, to avoid repetition, ſhall only remark here, that ignorance, the parent of bigotry and ſuperſtition, joined with other cauſes, amazingly increaſed the power and tyranny of the Roman pontiffs; and eccleſiaſtical pride was carried to its greateſt height. The pope claimed a divine power, which raiſed him as much above other princes, as thoſe princes are above their people. This claim, together with the title of Holineſs, founded on a long preſcription, could not fail of exciting the higheſt veneration in the minds of an ignorant and bigotted people, who believed them real. Leo X. by encouraging learning, undermined the foundation of papal authority; and the Reformation ſhook the ſtructure. At preſent the temporal princes, who ſtill profeſs the Roman-Catholic religion, ſeem to be ſhaking off the galling yoke their predeceſſors were ſubject to, and to be recovering from thoſe deluſions, which had for many centuries hoodwinked the greateſt part of Chriſtendom.

Naples was probably firſt peopled from Greece, and thence called Magna Græcia. In this ſtate it continued till ſubdued by the Romans; and on the decline of that power, in the fifth century, the Eaſtern emperor poſſeſſed himſelf of one part of the kingdom of Naples, and the Goths of the other. The Lombards diſpoſſeſſed the Goths of their part, and continued maſters of it, till they were driven out by Charlemagne, about the year 800. In the ninth and tenth centuries, the Saracens ſubdued part of Naples; but were expelled by the Normans under Tancred, who, with the aſſiſtance of the Greeks already ſettled there, eſtabliſhed a moſt reſpectable monarchy, flouriſhing in arts and arms, while the reſt of Europe was covered with the veil of monkiſh ignorance, and religious bigotry. The heirs of Tancred enjoyed the kingdom till the year 1166; when, by the intrigues of the Roman pontiff, the crown was transferred to the French, and the earl of Anjou placed upon the throne.

The poſterity of the laſt-mentioned prince continued in poſſeſſion of the crown till the year 1504, when they were driven out by the Spaniards, whoſe government was ſo oppreſſive, that the people revolted, and being headed by Maſſaniello, a young fiſherman, their ſucceſs was ſo alarming, that the haughty Spaniards were obliged to aboliſh the oppreſſive taxes, and to confirm the people in their former liberties. This revolt being terminated, the Spaniards continued in poſſeſſion of Naples till the year 1707, when they were driven out by the Imperialiſts, and the kingdom of Naples was confirmed to the emperor Charles VI. by the treaty of Utrecht in 1713. But in the year 1734, the French, Spaniards, and Sardinians, joining in a war againſt the emperor, Naples was ſubdued, and Don Carlos, ſon to the King of Spain, placed on the throne; and a peace being concluded in 1736, that prince was acknowledged king of the Two Sicilies, by the emperor. In the year 1759, Don Carlos aſcended the throne of Spain, and it being found that his eldeſt ſon was by nature incapacitated for reigning, he reſigned the crown of Naples to his third ſon Ferdinand. This prince, now Ferdinand IV. was born in 1751, and married in 1768 to Maria-Carolina-Louiſa, archducheſs of Auſtria, ſiſter to the emperor of Germany, by whom he hath iſſue, 1. Maria-Thereſa-Caroline, born June 6, 1772; 2. Louiſa-Maria-Amelia, born July 20, 1773; 3. Mary-Anne-Joſepha, born 1775; 4. Francis Janvier, born 1777; and, 5. Mary-Chriſtina, born in 1779.

With reſpect to the Milaneſe, that delightful country experienced various changes: the Viſcontis were ſucceeded by the Guleozzos and the Sforzas; but it fell into the hands of the emperor Charles V. about the year 1525, who gave it to his ſon Philip II. king of Spain. That crown kept poſſeſſion of it till 1706, when the French were driven out of Italy by the Imperialiſts. In 1743 they were diſpoſſeſſed of it; but when the emperor ceded Naples and Sicily to the

late

late king of Spain, it returned to the houſe of Auſtria, whoſe viceroy now governs it.

Mantua was formerly governed by the family of Gonzaga, who adhering to France, the territory was forfeited, as a fief of the empire, to the houſe of Auſtria, in whoſe poſſeſſion it now is, the laſt duke dying without male iſſue; but in 1748 Guaſtalla was ſeparated from it, and made part of the duchy of Parma, whoſe firſt duke was natural ſon to pope Paul II. the duchy having been annexed to the holy ſee by pope Julius II. in 1545. The deſcendents of the Farneſe family terminated in the late queen-dowager of Spain, whoſe ſon, his late Catholic majeſty, obtained that duchy, which together with Placentia, are now held by his nephew.

When the Goths, and other northern nations, invaded Italy in the fifth century, the inhabitants of Padua, and other cities on the continent, fled for ſafety to the neighbouring iſles, and laid the foundation of the Venetian republic. Secluded by their ſituation from the continent, they turned their thoughts to trade and navigation, and ſoon became a very formidable power at ſea. Their conqueſts were amazing; and being principally poſſeſſed of the lucrative commerce of the Indies, ſoon became the richeſt people of Europe. Envious of their ſucceſs, and deſirous of ſharing in the treaſures of the Eaſt, ſeveral leagues were formed againſt them by foreign powers, by which they were more than once reduced to the brink of ruin, but were always ſaved by the diſunion of the confederates. The diſcovery of a paſſage to India, by the Cape of Good Hope, gave the firſt blow to their greatneſs, as it loſt them the Indian trade. The Turks, by degrees, deprived them of their moſt valuable poſſeſſions on the continent; and ſo late as the year 1715, they loſt the Morea. Since the peace of Paſſarowitz, concluded in 1718, the Venetians have wiſely refrained from embarking in any of the conteſts that have drenched the fields of Europe with blood.

The principal armorial bearings and orders of knighthood in Italy are as follows:

The pope, as ſovereign prince of the Eccleſiaſtical State, bears for his eſcutcheon, gules, conſiſting of a long head-cape, Or, ſurmounted with a croſs, pearled and garniſhed with three royal crowns, and alſo St. Peter's two keys, placed in ſaltier.—Arms of Tuſcany, Or, five roundlos, gules, two, two, and one, and one in chief azure, charged with three fleur-de-lis, Or.—The arms of Venice, azure,—a lion winged, ſejant, Or, holding under one of his paws a book covered, argent.—Thoſe of Genoa, argent, a croſs, gules, with a crown cloſed for the iſland of Corſia; and for ſupporters, two griffins, Or.—Of Naples, azure, ſemée of fleur-de-lis, Or, with a label of five points, gules.—In Sardinia, there is an order of knighthood, called the Annunciade, or order of Annunciation, inſtituted in 1355 by Amadeus V. count of Savoy, in memory of Amadeus I. who bravely defended Rhodes againſt the infidels. The motto of this order is FERT, being the four initial letters of *Fortitudo ejus Rhodum tenuit*, "His bravery preſerved Rhodes." The collar of the order is compoſed of golden roſes, enamelled red and white, with lover's knots of the ſame. To the end of the middle is pendent the badge, which conſiſts of three chains of gold encircling an oval, and diſpoſed in knots: on the oval is repreſented the ſalutation of the Virgin May. The order of the Holy Ghoſt was founded by pope Innocent III. about the year 1198. They have a grand-maſter, and profeſs obedience, chaſtity, and poverty. Their revenue is eſtimated at 24,000 ducats daily, with which they entertain ſtrangers, relieve the poor, train up deſerted children, &c. Their enſign is, a white patriarchal croſs with twelve points ſewed on their breaſt on the left ſide of a black mantle.—The order of St. George was inſtituted about the year 1460, by Frederic III. emperor of Germany, who dedicated it to St. George, tutelar ſaint and patron of Germany. The doge is perpetual grand-maſter. The badge, a plain croſs enamelled, gules, pendent to a gold chain, and worn about their necks. The croſs is alſo embroidered on their cloaks. The order of St. Mark is uſually conferred by the doge of Venice on eminent perſons, or ſuch as have done ſome ſignal ſervice to the republic; the penſion annexed to it is 1000 ducats per annum. The badge is a medal of gold, pendent to a gold chain; on one ſide is the emblem of St. Mark, a winged lion ſejant with elevated wings, holding in his ſiniſter paw a drawn ſword erect, and in his right an open book with the words, *Pax tibi, Marce Evangeliſta meus*, "Peace be with thee, my Evangeliſt Mark." On the reverſe is the portrait of the reigning doge, with the image of St. Mark delivering a ſtandard to him.—The order of St. Stephen was inſtituted in the year 1561, by Coſmo of Medicis, firſt grand-duke of Tuſcany, in memory of a victory which ſecured to him the ſovereignty of that province: he and his ſucceſſors were to be grand-maſters. The knights wear a red croſs with right angles, orled, Or, on the left ſide of their habit, and in their mantle. It is a religious and military order; the knights are allowed to marry, and muſt make proof of their nobility of four deſcents.—The order of St. Lazarus was inſtituted in the year 1752, by Emanuel Philibert, duke of Savoy, who revived and united the obſolete order of St. Maurice to it; which was confirmed by the pope, on condition of maintaining two gallies againſt the Turks. The badge of the order is a croſs pometté, white, upon a croſs of eight points, green, and is worn pendent to a green ribband.—The order of St. Januarius was inſtituted in July 1738, by the late king of Spain, when king of Naples. The badge of the order is a croſs of eight points enamelled, white, edged with gold, and in the centre is a biſhop, holding in his left hand a book and croſier, and below his waiſt is this motto, *In ſanguine fœdus*, "The covenant is in blood:" on the reverſe is a book, on which are two red pillars, ſurmounted with palms, enamelled in their proper colours. The knights wear a badge of the order, pendent to a broad red ribband worn ſcarfwiſe, and a gold ſtar of eight points with fleur-de-lis at the angles, embroidered on their centre garment. They muſt prove the nobility of their deſcent for four centuries: their number is limited to 30. St. Januarius is the patron.

The gold coins in Italy are, the ſequin or chequin of Venice, worth 9s. 7d. The old Italian piſtole, worth 16s. 7d. The double ducat of Genoa, Venice, and Florence, worth 18s. 7d; and the ſingle ducat of the ſame places, worth 9s. 3½d. The ſilver coins are, the ducat of Venice and Naples, worth 3s. 4d. The new ducat of Venice, worth 1s. 8d. The ducat of Florence or Leghorn, worth 5s. 4d. The teſton of Rome, worth 1s. 6d. The tarin, worth 8d. and the curlin, worth 4d.

CHAP. XXVIII.

TURKEY IN EUROPE.

Situation, Extent, Boundaries, Diviſions, Climate, Produce, Mountains, Mines, Rivers and Lakes, Antiquities and Curioſities, Cities and Chief Towns, Iſlands belonging to it, &c.

THE European part of Turkey is ſituated between the 17th and 40th deg. of eaſt long. and between the 36th and 49th of north lat. being about 1000 miles in length, and 730 in breadth. It is bounded by Ruſſia, Poland, and Sclavonia, on the north; by Circaſſia, the Black Sea, the Propontis, Helleſpont,

Helleſpont, and Archipelago, on the eaſt; by the Mediterranean on the ſouth; and by the ſame ſea, together with the Venetian and Auſtrian territories on the weſt. Its diviſion, ſubdiviſions, and chief towns, are as follow:

On the north coaſt of the Black Sea, are the provinces of Crim and Little Tartary, the ancient Taurica Cherſoneſe, chief towns Precop, Brachiferia, Kaffa Budziac Tartary, chief town Oczakow; containing 38,200 ſquare miles.

North of the Danube are the provinces of Beſſarabia, chief towns Bender, Belgorod, containing 8000 ſquare miles; Moldavia, anciently Dacia, chief towns Jazy, Choczim, Falczin, containing 26,000 ſquare miles; Walachia, another part of the ancient Dacia, chief town Tergoviſc, containing 10,500 ſquare miles.

South of the Danube are Bulgaria, the eaſt part of the ancient Myſia, chief towns Widin, Nicopoli, Siliſtria, Scopia, containing 17,000 ſquare miles; Servia, the weſt part of Myſia, chief towns Belgrade, Semendria, Niſſa, containing 22,570 ſquare miles; Boſnia, part of the ancient Illyricum, chief town Seraio, containing 8,640 ſquare miles.

On the Boſphorus and Helleſpont, Romania, anciently Thrace, chief towns Conſtantinople, Adrianople, Philippopoli, containing 21,200 ſquare miles.

South of mount Rhodope, or Argentum, the north part of ancient Greece, Macedonia, chief town Strymon, Conteſſa, containing 18,980 ſquare miles; Theſſaly, now Janna, chief town Salonichia, containing 4650 ſquare miles; Achaia and Bœotia, now Livadia, chief towns Athens, Thebes, Lepanto, containing 3420 ſquare miles.

On the Adriatic ſea or Gulf of Venice, the ancient Illyricum, Epirus, chief town Chimæra, containing 7955 ſquare miles; Albania, chief towns Burtinto, Durazzo, Dulcigno, containing 6375 ſquare miles; Dalmatia, chief town Zara, containing 4560 ſquare miles; Raguſa republic, chief towns Narenza, Raguſa, containing 430 ſquare miles.

In the Morea, the ancient Peloponneſus, being the ſouth diviſion of Greece, are Corinthia, Argos, Sparta, Olympia, where the Games were held, Arcadia, and Elis, chief towns Corinth, Argos, Napoli de Romania, Lacedæmon, now Miſitra, on the river Eurotus, Olympia, or Longinica, on the river Alpheus, Modon, Coron, Partas, Elis, or Belvidere, on the river Peneus, containing 7220 ſquare miles.

The air in this part of Turkey is naturally healthy, but the plague is frequently brought hither from Egypt, and commits terrible devaſtation among the inhabitants; this calamity is partly aſcribed to the noxious vapours from the neighbouring countries, and partly from the indolence and uncleanlineſs of the Turks, who, infatuated with the belief of predeſtination, take no meaſures to guard againſt its approach. The ſoil is beyond expreſſion fertile, even in places where it has never been cultivated; and is adapted to both the purpoſes of agriculture and graſiery. The ſeaſons here are regular and pleaſant, and have been celebrated from the remoteſt antiquity.

Theſſaly, in Turkey, is famous for a fine breed of horſes, which are equally remarkable for their ſervice and their beauty. The black cattle, eſpecially in Greece, are extremely large; but the goats are the moſt uſeful animals to the inhabitants, who make great uſe both of their milk and fleſh. The neighbourhood of Babadagi abounds in large eagles, the tails of which furniſh the Turkiſh and Tartarian archers with the fineſt feathers for their arrows; and they are accordingly purchaſed at a prodigious price. In moſt of the diſtricts of Greece, there are great numbers of partridges; and every part of Turkey in Europe produces plenty of tame fowl, and moſt ſpecies of game: but the Turkiſh Mahometans ſeldom eat much animal food. Moſt of the rivers likewiſe abound in fiſh. The natural luxuriancy of the ſoil, with very little aſſiſtance from art, produces corn and other grain, excellent graſs, coffee, pot and garden herbs of almoſt every kind, oranges, lemons, citrons, pomegranates, grapes of an uncommon ſweetneſs, fine figs, olives, almonds, cotton, and various kinds of drugs, particularly rhubarb; all theſe productions are excellent in their kind.

The mountains in European Turkey have long been celebrated, but the principal part of them are now known by modern appellations. The mounts Olympus and Pindus, the latter of which is now called Mezzo Novo, ſeparate Theſſaly from Epirus. Parnaſſus, famed for being conſecrated to the Muſes, ſtill retains its original appellation. Mount Athos, now called Monte Santo; extends the whole length of a peninſula, which is ſeven Turkiſh miles, and ſtretches a conſiderable diſtance into the ſea. There are twenty-two convents on this lofty mountain, beſides a great number of cells and grottoes, with the habitations of no leſs than 6000 monks and hermits; though the proper hermits, who live in grottoes, are not above twenty; the other monks are anchorites, or ſuch as live in cells. Thoſe Greek monks, who call themſelves the inhabitants of the holy mountain, are ſo far from being a ſlothful people, that, beſides their daily offices of religion, they cultivate the olive and vineyards, are carpenters, maſons, ſtone-cutters, cloth-workers, taylors, &c. They alſo live a very auſtere life: their uſual food, inſtead of fleſh, being vegetables, dried olives, figs, and other fruit; onions, cheeſe, and on certain days, Lent excepted, fiſh. Their faſts are many, and chiefly kept, which, with the healthfulneſs of the air, renders longevity ſo common on this ſpot, that many of them live above 100 years. This mountain is ſo exceeding high, that on the top, as the ancients tell us, the ſun-riſing was beheld four hours ſooner than by the inhabitants of the coaſt. Beſides theſe, there are the mountains Suha, Witoſka, Staras, Plamina, and many others. Thoſe ſituated near the ſea are pleaſant and fertile, while the more inland are cold and barren. This country contains mines of gold, ſilver, iron, lead, &c. and quarries of the moſt beautiful marble.

The chief rivers in this country are, the Danube, the Save; the Nieſter; the Nieper, or Boriſthenes; and the Don, or Tanais. There are, beſides theſe, a number of leſs conſiderable rivers. The ſtreight of the Helleſpont, which joins the ſea of Marmora with the Archipelago; and the Boſphorus of Thrace, or paſſage into the Black Sea, are famous in hiſtory.

Lago di Scutari, in the province of Albania; Lago di Plavé and Lago di Holti, both of which have a communication through the river Zem with Scutari; the Stymphalis, in the province of Morea, was famous for its harpies, and ravenous birds, which frequented it; and the Peneus, for being the ſource of the river Styx, which the ancient poets termed the river of hell, are the moſt remarkable lakes. Medicinal waters and baths are very numerous in Turkey.

European Turkey, particularly Greece, may be conſidered as the ſtorehouſe of antiquities. The temple of Minerva at Athens, the temple of the eight Winds, and the lantern of Demoſthenes, are ſtill entire. Juſt without the city ſtands the temple of Theſeus, ſurrounded with fluted columns of the Doric order. The ruins of Neptune's temple, and the theatre where the Iſthmean games were celebrated, are ſtill viſible on the iſthmus of Corinth; as are the ruins of the temple of Apollo at Caſtri. On the ſouth ſide of Mount Parnaſſus, are ſome marble ſteps that deſcend to a running water, ſuppoſed to be the celebrated Caſtalian ſpring; and the niches in the rock, where ſtatues were formerly placed, are ſtill diſcernible. But among all the antique curioſities of this country, there are none exceeds the famous cave of Jupiter Trophonius, which is a ſquare room, with a bench on each ſide of it, cut out of a rock, in Livadia, the ancient Bœotia. At the further end of this cavern is a round hole, ſcarcely big enough for a man to creep through, which is ſuppoſed to be the place

from whence the oracles of this deity were delivered to his votaries.

The following are the moſt remarkable cities and towns in this country; viz.

Conſtantinople, ſituated in 41 deg. N. lat. and 21 E. long. is the capital of the whole Turkiſh empire, and the reſidence of the grand ſeigniors, it was built by the emperor Conſtantine the Great, who, in 330, made it the ſeat of the eaſtern part of the Roman empire. It continued in this ſtate till 1453, when, after having ſuſtained a ſiege of fifty-four years, it was taken by the Turks. It ſtands like old Rome on ſeven hills, commanding a beautiful and extenſive proſpect; and is moſt delightfully and advantageouſly ſituated, in form of a triangle, on a point of land waſhed by the ſea of Marmora and the Helleſpont on the ſouth; by the Thracian Boſphorus, or ſtreight of Conſtantinople, on the eaſt; and on the north is a very large and commodious harbour, formed by a canal from the Streights, extending inland towards the north-weſt; thus it has a communication by water with moſt parts of the empire. This city is uncommonly large, and when viewed at a diſtance has the appearance of an amphitheatre: but the ſtreets are badly paved, narrow, dark, ſteep, and ſlippery. The houſes are mean, being built of wood and mortar; they are, however, crowded with inhabitants, the number being computed at 8 or 900,000, three-fourths of whom are Greeks and Armenians. Here are 22 gates, ſix of which are towards the land, and the reſt towards the ſea; but the fortifications are antique and ruinous. The fineſt buildings are either without the city near the harbour, or in the moſt retired parts within the walls. At the point of the triangle, near the canal and harbour, ſtands the imperial palace or ſeraglio; which, together with the gardens, takes up a mile and a half in circuit; and may be ſtyled rather a collection of ſeveral palaces and apartments joined together, according to the taſte of the different emperors, than an uniform ſtructure. The wall which ſurrounds the ſeraglio is thirty feet high, having battlements, embraſures, and towers, in the ſtyle of ancient fortifications. There are nine gates belonging to it, but only two of them magnificent; and from one of theſe the Ottoman court takes the name of the Porte, or the Sublime Porte, in all concerns of a public nature. The palaces of the preſent Turkiſh nobility have nothing remarkable on the outſide, but within they are richly and elegantly decorated. The moſques, of which there are ſeven ſtyled royal, are very handſome edifices. They ſtand ſingly, within a ſpacious encloſure, planted with lofty trees, and adorned with delightful fountains. Among theſe moſques the moſt magnificent is that of St. Sophia, once the metropolitan church of the Chriſtians. It ſtands on an eminence oppoſite to the principal entrance of the imperial palace, and was built by the emperor Juſtinian, in the form of a Greek croſs. This building is of ſuch vaſt extent, that it is ſaid an hundred thouſand perſons may, with eaſe, be contained in it at one time. It is two hundred and fifty-two feet long, and two hundred and twenty-eight broad. The dome, which covers almoſt the whole ſtructure, reſts externally on four prodigious towers, which have been added of late years to ſupport it. The pavement, walls, and galleries, are all of marble, and it is likewiſe ornamented with a number of marble, porphyry, and Egyptian granite pillars; but there are no pictures or ſtatues in either this or the other moſques. The annual revenue of St. Sophia is ſaid to amount to thirty-two thouſand pounds. The grand ſeignior repairs to it every Friday, but a Chriſtian is ſcarce ever admitted. In this city are a great many Greek and Armenian churches, beſides two or three for the Roman Catholics, and one for the Lutherans, which was built by the Swedes.

There are ſome noble antiquities in and about Conſtantinople, particularly the ancient hyppodrome, or place for horſe-races. It is an oblong ſquare, four hundred paces in length, and one hundred in width, adorned with three beautiful antique pillars, one of braſs, and the other two of marble; one of the latter, which is of Theban marble, is of a quadrangular figure, terminating in a point, and filled with hieroglyphical inſcriptions.

Security and good order reign in Conſtantinople in a very eminent degree; for upon a foreigner's taking a Janizary with him, he may view every part of the town unmoleſted. They likewiſe preſerve the greateſt decency in their moſques, no one preſuming to hold diſcourſe or ſhew the leaſt mark of inattention. The circumference of this city, including the ſuburbs, is ſaid to be twenty-four miles. The environs are extremely pleaſant, eſpecially along the Streights, being covered with towns, villages, ſeats, gardens, meadows, vineyards, and woods. The proſpect from it is noble. The moſt regular part is the Beſeſtin, encloſed with walls, where the ſhops of merchants are excellently ranged. This city has frequently ſuffered by fires, either owing to the narrowneſs of the ſtreets, and the ſtructure of the houſes, or the arts of the Janizaries. In Auguſt 1784, a fire broke out in the quarter near the harbour, which ſpreading into other parts, about 10,000 houſes were conſumed, moſt of which had been rebuilt ſince the fire in 1782.

While Conſtantinople continued in the poſſeſſion of the Greek emperors, it had no equal; it was the only mart in Europe for the rich commodities of the Eaſt; it abounded in riches, in arts, in beautiful ſtructures, and in manufactures. It is now little more than the ſhadow of its ancient greatneſs; though ſtill, with regard to its ſituation, one of the fineſt cities in the world.

Scutaris ſtands oppoſite to the ſeraglio, on the Aſian ſide, at the diſtance of about a mile and a half: it is adorned with a royal moſque, and a pleaſure-houſe of the grand ſeignior.

Adrianople, called by the Turks Edrene, is ſituated in a very fertile country on the river Maritz, by means of which, and other rivers, it carries on a very conſiderable traffic. The city is large, but the ſtreets are remarkably dirty, the houſes in general low, and built of wood and clay, a few indeed are of brick.

The following are the iſlands belonging to Turkey in Europe, being part of ancient Greece.

Negropont, which was the ancient Eubœa, is ſituated on the eaſtern coaſt of Achaia, or Livadia, from which it is ſeparated by a narrow channel, called the Euripus. It is about ninety miles in length, and twenty-five miles in breadth; and is ſuppoſed to have been formerly joined to the continent of Greece by an iſthmus, as it is now by a bridge. This iſland produces corn, wine, oil, and fruit in great abundance, and ſome cattle. The principal places in it are Negropont, the capital, and Caſtel Roſſo; the firſt has a very ſpacious harbour, where a fleet of galljes are generally kept in readineſs to ſail againſt the pirates and the Malteſe. The tides on its coaſts are very irregular, frequently flowing thirteen times in twenty-four hours, and ebbing as often.

Stalimene, anciently Lemnos, is ſituated in the north part of the Ægean ſea, oppoſite the ſtreight of the Dardanelles, forming nearly a ſquare of twenty-five miles in length and breadth. It yields an abundance of corn and wine; but its principal production is a mineral earth known by the appellation of Terra Lemnia, or Sigillata, from a ſeal the Turks put upon every piece that is ſold to foreigners. Notwithſtanding this drug is ſo poſitively aſſerted to be an earth, and dug in this iſland, it has been long known to be a vegetable production; and it has lately been diſcovered to be the pulp of the fruit of a tree called Baobab, growing near Senegal in Africa. The inhabitants ſell this pulp, when thoroughly dry, to the Arabs, who diſtribute it into different parts of the Turkiſh empire,

View of SCIO one of the most celebrated CITIES in the ARCHIPELAGO.

empire, where it is made up in cakes, ſealed, and exported to Europe, under the name of ſealed earth, or earth of Lemnos. The principal places in this iſland are Stalimene, the capital, and Cachino.

Tenedos, about two leagues from the coaſt of the Leſſer Phrygia, oppoſite to old Troy, is in general rocky and barren, but contains ſome fruitful vallies, and the Muſcadine wines produced there are greatly eſteemed. It has one large town of the ſame name with the iſland, and an harbour defended by two caſtles. This is the place to which the Greeks retired, and left the Trojans in a fatal ſecurity, as related by Virgil.

Scyro, anciently Scyros, is ſituated about 25 miles from Negropont, is nearly 60 miles in circumference, and full of rugged barren rocks. It contains a ſmall town of the ſame name, a ſafe harbour, ſeveral villages, and ſome quarries of marble.

Leſbos, or Mytilene, is a conſiderable iſland, ſituated to the ſouth of Tenedos, oppoſite the coaſt of Lydia. It produces plenty of corn, wine, fruit, and figs; cattle alſo abound here. The capital is now called Caſtro, or Caſtri. It has an excellent harbour, defended by a ſtrong caſtle, in which is kept a conſtant garriſon. This iſland is famous for ſeveral remains of antiquity, and likewiſe for being the native place of a number of philoſophers and poets, particularly the inimitable Sappho.

Scio, formerly Chios, lies about eighty miles weſt of Smyrna, and is about an hundred miles in circumference. This iſland is in general mountainous and ſtony, but produces excellent wine, oil, ſilk, and a variety of gums, particularly that called maſtich, greatly uſed by the Turks. The chief town is Scio, which has an harbour and citadel, wherein a garriſon is kept; and there are about thirty villages beſides the capital, all well peopled. The number of the inhabitants is near 113,000, of whom 100,000 are Greeks, 10,000 Turks, and about 3000 Latins; who carry on manufactures of ſilk, velvet, and gold and ſilver ſtuffs. The women of this, and moſt of the other Greek iſlands, are remarkable for their beauty and ſymmetry, but not famous for chaſtity: even the Greek nuns are ſaid to be ſufficiently laviſh of their favours. Ione the tragic poet, Theopompus the hiſtorian, and Theocritus the ſophiſt, were all natives of this iſland. The inhabitants alſo contend with ſeveral other places for the honour of having Homer for their countryman; and they even ſhew ſtrangers a little ſquare houſe, at the foot of mount Epos, which they pretend was his ſchool. The Greeks, reſiding on this iſland, pay a capitation-tax according to their rank.

Samos, almoſt oppoſite to Epheſus, on the coaſt of the Leſſer Aſia, is about 30 miles long, and 15 broad. It is exceedingly mountainous, a chain, conſiſting chiefly of white marble, running through the whole iſland; but they are covered with a ſtaple of good earth, ſo that the country is very fertile, producing delicious Muſcadine wine, ſilk, oil, fruits, honey, ſaffron, fine wool, an excellent ſort of onions and garlic, various kinds of minerals and drugs, a fine red bole, emery, oker, and a black inſipid earth of great uſe in dyeing. The principal place in the iſland is Samos, which has a good harbour. This place gave birth to Pythagoras, and is now inhabited by between 12 and 14,000 Greeks, but ſubject to the Turks.

Patmos, ſouth of Samos, is a ſmall, barren and dreary iſland, only remarkable for having a convenient haven, and for being the place where, we are told, St. John wrote his Apocalypſe. There is a convent dedicated to that apoſtle, and, near it, is his grotto, the entrance to which is about ſeven feet high, with a ſquare pillar in the centre. On the top there is a cleft in the ſolid rock, through which the monks pretend the Holy Ghoſt dictated the Revelation to St. John.

Delos, the chief of the Cyclades iſlands, about which the reſt form a circle, is ſituated ſouth of the iſlands Mycone and Triſe, north of Paros, and nearly midway between the continents of Aſia and Europe, being about eight miles in circuit. It is now almoſt deſerted, but was formerly very populous, and much frequented by ſtrangers, on account of its being the birth-place of Apollo and Diana, who had both magnificent temples erected here, the ruins of which are ſtill diſcernible.

Paros is ſituated between the iſlands of Lucia and Melos, and is one of the ſmalleſt among the Cyclades. It is well cultivated, and produces wheat, barley, pulſe, ſeſamum, wine, cotton, cattle, and game. This iſland has always been celebrated for the beauty and inimitable whiteneſs of its marble; and in the walls of Parechia, its chief town, there are fine marble columns lying on the ground; beſides which, there lie, in ſeveral parts of it, architraves, pedeſtals, and other exquiſite pieces of carved marble, the remains of ancient Paros, on the ruins of which this town was built. It contains ſome good roads and harbours; and is famous for being the native place of Phidias and Praxiteles, two of the greateſt ſtatuaries the world ever produced.

Cerigo, anciently Cytherea, lies between Candia and the Morea: it is about ſixty miles in circumference, but being rocky and mountainous, produces little corn, wine, or oil. This iſland was formerly conſecrated to Venus, and conſidered as her favourite reſidence.

Santorin, formerly called Caliſta, and afterwards Thera, is one of the moſt ſouthern iſlands in the Archipelago; it is in a manner covered with pumice-ſtones; notwithſtanding which, through the induſtry of the inhabitants, it yields barley, wine, cotton, and ſome wheat. One third of the inhabitants, who are about 10,000 in number, are of the Latin church, and ſubject to a Popiſh biſhop.

Rhodes, ſituated between 28 deg. eaſt lon. and 36 deg. 20 min. north lat. about 20 miles ſouth-weſt of the continent of the Leſſer Aſia, is nearly 60 miles in length, and 25 in breadth: it abounds in fruits, excellent wines, and all manner of proviſions, corn excepted, which the inhabitants are obliged to import from the adjacent country. The capital, of the ſame name, is ſtill a handſome city, though much inferior to what it was formerly: it enjoys a convenient port, dock, and arſenal, and a ſquadron of gallies is always kept there to cruize againſt the corſairs. Here ſtood the famous Coloſſus, juſtly eſteemed one of the wonders of the world. It was erected at the entrance of the harbour, having a foot placed on each ſide of it, ſo that the ſhips ſailed between its legs. This enormous image was one hundred and thirty-five feet high; the thumbs were ſo large, that two men could hardly embrace them, and the face repreſented the ſun, to which it was dedicated. In one of the hands was placed a lantern, for the direction of mariners, during the night. Rhodes is even, at this time, the mart for all the merchandizes of the Mediterranean, particularly camblets, tapeſtry, cotton, ſilks, wine, wax, raiſins, and ſoap. From the year 1301 to 1522, this iſland was ſubject to the knights of St. John of Jeruſalem; but, under Solyman the Magnificent, it was then reduced by the Turks, who obliged the knights to retire to Malta.

Candia, the ancient Crete, alſo called Hecatompolis, from its hundred cities, for which it was ſo renowned, is ſituated between 35 and 36 deg. of north lat. at nearly an equal diſtance from Europe, Aſia, and Africa, and is about 200 miles long, and 60 broad. Many parts of it are mountainous, rocky, and barren, while others yield the moſt excellent wines, fruit, corn, honey, wax, ſilk, and wool. Mount Ida, ſo celebrated by the poets, ſtands in the centre of the iſland, and is covered a great part of the year with ſnow. Lethe, the river of oblivion, was likewiſe one

of

of its rivers, but now nothing more than a torpid ſtream. Candia, the capital, poſſeſſes no remains of its former grandeur: however, it will always be famous for the ſiege it ſuſtained from the Turks, who inveſted the town in 1645, but could not ſubdue it till 1669, and even then the garriſon ſurrendered on the moſt honourable terms. During this ſiege the place had been ſtormed 56 times, in the courſe of which the Venetians loſt upwards of 80,000 men, and the Turks above 180,000. This iſland was formerly the ſeat of legiſlature to all Greece.

Cyprus is ſituated in the Levant ſea, about thirty miles diſtant from the coaſts of Syria and Paleſtine. It is about 150 miles in length, and 70 in breadth. The ſoil, where properly cultivated, is very fruitful in corn, wine, oil, cotton, ſilk, and a great variety of game. The Venetians poſſeſſed themſelves of it in the year 1480; but were driven out by the Turks, about the middle of the ſixteenth century, who have been maſters of it ever ſince. Richard I. king of England, ſubdued it in revenge for the treachery of its king; after which the royal title was transferred to Guy Luſignan, king of Jeruſalem, from whence it paſſed to the Venetians, who are ſtill in poſſeſſion of that empty honour. The preſent inhabitants are an aſſemblage of Turks, Jews, Greeks, and Armenians, with ſome few Latins, Cophts, Maronites, and Neſtorians, who all enjoy the free exerciſe of their religion. Cyprus, while in the hands of the Chriſtians, was a rich and populous iſland, but, by the oppreſſion of the Turks, it is depopulated and impoveriſhed to ſuch a degree, that the revenue ariſing from it does not exceed 1250l. per ann. Nicoſia, the preſent capital, is a ſmall but handſome town; and Famaguſta, the ancient capital, has an exceeding good harbour. This iſland was formerly famous for the worſhip of Venus; and in the town of Paphos, then the ſeat of pleaſure and corruption, though now dwindled into a little mean ſea-port, are the remains of a magnificent temple, dedicated to that goddeſs. The preſent ladies of that iſland are not degenerated from their anceſtors; they are ſtill devotees to Venus.

The iſlands of Sapienza, Strivali, Cephalonia, Santa Maura, Iſola del Compare, the ancient Ithaca, the birth-place and kingdom of Ulyſſes, and ſeveral others of leſs note, are in the Ionian ſea, belong to the Venetians, and are in general fruitful.

Zante and Corfu alſo belong to the Venetians; who are ſaid to concern themſelves very little about the welfare and government of them. The firſt has a populous capital of the ſame name, and carries on a conſiderable trade; and Corfu, the capital of the latter, is a place of great ſtrength: all the reſt of theſe iſlands are, in general, fruitful. The inhabitants of Zante are about 30,000, moſtly Greeks, and of a more hoſpitable diſpoſition than thoſe of Corfu, whoſe number is eſtimated at 50,000.

CHAP. XXIX.

FRANCE.

Situation, Extent, Boundaries, Diviſions, Climate, Soil, Mountains, Rivers, Produce, Learning, Trade, Inhabitants, Cities, &c.

THIS extenſive and powerful kingdom, being the neareſt to England, claims our peculiar attention. Its name is taken from the Francs, a reſtleſs and enterpriſing German nation, who came from Franconia in the fifth century, conquered the Gauls, the ancient inhabitants; and the Roman force not being able to ſuppreſs them, they were permitted to ſettle in the country by treaty. It is ſituated between the 5th deg. of weſt, and 8th deg. eaſt long. and between the 42d and 51ſt deg. of north lat. being nearly 620 miles in length, and 510 in breadth. It is bounded by Germany, Switzerland, and Italy, on the eaſt; by the Bay of Biſcay, on the weſt; by the Engliſh channel and the Netherlands, on the north; and by the Mediterranean and Pyrenean mountains, which divide it from Spain, on the ſouth.

France, which is nearly a ſquare, is now divided into eighty-three departments, including Corſica. Every department is ſubdivided into Diſtricts, in all 547; and each diſtrict into cantons. The following are the chief towns of each department, and alſo the diſtricts. The new department of Savoy, which ſhould form the eighty-fourth, is not added, as being at preſent uncertain whether it will continue its connection with this kingdom. The whole are thus deſcribed:

Departments.		Chief Towns.
Iſle of France.	Paris	Paris

Avignon and Venaiſchin are in this department.

The air of France, particularly that of the interior parts, is in general mild and wholeſome; but it has been lately repreſented, by ſome, as not nearly ſo ſalubrious as is pretended; and it muſt be acknowledged that the French have been but too ſucceſsful in giving the inhabitants of Great-Britain falſe prepoſſeſſions in favour of their own country: it muſt indeed be owned, that their weather is more clear and ſettled than that in England. In the northern provinces, where the firing is chiefly of wood, the winters are intenſely cold; but towards the ſouth it is ſo mild, that many ſickly and aged perſons retire thither from England at that ſeaſon, to avoid the rigour of our climate.

The quality of the ſoil varies greatly according to its ſituation. The upper part of Provence is adapted for the growth of corn; and the lower for high-flavoured fruits. The ſoil of Burgundy is ſo rich, that it has been called the mother of wine and corn; and Picardy, that of the national magazine for corn, flax, and fruit. Some of their fruits have a higher flavour than thoſe of England; but neither the paſturage nor tillage are comparable to ours. The heats in many parts burn up the ground, ſo that it has no verdure, and the ſoil barely produces as much rye and cheſnuts as are ſufficient for the ſubſiſtence of the inhabitants.

No nation is better ſupplied than France is with wholeſome ſprings and water; of which the inhabitants make excellent uſe, by the help of art and engines, for all the conveniences of life. The French have of late endeavoured to ſupply the loſs ariſing from their precarious title to their lands, by inſtituting academies of agriculture, and propoſing premiums for its improvement, as in England; but theſe expedients, however ſucceſsful they may be in particular inſtances, can never become of national utility in any but a free country, where the huſbandman is ſure of enjoying the fruits of his labour.

The principal mountains in France, or on its borders, are the Alps, which divide it from Italy; the Pyrenees, which divide it from Spain; Vauge, which divides Lorrain from Burgundy and Alſace; Mount Jura, which divides Franche Compté from Switzerland; and Mount Der, in the province of Auvergne. In Dauphiné there is that called the Inacceſſible Mountain, being an inverted pyramid broader at the top than at the bottom; and Mount Breſier, ſituated near the Alps, which often breaks out into flames.

The chief rivers in France are the Loire, the Rhône, the Garonne, and the Seine. The Loire riſes in the Cevennes, and, running a courſe of north and north-weſt, falls into the Bay of Biſcay, below Nantz. The Rhône riſes in Switzerland, and flows in a ſouth-weſt courſe to Lyons, after which it runs due ſouth till it falls into the Mediterranean, being joined in its paſſage by the Saone, and other rivers of leſs note. The Rhône is always higheſt in ſummer, which is attributed to the melting of the ſnow upon the Alps. The Garonne has its ſource in the Pyrenees, and, after traverſing a north-eaſt courſe, falls into the Bay of Biſcay, below Bourdeaux. The Seine riſes in Burgundy, and, running to the north-weſt, falls into the Engliſh Channel between Havre-de-Grace and Harfleur, having in its way viſited Troyes, Paris, and Rouen.—Among the ſmaller rivers are the Saone; the Charente, which riſes near Havre-de-Grace, and diſcharges itſelf into the Bay of Biſcay; the Somme, which runs north-weſt through Picardy, and falls into the Engliſh Channel below Abbeville; the Adour, which running from eaſt to weſt through Gaſcoigne, falls into the Bay of Biſcay below Bayonne; and the Var, which has its ſource in the Alps, and, running ſouth, divides France from Italy, after which it falls into the Mediterranean weſt of Nice.

There are few conſiderable lakes in France: there is one at Iſſaire, in Auvergne; a ſecond at La Beſſes, which, if a ſtone is caſt into it, makes a noiſe nearly as loud as thunder; and a third on the top of a hill near Alegre, which, according to vulgar report, is bottomleſs.

The number of navigable rivers with which France is watered, together with the noble canals by which theſe rivers are united, and the navigation extended, have been productive of advantages unknown in many other kingdoms, and reflect more honour on Louis XIV. than all his victories. The canal of Languedoe was begun in 1666, and completed in 1680; it was intended for a communication between the ocean and the Mediterranean, for the ſpeedier paſſage of the French fleet; but though it was carried on at an immenſe expence, for 100 miles, over hills and vallies, and even through a mountain in one place, it has not anſwered that purpoſe. By the canal of Calais, travellers eaſily paſs by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orleans is another noble work, and runs a courſe of eighteen leagues, to the immenſe benefit of the public, and the royal revenue. France abounds with other canals of the like kind, which render her inland navigation inexpreſſibly commodious and beneficial. The great uſe of theſe canals in Picardy will appear when it is obſerved, that the river Somme, which riſes above St. Quintin, paſſes by that city, Ham, Peranne, Brai, Corbie, Amiens, Pequigny, Abbeville, and St. Valori, where it falls into the ſea. The river Oiſe has its ſource in Thierache, paſſes by Guiſe, Le Fere, Chauny, Noyon, Compeigne, Creil, Beaumont, Pontoiſe, and then diſcharges itſelf into the Seine above Conflans-Saint-Honore.

The moſt remarkable ſprings and mineral-waters are, 1. The freſh well near Veſaul in Burgundy, about 15 fathoms wide at the top, and 20 deep; but ſometimes it is ſo agitated as to overflow inſtantaneouſly, and produce a rapid ſtream. 2. The burning ſpring at Saſſenage. 3. A ſpring at the Roqueburne in Languedoc, on the waters of which ſwims a kind of oil, of a very ſalutary nature, both in internal and external applications. 4. A ſpring near Aigne in Auvergne, which boils violently, and makes a noiſe reſembling that of water thrown on lime; it is inſipid to the taſte, but of a poiſonous quality, and the birds that drink of it die immediately. The waters of Sultzbach in Alface,

face, are ſaid to cure the palſy, weak nerves, and the ſtone. At Bagueiis, not far from Bareges, are ſeveral wholeſome minerals and baths, to which people reſort as to the Engliſh baths, at ſpring and autumn. Ferges, in Normandy, is celebrated for its mineral-waters, and thoſe at St. Amand cure the gravel and obſtructions.

France abounds in marble and free-ſtone; in Languedoc there are ſome veins of gold and ſilver, as well as turquoiſes, the only gem this kingdom produces; Alſace contains ſilver and copper; Brittany has mines of iron, tin, lead, and copper; and in other parts are found alabaſter, jaſper, coal, chalk, oker, &c. At Berry there is a mine of oker, which ſerves for melting of metals, and for dyeing, particularly the beſt drab cloths; in the province of Anjou are ſeveral quarries of fine white ſtone; and at Laverdau, in Cominges, there is a mine of chalk.

The roots, herbs, and other vegetable productions of France, are much finer than thoſe of England, and conſequently their ſoups, ſalads, &c. are ſuperior to ours. The principal objects of cultivation among the French are their vines, and the excellency of the wines they produce is univerſally acknowledged, in particular the wines of Champagne, Burgundy, Bourdeaux, Gaſcony, and thoſe called Hermitage, Frontiniac, and Pontacke, are much admired, not only for their pleaſant taſte, but ſalubrious qualities.

Elm, aſh, and oak, are produced in France, but the latter is not ſo good as that which grows in England, and the interior provinces are now greatly in want of wood for fuel. Hemp and flax alſo abound in this kingdom. The province of Goſtmois yields great quantities of ſaffron. At Rhé, Rochfort, and their vicinity, great quantities of ſalt are made. The herb called kali, which grows in Languedoc, furniſhes abundance of pot-aſhes, and prunes and capers are produced near Bourdeaux and Toulon. The French were formerly famous for horticulture, but they are at preſent far inferior to the Engliſh, both in the management and diſpoſition of their gardens. The oppreſſed farmer had very little encouragement in France to apply himſelf to the practice of agriculture; ſo that, even in plentiful years, the lands yield little more than is neceſſary for the ſubſiſtence of the inhabitants; and a bad harveſt, eſpecially in time of war, is attended with the moſt diſtreſſing ſcarcity.

The horſes, black cattle, and ſheep of France, are far inferior to thoſe of England, and the wool is not ſo fine, but the hair and ſkin of the ſhamois, or mountain goat, are ſuperior to ours. There are few other animals, either wild or tame, in France, but what are common to England, wolves excepted; and theſe ferocious creatures do a great deal of miſchief, and are much dreaded by thoſe perſons who reſide near woods or foreſts. It is here neceſſary to deſcribe the wolf, which is the largeſt and fierceſt animal of the dog ſpecies, and partakes ſomewhat of the nature of a dog. He has a wild look, ſhining eyes, ſharp teeth, ſhort neck, and blackiſh colour. He bears hunger long, has a howling voice, oblong blunt muzzle, ſhort ears, and a thick tail.

The marine productions of France and thoſe of England are alike; but the former are not ſo plentifully ſupplied with ſalt-water fiſh, even on the ſea-coaſts.

The foreſts in France are very extenſive, the chief of which are, that of Orleans, which contains fourteen thouſand acres of wood, which are of various kinds, ſuch as oak, elm, aſh, &c. The foreſt of Fontainbleau, nearly as large as that of Orleans; and one near Morchiſmoir, wherein the trees are remarkably tall and ſtraight. The woods in this kingdom are alſo very large and numerous, but are ſituated ſo far from water carriage, that they are of very little utility, which is of the utmoſt advantage to a nation where wood forms the principal fuel; and, it is ſaid, that the internal parts of France begin to feel the want of firing greatly.

According to the lateſt and beſt calculations, France at preſent contains about 25,000,000 of inhabitants. It has been ſuppoſed that France was much more populous before the revocation of the edict of Nantes by Lewis XIV. ſince which period great numbers of the natives, particularly manufacturers, have left the kingdom, and ſettled in foreign parts. This fatal ſtep in politics, together with the almoſt perpetual wars in which that kingdom has been engaged, and the emigration to her colonies, have drained France of great numbers of her inhabitants.

The French, in their perſons, are rather lower and more ſlender than their neighbours; but they are well proportioned, and very nimble and active. They are of a ſallow complexion; and the ladies more remarkable for ſprightlineſs of their wit, than the charms of their beauty.

"The genius and manners," ſays a late writer, "of the French, are well known, and have been the ſubject of many able pens. A national vanity is their predominant character, and they are perhaps the only people ever heard of who have derived great utility from a national weakneſs. It ſupports them under misfortunes, and impels them to actions to which true courage inſpires other nations. This character, however, is conſpicuous only in the higher and middling ranks, where it produces excellent officers; for the common ſoldiers of France have but little idea of heroiſm. Hence it hath been obſerved, with great juſtice, of the French and Engliſh, that the French officers will lead, if their ſoldiers will follow, and the Engliſh ſoldiers will follow, if their officers will lead. The ſame principle of vanity is of admirable uſe to the government, becauſe the lower ranks, when they ſee their ſuperiors elated, as in the time of a former war with England, under the moſt diſgraceful loſſes, never think that they are unfortunate; thence proceeds the paſſive ſubmiſſion of the French under all their calamities." This national vanity is in nothing more diſcernible than in their writings, in which, when they mention the inhabitants of any other kingdom or ſtate, they take care not to omit ſome compliment to their own ſuperiority. They plume themſelves upon their courteſy, and fancy that politeneſs is confined to the natives of their country only. They may be characterized as being well mannered, rather than well bred. They are indiſcriminately complaiſant and officious, but they ſeldom know how to adjuſt their behaviour to the ſituation and character of thoſe they converſe with. All is a repeated round of politeneſs, which for want of diſcernment becomes affected, often ridiculous, and always diſguſtful to ſentimental people. The moſt abject flattery and diſſimulation coſt them nothing; they even value themſelves upon them, as conſtituting the eſſence of politeneſs. Sincerity is therefore not to be expected in their plauſible profeſſions; nor is candour to be hoped for from their moſt ſolemn promiſes; though a very judicious and experienced writer has attempted to palliate this part of their character, with ſome appearance of reaſon: "The French," ſays he, "have been cenſured for inſincerity; but this is a fault which they poſſeſs in no greater degree than their neighbours: and the imputation is generally owing to their exceſs of civility, which throws a ſuſpicious light upon their candour. In private life they have juſt as much virtue as other European nations, and have given as many proofs of generoſity and diſintereſtedneſs; but this is far from being the character of their government, which has prepoſſeſſed the Engliſh againſt the whole nation; and when the French are no longer formidable, they will be no longer thought faithleſs."

No people bear the frowns of the world with a better grace; yet they cannot ſuſtain proſperity with equal

equal moderation; but the leaſt elevation of fortune become intolerably vain, arbitrary, inſolent and imperious. In their loweſt circumſtances, they are capricious and litigious, and ſucceſs increaſes and gives a keener edge to their captious temper. The women enjoy great freedoms, which are authorized by fashion; and even when they appear too licentious, men are afraid to reſtrain them, leſt their *politeſſe* ſhould be called in queſtion, and they ſhould fall under the imputation of being narrow-minded. That [illegible] deportment which is ſo much admired in other countries, is here deemed *ruſticity*: and ſuppoſed to ſpring from the want of *knowing life*, or being introduced into *genteel company*. Hence the ladies are celebrated more for their ſprightly wit, and degagé behaviour, than for their perſonal beauty. The peaſantry, compared with thoſe of England, may juſtly be deemed ugly and dirty; but if they are not ſo handſome, they are livelier; and if they are not ſo neat, they are much merrier.

Many able writers have taken great pains in delineating the characters of the French; a very ingenious author of our own times, who wanted neither information nor abilities, has been very particular in deſcribing the particularities obſervable among this people.

"The natural levity of the French," ſays this writer, "is reinforced by the moſt prepoſterous education, and the example of a giddy people engaged in the moſt frivolous purſuits. A Frenchman is, by ſome prieſt or monk, taught to read his mother tongue, and ſay his prayers in a language he does not underſtand. He learns to dance and to fence by the maſters of theſe ſciences. He becomes a complete connoiſſeur in dreſſing hair, and adorning his own perſon, under the hands and inſtructions of his barber and valet de chambre. If he learns to play upon the flute or violin, he is altogether irreſiſtible. But he piques himſelf with being poliſhed above the natives of any other country, by his converſation with the fair-ſex. In the courſe of this communication, with which he is indulged from his tender years, he learns, like a parrot, by rote, the whole circle of French compliments, which are a ſet of phraſes ridiculous even to a proverb; and theſe he throws out indiſcriminately to all women without diſtinction, in the exerciſe of that kind of addreſs which is there diſtinguiſhed by the name of gallantry. It is an exerciſe, by the repetition of which he becomes very pert, very familiar, and very impertinent. A Frenchman, in conſequence of his mingling with the fair-ſex from his infancy, not only becomes acquainted with all their cuſtoms and humours, but grows wonderfully alert in performing a thouſand little offices, which are over-looked by other men, whoſe time has been ſpent in making more valuable acquiſitions. He enters, without ceremony, a lady's bed-chamber while ſhe is in bed, reaches her whatever ſhe wants, airs her ſhift, and helps to put it on. He attends at her toilette, regulates the diſtribution of her patches, and adviſes where to lay on the paint. If he viſits her when ſhe is dreſſed, and perceives the leaſt impropriety in her coiffure, he inſiſts upon adjuſting it with his own hands. If he ſees a curl, or even a ſingle hair amiſs, he produces his comb, his ſciſſors, and his pomatum, and ſets it to rights with the dexterity of a profeſſed frizeur. He ſquires her to every place ſhe viſits, either on buſineſs or pleaſure; and by dedicating his whole time to her, renders himſelf neceſſary to her occaſions. In ſhort, of all the coxcombs upon the face of the earth, a French petit-maitre is the moſt impertinent; and they are all petit-maitres from the marquis, who glitters in lace and embroidery, to the barber's boy, covered with meal, who ſtruts with his hair in a long queue, and his hat under his arm.

"I ſhall mention one cuſtom more, which ſeems to carry human affectation to the very furtheſt verge of folly and extravagance: that is, the manner in which the ladies are primed and painted. It is generally ſuppoſed, that part of the fair-ſex in ſome other countries make uſe of fard and vermillion for very different purpoſes, namely, to help a bad or faded complexion, to heighten the graces, or conceal the defects of nature, as well as the ravages of time. I ſhall not inquire whether it is juſt and honeſt to impoſe in this manner on mankind; if it is not honeſt, it may be allowed to be artful and politic, and ſhews at leaſt a deſire of being agreeable. But to lay it on as the faſhion in France preſcribes to all ladies of condition, who indeed cannot appear without this badge of diſtinction, is to diſguiſe themſelves in ſuch a manner as to render them odious and deteſtable to every ſpectator, who has the leaſt reliſh left for nature and propriety. As for the fard, or white, with which their ſhoulders and necks are plaſtered, it may be in ſome meaſure excuſable, as their ſkins are naturally brown or ſallow; but the rouge, which is daubed on their faces, from the chin up to their eyes, without the leaſt art or dexterity, not only deſtroys all diſtinction of features, but renders the aſpect really frightful, or at leaſt conveys nothing but ideas of diſguſt or averſion. Without this horrible maſk no married lady is admitted at court, or at any polite aſſembly, and it is a mark of diſtinction, which none of the lower claſſes dare aſſume."

The national vanity of the French induced them, till lately, to conſider the Engliſh as barbarians; but late wars, and the unanimous ſuffrages of their beſt writers, have greatly contributed to obliterate this falſe idea, and they now conſider the Engliſh in a very different light. It is, however, but juſtice to acknowledge, that the French have given a poliſh to the ferocious manners, and even virtues of other nations. It muſt alſo be obſerved, that the ſuperior order of men among the French are of a very different way of thinking from thoſe below them; they ſee with indignation the frivolous manners of both court and people, and heartily deſpiſe them. They think and act for themſelves, are open to conviction, and examine things to the bottom. Theſe men, during the war of 1756, ſaw the management of their armies, their finances, and fleets, with ſilent indignation, and their reſearches were favourable to the Engliſh. The concluſion of the peace of Fontainbleau, and the viſits which they have ſince paid to England, have improved that good opinion; the courtiers themſelves have fallen in with it; and, what ſome years ago would have been thought incredible, people of faſhion in France now ſtudy the Engliſh language, and imitate them in their cuſtoms, amuſements, dreſs, and buildings. They alſo both imitate and admire our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addiſon, Hume, Robertſon, Richardſon, and many others of the laſt and preſent century, are ſacred among the French of any education; and, to this truth, the writings of ſuch men have equally contributed, with our military reputation, to raiſe the name of Great-Britain to that degree of eſteem in which it has been held of late by foreign nations, and to render our language more univerſal, and even a neceſſary ſtudy among foreign nobility.

The continual fluctuation of the French faſhions would render any peculiar deſcription of their dreſs needleſs, and their perpetual caprices would make a minute detail impoſſible. It may, however, be ſaid, that they have more invention in their dreſs than any of their neighbours, and their conſtantly changing their faſhions is of infinite ſervice to their manufactures. "When a ſtranger firſt arrives at Paris," ſays a neighbouring writer, "he finds it neceſſary to ſend for the tailor, peruquier, hatter, ſhoemaker, and every other tradeſman concerned in the equipment of the human body. He muſt even change his buckles, and the form of his ruffles; and, though at the riſk of his life, ſuit his clothes to the mode of the ſeaſon. For example, though the weather ſhould be ever ſo cold

cold he muſt wear his *habit d'eté* [ſummer ſuit] or *demi ſaiſon* [mid ſeaſon] without preſuming to put on a warm dreſs before the day which faſhion has fixed for that purpoſe; and neither old age nor infirmity will excuſe a man for wearing his hat upon his head either at home or abroad. Females are, if poſſible, ſtill more ſubject to the caprices of faſhion. All their ſacks and negligés muſt be altered and new trimmed. They muſt have new caps, new laces, new ſhoes, and their hair new cut. They muſt have their taffeties for the ſummer, their flowered ſilks for the ſpring and autumn, and their ſatins and damaſks for winter. The men too muſt provide themſelves with a camblet ſuit trimmed with ſilver for ſpring and autumn, with ſilk clothes for ſummer, and cloth laced with gold or velvet for winter; and he muſt wear his bag-wig *à la pigeon*. This variety of dreſs is abſolutely indiſpenſable for all thoſe who pretend to any rank above the mere vulgar. All ranks from the king downwards uſe powder; and even the rabble, according to their abilities, imitate their ſuperiors in the fripperies of faſhion. The common people of the country, however, ſtill retain, without any material deviation, the old faſhioned modes of dreſs, the large hat and moſt enormous jack-boots, with ſuitable ſpurs; and this contraſt is even perceivable a few miles from Paris. In large cities the clergy, lawyers, phyſicians, and merchants, generally dreſs in black; and it has been obſerved that the French nation, in their modes of dreſs, are in ſome meaſure governed by commercial circumſtances. A Frenchman will ſooner part with his religion than his hair. Even the ſoldiers in France wear a long queue; and this ridiculous foppery has deſcended, as I ſaid before, to the loweſt claſs of people. The boy who cleans ſhoes at the corner of a ſtreet, has a tail of this kind hanging down to his rump; and the beggar who drives an aſs, wears his hair en queue, though perhaps he has neither ſhirt nor breeches."

The diverſions of the French are much the ſame as thoſe of the Engliſh, but they carry their gallantry to a much greater exceſs. Perſons in high rank accompliſh themſelves in the academical exerciſes of dancing, fencing, and riding; in the practice of which they excell all their neighbours in ſkill and gracefulneſs; and indeed few of the common people are without ſome knowledge of thoſe embelliſhments. They are fond of hunting; and the gentry have now left off their heavy jack-boots, their huge war-ſaddle, and monſtrous curb bridle, in that exerciſe, and accommodate themſeves to the Engliſh manner. The landlords were as jealous of their game as they are in England, and equally niggardly of it to their inferiors.

The only religion eſtabliſhed in France for many centuries paſt, was the Roman-Catholic, nor has any other been tolerated ſince the revocation of the edict of Nantes. In the ſouthern parts of France, ſome of the clergy and magiſtrates have been as intolerant as ever; and the perſecutions of the Proteſtants, or as they are called, Hugonots, who are very numerous in thoſe provinces, have been continued till very lately. The French, however, would never admit that infernal tribunal, the inquiſition, to be eſtabliſhed in their country: and in many reſpects the king, clergy, and laity, have been more free and independent of the pope of Rome, than in other Roman-Catholic countries. The Papiſts themſelves were divided into ſeveral ſects, among whom the Janſeniſts, the Quietiſts, and the Bourignons, were the principal. The Gallican church has more than once attempted to ſhake off the yoke of the popes, and made a very great progreſs in the attempt during the reign of Lewis XIV. but it was defeated by the ſecret bigotry of that prince, who, while he was bullying the pope, was inwardly trembling under the power of the Jeſuits, a ſet of dangerous eccleſiaſtics that is now exterminated from that kingdom. Upon the whole, the ſtate of religion in France has long afforded a ſtrong proof of the paſſive diſpoſition of the natives, and the bigotry of their kings, who, in complaiſance to the pope, have deprived the ſtate, as we have already hinted, of many thouſands of its moſt uſeful inhabitants.

By the laws of the new conſtitution, no man is to be moleſted for his opinions, nor interrupted in the exerciſe of his religion. The territorial poſſeſſions of the Gallican church have been claimed as national property, and diſpoſed of through the medium of a paper money called Aſſignats, for the creditors of the ſtate; and the clergy made dependent upon penſionary eſtabliſhments paid out of the national treaſury; out of which are paid alſo the expences of worſhip, the religious, and the poor. All monaſtic eſtabliſhments are ſuppreſſed; but the preſent friars and nuns are allowed to obſerve their vows, and nuns optionally to remain in their convents, or retire upon penſions.

The clergy are elected by the people, and take an oath to obſerve the laws of the new conſtitution; but many of thoſe, called refractory prieſts, have, from a conſcientious refuſal of this oath, been ejected from their benefices, and many of the popular curates made biſhops. The conforming clergy notify to the biſhop of Rome their union in doctrine; but do not pay him fees, nor acknowledge any ſubordination to his authority; and he has in conſequence threatened France with excommunication. They are ſupplied with lodgings upon their livings, whereon they are obliged to reſide, and perform the duties of their office. They vote as active citizens, and are eligible to ſome lay-offices in the diſtricts, but to no principal offices.

As France is now divided into nine metropolitan circles, there is a metropolitan biſhop with a ſynod to each. The metropolitan biſhop is confirmed by the chief biſhop in his circle. To theſe ſynods, appeals are made from the biſhops.

To each of the eighty-three departments, which form ſo many dioceſes, a biſhop is appointed; which appointment is made by the electoral aſſembly of the department, and confirmed by the metropolitan biſhop, but muſt have held an eccleſiaſtical office fifteen years. The ſalaries are from 500l. to 840l. per annum. Each dioceſe has alſo a ſeminary, with three vicars, and a vicar-general to prepare ſtudents for holy orders, and theſe vicars conſtitute a council for the biſhop.

The biſhop chooſes vicars of biſhops from among ſuch of the clergy of his dioceſe who have done duty ten years. The ſalaries are from 84l. to 250l. annually.

Thoſe who are miniſters of pariſhes, or curés in the diſtricts, are confirmed by the biſhop, and they muſt have been vicars to miniſters five years. They have ſalaries from 50l. to 160l. per annum, and receive penſions when infirm.

The vicars of miniſters are choſen by the miniſter from among the prieſts admitted in the dioceſe by the biſhop, and receive annual ſalaries from 50l. to 100l. ſterling.

There are in France more than two millions of Non-Catholics; and the Proteſtants, who are greatly increaſing, are, in proportion to the Catholics, as one to twelve. There are already many regular congregations: ſuch as German Lutherans, French and Swiſs Calviniſts, Bohemian Anabaptiſts, and Walloon or Flemiſh Diſſidents, beſides many chapels for the ambaſſadors. Many Jews alſo reſide here.

The French language is formed out of that of the Gauls, Romans, and Franks, and is pretty generally underſtood throughout Europe, particularly by genteel people, whoſe education is deemed defective without it. It is not however ſo ſtrong, expreſſive, and energetic, as the Engliſh, but ſeems beſt accommodated to dalliance, compliments, and common converſation.

Dryden juſtly obſerves, that the French language has all the ſwiftneſs of a greyhound, but the Engliſh all the ſtrength of a maſtiff. A late traveller ſays, "there are two great difficulties which an impractiſed

tiſed perſon is under here, in common ſpeech; the one is from the rapid pronunciation of the natives, which always appears to be the caſe when the language is not familiar to us; the other from the idioms or forms peculiar to the language. There is no effectual cure for either, but frequent converſation with the French people of all claſſes on their own ground. Some of our countrymen go armed with a dictionary, and make their French as they want it; but ſuch French is generally an awkward verſion of the Engliſh forms of ſpeech, not intelligible to French people. An Engliſh gentleman of this claſs was at dinner in a public company, and his buſineſs requiring him to be gone as ſoon as decency would permit, he wanted to tell the French ſervant that "*every body had done*," with deſign that the things might be taken away: he conſults his book, and finds that *every body* is *tout le monde*, and *done* is *fini*, which with his narrow Engliſh pronunciation was, *tout le monde eſt fini*. The waiter, who happened to be a lad of humour, took up the miſtake, and cried out, *Miſericorde! que ferons nous? Monſieur dit que tout le monde eſt fini*. "Mercy on us, what ſhall we do?—the gentleman ſays the world is at an end."

The Lord's prayer in French is as follows: Nôtre Pére qui es aux cieux, ton nom ſoit ſanctifié. Ton regne vienne. Ta volonté ſoit faite en la terre comme au ciel. Donne nous aujourd'hui nôtre pain quotidien. Pardonne-nous nos offences, comme nous pardonnons à ceux qui nous ont offenſés. Et ne nous indui point en tentation, mais nous delivre du mal: car à toi eſt le regne, la puiſſance, et la gloire, aux ſiécles des ſiécles. Amen.

With reſpect to learning and learned men, we may remark, that after the deſtruction of the Greek and Roman empire, by the barbarous nations of the north, and the ſtill more ferocious followers of Mahomet, France, like moſt other nations of Europe, lay immerſed in barbariſm for more than twelve centuries. The poetry of theſe times conſiſted wholly in a childiſh jingle of words; and the human genius, inſtead of being engaged in the ſtudy of objects worthy of its faculties, was devoted to frivolous queſtions with regard to abſtract and metaphyſical eſſences. At the ſame time the ſtate of ſlavery in which the far greater part of Europe lay, together with the ravages of ſuperſtition, at once the child and parent of ignorance, greatly contributed to debaſe the faculties of the human mind, and render the revival of learning a taſk of almoſt inſurmountable difficulty. At laſt the invention of printing, and the encouragement of Francis I. the friend of learning, gave a new turn to the ſtudies of the French; and the finiſhed works of the ancients were read with pleaſure and admiration.—Some progreſs was daily made in erudition, and the ſparks of genius, which had long lain neglected, were kindled by the noble and manly flame of the ancients.

Many learned men appeared during this reign in France, and did honour to their country. The works of the two Stephens are univerſally known. Malherbe, trained up in the ſtudy of the excellent poets of antiquity, and taking nature for his guide, enriched the French poetry with new beauties and harmony.—Balzac followed his example, and gave majeſty to their proſe. The ſociety of Port Royal continued what Balzac had begun, and added purity and accuracy, which rendered the French language at once pleaſing and nervous.

But the reign of Louis XIV. was the moſt ſplendid æra of literature in France. The encouragement he gave to learning, and the penſions he beſtowed on learned men, will render his name immortal. Encouragament is never beſtowed on men of genius in vain. The number of learned men was prodigious, and formed a brilliant conſtellation in the ſphere of literature. Corneille, for many years a ſlave to falſe taſte, became free at laſt, and diſcovered the laws of the drama by the ſtrength of his own genius, rather than by his reading. Racine ſtruck into a new track, introduced into tragedy a paſſion of tenderneſs known only on the ſtage of the ancients, and unfolded the artifices of the human heart in a ſtrain of truth and elegance joined with ſublimity. Both theſe writers are diſtinguiſhed for the juſtneſs of their painting, the elegance of their taſte, and their ſtrict adherence to the rules of the drama. Moliere finely painted and ridiculed the follies of age, and greatly excelled the ancient comedy. La Fontaine, in his fables, rivalled Æſop; and Boſſuet, Bourdeloue, Fletcher, and Maſſillon, carried the eloquence of the pulpit to a great degree of perfection.

The arts of eloquence are ſo connected with polite learning, that a turn for cultivating the one, leads to improve the other. While literature flouriſhed in this manner, Pouſſin produced his paintings, and Puget his ſtatues; Le Sueur painted the Chartreux, Le Brun the battles of Alexander, and Lulli invented a ſpecies of muſic adapted to the French language.

Sculpture is in general better underſtood in France than in moſt other countries of Europe. Their treatiſes on ſhip-building and engineering ſtand unrivalled; but in the practice of both they are outdone by the Engliſh. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were long our ſuperiors in architecture, though now we bid fair to excel them in that art.

The univerſities in France are eighteen in number, viz. Paris, Orleans, Rheims, Poictiers, Bourdeaux, Angers, Nantz, Caen, Bourges, Montpelier, Cahors, Valence, Aix, Avignon, Dole, Perpignan, Pont à Mouſon, and Orange. That of Paris is the principal, and is ſaid to have been founded by Charlemagne: here all the arts and ſciences are taught, particularly law, phyſic, and divinity: it conſiſts of above forty colleges, of which the chief are thoſe of the Sorbonne, Navarre, the faculty of phyſic, and of the four nations; lectures are read only in eleven of them. The head of this univerſity is the rector, who is choſen every three months, but is ſometimes continued four years. All the profeſſors have ſettled ſalaries; and the whole income of the univerſity is ſaid to amount to about 50,000 livres annually.

Beſides theſe univerſities, there are colleges eſtabliſhed in ſeveral parts of France; but all thoſe literary inſtitutions have ſuffered an irreparable loſs by the expulſion of the Jeſuits, who always made the languages, arts, and ſciences, their particular ſtudy, and taught them throughout that kingdom: but as the extinction of this body of men will probably leſſen the influence of ſuperſtition in France, there is reaſon to believe that the intereſts of real learning will, upon the whole, be promoted by that event.

There are eight academies in Paris, namely, three literary ones, the French academy, that of inſcriptions, and that of the ſciences; one of painting and ſculpture, one of architecture, and three for riding the great horſe, and other exerciſes of a military nature.

The progreſs of philoſophy was much ſlower than that of polite learning in France. A bigotted clergy, convinced that it is their intereſt to keep mankind in ignorance, obſtructed philoſophy in its dawn, and almoſt prohibited men from thinking. Even the power of Louis XIV. and his noble eſtabliſhments for the improvement of learning, were unable to remove the influence of the church. Some great men, however, broke through all reſtraint, and, like the ſun through the miſts of the morning, caſt a pleaſing light around them. Des Cartes had all the neceſſary qualifications for changing the face of philoſophy. His diſcoveries in mathematics were of the greateſt ſervice, and now form the moſt ſolid and indiſputable part of his glory; particularly his application of algebra to geometry, which will always prove a key to the deep reſearches

of the higher geometry, and conſequently to all the phyſico-mathematical ſciences.

Paſcal purſued the mathematical branches of philoſophy with great ſucceſs. His treatiſe on the cycloid diſcovers a prodigious force of genius; and that on the equilibrium of fluids, and the gravity of the air, has opened a new ſcience to philoſophers. Few men, either by their writings or lives, have done more ſervice to religion, than this great man and the archbiſhop of Cambray.

Since the time of Louis XIV. ſeveral writers of eminence have appeared. At the head of theſe is juſtly placed the celebrated Monteſquieu, who may be conſidered as the legiſlator of nations, and an honour to human nature. Buffon, in his Natural Hiſtory, has followed the model of Plato and Lucretius; he has embelliſhed his work with a majeſty and ſublimity of ſtyle ſuitable to the philoſophical ſubjects he deſcribes. Maupertuis has taught his countrymen to ſhake off the yoke of pedantry, and excels in the art of conveying the moſt abſtracted ideas intelligibly. D'Alembert has united the talents of a fine writer with the preciſion of a geometer.

The writers on the Belles Lettres in France are exceedingly numerous, and their productions very agreeable. Voltaire and D'Argens are the moſt conſiderable. The former excels both in proſe and verſe; and no writer ever better underſtood the uncommon art of denoting every idea by the moſt proper and familiar term. He embelliſhes his works without ever miſtaking the colouring; and has the happy talent never to riſe above or ſink below his ſubject.

The polite arts in general have not however made the ſame progreſs in France ſince the age of Louis XIV. as philoſophy. The French have now no painter of note, except M. Greuſe, who excels in portraits and converſation pieces; nor have their ſculptors produced any piece equal to thoſe that diſplay the magnificence of Louis the Great. Muſic alone has made an amazing progreſs ſince that period. The enterpriſing and fruitful genius of M. Rameau, has eraſed the opprobrium thrown by foreigners on the French muſic. His diſtinguiſhing character is the having ſucceſsfully ſtudied the theory of muſic, diſcovered the principles of harmony and melody in the thorough baſs, and by that means reduced to more certain and ſimple laws that which before was ſubject to arbitrary rules, or ſuch only as blind experience dictates.

It would, perhaps, be thought unjuſt to the French, if we did not mention the prodigious work lately publiſhed at Paris, under the title of Encyclopédie, or a General Dictionary of Arts and Sciences, which is the moſt complete ſyſtem of uſeful knowledge we are acquainted with. It is a noble collection of all the branches of human learning, and makes 28 volumes in folio. The plates belonging to this amazing work, with their explanations, make ſix volumes, and are executed in a very maſterly manner. The different parts of the Encyclopédie were drawn up by the moſt able maſters in each branch of literature, and the articles belonging to each are marked with particular letters; liſts of which, with proper explanations, are prefixed to the work. But the whole was methodized and publiſhed by Meſſ. D'Alembert and Diderot.

The cities, towns, palaces, and ſea-ports of France being too numerous to admit of particular deſcriptions of the whole, we ſhall therefore only particularize the moſt reſpectable, beginning with the capital.

Paris, called in Latin Lutetiæ, Pariſiorum, or Pariſium, is ſituated in the iſle of France (now called Oiſe) being both its metropolis, and alſo that of the whole kingdom. It lies in a ſpacious plain on the Seine. This is a very large, populous, and ſtately city, built of a circular form, and ſaid to be fifteen miles in circumference. The ſtreets are very narrow, and the houſes very high, many of them ſeven ſtories. The houſes are built of ſtone, and are generally mean, even to wretchedneſs, owing partly to their containing a different family on every floor.

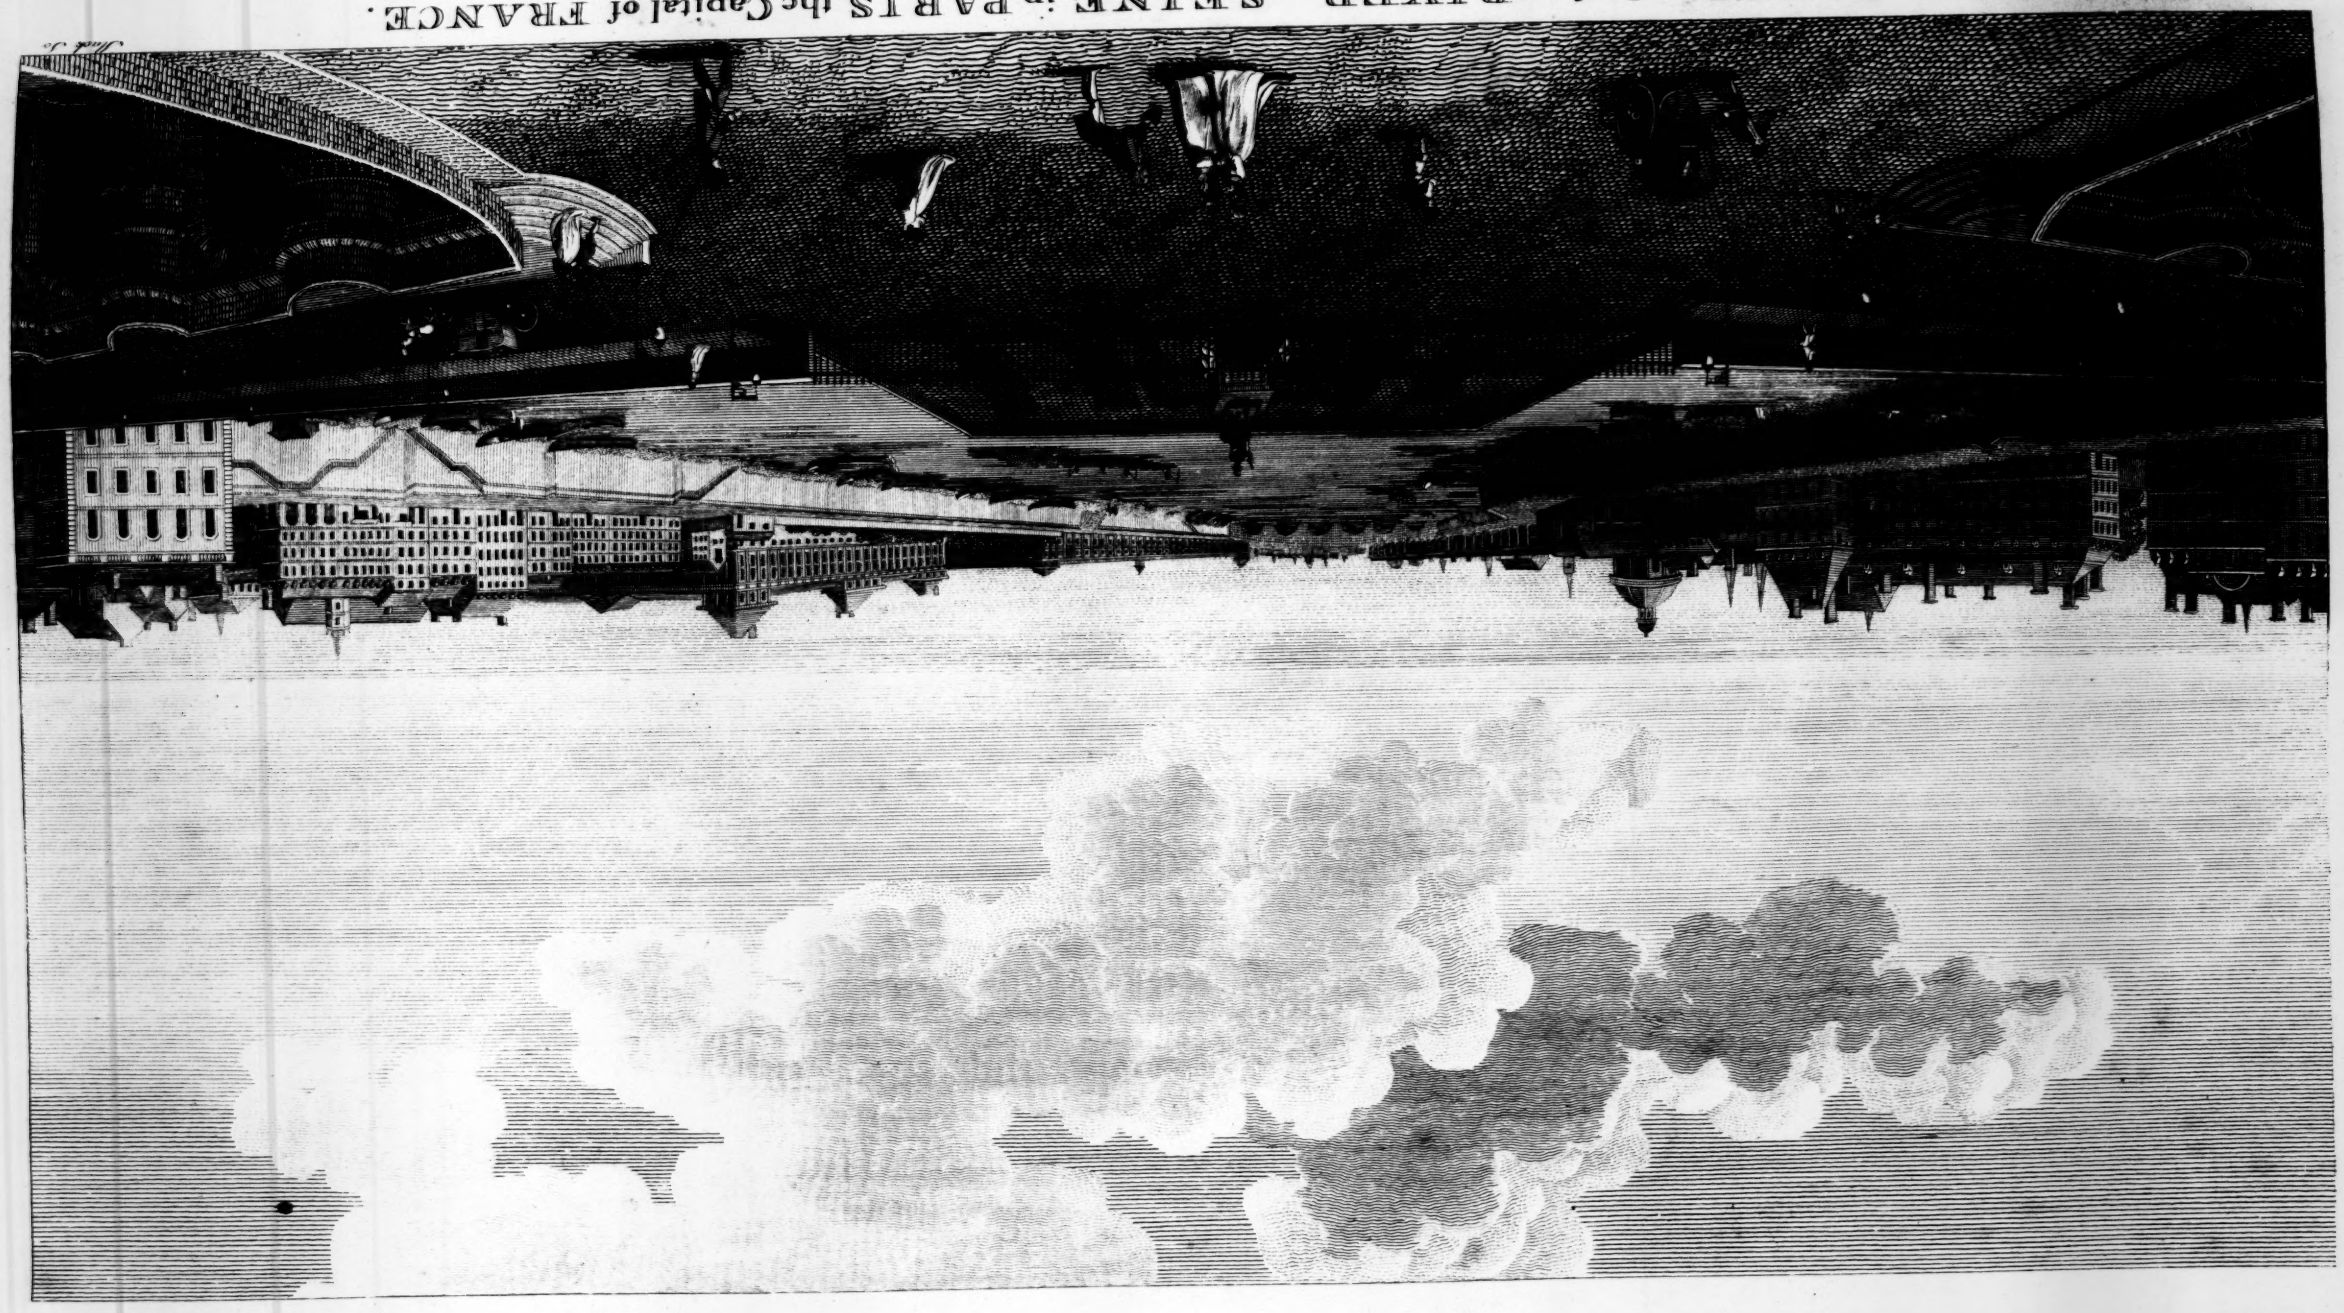
Paris is divided into three parts; the city, the univerſity, and that which was formerly called the town: the city (la cité) is old Paris; the univerſity and the town are the new. Paris contains more works of public magnificence than utility. Its palaces are more ſhewy; and ſome of the ſtreets, ſquares, hotels, hoſpitals, and churches, more ſuperbly decorated with a profuſion of paintings, tapeſtry, images, and ſtatues: but Paris, notwithſtanding its boaſted police, is greatly inferior to London in many of the conveniencies of life.

The ſtreets of Paris are generally crowded, particularly with coaches, which gives their capital the appearance of wealth and grandeur; though, in reality, there is more ſhew than ſubſtance. The glittering carriages that dazzle the eyes of ſtrangers, are moſtly common hacks, hired by the day or week for the numerous foreigners who viſit the city; and, in truth, the greateſt part of the trade of Paris ariſes from the conſtant ſucceſſion of ſtrangers that arrive thither daily from every nation and quarter of the globe. This aſcendancy over other nations is undoubtedly owing to the reputation of their language, their public buildings, the gobelines, or manufactures of tapeſtry, their libraries, and collections of paintings that are open to the public: the cheapneſs of proviſions, excellency of the French wines, and, above all, the purity of the air and climate in France. With all theſe advantages, however, Paris will not bear a compariſon with London in the more eſſential circumſtances of a thriving foreign and domeſtic trade, the cleanneſs of their ſtreets, elegance of their houſes, eſpecially within; the plenty of water, and that of a better quality than the Seine, which is ſaid to diſagree with ſtrangers.

In the houſes of Paris, moſt of their floors are of brick, and have no other kind of cleaning than that of being ſprinkled with water, and ſwept once a day. Theſe brick floors, the ſtone ſtairs, the want of wainſcotting in the rooms, and the thick party-walls of ſtone, are, however, good preſervatives againſt fire, which ſeldom does any damage in this city. Inſtead of wainſcotting, the walls are covered with tapeſtry or damaſk. There are ſaid to be 105 alleys or ſtreets which have no thoroughfare, upwards of 23,000 houſes of from four to ſeven ſtories, without including the public buildings, religious houſes, ſhops, or warehouſes: the houſes are, in general, handſome, and the fronts, for the moſt part, uniform. Before the revolution, it was the ſee of an archbiſhop, and contained fifty-one pariſh churches, twenty not parochial, ſeventeen collegiate churches, among which were thirteen chapters, forty chapels, three abbies, twenty-two priories, and fifty convents for men, eccleſiaſtical and ſecular; ſeven abbies, ſix priories, and fifty-three convents for women; twelve ſeminaries, ſixteen hoſpitals; ten of them appropriated to children and women, and ſix for deſerted children; an univerſity, ſix academies of ſcience; three academies for the inſtruction of young gentlemen; ſeven public libraries; 124 companies of artiſans and tradeſmen; four royal palaces; upwards of 500 palaces, or houſes inhabited by nobility, and private gentlemen of fortune; ſixteen principal ſquares, and upwards of ſixty inferior; fifty public markets, ſixty fountains, twelve bridges over the Seine, twenty-ſix quays, ſixteen gates, &c.

The chief ornament of the city of Paris is the Louvre, which was built or repaired under the reign of Philip Auguſtus, in the year 1214. It was a caſtle that ſtood without the city. Near it, on the banks of the river Seine, they built a large tower, called the Tower of the Louvre. It defended the river, together with another tower, that ſtood over-againſt it, named the Tower of Neſle. In this tower were ſometimes

A VIEW on the RIVER SEINE in PARIS, the Capital of FRANCE.



ſometimes kept the treaſures of the French kings. It was pulled down when the foundations of what is called the Old Louvre were laid, under Francis I. His ſon Henry II. employed the moſt eminent and celebrated architects of his time to render this building as regular and magnificent as could be. What is called the Old Louvre conſiſts of two ſets of buildings, that form an interior angle, the fronts of which are adorned with very fine pieces of architecture.—The whole building is three ſtories high. The firſt is of the Corinthian order, the ſecond of the Compoſite, and the third of the Attic. The fore or outward courts are adorned with chamfered columns, and the other with pilaſters of the ſame order with thoſe columns. What is chiefly admired is the proportion of the windows of the ſecond ſtory, the caſes of which are moſt elegantly adorned with a pediment alternately triangular and circular. The third ſtory, of the Attic order, has alſo its particular ornaments, conſiſting in trophies of arms, in baſſo-relievo fixed to the window caſes, with other ornaments in the entablatures. In the hall of the hundred Switzers is a kind of gallery ſupported by four gigantic figures. This hall was formerly uſed for great entertainments; and queen Catherine de Medicis cauſed plays and interludes to be acted here for the diverſion of the court.

Henry IV. built a gallery along the river ſide, quite to the Thuilleries, which is very long, and eſteemed the fineſt in Europe. Louis XIII. finiſhed the front to the weſt, and built a large pavilion, in the form of a dome, in the middle, over the gate, which is ſupported by two rows of very large pillars of the Ionic order, and alſo adorned the architrave of the front to the court with fine ſculptures. Louis XIV. beſtowed great coſts upon the eaſt front, in the middle whereof is the eaſt gate of the palace: here are forty columns of the Corinthian order, which ſupport a large terrace, that is railed with a ſtately baluſtrade. The court, which is in the middle of that large building, is very near twenty-three perches ſquare; the four ſides of it are compoſed of eight pavilions, and eight ſets of buildings, which ſurround that great court: there are yet but about three parts of it built. The architecture, after the manner it is begun, is to conſiſt of three orders of columns, with their pedeſtals; the firſt of the Corinthian, and the two others of the Compoſite order.—Louis XIV. who declared himſelf the protector of the French academy, gave that illuſtrious body an apartment in the Louvre to hold their aſſemblies in; as alſo to the academy of medals and inſcriptions, and to the academy of ſciences. The academy of architecture and painting meet in the old Louvre. In the gallery of the Louvre is the royal printing-houſe, eſtabliſhed by cardinal de Richlieu. They printed there the memoires of the royal academies of the ſciences, and the Belles Lettres, the king's orders, the decrees of the council, and ſuch books as the king pleaſed to have printed at his own expence. There is here alſo a mint where they ſtamped the king's medals, and likewiſe thoſe of all the corporations and trading companies in the kingdom, which have every one of them their own emblems and proper mottos. No medals were ſuffered to be ſtruck any where elſe than at the Louvre.

There is in the wardrobe of this palace a prodigious quantity of rich tapeſtry-hangings, both ancient and modern, the fineſt of which have been made in the reign of Francis I. Amongſt them there are the battles of Scipio, and the triumphs of the ſame general; the hiſtory of Joſhua, made after the deſigns of the famous Raphael; the hiſtory of Pſyche; the acts of the apoſtles; the hiſtory of St. Paul, &c. Louis XIV. cauſed ſeveral tapeſtries with gold and ſilver to be made, after the deſigns of Le Brun. There are alſo here, in ſeveral rooms, a large quantity of ancient arms; amongſt which are thoſe which Francis I. wore at the famous battle of Pavia; and on his cuiraſs are ſtill to be ſeen the marks of the blows he received before he ſurrendered to the Spaniards.

Poor women and maidens are allowed to ſojourn in the hoſpital dedicated to St. Catherine, and are entertained three days, being attended by the nuns of St. Auguſtine. In the grand chatelet the ſeſſions were held by the inferior courts of juſtice. Fort L'Eveque contains a mint and a priſon, and is cloſe to the ſpot where Henry IV. was ſtabbed by Ravilliac. St. Germain l'Auxerrais is termed the pariſh church royal, becauſe the Louvre and Thuilleries are ſituated in its pariſh.

The Thuilleries, or Tuileries, ſtands in a place where formerly they made tiles, called Tuiles in French, from whence that palace has its name. It is joined to the Louvre by a gallery which contains 108 models of fortreſſes that are executed with great accuracy: it conſiſts of one range of building, with a pavilion at each end, and a dome in the middle: in the front is an handſome large ſpace divided into three courts; the whole adorned with columns, pilaſters, and other ornaments. Behind this palace are gardens, adorned with fine walks, planted with evergreens, and other trees, and fine parterres; where are to be ſeen, the year round, all the flowers that are in ſeaſon. It has alſo three fine fountains, with their baſons, and a large octagonal canal. Towards the river is a fine terrace planted with three rows of trees. From this terrace is a moſt beautiful proſpect over part of the city, and over the adjacent country. A beautful walk opens on the banks of the river beyond the Thuilleries, which is compoſed of four rows of fine elms, that form three avenues, being together 120 feet broad. In the centre is a ring with trees planted round it in a circular manner, and at each end are iron gates.

The Baſtile was a kind of fortreſs, conſiſting of eight large round towers, joined together by other ſtrong buildings. In the year 1634 it was ſurrounded with ditches and baſtions. It was a priſon for ſtate criminals, and for ſuch as were taken up by lettres-de-cachet, that is to ſay, by warrants ſigned by the king, and ſealed. In it the king kept a governor, a lieutenant, and an independent company of ſoldiers. This building was totally demoliſhed by the populace at the beginning of the French revolution in 1789.

The palace of Luxemburg, alſo called the palace of Orleans, was built by queen Mary de Medicis, on the ruins of the old hotel or houſe of Luxemburg, which name it kept. It was finiſhed in five or ſix years time, under the direction of James de Broſſe; and is one of the moſt perfect and regular pieces of architecture in France. In this palace is a gallery of paintings, done by the famous Rubens, who ſpent two whole years on that work. The whole hiſtory of Mary de Medicis' life is here repreſented allegorically, in 24 large pictures, nine feet broad, and ten feet high, placed in the piers between the windows. The quarter called the Univerſity ſtands in the ſouth of the iſlands of the palace, and of our Lady. It was formerly incloſed by a wall, and ſurrounded with ditches; but under the reign of Louis XIV. the wall was pulled down, and the ditches filled, to make it contiguous to the neighbouring ſuburbs. That of St. Germain is the moſt conſiderable, and is alone larger than the whole quarter called the Univerſity; but it is not ſo populous, becauſe of the many monaſteries, hoſpitals, large houſes or hotels, and gardens that take up a great part of it. Adjoining to this ſuburb are that of St. Michael, which is but ſmall; that of St. James, which is pretty large; and that of St. Marceau, which is larger ſtill: the laſt of all, which is the neareſt to the river on the eaſt, is that of St. Victor, which is very large, but not built all over. The univerſity was founded by Charles the Great, and is appropriated to the cultivation of the arts, ſciences,

ſciences, &c. in general, and phyſic, law, and divinity in particular.

A very humane and noble foundation for the poor of the female ſex, is the general hoſpital, wherein great numbers of them are here provided for: thoſe who are well are compelled to work, but the ſick are tenderly nurſed, and carefully ſupplied with every neceſſary. Different wards are reſpectively aſſigned for foundlings, ſempſtreſſes, idiots, proſtitutes, &c. As this general hoſpital is appropriated to females only, the caſtle of Bicetre is a kind of counterpart, and appointed for the relief of ſimilar neceſſities in the male ſex; and likewiſe for another purpoſe, viz. the puniſhment of children who lead diſſolute lives, or are undutiful to their parents.

In the year 1626, the royal phyſic-garden was firſt founded, by order of Louis XIII. and finiſhed in 1634. There were at firſt four profeſſors of botany, in the room of whom the king eſtabliſhed, in 1671, two demonſtrators of the plants, one of whom is obliged to make the analyſis, or chemical demonſtration of them. There is alſo a laboratory where they read lectures of chemiſtry, and a particular hall for anatomical demonſtrations; and in the year 1712, there was another demonſtrator added, whoſe office is to read lectures on the Materia Medica. The king's firſt phyſician was director of this garden till the year 1718, when Dr. Chirac obtained that place; and after his death it was given to the ſecretary of ſtate for the city and diſtrict of Paris.

The ſeveral following academies in Paris deſerve to be particularly mentioned, viz. 1. The Academie Françoiſe, or French Academy, founded by cardinal Richlieu, for the improvement of the French language, in ſuch a degree as to reduce it to a determinate ſtandard. It conſiſts of forty members, who meet at ſtated times to ſuperintend the inſtitution, and promote the ſame by every probable means. 2. The Royal Academy of Inſcriptions and Belles Lettres, inſtituted for the advancement of polite litterature. In this academy ancient monuments are explained, and the tranſactions of the kingdom perpetuated by medals, inſcriptions, &c. 3. The Royal Academy of Sciences, inſtituted in 1666, has its honorary members, penſioners, aſſociates, and ſtudents. Theſe apply themſelves to the different branches of the mathematics and natural philoſophy. 4. The Royal Academy of Painting and Sculpture, founded in 1643. The maſter-pieces of the painters and ſculptors admitted into this academy are diſpoſed in different halls, and marked with the names of the ſeveral artiſts. The Royal Academy of Architecture was founded in 1671, but not authorized by letters patent before the year 1717. It is divided into two claſſes; the firſt is compoſed of ten architects, a profeſſor, and a ſecretary; and the ſecond of twelve other architects. The profeſſor, whoſe poſt, as well as the ſecretary's, is for life, is obliged to read public lectures on ſtated days in the hall of the Louvre. All theſe eſtabliſhments relate to arts and ſciences. There are others deſigned for the improvement of virtue, and promoting religion; ſuch as the ſeminaries where young clerks and prieſts are taught the ceremonies of the church, and the duties and functions of their calling. There are ten of theſe ſeminaries at Paris, among which is one for Engliſh, and another for Iriſh prieſts; and moſt of the biſhops have ſet up ſuch ſeminaries in their dioceſes.

The Pariſians, as well as the natives of France in general, are remarkably temperate in their living; and to be intoxicated with liquor, is conſidered as infamous. Bread and all manner of butcher's meat, and poultry, are extremely good in Paris: the beef is excellent; the wine they generally drink, is a very thin kind of Burgundy. The common people, in the ſummer ſeaſon, live chiefly on bread, butter, grapes, and ſmall wine. The Pariſians ſcarcely know the uſe of tea, but they have coffee in plenty. The police of Paris is ſo well attended to, that quarrels, accidental miſchief, or felonies, ſeldom happen; and ſtrangers, from all quarters of the globe, let their appearance be ever ſo uncommon, meet with the moſt polite treatment. The ſtreets are patroled night and day by horſe and foot; ſo judiciouſly ſtationed, that no offender can eſcape their vigilance. They likewiſe viſit the publicans, who are not permitted to retain company, or ſell liquor, after twelve at night. The public roads in France are under the ſame excellent regulations, which prevent robberies in that kingdom.

The neighbourhood of Paris is very pleaſant, and contains a great number of towns, villages, &c. and ſome fine ſeats, ſome of them being ſituated on the edge of mountains that riſe from the Seine, are extremely delightful. Among the laſt in this government are the royal palace of Meudon; that of the duke of Bourbon at St. Maur des Boſſex; of the arch-biſhop of Paris, near the conflux of the Sciene and Marine, called Conflans; of the prince of Condé at Iſſy; of the count of Thouloufe at Rambouillet; and thoſe called Maiſons and Colaguy, the latter of which belongs to the duke of Maine.

Compeigne, on the Oiſe, 13 leagues north-weſt of Paris, is the place where the maid of Orleans was taken priſoner by the Engliſh in 1430. Here is a palace, which was repaired by Louis XIV. and the gardens finely laid out. The trade of this place principally conſiſts of corn, wood, and wool. At Villers Corteretz, a little town five leagues from Compeigne to the ſouth-eaſt, at the ſide of the foreſt of Retz, is a fine palace formerly belonging to the duke of Orleans, and an abbey.

Soiſſons (now the department of Aiſne) is ſituated ſeven leagues from Paris to the north-eaſt, in a pleaſant valley on the banks of the river Aiſne, over which there is a ſtone bridge. The town is pretty large and well built, being the ſeat of a governor-general, and of an office of the finances, a ſalt-office, ſeveral courts of juſtice, and alſo of a biſhop, who is ſuffragan to the archbiſhop of Rheims, and had the right to anoint the French kings during the vacancy of the archiepiſcopal ſee, or in the archbiſhop's abſence. It drives a great trade in corn, contains ſeveral abbies, and other religious houſes, with an old caſtle, and has an academy, whoſe object is the ſame as that of the French academy at Paris.

Verſailles is ſituated four leagues from Paris to the ſouth-weſt; here Louis XIV. built a moſt magnificent palace, and adorned it with noble gardens; it ſtands on a riſing ground in the middle of a valley ſurrounded with hills, having, on the ſide towards Paris, a fine avenue leading to it through the town, which it divides into the Old and New. The apartments of the palace abound with innumerable paintings, ſtatues, antiques, &c. The chapel, built in 1699, is a moſt finiſhed piece of architecture, ſculpture, and painting. Every room in this noble palace has a particular name, taken from the chief ſubject painted on the ceiling.—As for inſtance, the hall or chamber of plenty, La Sale d'Abondance, becauſe plenty and liberality are painted on the ceiling. Here are ſeveral pictures, as the Holy Virgin on a column of jaſper, holding the infant Jeſus in her arms, and ſurrounded below with ſeveral pilgrims, done by Pouſſin: the Virgin Mary and St. Joſeph flying into Egypt, by Guido: the woman cured of a bloody-flux by our Saviour, done by Paul Veroneſe, &c. The hall of Venus has that goddeſs painted on the ceiling; ſhe ſits in a chariot drawn by doves; the gods and heroes, celebrated by the ancients, adorn her triumph. Here are the pictures of Nebuchadnezzar, who orders the forming of the gardens of Babylon: of Auguſtus, exhibiting a race of chariots in the Circus; of Alexander, marrying Roxana; and of Cyrus, reviewing his army. As the hall of war is dedicated

to Bellona, the frize is adorned with trophies, bucklers, and thunderbolts. Over the doors are trophies of gilt metal, under which are repreſented the four ſeaſons, by proper figures and feſtoons, ſignifying that Louis XIV. has been a conqueror in all the ſeaſons of the year. The ceiling of this hall is adorned with five pictures. The largeſt, which is in the middle, repreſents France holding a thunderbolt in one hand, and a buckler in the other. The four others are in the ſides. In the firſt is Bellona in a violent paſſion. The ſecond repreſents Germany doing her beſt but fruitleſs endeavours to defend the imperial crown. In the third, Spain ſeems to threaten France; but her ſoldiers are put to flight. The fourth ſhews Holland thrown back upon her lion. This room is alſo adorned with ſix heads of porphyry, repreſenting as many Roman emperors; they are in buſts, with a drapery of gilt braſs, and ſupported on pedeſtals of oriental alabaſter.

The moſt ſumptuous of all the rooms is the late king's bed-chamber. The carvings are all gilt, on a white ground. The bed is placed in a kind of alcove, where are two figures of Fame, repreſented ſitting: on the cupola, over the bolſter, is France ſitting, and ſeeming to watch for the preſervation of the king. There are ſeveral other pictures in this chamber, and particularly one of Hagar in the deſert, with her ſon, and an angel. The furniture of the bed is of crimſon velvet, embroidered with gold, and otherwiſe beautifully ornamented.

The gardens are not leſs magnificent than the palace. In deſcending from the terrace you meet with two baſons, where there are ſeveral water-ſpouts; and in the middle of each a collection of ſpouts in the form of a wheat-ſheaf, which riſes 29 feet high. The borders of theſe baſons are adorned each with eight groups of brazen figures, repreſenting rivers and nymphs; and four others of the ſame metal, repreſenting cupids, little nymphs, and genii. In two angles of the parterre are two other baſons of marble. The water-ſpouts that come from them form two ſheets of water exceedingly fine; and on the border of each of theſe baſons are two groups of figures of animals, made of braſs. From this parterre you ſee, in a kind of half-moon that is below it, the baſon of Latona, round which are repreſented, in a group of three figures, Latona, Apollo, and Diana. Latona ſeems to complain to Jupiter of the cruelty of the peaſants of Lycia, who are here repreſented metamorphoſed into frogs, which throw a vaſt quantity of water upon the group. There are ſeveral other baſons, with water-ſpouts, and other curious water-works, all adorned alſo with fine groups and ſtatues of ſeveral kinds. At one end of it is a baſon of an octagonal figure, and 420 feet diameter; four of its ſides are circular, three in ſtraight lines, and the other joins with the canal; in two of the angles of this baſon are two ſea-horſes, each of which carries a Triton on his back. The great canal is 32 fathoms broad, and 800 long, including the baſons at each end. In the middle it is croſſed by another canal, about 520 fathoms long. At the other end of the large canal is alſo a baſon 200 fathoms long, and 100 broad. Upon this canal the court ſometimes divert themſelves in yachts and gallies. The orangery, or green-houſe is a maſter-piece in its kind. It is expoſed to the ſouth, and contains firſt a large gallery, which is innermoſt, 408 feet long, and 32 feet broad, with 12 arched windows in the front; on each ſide of this gallery are two others, each 360 feet long. Theſe galleries are adorned without with fine rows of columns; the innermoſt gallery has eight double columns of the Tuſcan order, the two others have four columns each of four feet diameter. At the gate of the porch are two other columns of the ſame order, but much thinner. Before this green-houſe is a beautiful parterre, with a fine baſon in the middle, where the water ſpouts out 40 feet high. It is adorned with four rows of columns, of the Tuſcan order, groups of ſtone figures beautifully carved, vaſes, ſtatues of white marble, &c. In the ſummer time this parterre ſeems to be a foreſt of orange and lemon trees, myrtles, laurels, &c.

Here is a beautiful grove, which contains the labyrinth or maze, the ſeveral walks of which are ſo interwoven with each other, that it is a difficult matter to find the way out of it. At the entrance you meet with two ſtatues, the one of Æſop, and the other of Cupid, holding a clue of thread in his hand. At every turning of the avenues you meet with a beautiful fountain, adorned with a baſon of fine ſhell-work, where they have repreſented, in the moſt natural manner, one of Æſop's fables, the ſubject of which is expreſſed in four lines, engraved in gold letters on a thin braſs-plate with a black ground. In the garden are ſtatues, canals, groves, grottoes, fountains, and every thing that can render it delightful and elegant. The royal cabinet contains many fine medals, coins, paintings, &c. In the park ſtands the beautiful palace of Trianon, the outſide of which conſiſts wholly of variegated marble, of exquiſite workmanſhip. The gardens are large, and abound in ſtatues and water-works.

The late king's royal ſeat, called Marly, ſtands in a park contiguous to Verſailles, it has beautiful gardens belonging to it. The engine here for raiſing water from the Seine, to ſupply the reſervoirs and water-works, is equally grand and ingenious, and, with the other water-works, coſt immenſe ſums; the water being conveyed over ſeveral hills to the great reſervoir here, and from thence to Verſailles. St. Germain en Laye, a town in the foreſt of Laye, is chiefly remarkable for two caſtles, or royal palaces. The foreſt and park, contiguous to the caſtles, are very beautiful.

The town of Fontainbleau is ſituated in the middle of a foreſt of the ſame name, eleven leagues ſouth of Paris, and about one from the Seine. Its ſpacious royal caſtle or palace hath chiefly contributed to its fame. Here are neat gardens, laid out with very good taſte; and beſides the great fountain are many others, which greatly adorn this charming ſeat. All the halls or rooms of this palace are adorned with very fine paintings and carvings. The greateſt room of all is that where plays are acted when the court is here.—There is in that room a fine chimney, built by Henry IV. in 1599; it is twenty-three feet high, and twenty wide, and is adorned with four large Corinthian columns of ſpotted marble, with baſes and chapiters of white marble: in the middle of the chimney is a table of black marble, on which ſtands the Equeſtrian ſtatue of Henry the Great: underneath are two baſſo-relievos; the one repreſenting the battle of Ivry, and the other the ſurrender of the city of Mate. Two marble ſtatues placed on each ſide of this figure repreſent loyalty and peace: over-againſt the chimney is a noble theatre for acting plays.

Fontainbleau was conſiderably increaſed under the reigns of Henry IV. and Louis XIII. The latter built the parochial church, which is adorned with fine paintings: on each ſide of the great altar is a Corinthian column twenty feet high, and over it is a picture of our Saviour curing the man ſick of the palſy, exquiſitely done by Varin. This town is the ſeat of a royal provoſtſhip, conſiſting of a provoſt, a commiſſary of inquiries both in civil and criminal matters, a king's attorney, and a recorder.

The diſtricts of Artois and Picardy (now Somme) produce wine, grain, fruits, paſturage, and turf, Picardy, the name of which is thought to be derived from Picard, ſignifying a paſſionate wrangler, is bounded on the eaſt by Champagne; on the ſouth by the Iſle of France; on the north by the Pais de Calais, Artois, and Hainault; and on the weſt by Normandy and the channel. Its rivers are the Somme, which riſes in the Vermandois, and falls into the channel; the Olſe, in Latin Iſara, which riſes in Picardy,

and at the Conflans falls into the Seine; and the Canche, which riſes in Artois, and falls into the ſea at Staples. The other ſmaller rivers are the Lauthie, the La Lis, the Aa, the Scarpe, and the Deule. This province, in conſequence of its flouriſhing manufactures, its ſituation upon the ſea, and its fiſheries, is the ſeat of a very extenſive trade. Like moſt of the other provinces, it had formerly its petty princes, dependent, however, on the crown of France. For the adminiſtration of juſtice, here were many inferior courts ſubordinate to the parliament of Paris.

Bologne, on the mouth of the Lane, is only eight leagues from the neareſt coaſt of England. It is the capital of a diſtrict called the Boulonnois, which enjoys peculiar privileges of exemption from ſeveral taxes; and has a governor independent of the governor general of Picardy. The harbour cannot be entered but at high-water, and is defended by a fort.—The town is divided into Upper and Lower. The former of which is ſurrounded with walls, and contains about 400 houſes. This part was principally inhabited before the revolution by nobility. The lower town lies nearer to the ſea, and is not ſurrounded with walls, and contains a greater number of inhabitants than the upper town, and, from its connection with the harbour, monopolizes almoſt the whole of the trade. Before the revolution, it was the ſee of a biſhop, ſuffragan of Rheims, the ſeat of a governor, a commandant, a king's lieutenancy, &c. The harbour is difficult to enter, and the anchorage not good. There is not depth of water for ſhips of war, and trading veſſels muſt take the advantage of the tide.

The town of Calais, is ſituated on the narroweſt part of the channel oppoſite to Dover, from which it is diſtant about ſeven leagues, is the capital of the Pais Reconquis, or Recovered Country. It is pretty large, and well fortified, but the harbour is of very difficult and dangerous acceſs. Here are a fine arſenal and a citadel which commands the town, the harbour, and all the adjacent country, ſeveral convents, and a fort, whence all the country about the town may be laid under water in twenty-four hours. By the Canal of Calais, the inhabitants have an eaſy communication with Dunkirk, St. Omer, Graveline, Ypres, &c. and in time of peace a packet-boat paſſes regularly twice a week between England and Calais. There are two inconveniencies which they who paſs from Dover to Calais would always wiſh to avoid: The firſt is, that of loſing the tide, and being obliged to take a French boat to get into the harbour; the other is that of landing ſo late as to be ſhut out of the town, and compelled to lodge in one of the houſes that ſtand without it. The town of Calais makes a much handſomer appearance from the water than the town of Dover; its towers begin to become viſible on reaching the middle of the ſtreights. It has two piers of great length, which run parallel, and are both of timber.—One of them affords a very agreeable walk over a boarded floor, which, at ſeveral times of the day, but eſpecially in ſummer evening, is frequented by many genteel people of the place. On this pier a troop of ſervants from the ſeveral houſes of accommodation, ſtand ready to receive the paſſengers at their landing, and conduct them, together with their baggage, according to their ſeveral deſtinations.

Artois, is one of the moſt fertile diſtricts of the whole kingdom. It is 24 leagues long, and 12 broad, being bounded on the eaſt by Hainault, on the north by Flanders, and on the weſt and ſouth by Picardy. A conſiderable trade is carried on in the province in grain, flax, hops, wool, linen, &c. The ſtates conſiſt of the clergy, nobility, and commoners, who hold their ſeat at Arras.

Champagne, or Upper Marne, (now in the department of the Ardennes) has Hainault and Liege on the north, Burgundy on the ſouth, Luxemburg and Lorrain on the eaſt, and the Iſle of France and Picardy on the weſt. It is 160 miles long, in ſome places exceeds 140 in breadth, and is watered by the Seine, Maine, Aube, Aiſne, and Maes. The air is pure, and the ſoil fertile. The few hills abound with mines, the vallies with mineral waters, and the foreſts with game. The province itſelf receives its name from its extenſive plains. The trade conſiſts in corn, wine, and iron; and the whole was under the juriſdiction of the parliament of Paris; except the territory of Sedan, which belonged to the parliament of Metz.

Burgundy (in the department of Yonne, Saonne and Loir,) has Champagne on the north, Lyonnois on the ſouth, Franche Comté, on the eaſt, and Nivernois and Bourbonnois on the weſt. Its length, from north to ſouth, is about 45 leagues, and its breadth, from eaſt to weſt, about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Dehume, which falls into the Soane, the Brebince, or Bourbince, the Armancon, the Ouche, and the Tille. There are ſome noted mineral ſprings in it, with ſubterraneous lakes, and plenty of ochre. For a long time it had dukes of its own, ſubordinate to the crown of France; but Louis XI. at laſt, upon the failure of heirs male, ſeized upon it, and annexed it to his crown.

Dauphiné (now the department of Ardeche,) called alſo the Upper Alps, is bounded on the ſouth by Provence, on the north by Breſſe and the Rhône, on the eaſt by the Alps and Savoy, and on the weſt by the Rhône, which ſeparates it from the Lyonnois and Languedoc. It had long princes of its own, who were ſtyled dauphins du Viennois. At laſt Dauphin Humbert, having no children, made it over to Philip VI. of France, on condition that the inhabitants ſhould ſtill retain their privileges, that the province ſhould be for ever incorporated with the crown of France, and that the king's eldeſt ſon ſhould enjoy it, with the arms and title of Dauphin. In the year 1319, this agreement was fully executed. Dauphiné has a governor and parliament. Near two-thirds of the department are very barren and mountainous; but the mountains contain a variety of minerals, and, in ſome places, are covered with larch trees, which are very valuable, as they not only yield a very durable wood, but alſo manna, benzoin, and agaric, the laſt of which is uſed in phyſic and dyeing ſcarlet. The more level and fruitful part of the department is called Lower Dauphiné.—On the mountains are alſo found ſeveral ſorts of wild animals, as bears, marmots, chamois goats, and other ſpecies of goats, called by the French, bouquettons, or chevrels, together with white hares, partridges, eagles, hawks, &c.

Grenoble, ſituated on the conflux of the Iſere and Drac, in a plain at the foot of the mountains. It received its name from the emperor Gratian, ſon of Valentinian I. from whence it is called, in Latin, Gratianopolis. It is, however, much more ancient, was before called Cularo, and belonged to the Allobroges. It has been a biſhop's ſee ever ſince the 4th century. The Delphinial council, eſtabliſhed here in 1340, by Humbert II. dauphin of Viennois, was erected into a parliament in 1453, by king Louis XI. The governor and lieutenant-general of the province reſide here, and had formerly ſeats in the parliament above the firſt preſident. This city is well-peopled, and commanded by a fort called la Baſtille. The Iſere divides the city into two unequal parts. Here are no fine buildings, except the biſhop's palace, which owes its beauty to cardinal le Camus, biſhop of Grenoble; and is adorned by excellent paintings, repreſenting our Saviour's life and paſſion, and by the picture of the biſhop. The town was fortified by the chevalier de Ville. The ſkins and gloves of Grenoble are very much eſteemed; but the woollen ſtuffs are but coarſe.

Provence (in the department of the Lower Alps) derives its name from the Latin Provincia; and is bounded to the ſouth by the Mediterranean; to the north by Dauphiné; to the weſt by the Rhône, which ſeparates

ſeparates it from Languedoc; and to the eaſt by the Alps and the Var, which ſeparate it from the dominions of the king of Sardinia. It is divided into the Upper and Lower, its length being about 42 French leagues, and its breadth about 30. The air and ſoil differ widely in the two diviſions; for in the former the air is temperate, but in the latter extremely hot. The former yields good corn, apples, and pears, and abounds in cattle, but has little wine. On the contrary, the latter has plenty of wine, with orange, lemon, pomegranate, fig, palm, cypreſs, olive, maſtic, medlar, and ſea-cherry trees; but does not produce half the quantity of corn neceſſary for the inhabitants. This diſtrict yields alſo a kind of box, the fruit of which proceeds from the middle of the leaf, and continues all the year round. Of their wines, the Muſcadel is the beſt. In the road and harbour of Toulon is caught a fiſh, encloſed in a ſtone, which muſt be broke before the fiſh can be come at; it is called a date, from its reſemblance to that fruit. The taſte of it is very agreeable: but, in general, the fiſh of the Mediterranean are inferior to thoſe of the ocean. There is alſo a ſmall bird in Provence, called becca-figo, that feeds only upon grapes and figs, and is delicate eating. Iron, black agate, copper, and lead, are found here. There are no conſiderable rivers in this diſtrict: the chief are the Durance, the Sourge, the Largens (ſo called from the tranſparency of its water,) the Lare, the Verdon, and the Var; the laſt of which divides France from Italy. The woods are numerous, and afford a great deal of timber for ſhip-building and other uſes. Almoſt the whole trade from France to Italy, the Levant, and the greater part of Spain, is carried on from this part of the country.

Lyons is the ſecond city of France, in point of ſize and population, but ſuperior to Paris in trade, commerce, and manufactures, containing about 150,000 ſouls. They reckon eleven pariſhes, ſix gates, and four fauxbourgs, and it is divided into thirty-five quarters, named Penonages. It was the ſee of an archbiſhop, who was primate of France, and had formerly great political power over the Lyonnois. The cathedral church was a vaſt Gothic building, yet majeſtic in its appearance. The town-houſe is eſteemed one of the moſt beautiful in Europe; other public buildings, were before the revolution, four abbys, fifty convents, three public ſchools, a college of phyſic, two general hoſpitals, &c. Here were, beſides, an academy of arts and ſciences and belles-lettres, a ſociety of agriculture, a veterinary ſchool, a theatre, public library, ſeventy companies of tradeſmen and artiſts, three forts, an arſenal well ſupplied, and arranged with care, magnificent quays, &c. The trade is immenſe with Spain, Italy, Switzerland, Germany, Holland, England, &c. Early in the French revolution, an union was formed between the towns of Lyons, Marſeilles and Toulon, under the title of Federal Republicaniſm, contrary to the general ſenſe of the nation, which was for a republic one and indiviſible. Lyons contained a great number of diſaffected citizens of every claſs, Royaliſts and Girondiſts, and was declared to be in a ſtate of rebellion. After a ſiege of two months, in which the Lyoneſe were computed to have loſt 2000 men, and great part of the city was reduced to aſhes, the city ſurrendered. The chiefs of the rebels had fled, but ſeveral of them were afterwards taken and executed. By a decree of the convention, the walls and public buildings of Lyons, were ordered to be deſtroyed, and the name of the city itſelf to be changed to that of *Ville Affranchie*; this decree was afterwards repealed.

Rheims, one of the moſt ancient and celebrated cities of all France, ſituated on the Veſle. Before the revolution, it was the ſee of an archbiſhop, who was the firſt duke and peer of France, and always crowned the king. The abby of Benedictines of St. Remy here was one of the nobleſt belonging to that order in all France, and on the altar of its church, under which St. Remigius lies buried, was kept the holy vial, which according to the ſtory, in the year 496, at the baptiſm of Clovis, by biſhop Remigius, was brought from heaven, by a dove, at the prayer of that Saint, the crowd hindering him from being able to come to the font with the uſual oil. The univerſity here was founded in the years 1547 and 1549, authoriſed by the parliament of Paris. This city carries on alſo a conſiderable trade in wine, woollen and ſilk ſtuffs, and gingerbread. In it are ſeveral remarkable remains of Roman antiquities, particularly three gates of the city, which to this day bear the names of ſo many pagan deities, viz. of the Sun, Mars, and Ceres.

Liſle, before the revolution, the capital of French Flanders, is ſituated on a rich and marſhy ſoil, ſurrounded with walls, and ſtrongly fortified by Monſieur Vauban. The river Deule croſſes it. They reckon 170 ſtreets, many of which are handſome, thirty public places, 8000 houſes, and 56,000 inhabitants. Before the revolution, it contained eighteen convents, a penitentiary houſe for women of bad life, ſix hoſpitals, three colleges, &c. It was divided into ſeven pariſhes, and had ſeven gates, ſome of which are admired for their architecture. Here are manufactures of cloth, camblets, ratteens, ſtuffs of ſilk and woollen, cotton, linen, of all qualities and deſigns, lace, ribbons, carpets, hats, ſtockings, paper, ſoap, &c. The citadel of Liſle is conſidered as one of the beſt works of Vauban, and, except Turin, the ſtrongeſt in Europe. In the year 1792, Liſle was ſummoned by the Auſtrians, under the command of the duke of Saxe Teſchen, and on the refuſal of the citizens to ſurrender it, was bombarded, but without ſucceſs. The ſiege began on the 29th of September, and was raiſed on the 8th of October, during which time it is ſuppoſed that upwards of 30,000 red hot balls, and 6000 bombs were thrown into the city, excluſive of the battering train. The damage done to the town was conſiderable, with the loſs of about 500 lives, chiefly women and children.

Dunkirk was only a ſmall village, inhabited by fiſhermen, till St. Eloy, biſhop of Noyon, built a church there in the ſeventh century. In the year 980, it was ſurrounded with walls, by Baldwin III, ſirnamed the Young, count of Flanders, and many inhabitants induced to reſide there by particular privileges and immunities granted them by him and his ſucceſſors. In the year 1662, Louis XIV. made it one of the ſtrongeſt places in Europe, and rendered the harbour commodious. By an article of the treaty of peace ſigned at Utrecht, it was agreed, that all the fortifications ſhould be demoliſhed, and the harbour filled up. This article was renewed in every ſubſequent peace, till the peace of 1783, after the American war. In the year 1793, the Engliſh army, under the duke of York, attempted to beſiege it, but were compelled to retire. It is the moſt important town and harbour on the whole coaſt, and having been declared a free port, had a great deal of commerce. By means of a ſluice forty-two feet wide, the baſon within the town will hold forty ſhips of the line always floating. Dunkirk is divided into Old and New Town. The number of inhabitants is eſtimated at 80,000.

Valenciennes, a ſtrong, large, and well-built city in the French Netherlands, ſituated on the Scheldt, which runs through the town in ſeveral branches, and here becomes navigable. Before the revolution, it belonged to Hainault, and contained ſeveral churches and convents. The town-houſe is an ancient building of free-ſtone, founded in the fourteenth century, the ſquare or grand place is handſome, but the ſtreets are in general narrow, dark, and crooked. The form of its municipial government was conſidered ſo good as to ſerve for the model of ſeveral republics, particularly Venice and Nuremberg, which ſent deputies to collect the laws. Near the town is a coal-mine.

In the year 1793, Valenciennes was inveſted by the allies, under the conduct of the duke of York, and the governor Ferrand, ſummoned to ſurrender, which he refuſed. During the beginning of June, a very briſk fire was kept up from the fortreſs; and on the 5th the French attacked the advanced poſts, but were repulſed. In the courſe of the ſiege a difference of opinion aroſe, between the Engliſh engineer, colonel Moncrief, and M. Ferraris, the chief engineer of the emperor. The Britiſh officer was for planting batteries immediately under the wall of the city, inſtead of approaching it by regular parallels. M. Farraris, however, contended, that the work of the great Vauban was not to be treated with ſo little reſpect, and his opinion was adopted by the council of war. On the morning of the 14th of June, the trenches were opened. The Britiſh commander then ſummoned the garriſon; but receiving an unſatisfactory anſwer, the artillery began to play upon the town with great vigour, and in the courſe of the night above 500 red hot balls were poured in upon it. Towards the beginning of July, the beſiegers were able to bring 200 pieces of heavy artillery to play without intermiſſion on the town, and the greater part of it was reduced to aſhes. The moſt ſingular fact in the hiſtory of this ſiege is, that a conſiderable part of the war was carried on under-ground, mines, and counter-mines innumerable, having been formed both by the beſiegers, and beſieged. The principal of theſe on the ſide of the former, were one under the glacis and one under the horn-work of the fortreſs; theſe mines were completed and charged on the 25th of July, and in the night between nine and ten o'clock were ſprung, with the moſt complete ſucceſs. The Engliſh and Auſtrians immediately embraced the opportunity to throw themſelves into the covered way, of which they made themſelves maſters. The die was now caſt, and, on the 26th, the duke of York again ſummoned the place, which ſurrendered on capitulation the ſucceeding day; the duke of York taking poſſeſſion of it in behalf of the emperor of Germany. The following year, however, in conſequence of the ſucceſſes of the French arms, Valenciennes ſurrendered to the republicans, on capitulation, on the 26th of Auguſt. The garriſon were made priſoners of war, but to be conducted to the firſt poſt of the Imperial and Dutch armies, on condition that they were not to ſerve againſt the republic, till regularly exchanged. Conſiderable ſtores of every kind, with 100 pieces of cannon, 1,000,000 pounds of gunpowder, and 3,000,000 of florins in ſpecie, and 6,000,000 and a half of livres, were found in Valenciennes; 1000 head of horned cattle, and great quantities of oats and other corn were alſo included within the fortreſs. So earneſt indeed had the emperor been to retain this important place, that he is ſaid to have expended 3,000,000l. in repairing and improving the fortifications. What is moſt to be lamented is, that upwards of 1000 unhappy emigrants were ſurrendered on this occaſion, to the vengeance of their enraged countrymen. The principal manufactures are lace, cambrick, and woollen mits, camblets, &c.

Rochelle, or La Rochelle, is ſituated on the ſea-coaſt, two leagues from the Iſle of Rhé, and four from Oleron; it is a handſome town, with a fine port, of a circular form, and ſtrong fortifications. Here alſo are a mint, a chamber of commerce, an admiralty, and other courts, an academy of Belles Lettres, a ſugar refinery, and a medical, botanical, and anatomical ſchool. Before the revolution it was the ſee of a biſhop, ſuffragan to Bourdeaux. The ſalt marſhes affect the air of this place greatly. This city, being the chief ſeat of the reformed in France, ſuffered very much during the civil wars, and was often valiantly defended, and long poſſeſſed by that party, till at length Louis XIII. after a long and famous ſiege, made himſelf maſter of it in the year 1628, chiefly by the means of an admirable rampart, or bank of earth which cardinal de Richlieu cauſed to be raiſed againſt it on the ſide of the Ocean. After it was taken, the king cauſed the walls and fortifications to be demoliſhed, except only two towers, which defend the port; but Louis XIV. cauſed new and ſtrong fortifications to be raiſed about it.

Rochfort, a handſome new town, ſituated on the Charente, was built by Louis XIV. It is ſtrongly fortified and furniſhed with all the neceſſary magazines, ſtorehouſes, &c. for ſhipping, together with a fine large dock, a victualling office, and hoſpital for ſick and wounded ſeamen, a foundery, a manufactory of ſail-cloth, and a marine academy. The harbour here is very convenient, and the river, which is well guarded with forts all the way to its mouth, is ſo broad and deep, that the largeſt ſhips may come up to the town without either danger or difficulty.

Breſt is a ſmall but ſtrong town, ſituated on the north ſide of a large commodious bay and harbour, capable of containing 500 men of war in eight, ten, and fifteen fathom at low water. The coaſt on both ſides is well fortified. The entrance is narrow and difficult, with covered rocks, that make it dangerous to thoſe not well acquainted with it. It contains two pariſhes, and a marine ſeminary. The arſenal is an immenſe and ſuperb building, and the dock yards well conſtructed. It is the ſeat of a governor, of an admiralty board, and a municipality.

The city of Toulon, which is large, before the revolution, was the ſee of a biſhop, and, beſides the cathedral and other pariſh churches, contained nine convents, a ſeminary, and a college. The old and new harbour lie contiguous, and, by means of a canal, communicate with one another, both having an outlet into the ſpacious outer harbour, which is naturally almoſt of a circular figure, and very large, being ſurrounded with hills. The entrance on both ſides is defended by a fort, with ſtrong batteries. The new harbour, which is a work of Louis XIV. is well defended by batteries, and round it ſtands the arſenal, where every man of war has its own particular ſtore-houſe, but the guns and cordage are laid up ſeparate. In it are ſpacious working houſes for black-ſmiths, joiners, carpenters, lock-ſmiths, carvers, &c. The rope-houſe is built wholly of freeſtone, being 320 toiſes in length, with three arched walks, in which as many parties of rope-makers may work at the ſame time. The general magazine here, which ſupplies whatever may be wanting in the particular ſtore-houſes for ſingle ſhips, contains an immenſe quantity of all kinds of ſtores, diſpoſed in the greateſt order and conveniency. The cannon foundery here is conſiderable. In Auguſt 1793, Lord Hood, the Britiſh Admiral, obtained poſſeſſion of the harbour, ſhips, and fortreſſes of Toulon, on certain conditions agreed on between the king of Great-Britain and the Royaliſts; but on December 20 following, he evacuated the ſame, after deſtroying ten of the enemy's ſhips of the line in the arſenal, with the maſt-houſe, great ſtore-houſe, hemp-houſe, and other buildings: the admiral alſo took poſſeſſion of the Commerce de Marſeilles, Puiſſant, and Pompée of the line; with the Pearl, Arethuſa, and Topaz frigates, beſides ſeveral large corvettes.

The city of Marſeilles is ſituated on the coaſt of the Mediterranean ſea, and is divided into the Old and New; the former of which is but meanly built, but in the latter, the ſtreets are ſtraight and broad, adorned with handſome edifices. Before the revolution, this city was the reſidence of a bailiwick, and the ſee of a biſhop, ſuffragan to the archbiſhop of Arles, who has a dioceſe, containing thirty-ſix pariſhes, with an annual revenue of 30,000 livres. In it was alſo a mintage, together with four pariſh churches, including the cathedral and two collegiate ones, with two abbies, an academy of the beaux arts, and an obſervatory. It contains a large arſenal, well ſtored

ſtored with all the implements for fitting out the gallies. The large armoury here, which conſiſts of four walks croſſwiſe, and is accounted the fineſt in the whole kingdom, contains arms for 40,000 men. In the arſenal is a dock for building the gallies. This is roofed over, and communicates with the harbour, which is a parallelogram, having public and private buildings on the two long ſides, and one of the ſhorter. The other ſide is the iſſue into the Mediterranean, which is defended, on each point, by a ſtrong fort. The entrance into the harbour, on account of a rocky cape near it, is difficult, and has not depth of water enough for men of war. Gold and ſilver ſtuffs are made here. It is ſaid to contain 90,000 inhabitants.

Avignon, a large and beautiful city, is ſituated at the conflux of the Rhône and Sorgue, ſeven miles from Arles to the north, and fifteen from Aix to the north-weſt. Here is a papal palace, in which the vice-legate, or governor, reſided; a ſtone bridge over the Rhône; a very handſome college; and an univerſity, founded in the year 1303. No leſs than ſeven popes reſided here ſucceſſively, from the year 1307 to 1377. In the church of the Franciſcans is the tomb of the beautiful and learned Laura, ſo much admired and celebrated by the immortal Petrarch. The grave having been opened in the time of Francis I. a leaden box was found in it, containing a medal, with a copy of verſes written on parchment by Petrarch, in praiſe of his miſtreſs. The Jews enjoy the free exerciſe of their religion in this city.

Languedoc, now called Gard, is bounded to the ſouth by the Mediterranean and Rouſſillon; to the north by Auvergne, Lyonnois, and Guienne; to the eaſt by the Rhône; and to the weſt by Gaſcony. It is ſeventy leagues in length, and, where wideſt, thirty-two in breadth. The principal rivers are the Rhône, Garonné, Aude, Tarne, Allier, and Loire. The royal canal of Languedoc is upwards of 100 miles in length, ſix feet deep every-where, and the breadth about twenty fathoms. In ſome places it is carried under mountains, and in others over vallies, having all along ſluices, dams, reſervoirs, watercourſes, and draw-bridges.

Several remarkable winds are obſerved in this department. That called the cers blows generally from the weſt along the ſouthern coaſts, and is very refreſhing in ſummer: another, called autan, blows generally from the oppoſite quarter, and is hot and unwholeſome: and a third, called biſe, or the black, blows frequently in the valley through which the Rhône runs, very ſtrong and cold. When the wind in this valley blows from the ſouth, unattended with rain, it is no leſs unwholeſome than the autan. From the coaſts of Leucate to the Rhône, in the heat of ſummer, a ſea breeze ſets in, from ten in the forenoon to five in the afternoon, which cools the air, that would be otherwiſe almoſt inſupportable. In a valley, at the foot of the Pyrenees, there is a ſharp weſt or north-weſt wind, called the le vent de pas, which blows only in the night, and generally, in the ſummer, through the openings of the mountains; hence the people of the valley are obliged to winnow their corn in the night. A very remarkable cuſtom prevails in this diſtrict, which is that of treading out their corn by horſes or mules, according to the Eaſtern cuſtom, frequently alluded to in the ſcriptures. The ſtates of the province conſiſted of three orders, the clergy, nobility, and commons. The coaſts of Languedoc are not only dangerous, but deſtitute of ſafe and good harbours. The exports conſiſt chiefly of wine, oil, dried cheſnuts, raiſins, woollen cloth, ſtuffs, ſilk, and corn. The common diviſion of the department is into Upper and Lower.

The capital of the whole department is Thouloufe, ſituated on the Garonne, over which it has a ſtately bridge, is one of the largeſt and moſt ancient cities in France; yet, having little trade, it is neither populous nor rich.

Montpelier, ſituated on an eminence, near the river Lez, is the largeſt city in the department next to Thouloufe, and the ſee of a biſhop, ſuffragan to Narbonne. It contains a citadel, univerſity, phyſic-garden, and royal academy of ſciences: of the fifteen ordinary fellows of the latter, three apply themſelves to the mathematics, three to anatomy, three to chemiſtry, three to botany, and three to natural philoſophy. The air of this city is deemed remarkably ſalubrious: the houſes are handſome, but the ſtreets narrow; and here is a good trade in ſilks, woollens, wine, ſtrong waters, verdigris, &c. Montpelier is pleaſantly ſituated, and commands many beautiful proſpects. On the Pierou there is a fountain, which, for ſimplicity and beauty, excels moſt others: the water is brought from a mountain five miles diſtant. The environs of this city are planted with vines, olive, fig, and mulberry-trees; the latter to nouriſh the ſilk-worms, which form the moſt conſiderable object of trade. Another thing that brings in a conſiderable revenue to this city is the diſtillation of waters of all ſorts, of *liqueurs*, and ſyrups, that are famous all over Europe. This place is much reſorted to by thoſe of the Engliſh who labour under diſorders of the lungs; whom the reputed clearneſs of its atmoſphere, and fame of its phyſicians, have lured in hopes of a cure. Beſides its univerſity, and ſchools of medicine, Montpelier boaſts a royal academy of ſciences, which is compoſed of ſix honorary members, three phyſicians, three aſtronomers, three mathematicians, three chemiſts, and three botaniſts. Rabelais is ſaid to have been of this univerſity; and his gown and cap are ſtill preſerved, with a kind of religious veneration, and uſed in the ceremony of conferring the degree of doctor. Balaruc, on the Thau, not far from Montpelier, has ſome warm baths, the waters of which will retain their heat at leaſt eight hours.

Foix is bounded on the weſt by Gaſcoigne, on the eaſt and north by Languedoc, and to the ſouth by Rouſſillon and the Pyrenean mountains. It is divided into Upper and Lower. The former is mountainous, but abounds in wood, iron, caverns, and mineral waters; and the latter is fruitful in corn, wine, &c.

Rouſſillon (now the Eaſtern Pyrenees department) is bounded on the north by the Leſſer Pyrenees, on the ſouth by the Greater, on the weſt by Cerdogne, and on the eaſt by the Mediterranean Sea. It is twenty leagues long, and twelve broad, and received its name from a Roman colony, called Ruſcino. The heat here, in ſummer, is intenſe; but the ſoil is fruitful in corn, wine, oil, millet, oranges, &c. Sheep, quails, partridges, and pigeons abound; but cows and oxen are ſcarce. The ground is ploughed by mules; and a great deal of oil, with ſome corn, millet, and wool, are exported from the country. It is watered by the Tet, the Tec, and the Agly, which are, properly ſpeaking, only torrents, produced by the melting of the ſnow on the mountains. It belonged formerly to Spain, but was yielded for ever to France by the treaty of the Pyrenees in 1659. Beſides Rouſſillon, this department includes a part of Cerdagne.

The principal place in Rouſſillon is Perpignan, the capital, ſituated on the river Tet, a league from the Mediterranean, which, though not large, is populous, well built, and ſtrongly fortified. It is alſo the ſee of a biſhop, ſuffragan to Narbonne. Here are an univerſity, ſeveral convents, alms-houſes, hoſpitals, and churches, a noble cannon-foundery, a ſalt-office, a mint, and a high court of juſtice, to which appeals lie from all the inferior courts. The remains of the old town of Rouſſillon lie on the river Tet, not far from Perpignan.

Navarre and Bearn. The boundaries of this department are Labourd on the weſt, Bigorre on the eaſt, Gaſcoigne on the north, and the Pyrenean

mountains on the ſouth. Navarre, included in this department, is but a ſmall portion of the ancient kingdom of Navarre, which, having been ſeized upon by Ferdinand, king of Arragon and Caſtile, this part alone was reſtored, and became annexed to the crown of France. It is only eight leagues in length, and five in Breadth. Navarre is barren and mountainous, and contains only one place worth notice, viz. St. Jean-Pié-de-Port, which is ſituated on the Nice, a league from the borders of Spain, and eight from Bayonne. It is well fortified, and has a caſtle, commanding the paſs of the mountains.

Guyenne and Gaſcony, which is the largeſt department in France, being ſixty-five leagues in length, from eaſt to weſt, and fifty-ſix in breadth, from north to ſouth, is bounded on the ſouth by the Pyrenean mountains; on the north by Limouſin, Angoumois, and Saintonge; on the eaſt by Languedoc and Auvergne; and on the weſt by the Ocean. This department is fruitful in corn, wine, fruits, and hemp, tobacco, brandy, prunes, and many other commodities. They have alſo medicinal ſprings, with copper, coal, and other mines, and quarries of marble of all colours. The chief rivers are the Garonne and Adour, both which diſcharge themſelves into the Ocean.

Guyenne, properly ſo called, is bounded on the north by Saintonge, on the eaſt by Perigord (now Dordogne), and Agenois, on the ſouth by Bzadois and Gaſcony, and on the weſt by the Ocean; and contains the following places of note: Bourdeaux, the capital of the whole department, which ſtands on the banks of the Garonne, about twenty leagues from its mouth, and is one of the moſt ancient in France. It carries on a great trade with moſt parts of Europe, the tide riſing ſo high in the river, that ſhips of great burden can come up to the quay. The city and harbour are defended by three forts. The fineſt parts of the former are the palace-royal near the harbour, and the ſuburb of Chartron. It is the ſee of an archbiſhop. Here are an univerſity, an academy of ſciences and fine arts, a large Gothic cathedral dedicated to St. Andrew, ſeveral other churches and convents, three ſeminaries, ſeveral public fountains, an exchange, a mint, a parliament, an admiralty, ſeveral other courts and offices, ſome remains of antiquity, and a manufactory of lace. About ſix leagues below the city is a watch-tower, or light-houſe, called La Tour de Cordouan. Foreign Proteſtant merchants are indulged here in the private exerciſe of their religion. Richard II. king of England, was born here in 1367.

An ingenious writer comments on this city in the following picturesque manner: "The favourable impreſſion which Bourdeaux cannot fail to make on a ſtranger at his arrival is well confirmed by a reſidence in it. Pleaſure ſeems to have as many votaries here as commerce; luxury and induſtry reigning within the ſame walls, and that in the moſt extended degree. The air of courts is ever effeminate, ſeductive, and voluptuous. Commercial cities are uſually marked by oppoſite manners, and the love of gain. Avarice, powerful in its influence over the human heart, ſwallows up and abſorbs the more ſoft and melting paſſions. Here, however, theſe rules are entirely controverted. Diſſipation and debauchery are more openly patronized, and have made a more univerſal and apparent conqueſt, than in half the capitals of Europe."

The neighbouring diſtrict called Bourdelois, is very fruitful, particularly in vines, cheſnuts, and fig trees.

Montaubon, on the Tarne, is a handſome well built town, eight leagues from Thouloufe, and under the juriſdiction of its parliament. The biſhop is likewiſe ſuffragan to the archbiſhop of Thouloufe. Here were an academy of Belles Lettres, ſeveral convents, a manufactory of woollen ſtuffs, ſeveral inferior courts of juſtice, &c. This town ſuſtained conſiderable damage by a dreadful inundation of the river Tarne, which began on the 14th of November 1766, and laid 1200 houſes in ruins. The particulars of this melancholy diſaſter are thus related: The fall of the houſes began in the ſuberb of Sapiac. The noiſe occaſioned by their tumbling was heard in the neighbouring ſuburb, with the cries of ſeveral perſons who called out for help; but as the water ſurrounded entirely the ſuburb of Sapiac, it was very difficult going to the aſſiſtance of the unhappy inhabitants. The river, which was prodigiouſly ſwoln and rapid, was laden with a number of trees of an enormous ſize, that had been torn up by the roots, and carried down along with it; a circumſtance which, joined with the darkneſs of the night, rendered the paſſage of boats very dangerous. Theſe obſtacles, however, did not intimidate a mariner, who, in ſpite of the entreaties and tears of his wife and children, ventured to croſs the river, in order to ſave ſuch as were on the point of periſhing. His courage rouſed ſeveral of his fellow boatmen to imitate him; and by means of their help no one periſhed. The floods continued to increaſe, and redouble their alarms. The inhabitants of the city, ſeparated from the ſuburb by a bridge, ran to the Ville Bourbonne. At ſeven o'clock of the morning of Tueſday, November 18, the floods began to abate, and their decreaſe continued till noon. Hope immediately began to ſpring up in every boſom, but was ſoon ſtifled by the fall of the greateſt part of the ſuburb of Gaſſeras, adjoining to that of Ville Bourbonne; and it was perceived that all the houſes, even thoſe that were yet at a diſtance from the waters, were tottering, and reſted only on a looſe earth, which the waters had already undermined. At noon the ſwell began again, and was continually augmenting. The conſternation was then univerſal. Orders were given to move off all the effects. Perſons of all ranks were deſired to aſſiſt in the removal; and all the carriages were engaged to make the removal the more ſpeedy. The tribunals of juſtice opened their halls, the monks their convents and cloiſters: the churches were alſo offered as repoſitories for the effects of the people. The inhabitants of Ville Bourbonne abandoned ſucceſſively their houſes; and the inhabitants of the city, with an earneſtneſs which did honour to humanity, received their unhappy neighbours, and, with marks of true tenderneſs, endeavoured to aſſuage a grief which had no bounds. The inundation increaſed during the whole day, and continued ſtill augmenting till ſeven in the morning of November 19, when the waters were thirty-two feet above the common water level. Such an extraordinary inundation occaſioned ſundry neighbouring villages to be entirely overflowed, and produced the greateſt ravages. In the plains the buildings were overwhelmed, the grain waſhed away, the cattle drowned, and the greateſt part of the inhabitants found their only ſafety in ſudden flight, or in climbing high trees, where the horrors of famine were joined to the dreadful ſpectacle of beholding their dwellings deſtroyed, and their effects carried away by the flood.

The town of Bayonne is the capital of the diſtrict of Labourd, which produces ſome fruits; it is a pretty large city near the ſea, five leagues on the borders of Spain to the north, and 120 from Paris. Being one of the keys of the kingdom on the Spaniſh ſide, it is ſtrongly fortified. Here are a citadel, with two forts, and other works; an admiralty, a mint, ſeveral convents, and the ſee of a biſhop, who is ſuffragan to Auch, and has a revenue of 19,000 livres, out of which his taxation to Rome is only 100 florins. Bayonne is moſt agreeably ſituated at the conflux of two rivers, the Adour and the Nive. The firſt is ſcarce leſs conſiderable than the Thames oppoſite Lambeth; and acroſs it is a wooden bridge, which joins the place to a ſuburb, called Le Fauxbourg du St. Eſprit. The Nive, which is ſmall, and riſes in the Pyrenees, interſects the centre of the city, and reſembles one of

†

of the canals in Holland. The entrance into the Adour, which is about four miles below the town, is rendered both difficult and hazardous, from the ſands, which have collected and formed a bar towards the mouth. It is, notwithſtanding, a very agreeable place of reſidence, and furniſhes, in profuſion, all the requiſites of life.

Saintonge and Agoumois, or Angoumois, now Charente department, is twenty-five leagues long, twelve broad, and bounded on the eaſt by Agoumois and Perigord, on the weſt by the Ocean, on the north by Poitou and Aunois, and on the ſouth by the Garonne and Burdelois. The rivers are the Charante and Butonne; and the country abounds in grain, wine ſaffron, fruit, ſalt, and mineral ſprings.

Aunois is bounded on the ſouth and eaſt by Saintonge, on the north by Poitou, and on the weſt by the Ocean. It is only ten leagues long, and about as many broad, being the ſmalleſt province in France; but is fertile in grain, paſturage, vines, &c. It has a good harbour, great quantities of ſalt, and lies within the juriſdiction of the parliament of Paris.

Poitou (now Vendee) is bounded on the north by Touraine and Anjou; on the ſouth by Aunois, Saintonge, and Agoumois; on the eaſt by La Marche and part of Berry; and on the weſt by the Ocean. It is forty-eight leagues long, and twenty-two broad. It belonged formerly to the kings of England; but being loſt by Henry VI. was re-united to the crown of France. The rivers are the Sevre-Niortoiſe, Vienne, and Clain. The produce and commodities are corn, cattle, and woollen ſtuffs; and the whole was under the juriſdiction of the parliament of Paris.

The capital of the department is Poitiers, ſituated on the river Clain; it is large, and contains many churches, ſeveral abbies, convents, and courts of juſtice, ſome remains of Roman antiquities, an univerſity, a mint, and manufactories of woollen caps, ſtockings, gloves, and combs. It is the ſee of a biſhop, ſuffragan to the archbiſhop of Bourdeaux. In the year 1356, the French were defeated by the Engliſh, under Edward the Black Prince, near this town, and John, their king, taken priſoner.

Britanny, (Finiſterre) is a peninſula, which borders on Normandy, Maine, Anjou, and Poitou, towards the eaſt only, all the other parts being bounded by the ſea. It is ſixty leagues long, forty-five broad, and had its name from the Britons, who fled hither from the Saxons, in the tenth century. It is watered by the Loire and Vilaine, and abounds in lead, pit-coal, wood, ſalt, butter, cattle, &c. has many good harbours on the coaſt, and contains abundance of ſeamen, fiſhermen, &c. The air is but indifferent. The province had a parliament of its own; and the people ſpeak a jargon ſomewhat reſembling the Welſh.

Rennes, the honorary capital of Bretagne, becauſe the ſtates aſſembled there, is ſituated at the conflux of the Iſle and the Vilaine, about fourteen leagues from the ſea; it is pretty large and populous, the ſeat of ſeveral courts, and alſo of a biſhop, who is ſuffragan to Tours. Here were a number of convents and churches, beſides the cathedral. Some of the principal ſtreets are handſome, as the conflagration in the year 1720, which almoſt reduced the whole place to aſhes, obliged the inhabitants to rebuild them. In one of the ſquares is a fine ſtatue, in bronze, of Louis XV. It was erected by the province in 1744, ſoon after his recovery from that dangerous illneſs in Flanders, when he obtained the title of "Bien Aimé." Beneath the prince appears, on one ſide, Hegeya, the goddeſs of health, with her ſerpent and patera; and on the other is the genius of Bretagne kneeling on one knee, and in her countenance exultation and reverence finely marked. At the foot of the pedeſtal is an honorary inſcription in Latin.

The city of St. Malo is ſmall, but populous; it is ſituated on a little iſland (which is joined to the continent by a mole or cauſeway, at the head of which is a ſtrong fort) on the northern coaſt of Brittany. Here are a court of admiralty, ſeveral fine monaſteries and churches, and a large harbour, but of difficult acceſs. For the defence of the town and harbour, there are ſeveral forts, and other works, with a good garriſon. The biſhop is temporal lord of the city, and ſuffragan to the archbiſhop of Tours. The trade of the town is very conſiderable; in particular it ſends a number of ſhips to the cod fiſhery; and, in time of war, fits out many privateers. The caſtle was built by the celebrated Anne of Bretagne, who annexed the duchy to the crown of France, by her marriage with Charles VIII. Being aſked by the engineer, who conſtructed it, what plan ſhe would chooſe as its model, ſhe replied, "My coach." It is ſo in effect. A large ſquare area within conſtitutes the body; two ſmall towers, in the fore part, anſwer to the fore wheels of a carriage; as two others of ſuperior ſize do to the hinder ones; a projection in front forms the pole; and an arched nich behind correſponds to the place where the laquais ſtand.

Normandy department, now called Calvados and Eure, extends from eaſt to weſt ſixty leagues, and from north to ſouth about thirty leagues. It is bounded on the ſouth by Maine, Perche, and Beauce; on the north by the Britiſh channel; on the weſt by Brittany; and on the eaſt by the Iſle of France and Picardy. It is fruitful in corn, flax, hemp, fruit, and paſturage; and abounds in wood, coals, cattle, madder, woad, mineral-waters, iron, copper, &c. The rivers are the Seine, Eure, Andelle, Rille, Dive, Lezon, Carentone, Aure, Antes, Arne, Drome, &c.

Rouen, the capital of the department, ſtands on the north bank of the Seine, in a valley, almoſt ſurrounded with hills, twenty-two leagues from Paris to the north-weſt, is the ſeat of a parliament and admiralty, and of ſeveral other courts, offices, and churches; and alſo of an archbiſhop. In one of the towers of the cathedral is a bell of an enormous ſize. The bridge of boats over the Seine is a great curioſity, being paved like a ſtreet, and riſing and falling with the tide. Beſides other tombs of great perſons in the cathedral, is that of John duke of Bedford, who was regent of France under our king Henry VI. The trade of this city is very conſiderable, the tide of flood riſing ſo high, that veſſels of above 200 tons can come up to it, though it is twelve leagues from the mouth of the river. In the place Aux Veaux, is a ſtatue of the Maid of Orleans, kneeling before Charles VII. William I. ſurnamed the Conqueror, died here. In one of the ſuburbs are ſeveral mineral ſprings.

Caen is ſituated at the conflux of the Orne and Odon. Here are a caſtle, an univerſity, an academy of ſciences, and many churches and convents, with ſeveral courts and offices. It is a place of good trade. William the Conqueror was interred in the abbey of St. Stephen in this city, which he had founded.

Cherburg, fourteen leagues north of Coutance, has a ſmall commodious harbour, and, by the flowing of the waves, is every tide almoſt ſurrounded by the ſea. This town was taken by the Engliſh in 1758, and the fortifications demoliſhed, together with the famous baſon.

The little town of Mont St. Michael, with an abbey and caſtle, is built on a rock, in the midſt of a ſandy ſhore, which, at high water, is overflowed.—The abbey has been much reſorted to by pilgrims. As this place is diſtinguiſhed by ſome remarkable circumſtances, we ſhall give the following ample and entertaining deſcription of it, in the words of an ingenious traveller:

"This

" This extraordinary rock (for it is no more) riſes in the middle of the bay of Avranches. Nature has completely fortified one ſide by its craggy and almoſt perpendicular deſcent, which renders it impracticable for courage or addreſs, however conſummate, to ſcale or mount it. The other parts are ſurrounded by walls, fenced with ſemilunar towers in the Gothic manner; but ſufficiently ſtrong, ſuperadded to the advantages of its ſituation, to deſpiſe all attacks. At the foot of the mountain begins a ſtreet or town, which winds round its baſe to a conſiderable height. Above are chambers where priſoners of ſtate are kept, and other buildings intended for reſidence; and on the ſummit is erected the abbey itſelf, occupying a prodigious ſpace of ground, and of a ſtrength and ſolidity equal to its enormous ſize; ſince it has ſtood all ſtorms, in this elevated and expoſed ſituation, during many centuries. I ſpent the whole afternoon in the different parts of this edifice: and as the Swiſs, who conducted me through them, found he could not gratify my curioſity too minutely, he left no apartment or chamber unſeen.

" The Sale de Chevalerie, or Knights-hall, where the knights of St. Michael uſed to meet in ſolemn convocation on important occaſions. They were the defenders and guardians of the mountain and abbey, as thoſe of the temple, and of St. John of Jeruſalem, were to the holy ſepulchre. At one end is a painting of the archangel, the patron of their order: and in this hall Louis XI. firſt inſtituted, and inveſted with the inſignia of knighthood, the chevaliers of the croſs of St. Michael.

" We paſſed on through ſeveral leſſer rooms into a long paſſage, on one ſide of which the Swiſs opened a door, and through a narrow entrance, perfectly dark, he led me, by a ſecond door, into an apartment, or dungeon (for it rather merited the latter than the former appellation) in the middle of which ſtood a cage. It was compoſed of prodigious wooden bars; and the wicket, which admitted into it, was ten or twelve inches thick. I went into the inſide. The ſpace it compriſed was about twelve or fourteen feet ſquare; and it might be nearly twenty in height. This was the abode of many eminent victims in former ages, whoſe names and miſeries are now obliterated and forgotten.

" There was, ſaid my conductor, towards the latter end of the laſt century, a certain news-writer in Holland, who had preſumed to print ſome very ſevere and ſarcaſtic reflections on Madame de Maintenon, and Louis XIV. Some months after he was induced, by a perſon ſent expreſsly for that purpoſe, to make a tour into French Flanders. The inſtant he had quitted the Dutch territories, he was put under arreſt, and immediately, by his majeſty's expreſs command, conducted to this place. They ſhut him up in this cage. Here he lived upwards of twenty-three years; and here he, at length, expired. During the long nights of winter, continued the man, no candle or fire was allowed him. He was not permitted to have any book. He ſaw no human face except the jailor, who came once every day to preſent him, through a hole in the wicket, his little portion of bread and wine. No inſtrument was given him with which he could deſtroy himſelf; but he found means at length to draw out a nail from the wood, with which he cut or engraved, on the bars of his cage, certain fleurs-de-lis, and armorial bearings, which formed his only employment and recreation.—Theſe I ſaw, and they are, indeed, very curiouſly performed with ſo rude a tool.

" It is now fifteen years, ſaid the Swiſs, ſince a gentleman terminated his days in that cage. It was before I came to reſide here. But there is one inſtance within my own memory. Monſieur de F——, a perſon of rank, was conducted here by command of the king. He remained three years ſhut up in it. I fed him myſelf every day; but he was allowed books and candle to alleviate his miſery; and at length the abbot, touched with his deplorable calamities, requeſted and obtained the royal pardon. He was ſet free accordingly.

" The ſubterranean chambers, added he, in this mountain are ſo numerous, that we know them not ourſelves. There are certain dungeons, called Oubliettes, into which they were accuſtomed anciently to let down malefactors guilty of very heinous crimes.—They provided them with a loaf of bread and a bottle of wine; and then they were totally forgotten, and left to periſh by hunger in the dark vaults of the rock. This puniſhment has not, however, been inflicted by any king in the laſt or preſent century.

" We continued our progreſs through the abbey.—He led me into a chamber, in one corner of which was a kind of window. Between this and the wall of the building was a very deep ſpace or hollow, of near an hundred feet perpendicular; and at the bottom was another window opening to the ſea: it is called the Hole of Montgomeri. The hiſtory of it is this: In the year 1559, Henry II. king of France, was unfortunately killed at a tournament by the count de Montgomeri. It was not intended on that nobleman's part; and he was forced, contrary to his inclination, to puſh the lance againſt his ſovereign, by his expreſs command. He was a Hugonot; and having eſcaped the maſſacre of Paris and Coligny, made head againſt the royal forces in Normandy, ſupported by our Elizabeth with arms and money. Being driven from his fortreſſes in thoſe parts, he retired to a rock, called the Tombelaine. This is another ſimilar to the Mont St. Michael, only three quarters of a league diſtant from it, and of nearly equal dimenſions. At that time there was a caſtle on it, afterwards demoliſhed, and of which ſcarce any veſtiges now remain. From this faſtneſs, only acceſſible at low tides, he continually made excurſions and annoyed the enemy, who never dared to attack him. He coined money, laid all the adjacent country under contribution, and rendered himſelf univerſally dreaded. Deſirous, however, to ſurpriſe the Mont St. Michael, he found means to engage one of the monks reſident in the abbey, who promiſed to give him the ſignal for his enterprize, by diſplaying a handkerchief. The treacherous monk having made the ſignal, betrayed him, and armed all his aſſociates, who waited Montgomeri's arrival. The chieftain came, attended by fifty choſen ſoldiers, deſperate, and capable of any attempt. They croſſed the ſand, and having placed their ſcaling ladders, mounted one by one: as they came to the top, they were diſpatched each in turn, without noiſe. Montgomeri, who followed laſt, at length diſcovered the perfidy, and eſcaped with only two of his men, with whom he regained the Tombelaine. They preſerve, with great care, the ladders and grappling-irons uſed on this occaſion. The count himſelf was at laſt beſieged and taken priſoner, by the Mareſchal de Matignon, in 1574, at Domfront, in Normandy; and Catharine of Medicis, who deteſted him for his having been, though innocently, the cauſe of her huſband's death, ordered him to be immediately executed.

" The church itſelf detained me a long time, and is matter of high curioſity. It reſts on nine pillars of moſt enormous dimenſions, which ſtand upon the ſolid rock. I did not meaſure them; but as far as the gloomineſs of the place would admit, I apprehend that each of them muſt be five-and-twenty feet in circumference. Beſides theſe, there are two others, of much inferior ſize, which ſupport the centre of the church, over which is the tower. If the prodigious incumbent weight be conſidered, and the nature of its ſituation, nothing leſs maſſy could ſuſtain the edifice. They ſeem as if deſigned to outlive the ravages of time, and the convulſions of nature. The building was begun in 966, when Richard, the ſecond duke of Normandy, began to erect the abbey. It

was

was completed about the year 1070, under William the Conqueror; though many other additions were made by ſucceeding abbots.

"The treaſury is crowded with relics innumerable, among which ſome few have a real and intrinſic value. There is a fine head of Charles VI. of France, cut in cryſtal, which drew my attention. They have got, I know not by what means, an arm of Edward the Confeſſor's; and they ſhewed me another of St. Richard, king of England. Who this ſaint and prince was, I confeſs, is beyond my comprehenſion. I am ſure they could not term Richard I. ſo, unleſs his cruelty againſt Saladine wiped out all his ſins, and canonized him. Richard II. has no better pretenſions to ſanctity. I do not mention him who fell at Boſworth: ſo that who this royal ſaint was, I muſt leave you to decide. As to the monks, they know nothing about it; but they are poſitive he was a king of England. An enormous golden cockle-ſhell, weighing many pounds, given to Richard, the ſecond duke of Normandy, when he founded the abbey, is worthy remark.

"The refractory cloiſters, and cells of the monks, have been magnificent and ſpacious; but a vaſt ſum of money is wanted to put the whole in repair, and reinſtate what the lapſe of ages has defaced and deformed."

Havre-de-Grace, which conſtitutes part of Upper Normandy, was under the juriſdiction of the parliament of that province. Havre-de-Grace is a ſtrong ſea-port town at the mouth of the Seine, 12 leagues weſt of Rouen, well built, ſtrongly fortified, has an excellent harbour, a good trade, is the ſeat of the department, and contains ſeveral courts of juſtice.—Harfleur, on the Lizard, eight leagues from Havre-de-Grace, has ſome concern in the cod and herring fiſheries, by means of a ſmall harbour; is defended by a caſtle, and contains manufactories of tanned leather, hats, laces, ſerges, linens, woollen cloths, &c.

Maine (Mayenne), Perche, and the county of Laval, are compriſed in one.—Maine is bounded by Perche on the eaſt, by Britanny and Anjou towards the weſt, by Touraine and Vendemois towards the ſouth, and by Normandy to the north. It is 30 leagues long, 20 broad, fruitful in corn, wine, wood, paſture, &c. and contains ſome iron-works, ſlate, free-ſtone, quarries of marble, mineral-waters, &c. Its rivers are the Loire, Sarte, Haine, and Mayenne; and this department, as well as Perche, was ſubject to the parliament of Paris.

Mans, the capital of the whole department, ſituated on the river Sarte, is a very ancient city, and the ſee of a biſhop, ſuffragan to Tours. There are many churches here, ſeveral convents, inferior courts of judicature, with a college, and ſalt-office.

That part of this department called Perche, is bounded on the eaſt by Chartrain and Timerais, on the weſt and north by Normandy, and on the ſouth by Mayenne, being fifteen leagues in length, and twelve in breadth. The country abounds in cattle, ſheep, corn, flax, hay, mineral-waters, iron-mines, and cyder.

In this department is La Trappe, a celebrated abbey of Ciſtertian monks, who are remarkable for the auſterity of their manners. It ſtands between the cities of Seez, Montagne, Verneuil, and Laigle, in a large vale ſurrounded with hills and foreſts, which ſeem deſigned to hide it from the reſt of the world. It was founded in the year 1140, by a count of Perche. But the monks being, in proceſs of time, fallen into a great remiſſneſs of manners and diſcipline, a very ſtrict reformation was introduced in this abbey in the year 1662, by Armand John Bouthilier de Rance, the commandatory abbot.

Orleannois (now Loire department) conſiſts of ſeveral diſtricts, and is bounded on the north by Normandy, on the eaſt by Champagne and Burgundy, on the ſouth by Nivernois and Berry, and on the weſt by Touraine and Maine; including Orleannois Proper, Chartrain, or Beauce Proper, Vendemois, Blaiſois, Solagne, Demois, Perche Gouet, and Gatinois Orleannois. The whole department was ſubject to the parliament of Paris.

Orleannois Proper abounds in cattle, game, and fiſh; yields grain, wine, fruit, and wood; and contains the following places:—Orleans, the capital, not only of Orleannois Proper, but of the whole department, ſtands on the northern bank of the Loire, 20 leagues ſouth of Paris. Over the river is a fine ſtone bridge, leading into a ſuburb on the ſouth ſide of the river. It is one of the largeſt cities in the kingdom, and contains ſeveral inferior courts of juſtice, with an univerſity, a public library, a ſtately Gothic cathedral, and a great number of other churches, ſome of which are collegiate; a public walk, planted with ſeveral rows of trees; ſome ſugar-houſes, a manufactory of ſtockings and ſheep-ſkins, and a ſeminary. It carries on a great trade in brandy, wine, ſpices, and ſeveral manufactures, which, with many other commodities, are conveyed from hence to Paris, and other places, by means of the Loire, and the canal which takes its name from the city. The number of inhabitants are about 35,000. To the north of the city is a foreſt, the largeſt in the whole kingdom, formerly belonging to the duke of Orleans.

Ever ſince the year 1344 this city has been a dukedom and peerage, and uſually an appendage of ſome prince of the blood. Louis XIV. gave it to his brother Philip, who begun and finiſhed the canal, in whoſe family it ſtill continues. The duties paid by veſſels going up and down the canal amounts, in ſome years, to 150,000 livres. The biſhop of this city is ſuffragan to the archbiſhop of Paris. On the 8th of May 1429, Orleans, then cloſely beſieged by the Engliſh, was relieved by Joan of Arc, commonly called the Maid of Orleans; and the anniverſary of that deliverance is ſtill kept here. To perpetuate the memory of it, a monument of braſs was erected on the bridge. In the Hotel de Ville is a portrait of the ſame extraordinary woman. It was done in the year 1581, and is the oldeſt extant. The painter ſeems to have drawn a flattering reſemblance, and to have decorated her with imaginary charms. Her face, though long, is of exceeding beauty, heightened by an expreſſion of intelligence and grandeur rarely united. Her hair falls looſely down her back. She wears a ſort of bonnet enriched with pearls, and ſhaded with white plumes, tied under her chin with a fillet. About her neck is a little band; and lower down on her boſom a necklace, compoſed of ſmall links. Her habit fits cloſe to the body, and is cut or ſlaſhed at the arms or elbows. Round her waiſt is an embroidered girdle; and in her right hand ſhe wields the ſword with which ſhe expelled the enemies of her country.

Nivernois (now the department of Nyevre) within the juriſdiction of the parliament of Paris, was before the Revolution a dukedom and peerage. It is bounded on the ſouth by Bourbonnois, on the north by Gatinois and Aurenois, on the weſt by Berry, and on the eaſt by Burgundy, being about 20 leagues in extent both ways, as it is nearly of a circular form, and yielding corn, wine, fruit, wood, pit-coal, iron-ore, and mineral ſprings. The moſt barren and mountainous part of it is the diſtrict of Morvant. It is watered by ſeveral rivers, of which three are navigable, viz. the Loire, the Allier, and the Yonne.—Nevers is the capital of the diſtrict, and takes its name from the rivulet Nievre, in Latin Niveris, which, with the Allier, falls near the town into the Loire. Here are ſeveral churches, convents, and courts of juſtice, with manufactories of glaſs, white-iron, and earthen-ware; and a ſtately ſtone bridge over the Loire. The biſhop of this town is lord of three caſtlewards, and ſuffragan to Sens. About two

leagues from hence, at the village of Pouges, in the road to Paris, is a noted mineral ſpring.

Bourbonnois (now Allier department) is bounded on the ſouth by Auvergne (now Cantal) on the north by Berry and Nivernois, on the eaſt by Burgundy and Forez, and on the weſt by Upper Marche (Creuſe,) It is 30 leagues long, 20 broad, fruitful in corn, wine, and paſturage; and is watered by the Loire, Allier, and Cher. From its ancient dukes the late royal family of France are deſcended. This department had belonged to the prince of Condé, whoſe authority was very great; but cauſes of importance were referred to the parliament of Paris.

The capital, Moulins, on the Allier, received its name from the numerous mills in its vicinity. It contains ſeveral churches, convents, courts of judicature, manufactories of hardware, iron, ſteel, &c. and is, upon the whole, a handſome populous town. In the church belonging to the nuns of the Viſitation is the magnificent tomb of duke Henry II. of Montmorenci, who fell a ſacrifice to the reſentment of cardinal Richlieu; and near the town there is an admirable mineral ſpring.—Bourbon le Archambaud, five leagues weſt of Moulins, is remarkable for its mineral waters, hot and cold, and for ſtones reſembling diamonds and cut glaſs, which are found in the rocks near the town. Mont Lucan, near the Cher, with a ſtone bridge over that river, has ſeveral convents, churches, and courts of judicature, with a ſalt office and hoſpital; and a neighbouring market-town, named Neris, has ſome excellent hot baths.

Lionnois department (compriſing Rhône and Loire) contains the provinces Lionnois, Forez, and Beaujolois; and is bounded to the north by Maconnois and Burgundy; to the ſouth by Vivarais and Velais; to the eaſt the Soane and the Rhône part it from Breſſe and Dauphiné; and to the weſt it terminates on Auvergne (Cantal.) It produces corn, wine, and fruits, particularly excellent cheſnuts, with pit-coal and mineral ſprings; and about four leagues from Lyons is a mine of copper and vitriol. Appeals lay from hence to the parliament of Paris. The principal rivers of the department are the Rhône, the Soane, and the Loire. Under the governor in chief, as in all the other provinces, were ſeveral ſub-governors.—Lionnois, properly ſo called, is twelve leagues long, and ſeven broad. Anciently it was ſubject either to counts, or to the archbiſhop and chapter of Lyons.

Auvergne (now Pays de Dome department) which is within the juriſdiction of the parliament of Paris, is bounded on the ſouth by the Cevennes, on the north by Bourbonnois, on the eaſt by Forez, and on the weſt by Limoſin, Quercy, and La Marche. It is 40 leagues long, and 30 broad, and divided into Upper and Lower. The rivers are the Allier, the Dargogne, and the Alagnon; the manufactures are ſilks, ſtuffs, cloths, laces, iron-works, paper; and the produce corn, wine, cattle, cheeſe, coals, &c.

In Upper Auvergne are:—St. Fluer, the capital, which is ſituated at the foot of Mount Cantal, one of the higheſt in Auvergne. It took its name from that of a biſhop, who having come hither from Languedoc to preach the goſpel towards the end of the fourth century, died, and was buried here. It is now the ſee of a biſhop, who is lord of the city, though ſubject in ſpirituals, to the archbiſhop of Bourges. Here is a conſiderable traffic in rye and mules, as well as in knives, carpets, and cloths. Aurillac contains ſeveral convents, inferior courts of judicature, manufactories of tapeſtry and lace, a caſtle, &c.

In Lower Auvergne are:—Clermont, the capital of the whole province, ſituated near the mountain called Pu de Domme, 14 leagues from St. Fleur to the north, betwixt the rivers Artier and Bedat. It was built by the emperor Auguſtus, and thence was anciently called Auguſtonemetum, or Auguſtonemoſum. Here are ſeveral churches, beſides the cathedral; many courts of juſtice, abbies, convents, &c. It is the ſee of a biſhop, ſuffragan to the archbiſhop of Bourges. In the neighbourhood of the town are ſeveral petrifying ſprings; one of which, in the ſuburb of St. Allire, has formed a ſolid rock, and a kind of bridge, under which the rivulet of Firidaine paſſes.

Of this natural curioſity, and of the town itſelf, we have the following accurate and authentic account from an intelligent traveller: "The ſituation of Clermont is agreeable, on a little eminence, to which the acceſs is gradual and eaſy. The place itſelf ſeems to have been built in an age the moſt barbarous. The ſtreets are ſo narrow and winding, that no carriage can enter them, and the buildings correſpond to the other parts; but, to compenſate for the inconvenience, the ſuburbs are charming, and the houſes modern and elegant. I viſited, this morning, the petrifying ſpring which Charles IX. is ſaid to have ſurveyed with ſo much wonder and pleaſure. It is only a quarter of a mile from the town. In the courſe of ages it has formed a ridge of ſtone, or incruſtation, not leſs than 16 feet in height, above 100 feet long, and, in ſome parts, near 10 in thickneſs. As it impeded, and, at length, totally ſtopped the current of a little rivulet which interſected its courſe, the inhabitants were obliged to dig a paſſage through it. The ſtream is now directed into another channel, and has begun to form a new bridge acroſs the rivulet into which it falls."

Limoſin (now the department of Upper Vienne) is bounded on the eaſt by Auvergne, on the weſt by Angoumois and Perigord, on the ſouth by Quercy, and on the north by Poitou and La Marche. It is 25 leagues long, and near as many broad; the whole being divided into Upper and Lower. The upper parts are cold and mountainous, the lower warm and fruitful; the produce being rye, barley, buck-wheat, cheſnuts, oxen, cows, horſes, &c. alſo lead, tin, copper, iron, and ſteel. The rivers are the Vienne, the Vizere, and the Dordogne.—The government was ſuperintended by a chief governor, a general-lieutenant, and two ſub-governors; but the whole was under the juriſdiction of the parliament of Bourdeaux.

In Upper Limoſin are:—Limoges, on the Vienne, 165 leagues ſouth of Paris, the capital of the whole department, which contains three abbies and convents, is the ſeat of ſeveral courts of judicature, and the ſee of a biſhop. Here are manufactories of paper, leather, and woollen cloths; four aqueducts, conſtructed by the Romans, and other remains of antiquity.—St. Leonard, on the Vienne, contains manufactories of paper and cloth; and St. Iriez, on the Iſle, hath likewiſe ſome conſiderable iron-mines in the neighbourhood.—Chalus, a town and caſtle ſituated at the ſpring of the Tardouere, one of the rivers that fall into the Charente, is ſix leagues diſtant from Limoges to the north-weſt. This little city has the title of a county or earldom, and belonged formerly to the viſcounts of Limoges.

It happened that a gentleman of Limoſin found upon his eſtate a treaſure, which had been buried there many ages before. It conſiſted of the ſtatues of an emperor and his conſort, ſitting round a table with their children, the whole being of ſolid gold. Richard I. king of England, who was then maſter of Limoſin, pretended that the treaſure belonged to him as ſovereign lord of the country where it was found. The gentlemen was willing to give him part of it; but ſeeing that the king claimed the whole, he implored the protection of the viſcount of Limoſin, who gave him leave to take ſanctuary in his caſtle of Chalus. Richard going to beſiege the place, was wounded with an arrow ſhot by a croſs-bow-man, and died of the wound April 6, 1199. There is a famous horſe-fair kept here every year on St. George's day.

In Lower Limoſin are:—Tulle, the capital, at the conflux of the Coureze and Solan. It is the ſee of a biſhop, who is temporal lord of the town, and ſuffra-

gan

gan to the archbiſhop of Bourges. Here are ſeveral inferior courts of judicature, and convents.

La Marche (now the department of Creuſe) is bounded on the ſouth by Limoſin, on the north by Berry, on the weſt by Poitou, and on the eaſt by Anvergne; being about 22 leagues from eaſt to weſt, and eight or ten from north to ſouth, and lying within the juriſdiction of the parliament of Paris. It is watered by the Vienne, the Cher, the Creuſe, and the Gartempe; and is not only fruitful in corn, but produces wine. It was a dukedom and peerage, and, beſides a chief-governor, had two ſub-governors.—Gueret, the capital of the province, is ſituated in the Upper Marche, on the river Gartempe. Here are ſeveral inferior courts of juſtice, with a college, two convents, a priory, and an hoſpital. Anthony Varillas, the hiſtorian, was born, and founded a convent here.—Aubuſſon, on the river Creuſe, has a manufactory of tapeſtry, and belongs to the duke de la Feuillade, whoſe ſurname is d'Aubuſſon.

Berry (now Cher department) is bounded on the ſouth by Bourbonnois and Marche, on the north by Orleannois, and on the weſt by Nivernois; its greateſt length being about 35 leagues, and its breadth about 28. Its name, and that of its capital, Bourges, are derived from the ancient Bituriges, ſurnamed Cubi, to diſtinguiſh them from the other Bituriges, called Vibiſci, who were thoſe of Bourdeaux. The air of this department is temperate, and the ſoil fruitful, producing wheat, rye, wine, good fruit, a great deal of flax and hemp, and fine paſture, both for ſheep and black cattle. Near Vierzon is a mine of ochre, and near Bourges are quarries of ſtone. Here are ſeveral rivers, the chief of which are the Loire, the Creuſe, the Cher, the Large and Leſſer Saudre, the Indre, the Orron, the Aurette, the Moulon, and the Evre. There is alſo a lake, called the lake of Villiers, which is pretty large.

Touraine (now Indre and Loire department) is bounded to the ſouth by Berry and Poitou, to the north by the river Maine, to the weſt by Anjou, and to the eaſt by Orleannois; its greateſt breadth being 22 leagues, and its length 24. It is watered by ſeveral rivers, the chief of which are the Loire, the Cher, the Creuſe, and the Vienne. The climate is very mild, and the ſoil, in general, fertile. In the country of Noyers are mines of iron and copper. This diſtrict had formerly counts of its own; but, in 1202, was united with the crown; and in 1356, was raiſed to a dukedom and peerage. It lay within the juriſdiction of the parliament of Paris, and, beſides a chief governor, had a general-lieutenant, and a ſub-governor.—Tours, the capital of the department, which alſo takes its name from it, is ſituated on the Loire. Here is a fine bridge over that river, ſeveral inferior courts of juſtice, many churches and convents, a mint, a ſalt-office, an academy, and is the ſee of an archbiſhop. The cathedral is a fine building, containing a library, in which are ſome ancient manuſcripts. This city is free, the people paying no taille, or tillage. In 737 Charles Martel defeated the Saracens near this place with a very great ſlaughter. Here is a ſilk and cloth manufactory.—At Amboiſe, a town ſituated at the conflux of the Amaſſe and Loire, Charles VIII. was born and died. The name of Hugonot had its riſe in this town, wherein alſo the civil war broke out in 1561. Beſides a ſalt-office, an hoſpital, and two churches, here are ſeveral convents and inferior courts of juſtice.—At Loches, ſituated on the river Indre, ſeven leagues from Amboiſe, is a ſtrong caſtle, in one of the ſubterranean paſſages of which Louis Sforza, duke of Milan, was kept priſoner ten years. In one of the two cages alſo, which are kept in this caſtle, cardinal Balvre, biſhop of Algiers, was confined by Louis XII.—Chinon, on the Vienne, has four churches, and a number of convents. The celebrated Rabelais was a native of this town; and, A. D. 1189, Henry II. king of England, died in the caſtle here. Ten leagues ſouth of Tours is La Hayne, the birth-place of the great philoſopher Des Cartes.

Anjou (now the department of Mayne and Loir) which is 26 leagues long, and 24 broad, is bounded by Poitou to the ſouth, by Maine to the north, by Touraine on the eaſt, and by Bretagne to the weſt. It is fruitful, pleaſant, well watered, and was within the juriſdiction of the parliament of Paris. Angers, the capital, ſituated on the Mayenne, is a large city, being the ſee of a biſhop, ſuffragan to the archbiſhop of Tours. It contains, beſides the cathedral, many churches, of which ſome are collegiate, a ſtrong caſtle, ſeveral abbies and convents, a ſalt-office, and a mint. Here alſo are ſeveral inferior courts of juſtice, a ſeminary, an academy, an univerſity, and ſome remains of Roman antiquities. The firſt walls of the city were built by John, king of England, and duke of Anjou. The inhabitants are employed chiefly in bleaching wax and linen, refining ſugar, and making camblets, ſerges, and fine woollen ſtuffs, ſtriped with ſilk and gold. At Chateau-Gontier on the river Maienne, are a caſtle, ſeveral churches and convents, with manufactories of linen cloth and ſerges, and mineral ſprings. Saumur is a town on the ſouth bank of the river Loire, over which it has a ſtone bridge, ſix leagues from Angers to the ſouth. Here are a caſtle, ſeveral convents, churches, and inferior courts of juſtice, together with an univerſity, and ſome trade in ſalt-petre, ſugar, ſteel, iron-works, medals, rings, chaplets, and ſtrings of beads. It was one of the cationary towns given to the Proteſtants; and during the time of its being in their hands, the celebrated John Cameron, a Scotch divine, was for ſome time profeſſor of divinity in the univerſity. The diſtrict is called Saumurois; and the governor of that, as well as the town and caſtle, is independent of the governor of the department. While the town was in the hands of the Proteſtants it was opulent, but was declined ſince its being re-poſſeſſed by the Roman-Catholics.—At Doé, three leagues weſt of Saumur, is a fountain in the form of a horſe-ſhoe, which is one of the greateſt curioſities in France.

The natural curioſities of France conſiſt chiefly in ſprings and ſubterraneous caverns.

Near Salins in Burgundy are ſeveral very remakable caves, the extent of which taken all together is about 400 feet in length, and ſixty in breadth. The deſcent into them is by forty ſtone ſteps, and twenty of wood. At the bottom, by help of lighted torches, which each perſon carries with him, may be ſeen ſix ſprings of ſalt-water, and two of freſh, guſhing out and running with great rapidity. Theſe ſtreams are kept ſeparate by proper trenches, which conduct them into other vaults ſupported by large pillars, wherein are placed reſervoirs for the reception of the ſalt-water, afterwards conveyed to the top by proper engines, and being put into pans, great quantities of ſalt are extracted from it. This water is obſerved to be moſt ſtrongly impregnated in rainy weather; and is ſuppoſed to acquire its ſaline quality from ſome vaſt rocks of ſalt through which it paſſes in its ſubterranean courſe. At Baulme, twelve miles from Beſançon, is a cavern, above three hundred feet under ground, wherein are a number of icicles, and in the bottom a little river, which flows in the winter, but is frozen in ſummer. In the foreſts of St. Aubin du Cormies in Bretagne, is a cave, through which runs a great torrent of water; and from another, ſituated at Nions, proceeds a violent wind. The cave of our Lady of Balm, in Dauphiné, is between four and five fathoms broad, and from five to eight feet deep; and, in the valley of Liberſtat, in Alſace, is a cavern, out of which flows an oily liquor, which being diſtilled, and properly prepared, yields a moſt excellent ſalubrious oil. In the neighbourhood of Niſmes, there is a ſubterraneous paſſage, which the vulgar inform us reaches

to

to Arles, under the Rhône, being a diſtance of 20 miles.

The artificial curioſities of France conſiſt chiefly in their canals, and public buildings. The former of theſe have already been deſcribed, and the others have been noticed in the account of its cities and principal towns.

France poſſeſſes ſeveral valuable remains of antiquity, many of which have been traced back even to the time of the Celts: and after Gaul was reduced by the Romans, they adorned it with numerous edifices, both civil and ſacred, ſome of which are ſtill very perfect. Triumphal arches are found in ſeveral parts of the kingdom, but the moſt entire is at Orange, erected on account of the victory obtained over the Cimbri and Teutones, by Caius Marius and Luctacius Catulus. Niſmes abounds in monuments of antiquity. The famous Pont du Garde was raiſed in the Auguſtian age by the Roman colony of Niſmes, to convey a ſtream of water between two mountains for the uſe of that city, and is as freſh to this day as Weſtminſter-Bridge: it conſiſts of three bridges, or tiers of arches one above another; the height is 174 feet, and the length to 723. The moderns are indebted for this, and many other ſtupendous aqueducts, to the ignorance of the ancients, that all ſtreams will riſe as high as their ſources.

The commerce and manufactures of France may be conſidered under two heads, viz. inland and foreign. This country, by her ſituation, the turn of her inhabitants for certain manufactures, and the happineſs of her ſoil, muſt be always poſſeſſed of a great inland traffic, which in many particulars exceeds that of any other country in Europe, and is in a great meaſure carried on by their navigable canals.

The introduction of the ſilk manufacture to France took place ſo late as in the reign of Henry IV. and in that of his grandſon Louis XIV. the city of Tours alone employed 8000 looms and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjuſt revocation of the edict of Nantes, the expulſion of the Proteſtants, and the ruinous wars maintained by France, they decreaſed to 4000; and their ſilk manufacture is now rivalled by that of England, where the French Proteſtants took refuge, and were happily encouraged. On the other hand, the French woollen cloths and ſtuffs, more eſpecially at Abbeville, are ſaid to be now little inferior to thoſe of Holland and England, aſſiſted by the clandeſtine importation of Engliſh and Iriſh wool, and workmen from this country. This deſtructive traffic is principally carried on between Boulogne in France and Romney-Marſh in Kent.

The foreign trade of France may be ſaid to extend itſelf all over the globe. That country is thought to be no great loſer by its ceſſion of Canada, and part of Louiſiana at the late peace. But the moſt valuable part of Hiſpaniola in the Weſt-Indies, which ſhe poſſeſſes by the partiality and indolence of Spain, is a moſt improveable acquiſition, and the moſt valuable of all her foreign colonies. In the Weſt-Indies, ſhe likewiſe poſſeſſes the important ſugar-iſlands of St. Lucia, St. Bartholomew, Deſeada, and Marigalante. A ſmall tract upon the Miſſiſſippi is the whole of what ſhe poſſeſſes in North-America. Thoſe belonging to her in the Eaſt-Indies are not very conſiderable; though had the genius of the French been more turned for commerce than war, they might have ingroſſed more territory and revenues than are now in poſſeſſion of the Engliſh; but they over-rated both their own power and their courage, and their Eaſt-India company never made a conſiderable figure. Pondicherry, &c. in the Eaſt-Indies, and St. Domingo in the Weſt, were taken by the Engliſh in the year 1793.

The manufactures of France are ſilks, as luſtrings, alamodes, ſarcenets, broad, flowered, and brocaded ſilks, velvets, and gold and ſilver ſtuffs. Woollen manufactures in imitation of thoſe of England, which are chiefly carried on in Normandy, Poictou, Languedoc, Provence, and Guienne. Fine linens, lawns, and lace are made in the inland parts; as is canvaſs in Normandy, ſail-cloth at Vitry, and other places, and dowlaſſes at Morlaix. In Picardy and Paris are made exceeding beautiful and rich tapeſtries, and Auvergne is famous for fine paper. Manufactures of ſoap are eſtabliſhed in Provence; this is ſo conſiderable an article in their commerce, that when they have a ſcarcity of oil, they fetch a prodigious quantity from the Levant to ſupply the ſoap-makers. They have long obtained the ſecret from Spain of making that ſpecies of ſoap called Caſtile, of which they have eſtabliſhed large manufactures at Marſeilles and Toulon, and thereby deprived the Spaniards of that valuable branch of trade.

The conſtitution of France was formerly a limited monarchy; but the oppreſſions of the great landholders grew, by degrees, ſo irkſome to the ſubjects, that they preferred the monarchical to the ariſtocatical government. But Richlieu, in the time of Louis XIII. gave ariſtocracy a mortal blow; and all the civil diſputes in France, ſince that period, have been among great men for power and places, and between the kings and their parliaments.

The life and property of the ſubject were afterwards entirely at the mercy of the ſovereign; he impriſoned whom he pleaſed, without being accountable to the laws, and, whenever he thought it neceſſary for his purpoſe, appointed what judges he deemed proper for the trial of offenders. The great officers of ſtate took their oaths to him, which they formerly did to the parliament; and he appointed, removed, extended, or retrenched their authority as he pleaſed. The regiſtering of the edicts, which formerly gave them the ſanction or force of laws, at length became a mere matter of form. The parliaments indeed ſome years ago made a noble oppoſition to the king's command with regard to this particular, but this generally procured a temporary baniſhment; for, arbitrary as he was, he never ventured to inflict any further puniſhment than a ſlight baniſhment, or impriſonment, for their moſt provoking acts of diſobedience; a tacit acknowledgment of the infirmity of the French conſtitution, and a proof that the people conſidered the parliaments as their natual guardians and protectors.

Before the revolution, diſtributive juſtice was adminiſtered in France by parliaments, chambers of accounts, courts of aid, preſidial courts, generalities, elections, and other inferior courts. The parliaments were fifteen in number, namely, Paris, Thouloufe, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rheims, Pau, Metz, Beſançon, Doway, Perpignan, Calmer, and Arras; but ſeveral of thoſe parliaments are now united into one, and that of Paris branched out into ſix. It was however the chief, and took the lead in all national buſineſs. It was divided into ten chambers. The grand chamber was chiefly appropriated to the trial of peers. The Tournelle took cognizance of all matters of property above 1000 livres in value. The Tournelle Criminelle received and determined appeals from inferior courts in criminal caſes. Beſides theſe three capital chambers, there were five of requeſts for receiving the depoſitions of witneſſes, and determining cauſes, nearly in the ſame manner as our court of exchequer. In ſome provinces, the adminiſtration of juſtice was regulated by the civil law, and in others by their particular cuſtoms, ſo far as they were conſiſtent with the king's edicts and declarations.

The chamber of accounts was the next court of judicature in France: here all matters of public finance were examined, treaties of peace and and grants regiſtered, and the vaſſalages due from the royal fiefs were received: the chambers were in number twelve, and held in the cities of Paris, Rouen, Dijon, Nantes,

Montpelier

Montpelier, Grenoble, Aix, Pau, Blois, Liſle, Aire, and Dole. The third court of judicature was the court of aid, where all matters that related to the royal revenue, and the raiſing of money, were determined. The fourth were the preſidial courts, which were compoſed of judges for determining matters in appeal from magiſtrates of little towns and villages. The next court were the generalities, who proportioned the taxes to be raiſed in their diſtricts, according to the ſum that is appointed to be levied: they likewiſe took cognizance of matters relating to the crown-lands, and certain branches of the revenue. Theſe courts are in number 23, each conſiſting of 23 perſons, and they were diſtributed over the kingdom for the more convenient diſpatch of buſineſs. The courts of elections, which were ſubject to thoſe generalities, ſettled the ſmaller proportions of taxes that were to be paid by pariſhes and inferior diſtricts, and how much each individual in the ſame was to pay: this was done by a collector, who returned the aſſeſſments to the court of generalities.

Beſides the above courts, the French had intendents of juſtice, police, and finances, whoſe powers, when properly executed, were of great ſervice to the peace of the community. They had likewiſe provoſts, ſeneſchals, baliffs, and a variety of other officers.

From this general review of France in its monarchical ſtate, the reader will be apt to conclude, that ſhe was the moſt powerful nation, and the people the moſt opulent and happy in Europe. The reverſe, however, appears to be the conſtant ſtate of that nation; ſince we do not find that in any former period they were more rich or more happy. In a country ſo extenſive and fruitful, her government finds immenſe reſources in men and money; but, as if the French councils were directed by an evil genius, theſe reſources, great as they are, have proved, by a wrong application, the ruin of the people. The moſt obvious cauſes of this national poverty originated from the ambition and vanity of their kings and leading men, which led them into ſchemes of univerſal dominion, the aggrandizement of their name, and the enſlaving of Chriſtendom. Their wars, which they ſometimes carried on againſt one half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the ſubject, under various pretences, in the name of loans, free-gifts, &c. When theſe failed, other methods, more arbitrary and unjuſtifiable were adopted, ſuch as raiſing and reducing the value of money, as they thought proper, national bankruptcies, and other grievous oppreſſions, which gave the finiſhing ſtroke to public credit, and ſhook the foundations of trade, commerce, and induſtry; the fruits of which no man could claim as his property. When we alſo conſider the motives of theſe wars, a deſire to enſlave and render miſerable the neighbouring nations, that man muſt be devoid of humanity whoſe breaſt is not fired with indignation at the bare mention of the blood that has been ſpilt, the miſeries and deſolations that have been brought upon mankind, and the numerous places that have been ſacrificed to their ambition and avarice. From the late attack upon Corſica, it appears that their own misfortunes have not taught them wiſdom or humanity; for while they thus graſped after foreign conqueſt, their own country exhibited a picture of miſery and beggary, unknown even to ſome of the moſt uncivilized of the adjoining kingdoms.—To this we may add, that many of the taxes and revenues in France were let out, for a time, or farmed to the beſt bidder; and theſe harpies, the farmers-general, and their under-farmers and receivers, made no ſcruple of fleecing the people moſt unmercifully; and the reſidue, if any remained, went to ſatisfy the cravings of a numerous clergy, who in their turn were obliged, as well as the laity, to advance the government immenſe ſums under various names.

The revenues of ſo deſpotic a government as that of France was during the monarchy, when the eſtates as well as lives of the people were ſubject to the will of the prince, cannot well be aſcertained. The whole ſpecie of France, in gold and ſilver, was computed in 1716 to be about 17,000,000l. ſterling; and though the crown was then doubly a bankrupt, being in debt about 100 millions ſterling, or 2000 millions of livres, yet by ſeizing almoſt all the current money in the kingdom, and by arbitrarily raiſing or lowering the value of coins, in four years time the duke regent of France publiſhed a general ſtate of the public debts, by which it appeared that the king ſcarcely owed 340 millions of livres. The reader is left to judge whether ſo great a reduction muſt not be the effect of the moſt abſolute deſpotiſm, and the act itſelf deſerves no better name than that of a national robbery. The French court has not ſince that time bluſhed to own, as towards the concluſion of a former war, and alſo in 1769, that their king was a bankrupt; and, in order to recruit the royal finances, his miniſters have purſued meaſures pretty ſimilar to thoſe practiſed by the regent above-mentioned.

The ordinary revenues of France, by ſome late calculations, amounted, during the monarchy, to above 12,000,000l. ſterling. They aroſe from the demeſnes; the taillé, or land-tax; the taillon, another ſort of land-tax, which the nobility were obliged to pay as well as the commons; by aids, which we call cuſtoms on merchandize; by gabels, which is a tax upon ſalt; by a capitation, or poll-tax; by the tenths of eſtates and employments; by the ſale of all offices of juſtice; by a tenth, or free-gift of the clergy; excluſive of their additional yearly ſum of 12,000,000 of livres; and by confiſcations and forfeitures.

The comptroller-general was the head of the officers of the finances; and for the management of the revenues, and the determination of all diſputes relative to it, there were ſeveral tribunals and offices in different parts of the kingdom, of which one at Paris was the chief.

The amount of the aſſeſſed taxes for the year 1792, are by ſome authors eſtimated only at 300,000,000 livres, equal to 12,500,000l. ſterling; and with the incidentel taxes in all 15,500,000l. ſterling; near nine millions leſs than before the revolution, when the clergy and nobleſſe were exempted.

All exciſes and exciſemen, tythes, and game-laws, are now aboliſhed, and the funds maintained at the public charge.

In the year 1788, before the revolution, the revenue was twenty millions and a half ſterling; and its ordinary expenditure exceeded the revenue five millions and a half. In 1784, the public debt was 141,666,000l.

There is no nation in Europe where the art of war, particularly that part of it relative to gunnery and fortification, is better underſtood than in France. Beſides other advantages for learning it, there is a royal academy eſtabliſhed purpoſely for training up five hundred young gentlemen at a time, in the ſeveral branches of this great art. The number of forces in France, even in time of peace, are ſeldom leſs than 200,000, the pay of theſe being little more than twopence halfpenny per day; in time of war, they are uſually double that number; but thoſe raiſed from the militia are very indifferent troops.—In the reign of Louis XIV. the navy of France amounted to 100 ſhips of the line of battle, but it has not been ſo conſiderable lately. In the war of 1756 with England, their marine was almoſt totally deſtroyed; but ſince the peace they have been very aſſiduous in reſtoring it, and in the year 1769, it was ſaid to conſiſt of ſixty-four ſhips of the line, including thoſe of fifty guns, and twenty-five frigates, beſides ſmaller veſſels. The ſeamen in the maritime provinces of this kingdom were regiſtered, and divided into claſſes, each claſs ſerves three or four years alternately, and thoſe who

were not in actual ſervice, might enter on board merchant ſhips. Beſides the ſeamen, an hundred independent companies were maintained to ſerve on board the ſhips of war as marines. After the commencement of hoſtilities in the war of 1774, between Great Britain and France, the French navy was more formidable than at any preceding period.

Towards the cloſe of the year 1791, the report of the miniſter ſtates the ſhips in good condition to be eighty-ſix of the line, and, including thoſe building, as follows:

Large firſt-rates	8
100 guns	5
80 guns	10
74 guns	67
64 guns	1
Total	91
Frigates	78

beſides fire-ſhips, corvettes, galleys, and cutters. But from this account we muſt probably make a deduction, in conſequence of the naval ſucceſſes of England, and the ſhips deſtroyed at Toulon and in different ſea engagements.

There are twenty-eight of the line and five frigates in commiſſion, and 80,000 ſeamen, with officers regiſtered to man the fleet; but the French navy is at preſent without proper ſubordination.

Under the revolution, the peace eſtabliſhment of the army for the year 1792, was:

Infantry	111,000
Cavalry	30,000
Artillery	11,000
Total	152,000

They call theſe troops of the line, and, along with the volunteer national guards, they formed an army on the frontiers of 224,000 men.

Thoſe termed the municipal army, or national guards, are a kind of embodied militia for the interior defence of the kingdom, and amount to between three and four millions.

Beſides the above, we may add the gens-d'armerie, an auxiliary body of troops for the protection of police and laws.

The national aſſembly, deſirous of eſtabliſhing the French conſtitution on the principles it has announced, has aboliſhed, irrevocably, thoſe inſtitutions which have been deemed injurious to liberty and equality of rights, ſuch as royal titles, arms, nobility, orders, &c.

In France there is no longer any nobility, nor peerage, nor hereditary diſtinctions nor difference of orders, nor feudal government, nor patrimonial juriſdiction, nor any of the titles, denominations, and prerogatives, which are derived from them; nor any of the orders of chivalry, corporations, or decorations, for which proofs of nobility were required, nor any kind of ſuperiority but that of public functioners in the exerciſe of their functions. Royalty alſo, which was one branch of the firſt conſtitution, is now aboliſhed, and the unfortunate monarch put to death by his ſubjects.

The French gold coins were the old Louis-d'or, worth 16s. 9d. and the new Louis, or guinea, worth 20s. The ſilver coins are the old ecu, or crown, worth 4s. 6d. and the new ecu, worth 5s. all theſe have the half and quarter in proportion.—Accounts are kept in France by livres, ſols, and deniers; one livre is 20 ſols, and one ſol 12 deniers. Their livres, by ſome late arrets, have been reduced to half the value.

The king's titles were, Louis XVI. by the grace of God king of France and Navarre. His ſubjects, in writing or ſpeaking, called him Sire; foreigners called him the Moſt Chriſtian King; and the pope gave him the appellation of The Eldeſt Son of the Church.—His arms were three fleurs-de-lis, Or, in a field argent, ſupported by two angels in the habits of Levites, having each of them a banner in his hand, with the ſame arms. The motto is *Lilia non laborant neque nent*, "Lilies neither toil nor ſpin." The ſon of the king of France, and heir to the crown, was ſtyled Dauphin; the ſecond ſon duke of Orleans, and the third duke of Anjou. The eldeſt ſon of the Dauphin was the duke of Burgundy, the ſecond duke of Aquitain, the third duke of Berry, and the fourth duke of Provence.

The nobility conſiſted of four claſſes, viz. princes of the blood, high nobility, ordinary nobility, and modern nobility. He who was neareſt to the crown, after the king's children, was the firſt prince of the blood. Among the higher nobility, the dukes and counts, peers of France, had the precedence; they aſſiſted at the unction of a king, attended when he held a *lit de juſtice*, or *bed of juſtice*, and enjoyed a ſeat in the parliament of Paris. In this claſs were likewiſe included the knights of the Holy Ghoſt, the governors of provinces, and lieutenant generals, with ſome other dukes, counts, and marquiſes. The ordinary nobility were divided into *nobleſſe de race*, and *nobleſſe de naiſſance*. The modern or new nobility were thoſe to whom the king had granted letters of nobility, or on whom he had conferred ſome places by which they became ennobled.

In this kingdom there were three orders of knighthood: firſt, that of St. Michael; ſecondly, that of the Holy Ghoſt; and thirdly, that of St. Louis.

The order of St. Michael was inſtituted in 1469, and was at firſt compoſed of thirty-ſix knights only; but their number was afterwards increaſed to a hundred. They wore a gold chain of double ſcolloped ſhells, with a medal expreſſing a rock, on which is repreſented St. Michael encountering the dragon. It is fallen into diſrepute, being conferred on artiſts, phyſicians, magiſtrates, &c.

The order of the Holy Ghoſt, which was founded in 1578, by Henry III. conſiſted of an hundred perſons, excluſive of the ſovereign. Their enſigns were a gold croſs, with a white dove enamelled on the centre of one ſide, and on the other the image of St. Michael, which is appendent to a blue ribbon, paſſing from the right ſide to the left; and on the left breaſt of their coats is a ſilver croſs, with a dove embroidered argent. No perſon can be admitted a knight of this order, who has not firſt belonged to St. Michael; and it is never conferred but on princes of the blood and perſons of the higheſt rank. All were to be Papiſts, and, except the fourteen commanders, which conſiſted of cardinals, prelates, and the officers of the order, were all to prove the nobility of their deſcent for above 100 years. The Dauphin was received into both orders on the day of his birth.

The order of St. Louis was inſtituted by Louis XIV. in 1693, and was deſigned as an encouragement and reward to military merit. Accordingly there was ſcarce a French officer, even ſubalterns, who did not wear it. Its enſign is a gold croſs enamelled, argent, and adorned with golden lilies, having on one ſide a coat of mail with the inſcription LUD. M. INSTITUT. 1693, and on the other a drawn ſword, with a wreath of laurel at its point, and the motto *Bell. virtutis præm.* Thoſe called the Grand Croix, wore it on a broad flame-coloured ribbon over the ſhoulder, having alſo a gold embroidered croſs on their coat. The commanders wore it in the ſame manner; but without the embroidered croſs; and the other knights wore the croſs appendent to a narrow flame-coloured ribbon faſtened to one of their button-holes. There are two chevaliers of the Grand Croix, four of the ſecond claſs, and an unlimited number of ordinary knights.

HISTORY OF FRANCE.

This kingdom was called, by the Romans, Tranſalpine Gaul, or Gaul beyond the Alps, to diſtinguiſh it from Ciſalpine Gaul, or Gaul on the Italian ſide of the Alps. It was probably peopled firſt from Italy; but, like other European nations, it ſoon became a deſirable object to the Romans, and, after a very brave and reſolute reſiſtance, was annexed to their empire by Julius Cæſar, about 48 years before the birth of Chriſt.

Gaul continued in the poſſeſſion of the Romans till the ſubverſion of the empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who ſubdued but did not extirpate the ancient natives. The Franks, who gave it the name of France, or Frankenland, were a collection of ſeveral people inhabiting Germany, and particularly the Salii, who lived on the banks of the river Sale, and who cultivated the principles of juriſprudence better than their neighbours. The Franks, who were ſtill mixed with the Salii, adopted one of the laws of that people, by which all females were excluded from the ſovereignty, and is ſtill known by the name of the Salic law among the French.

After the Franks and Burgundians had eſtabliſhed their power, and reduced the original natives to a ſtate of ſlavery, they parcelled out the lands among their principal leaders; and ſucceeding kings found it neceſſary to confirm their privileges, allowing them to exerciſe ſovereign authority in their reſpective governments, until they at length aſſumed an independency, only acknowledging the king as their head. This gave riſe to thoſe numerous principalities which were formerly in France, and to the ſeveral parliaments there; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes impoſed, without the concurrence of the grand council, conſiſting of the clergy and nobility. Thus the firſt government in France ſeems to have been a kind of mixed monarchy, and the power of their kings was extremely circumſcribed and limited by the feudal barons.—The ſame circumſtances took place in other European nations, immediately after the diſſolution of the Roman empire.

A French hiſtorian of credit informs us, that Clovis was the firſt Chriſtian monarch of the French: that he began his reign in the year 481, and, after being baptized, introduced Chriſtianity in the year 496; from which period the French hiſtory exhibits a ſeries of remarkable events; and we find them generally engaged in domeſtic broils, or in foreign wars. The firſt race of their kings, prior to Charlemagne, found a cruel enemy in the Saracens, who then over-ran Europe, and retaliated the barbarity of the Goths and Vandals upon their poſterity. In the year 800, Charlemagne, king of France, who was the glory of that dark age in which he lived, made himſelf maſter of Germany, Spain, and part of Italy, was crowned king of the Romans by the pope, and thus became emperor.

Charlemagne, at his death, divided his empire by will among his ſons, which proved fatal to his family and poſterity. Soon after this, the Normans, a fierce, warlike people of Norway and Denmark, invaded and ravaged the kingdom of France, and, A. D. 900, obliged the French to yield up Normandy and Bretagne to Rollo their leader, who became a Chriſtian, and married the king's daughter. This laid the foundation of the Norman power in France, which afterwards became of pernicious conſequence to that nation; as from William the Norman, who conquered England, the animoſities between that kingdom and France had their origin, and the conteſts proved for the moſt part injurious to the latter, notwithſtanding their numbers, and the aſſiſtance they received from the Scots.

It hath been juſtly obſerved, that the rage of cruſading, which broke out about this time, was rather beneficial than otherwiſe to the French monarchs, as they took off many of their turbulent ſubjects, who were almoſt independent of their authority, and left them heirs to ſeveral of their nobles, who died in the Holy Land. But we ſhall paſs over theſe dark ages, and proceed to the period, when the French began to extend their influence over Europe, and this brings us to the reign of Francis I. who was cotemporary with our Henry VIII. of England. This prince was a candidate for the empire of Germany, but loſt the Imperial crown. Charles V. of the houſe of Auſtria, and king of Spain, being choſen in his ſtead. Francis made ſeveral capital expeditions into Spain, but in one, which he undertook againſt Italy, he was defeated at the battle of Pavia, taken priſoner, and obliged to agree to the moſt humiliating terms, in order to obtain his releaſe. His breach of the terms by which he procured his enlargement occaſioned continual wars againſt the emperor till the death of Francis, which happened in 1547.

At this period, France was rather in a flouriſhing condition, and Henry II. ſon and ſucceſſor of Francis I. was in general a very fortunate prince; for though he loſt the battle of St. Quintin, againſt the Engliſh and Spaniards, yet he took Calais from the former, who never after had any footing in France. He married his ſon the Dauphin to Mary queen of Scots, in hopes of uniting that kingdom to his own; but in this ſcheme he, or rather his country, was unfortunate, as may be ſeen in the hiſtory of Scotland. In 1559, he was killed at a tilting match by the count of Montgomery. He was ſucceeded by his ſon Francis II. who lived but two years; after whom his brother Charles IX. aſcended the throne, who being then but eleven years of age, and the Guiſes, with the concurrence of Catherine de Medicis, the king's mother, taking upon them the adminiſtration, Anthony de Bourbon king of Navarre, the prince of Condé, and the Proteſtants, entered into a confederacy againſt the court, and a civil war enſued, in which the king of Navarre was killed on one ſide, and the duke of Guiſe on the other; but a peace was concluded ſoon after between the contending parties. The war was however renewed ſeveral times till the year 1571, when a treacherous peace was made with the Proteſtants, in order to deſtroy them by a maſſacre, which was put in execution at Paris, in the night of the 24th of Auguſt, 1572, and immediately after in ſeveral other great towns; and a confederacy called the Holy League, was entered into by the Papiſts of France and Spain for the extirpation of the Proteſtants. This project proved but too ſucceſsful, though it was not completely executed till on St. Bartholomew's day, 1672. The heads of the Proteſtants were invited to the celebration of the nuptials between the young king of Navarre, a Proteſtant, and the French king's ſiſter. The king himſelf, Charles IX. aſſiſted in the maſſacre, in which the admiral Coligni fell. The ſignal for the inhuman ſlaughter of ſo many thouſands was to be made by ſtriking the great bell of the palace. At that dreadful knell the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect, amidſt the general carnage, that ſome few moments ſhould be devoted to the fate of Coligni. He had not long retired to reſt, when he was arouſed by the noiſe of the aſſaſſins who had ſurrounded his houſe. A German, named Beſme, entered his chamber; and the admiral, apprehending his intentions, prepared to meet death with that fortitude which had ever diſtinguiſhed him. Incapable of reſiſtance from the wounds he had received by two balls in a late attempt to aſſaſſinate him, he had ſcarce with an undiſmayed countenance uttered the words, "Young man,

man, reſpect theſe grey hairs, and ſtain them not with blood," when Beſme plunged his ſword into his boſom, and with the help of his barbarous aſſociates, threw the body into the court. The young duke of Guiſe contemplated it in ſilence; but Henry count d'Angouleſme, natural brother to Charles, ſpurned it with his foot, exclaiming, "Courage, my friends; we have begun well, let us finiſh in the ſame manner." It is ſaid that about 30,000 Proteſtants were murdered at Paris, and in other parts of France; and this brought on a fourth civil war. Though a freſh peace was concluded in 1573, with the Proteſtants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs.—About the ſame time the duke of Anjou, who was offered the ſovereignty of the Netherlands, made his court to Elizabeth queen of England, to whom ſhe ſeemed to give encouragement, either on political views, or to procure the Proteſtants ſome relaxation from perſecution; but the queen, at length, diſcarded the duke, which occaſioned ſome ſevere reflections upon her inconſtancy.

Henry III, king of Poland, ſucceeded to the kingdom of France, 1574, when pope Sixtus V. depoſed the king of Navarre, and abſolved his ſubjects from their allegiance on account of religion; and the king of France, Henry III. taking the part of the Proteſtants againſt the leaguers, was mortally wounded by one Clement, a friar, with a knife, which the king drew out of his body, and ſtruck the aſſaſſin in the eye with the ſame knife, and he was ſoon knocked on the head by the king's ſervants.

Henry, king of Navarre, of the houſe of Bourbon, ſucceeding, the Proteſtants obtained an edict, called the edict of Nantz, 1589, in their favour, from Henry IV. whereby they were tolerated in the free exerciſe of their religion, in all parts of the kingdom except at Paris; but ſtill the king (Henry IV.) obſerving a great majority of his kingdom zealous Catholics, found himſelf under a neceſſity of declaring himſelf of that religion; nor could this preſerve him from the malice of the monks; for Ravillac a friar ſtabbed him to the heart in his coach, in the ſtreets of Paris, the 14th of May 1610, on preſumption that he was ſtill a Proteſtant. The king leaving his ſon Louis XIII. a minor of nine years of age, the queen his mother, Mary of Medicis, was made regent; during whoſe adminiſtration, great encroachments were made on the liberties of the people, notwithſtanding the oppoſition that was made to thoſe arbitrary meaſures by the parliament of Paris; but the Proteſtants, being moſt oppreſſed, ſtood upon their defence, and the kingdom was involved in another civil war. The king having taken ſome extraordinary ways to raiſe money, the parliament of Paris refuſed to concur in them, until his majeſty went thither in perſon, with the princes of the blood, and terrified them into a compliance. Cardinal Richlieu, being advanced to the poſt of prime-miniſter, ſoon after put a final end to the liberties of France. He began by ſuppreſſing the Hugonots, and reducing all the towns they were poſſeſſed of, the laſt of which was Rochelle, which held out two years againſt the whole power of France, but was obliged to ſurrender the 8th of October 1628. This put an end to the civil wars, on account of religion, in France. Hiſtorians ſay, that during theſe wars above 1,000,000 of men loſt their lives; that 150,000,000 livres were ſpent in carrying them on; and that nine cities, 400 villages, 2000 churches, 2000 monaſteries, and 10,000 houſes were burnt, or otherwiſe deſtroyed. He proceeded to inſult the parliament of Paris, prohibiting them, in the king's name, to intermeddle in affairs of ſtate; he then erected courts of juſtice to try by a ſpecial commiſſion the peers that oppoſed his meaſures. Whereupon the dukes of Orleans and Montmorency had recourſe to arms; but being defeated, Montmorency was taken priſoner, and executed as a traitor. This occaſioned ſeveral conſpiracies of the princes of the blood, and the nobility, againſt the cardinal, which he however defeated, but very narrowly eſcaped being aſſaſſinated.

Louis XIV. ſon of Louis XIII. and of Anne of Auſtria, Infanta of Spain, was born the 5th of September 1638. He ſucceeded his father the 14th of May 1643, being then in the fifth year of his age: cardinal Richlieu died juſt before the late king, and the queen-mother about the ſame time. The king being a minor, the queen his mother had the adminiſtration of the government, and made cardinal Mazarine, an Italian, her prime-miniſter. He had been introduced into the adminiſtration by Richlieu, in the laſt reign, and followed his plan of continuing to enlarge the French frontiers in Flanders, Catalonia, Germany, and Italy; and imagining that Charles I. king of England was inclined to aſſiſt Spain, he fomented the rebellion againſt that prince, as Richlieu had done, when he might eaſily have ſuppreſſed it. By the treaty of Weſtphalia, the biſhoprics of Metz, Toul, and Verdun, were confirmed to France, with ten imperial cities in Alſace, among which were Landau, and the caſtle of Philipſburg in the palatinate.

The parliament of Paris beginning to reſume their authority, and inſiſting on the baniſhment of the cardinal, as an enemy to the king and kingdom, the the queen-mother and the cardinal engaged the prince of Condé and the army in their intereſt, and perfectly ſubdued the parliament; and becauſe the prince of Condé ſeemed inclined to defend the rights and privileges of the peers, he was laid aſide as ſoon as he had ſerved the miniſter's turn, and the command of the army given to other generals; whereupon the prince of Condé quitted the kingdom, and commanded the Spaniſh army in Flanders.

Cardinal Mazarine entered into an alliance with Cromwell, as the likelieſt means to ſupport himſelf; and his forces having joined the cardinal's in Flanders, they beſieged and took Dunkirk, which was put into the hands of the Engliſh, and the cardinal found himſelf obliged to ſubmit to ſuch terms as Cromwell inſiſted on; but the union between the protector and this French miniſter proved the ruin of the conſtitution in both kingdoms, and of the balance of power in Europe. In the year 1661 died cardinal Mazarine, when Louis XIV took the adminiſtration of the government into his own hands.

Louis XIV. on the death of Mazarine, put the domeſtic affairs of his adminiſtration into the hands of Colbert, who formed new ſyſtems for the glory, commerce, and manufactures of France, all which were carried into execution with great aſſiduity. A late author very juſtly ſays, "To write the hiſtory of his reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Louis. Through the former, he was blind to every patriotic duty as a king, and promoted the intereſts of his ſubjects only that they might the better anſwer the purpoſes of his greatneſs; by the latter, he embroiled himſelf with all his neighbours, and wantonly rendered Germany a diſmal ſcene of devaſtation." His reign, which began ſplendidly, was, towards the cloſe of it, one continued ſeries of defeats and calamities; and he had the mortification of ſeeing thoſe places taken from him, which, in the former part of his reign, were acquired at the expence of many thouſand lives. He died on the firſt of September 1715, being ſucceeded by his grandſon Louis XV. who in the courſe of his reign, was ſtyled the Well Beloved, which he loſt ſome years before he died; he was deteſted and deſpiſed by his ſubjects, for his ſhameful and licentious attachments, and illiberal treatment of ſome of the worthieſt men of the kingdom. Though the ſyſtem of this prince was more pacific than that of his grandfather, yet the ſituation of affairs in Europe more than once embroiled him with the houſe of Auſtria. The intention of the French king was, to place his father-

in-law

in-law, Staniſlaus, on the throne of Poland. In this he failed, through the interpoſition of the Ruſſians and Auſtrians; but Staniſlaus enjoyed the title of king, and the revenues of Lorrain, during the remainder of his life. The connection between France and Spain forced the former to become principals in a war with Great-Britain; in the management of which the latter was ſo ill ſeconded by her allies, that it was finiſhed by the peace of Aix-la-Chapelle in 1748. We have mentioned, in the hiſtory of England, the war ſo humiliating to France, and the chief events attending it, which was ended by the peace of Fontainbleau, in 1763. He died A. D. 1774, in the 64 year of his age, and 59 of his reign.

Louis XVI. the late unfortunate king of France, ſucceeded his grandfather, Louis XV. on the 10th of May 1774. Several regulations, highly favourable to the general intereſts of the nation, particularly the ſuppreſſion of the muſquetaires, took place ſoon after the acceſſion of this monarch. But the moſt remarkable circumſtance which attended the preſent reign, was the placing Mr. Neckar, a Proteſtant, and a native of Switzerland, at the head of the French finances, in 1776. Under the direction of this gentleman, a general reform took place in France, throughout every department in the revenue. When hoſtilities commenced between France and Great-Britain, in conſequence of the former's taking part with the revolted Britiſh colonies in America, the people of France were not burdened with new taxes for carrying on the war; but the public revenue was augmented by his œconomy, improvements, and reformation that were introduced into the management of the finances. But the beneficial meaſures purſued by Mr. Neckar were not calculated to procure him friends at court; the vain, the intereſted, and the ambitious, naturally became his enemies; and the king appears not to have poſſeſſed ſufficient firmneſs of mind to ſupport an upright and able miniſter. He was therefore for a time diſplaced; and is ſaid to have been particularly oppoſed by the queen's party. The freedom of America had been the grand object of France; and that having been acknowledged in the fulleſt and moſt expreſs terms by Great-Britain, the preliminary articles of peace were ſigned at Paris on the 20th of January 1783; but the immenſe expences incurred were found at laſt to be much more than the revenues of the kingdom could by any means ſupport; and the miſerable exigencies to which government was reduced, contributed no doubt to bring about the revolution. In the year 1786 a treaty of navigation and commerce was concluded between the two courts of London and Verſailles; and this concluded the tranſactions between the two kingdoms.

The ambition of the French government, which made it acquainted with liberty, in aſſiſting the inſurgents in America and Holland, kindled a ſpirit among the people, which could not well admit of the continuance of arbitrary power at home.

The diſmiſſion of Monſieur Neckar from the direction of public affairs, and ſucceeding miniſters being endowed neither with his integrity nor abilities, the finances of the nation were on the point of being totally ruined. And when the edict for regiſtering the loan at the concluſion of the year 1785, which amounted to the ſum of three millions three hundred and thirty thouſand pounds, was preſented to the parliament of Paris, the murmurs of the people, and the remonſtrances of the aſſembly, aſſumed a more legal and formidable aſpect. The king, however, ſignified to the ſelect deputations that were commiſſioned to convey to him their remonſtrances, that he expected to be obeyed without further delay. The ceremony of the regiſtering took place on the next day, but was accompanied with a reſolution, importing, that public œconomy was the only genuine ſource of abundant revenue, the only means of providing for the neceſſity of the ſtate, and reſtoring that credit which borrowing had brought to the brink of ruin. This proceeding was no ſooner known, than the king required the attendance of the grand deputation of parliament: he eraſed from their records the reſolution which had been adopted; and declared himſelf ſatisfied with Monſieur de Calonne, his comptroller-general and acting miniſter.

This gentleman, how gratified ſoever he might be by the ſupport of his ſovereign, could not but feel himſelf deeply mortified by the oppoſition of the parliament. An accurate inquiry into the ſtate of the public finances had convinced him that the expenditure had far exceeded the revenues: to impoſe any new taxes, in the preſent ſituation was impoſſible; to continue the method of borrowing, was ruinous; and to have recourſe only to œconomical reform, would be found wholly inadequate; therefore he heſitated not to declare, that it would be impracticable to place the finances on a ſolid baſis, but by the reformation of whatever was vicious in the conſtitution of the ſtate. The miniſter, in order to give weight to this reform was ſenſible that ſomething more was neceſſary than royal authority; he perceived that the parliament was neither a fit inſtrument for introducing a new order into public affairs; nor would ſubmit to be a paſſive machine for ſanctioning the plans of a miniſter, even if theſe plans had perfect wiſdom for their ſource.

The only alternative that ſeemed, under theſe circumſtances, to remain, was, to have recourſe to ſome other aſſembly, more dignified and ſolemn in its character, and that ſhould conſiſt in a greater degree of members from the various orders of the ſtate, and the different provinces of the kingdom; but the true and legitimate aſſembly of the nation, the ſtates-general, had not met ſince the year 1614. Another aſſembly had occaſionally been ſubſtituted in the room of the ſtates-general: this was diſtinguiſhed by the appellation of the notables, or men of note, and conſiſted of a number of perſons from all parts of the kingdom, chiefly ſelected from the higher orders of the ſtate, and nominated by the king himſelf. This aſſembly had been convened by Henry IV. and again by Louis XIII and was now once more ſummoned by the authority of the then reigning monarch; and the period appointed for their opening was the 29th of January 1787.

Monſieur de Calonne, though embarraſſed by great difficulties, firſt met the aſſembly of the notables, and communicated his long-expected plan. He began by ſtating, that the public expenditure had for centuries paſt exceeded the revenues: that a very conſiderable deficiency had of courſe exiſted; and that at his own acceſſion to office it was three millions three hundred and thirty thouſand pounds. To remedy this evil, the comptroller-general recommended a territorial impoſt, in the nature of the Engliſh land-taxes; from which no rank or order of men were to be exempted; an inquiry in the poſſeſſions of the clergy, which hitherto had been deemed ſacred, from their proportion of the public burdens: the various branches of internal taxation were alſo to undergo a ſtrict examination; and a mortgage of the demeſne lands of the crown preſented a conſiderable reſource.

Monſieur Neckar, before he retired from the management of the finances, had publiſhed his Compte rendue au Roi, in which France was repreſented as poſſeſſing a clear ſurplus of four hundred and twenty thouſand pounds ſterling. This performance had been read with avidity, and was conſidered as an æra in the hiſtory of France. The credit of this ſtatement was ably vindicated by M. de Brienne, archbiſhop of Thouloufe, and by the count de Mirabeau, a ſtill more formidable enemy to Calonne. His eloquence, however, might have ſucceſsfully vindicated his ſyſtem and reputation againſt the calculations of Brienne, and invectives of Mirabeau: but the genius of the comptroller-general ſunk under the influence of the three

great bodies of the nation. The grand and eſſential object of reform was, to equalize the public burdens, and, by rendering the taxes general, to diminiſh the load of the lower and moſt uſeful claſſes of the people.

The ancient nobility and the clergy had ever been free from all public aſſeſſment; the crowds of new nobleſſe, who had purchaſed their patents, were by that ſhameful cuſtom exempted, together with their poſterity, from contributing proportionably to the expences of the ſtate; the magiſtrates likewiſe throughout the kingdom enjoyed their ſhare of exemptions; ſo that the whole weight of the taxes fell on thoſe who were the leaſt able to bear them. Thus the nobility, the clergy, the magiſtracy, were united againſt the miniſter, and the event was ſuch as might be expected. The intrigues of theſe three bodies raiſed againſt him ſo loud a clamour, that, finding it impoſſible to ſtem the torrent, M. de Calonne not only reſigned his place on the 12th of April, but, to avoid the ſtorm of perſecution, ſoon after retired to England.

In the mean time the notables proceeded in their inquiries: and it was now ſuggeſted, that an aſſembly of the ſtates ſhould be called, as the notables were not competent to impoſe a new tax. As the deliberations of the notables were not carried on in ſecret, this propoſal was inſtantly circulated through the capital, and ſuppoſed to be a new diſcovery. The notables were ſoon after diſſolved, without having accompliſhed any thing excepting the juſtification of M. Neckar. The ſtamp-act, however, was eſtabliſhed, and a bed of juſtice was held by the king on the 5th of Auguſt 1787, at which the parliament of Paris was obliged to attend; and the edict was regiſtered, notwithſtanding their proteſt to the contrary. But the parliament, though defeated, were far from ſubdued: on the day after the king had held his bed of juſtice, they entered a formal proteſt againſt the conceſſion that had been extorted from them. On the other hand, though every appearance of violence muſt have proved painful to the mild diſpoſition of Louis, he could not conſent to ſurrender, without a ſtruggle, that authority which had been ſo long exerciſed by his predeceſſors.

Since the commencement of the preſent diſcontents, the capital had been gradually filled with conſiderable bodies of troops; and about a week after the parliament had entered their proteſt, an officer of the French guards, with a party of ſoldiers, went at break of day to the houſe of each individual member, to ſignify to him the king's command that he ſhould immediately get into his carriage, and proceed to Troys, a city of Champagne, about ſeventy miles from Paris, without writing or ſpeaking to any perſon out of his own houſe before his departure. Theſe orders were ſerved at the ſame inſtant; and before the citizens of Paris were appriſed of the tranſaction, the parliament were already on the road to the place of their exile.

The reſentment of the whole nation, againſt the baniſhment of the parliament, roſe to ſo great a height, that, after a month's abſence, it was recalled. This was ſcarcely done, when they were required to regiſter a loan; at which they heſitated, notwithſtanding all the manœuvres of the miniſter. At laſt the king came to the houſe, and held what is called a royal ſeſſion. The edicts were now regiſtered; but the duke of Orleans proteſted, in the preſence of the king, againſt the legality of the proceeding. The parliament proteſted againſt the legality of the ſeſſion itſelf, but to no purpoſe. The duke of Orleans, with four others, were baniſhed; the king called for the journals of the houſe, deſtroyed the proteſt, and forbad it to be inſerted again. Great clamours were excited by the baniſhment of the duke of Orleans, and the other members of parliament; remonſtrances were preſented by the parliaments of Paris, Bourdeaux, and Rennes; but it was not till the ſpring of 1788 that the exiles were recalled.

Louis had now no alternative remaining, but to plunge his country into all the calamities of civil war, or to comply with the wiſhes of his people, and reeſtabliſh the ſtates-general. In the firſt caſe, he muſt have expected to encounter the majority of the people, animated by the exhortations and examples of their magiſtrates: the peers of the realm had expreſſed the ſtrongeſt diſapprobation of his meaſures, nor could he even depend any longer on the princes of the blood: but what afforded moſt ſerious matter of alarm was, the ſpirit lately evidenced among the military, who, during the diſturbances in the provinces, had reluctantly been brought to draw their ſwords againſt their countrymen; and many of whoſe officers, having recently ſerved in America, publicly avowed their abhorrence of a deſpotic government.

Under theſe impreſſions, in the beginning of Auguſt, an arret was publiſhed, which fixed the meeting of the ſtates-general to the firſt of May in the enſuing year, 1789; at the ſame time every ſtep was taken to ſecure the favourable opinion of the public. New arrangements took place in the adminiſtration; and M. Neckar, whom the confidence of the people had long followed, was again introduced into the management of the finances. The torture, which by a former edict, had been reſtricted in part, was entirely aboliſhed; every perſon accuſed was allowed the aſſiſtance of council, and permitted to avail himſelf of any point of law; and it was determined, that in future ſentence of death ſhould not be paſſed on any perſon, unleſs the party accuſed ſhould, by a majority of at leaſt three judges, be pronounced guilty.

At this time the eyes of all Europe were turned on the ſtates-general, or national aſſembly, whoſe reeſtabliſhment, in the month of May 1789, preſented a new æra in the government of France.—By the revolution which took place in that year, France founded a new conſtitution, upon the principles that all men are free and equal in their rights, and that ſovereignty reſides in the nation. This conſtitution has been virtually overthrown by the abolition of the monarchical part of it, and by the ſubſequent condemnation and execution of the king; a deed of moſt ſingular atrocity, by which the national convention have ſtamped eternal infamy upon their characters.

The moment of the meeting of the ſtates-general was far from auſpicious to the court, but abundantly ſo to the intereſts of the nation. The minds of the French had long been agitated by various rumours; the unanimity that had been looked for from the different orders of the ſtates was extinguiſhed by the jarring pretenſions of each; and their mutual jealouſies were attributed, by the ſuſpicions of the people, to the intrigues of the court, who were ſuppoſed already to repent of the haſty aſſent that had been extorted. A dearth that pervaded the kingdom increaſed the general gloom and diſcontent; and the people, preſſed by hunger, and inflamed by reſentment, were ripe for revolt. The ſovereign alſo, equally impatient of the obſtacles he inceſſantly encountered, could not conceal his chagrin; the influence of the queen in the cabinet was again eſtabliſhed, and was attended with the immediate removal of M. Neckar. This ſtep, which evinced a total change of reſolutions, and, which, from the popularity of the miniſter, was likely to produce a violent fermentation in every order of men, was followed by others equally injudicious. The ſtates-general were driven into the Salle des Etats, where they held their meetings, by detachments of the guards, who ſurrounded them, and who waited only the orders of the court to proceed to greater extremities againſt the repreſentatives of the nation, who were obnoxious to them.

Theſe manifeſtations of vigour, had they been only ſuſtained by inſtantly attacking and entering Paris, it is not to be doubted that, unprepared as it ſtill was, and unwilling to expoſe the lives and properties of its citizens to the licentious will of an incenſed ſoldiery, the capital would have been without difficulty

reduced

reduced to obedience: but the delay which ſucceeded gave the inhabitants time to recover from their firſt emotions of ſurprize and apprehenſion. They ſaw the timidity and imbecility of the government, who, having founded the charge, dared not advance to the attack. They profited by this want of exertion; and, rapidly paſſing from one extreme to another, they almoſt unanimouſly took up arms againſt their rulers. Joined by the French guards, who, from a long reſidence in the capital, had been peculiarly expoſed to ſeduction, and who at this deciſive moment abandoned their ſovereign, the Pariſians broke through every obſtacle by which they had hitherto been reſtrained.

By the acceſſion of the French guards, the people had obtained a ſupply of arms and ammunition, and a conſiderable train of artillery; the ſhops of the armourers were ranſacked for weapons, and the ſoldier-citizens were even trained to ſome appearance of diſcipline. The night of the 13th of July paſſed without any event of conſequence: the morning diſcovered that, taking advantage of the darkneſs, the troops encamped in the Champs Eſyſées had moved off. The people, however, were ignorant of the cauſes of this removal, and an immediate attack was expected. The national guard (for that was the name which the mixed band of ſoldiers and citizens now aſſumed) amounted to the number of 150,000 men; but the majority were ſtill without arms. The marquis de la Salle was named commander in chief; the green cockade, which they had at firſt adopted, was changed for the ſince national colours, red, blue, and white; the new army was now more regularly officered; and various deputations were diſpatched in queſt of arms and implements of war. M. de Fleſſelles, the prévôt des marchands (or mayor) made many promiſes on this ſubject; but they all proved deluſive.—In the courſe of their inquiries after arms, a party of more than 30,000, conducted by M. Ethis de Corny, repaired to the Hôtel des Invalids.

M. Sombreuil, the governor, had received orders ſo early as on Sunday the 12th to hold himſelf in readineſs for an attack, and his men had remained during the whole of Monday under arms, and on the morning of Tueſday he had permitted them to take a few hours reſt. At this moment M. de Corny arrived; and on making known to the governor the object of his miſſion, he was anſwered, that the invalids had not any arms. M. Corny was re-conducted by M. Sombreuil to the gate; but it was no ſooner opened than the multitude ruſhed in, like an irreſiſtible torrent, and in a few minutes ranſacked every part of the hôtel.—More than 30,000 muſkets, and twenty pieces of cannon, were the fruit of this expedition. On the oppoſite ſide of the Seine a ſimilar event occurred; there another party attacked the *garde-meuble* de la couronne, and procured from that ancient ſtore an immenſe number of weapons of different kinds.

The Baſtile had from the firſt moment of the alarms in Paris been put in a ſtate of defence. Fifteen pieces of cannon were mounted on the towers; and three field-pieces, loaded with grape and caſe-ſhot, guarded the firſt gate. An immenſe quantity of powder and military ſtores had been brought from the arſenal, and diſtributed to the different corps; the mortars had been exerciſed, the draw-bridge and gates ſtrengthened and repaired; the houſe of the governor himſelf was fortified, and guarded by light pieces of artillery. The ſhortneſs of the time had not permitted him to be equally provident in laying in a ſufficient ſtore of proviſions. The forces which the fortreſs included were chiefly foreigners.

On the morning of the 14th, ſeveral deputations had waited on the Marquis de Launay, the governor, to demand arms and peace: they were courteouſly received by him, and he gave them the ſtrongeſt aſſurances of his good intentions. Indeed, it is ſaid, that he was himſelf averſe to hoſtile meaſures, had he not been ſeduced by the perfidious counſels of the ſieur Louis de Flue, commander of the Swiſs guards, by the orders of the baron de Bezenval, and by the promiſes of M. de Fleſſelles. The Swiſs ſoldiers had even been engaged by an oath to fire on the invalids who were in the fortreſs, if they refuſed to obey the governor; and the invalids themſelves, it is ſaid, were intoxicated with a profuſion of liquor which had been diſtributed among them.

M. de la Roſiere, a deputy of the diſtrict of St. Louis de la Culture, waited on the governor, about eleven o'clock in the morning, and was accompanied by a mixed multitude of all deſcriptions. He entered alone into the houſe of the governor, and the people remained in the outer court. "I come, Sir," ſaid the deputy, "in the name of the nation, to repreſent to you, that the cannons which are levelled againſt the city from the towers of the Baſtile, have excited the moſt alarming apprehenſions, and I muſt entreat that you will remove them." The governor replied, "that it was not in his power to remove the guns, as they had aways been there, without an order from the king; that he would, however, diſmount them, and turn them out of the embraſures."

The deputy having with difficulty obtained leave from M. de Loſme, major of the fortreſs, to enter into the interior court, ſummoned the officers and ſoldiers in the name of honour and their country to alter the direction of the guns, &c.—and the whole of them, at the deſire even of the governor, engaged themſelves by oath to make no uſe of their arms, unleſs attacked. M. de la Roſiere, after having aſcended one of the towers with M. de Launay, went out of the caſtle, promiſing to engage the citizens to ſend a part of the national guard to do the duty of the Baſtile in conjunction with the troops.—The deputy had ſcarcely retired, before a number of citizens approached the gate, and demanded arms and ammunition. As the majority of them were unarmed, and announced no hoſtile intention, M. de Launay made no difficulty of receiving them, and lowered the firſt draw-bridge to admit them. The more determined of the party advanced to acquaint him with the object of their miſſion: but they had ſcarcely entered the firſt court, when the bridge was drawn up, and a general diſcharge of muſketry deſtroyed the greater part of theſe unfortunate people.

This apparent act of perfidy immediately raiſed the reſentment of the people almoſt to phrenſy. The inſtantaneous determination was, to ſtorm the fortreſs; and the execution was as vigorous, as the reſolution was daring. An immenſe multitude, armed with muſkets, ſabres, &c. ruſhed at once into the outer courts. A ſoldier of the name of Tournay, climbed over the corps-de-garde, and leaped alone into the interior court. After ſearching in vain for the keys of the draw-bridges in the corps-de-garde, he called out for a hatchet—he ſoon broke the locks and the bolts; and being ſeconded by the efforts of the people on the other ſide, the two draw-bridges were immediately lowered. The people loſt no time in making good their ſtation, where for more than an hour they ſuſtained a moſt ſevere fire from the garriſon, and anſwered it with equal vigour.

Several deputations from the Hotel de Ville appeared, before the walls, during the conteſt, with flags of truce, intending to perſuade the beſieged to a peaceful ſurrender: but either they were not diſcovered amidſt the general confuſion, or, what is more probable, M. de Launay deſpaired of finding mercy at the hands of the populace, and ſtill flattered himſelf with ſome deluſive hope of deliverance. The guards, who now acted openly with the people, proved of moſt eſſential ſervice; and, by the advice of ſome of the veterans of this corps, three waggons loaded with ſtraw were ſet on fire under the walls, the ſmoke of which interrupted the view, and conſequently intercepted the aim of the beſieged; while the

the aſſailants, being at a greater diſtance, were able to direct their fire to the battlements with an unerring aim. In the mean time, the arſenal was ſtormed, and a moſt dreadful havock was prevented there by the prudence and courage of M. Humbert, who firſt mounted the towers of the Baſtile: a hair-dreſſer was in the very act of ſetting fire to the magazine, when M. H. whoſe notice was attracted by the cries of a woman, knocked the deſperado down with the but-end of his muſket; next, inſtantly ſeizing a barrel of ſalt-petre which had already caught fire, he was happy enough to extinguiſh it, by turning it upſide down.

An immenſe crowd, as if unconſcious of danger, filled the courts of the fortreſs, in ſpite of the unremitted fire of the garriſon, and even approached ſo near the towers, that M. de Launay himſelf frequently rolled large maſſes of ſtone from the platform upon their heads. Within, all was confuſion and terror; the officers themſelves ſerved at the guns, and diſcharged their firelocks in the ranks. But when the governor ſaw the aſſailants take poſſeſſion of the firſt bridge, and draw up their cannon againſt the ſecond, his courage then was changed into deſpair, and even his underſtanding appeared to be deranged. He raſhly ſought to bury himſelf under the enormous maſs, which he had in vain attempted to defend.—While a turnkey was engaged in diſtributing wine to the ſoldiers, he caught the match from one of the pieces of cannon, and ran to the magazine with an intention to ſet it on fire; but a ſubaltern of the name of Ferrand, repulſed him with his bayonet. He then went down to the Tour de la Liberté, where he had depoſited a quantity of powder: but here alſo he was oppoſed by the ſieur Beguard, another ſubaltern officer, who thus prevented an act of inſanity, which muſt have deſtroyed thouſands of citizens, and with the Baſtile would have infallibly blown up all the adjacent buildings, and a conſiderable part of the ſuburb of St. Antoine.

De Launay at length propoſed ſeriouſly to the garriſon to blow up the fortreſs, as it was impoſſible that they could hope for mercy from the mob. But he was anſwered by the ſoldiers, that they would rather periſh, than deſtroy in this inſidious manner ſuch a number of their fellow-citizens. He then hung out a white flag, intimating his deſire to capitulate; and a Swiſs officer would have addreſſed the aſſailants through one of the loop-holes of the draw-bridge—but the hour was paſt, and the exaſperated populace would attend to no offer of capitulation. Through the ſame opening he next diſplayed a paper, which the diſtance prevented the beſiegers from reading. A perſon brought a plank, which was reſted on the parapet, and poiſed by a number of others. The brave unknown advanced upon the plank; but juſt as he was ready to ſeize the paper, he received a muſket ſhot, and fell into the ditch. He was followed by a young man of the name of Maillard, ſon to an officer of the chatelet, who was fortunate enough to reach the paper, the contents of which were—"We have twenty thouſand pounds weight of gunpowder, and will blow up the garriſon and all its environs, if you do not accept the capitulation."—M. Elie, an officer of the queen's regiment, who was inveſted with a kind of ſpontaneous authority, was for agreeing to terms; but the people indignantly rejected the very word Capitulation, and immediately drew up three pieces of artillery to the ſpot.

It being now perceived by the garriſon that the great bridge was going to be attacked, they let down the ſmall draw-bridge, which was to the left of the entrance into the fortreſs. Meſſrs. Elie, Hulin, Maillard, Reole, Humbert, Tournay, and ſome others, leaped inſtantly on the bridge, and, ſecuring the bolts, proceeded to the door. In the mean time the French guards, preſerving their habitual coolneſs and diſcipline, formed a column on the other ſide of the bridge, to prevent the citizens from ruſhing upon it in too great numbers. An invalid came to open the gate behind the draw-bridge, and aſked the invaders what they wanted? "The ſurrender of the Baſtile," they cried; and he permitted them to enter. The conquerors immediately lowered the great bridge, and the multitude entered without reſiſtance: the invalids were ranged to the right, and the Swiſs on the left hand, and their arms piled againſt the wall. They took off their hats, clapped their hands, and cried out "Bravo!" as the beſiegers entered. The firſt moments of this meeting paſſed in peace and reconciliation: but ſome ſoldiers on the platforms, ignorant of the ſurrender, unhappily fired upon the people; who, ſuſpecting a ſecond act of perfidy, fell upon the invalids, two of whom (the unfortunate Beguard, who had prevented the governor from blowing up the Baſtile, and another equally innocent) were dragged to the Place de Grève, and hanged.

M. de Launay, when ſeized, was not in an uniform, but in a plain grey frock: he had a cane in his hand, and would have killed himſelf with the ſword that it contained, but the grenadier Arné wreſted it out of his hand. He was eſcorted by Meſſrs. Hulin, Arné, Legris, Elie, and ſome others, and every effort was exerted by theſe patriots to ſave his life, but in vain:—they had ſcarcely arrived at the Hotel de Ville before his defenders were overpowered, and even wounded by the enraged populace, and he fell under a thouſand wounds. M. de Loſme Salbrai, his major, a gentleman diſtinguiſhed for his virtue and his humanity, was alſo the victim of the popular fury. The marquis de Pelleport, who had been five years in the Baſtile, and during that time had been treated by him with particular kindneſs, interpoſed to ſave him at the riſk of his life, but was ſtruck down by a hatchet, and M. de Loſme was inſtantly put to death. The heads of the governor and the major were ſtruck off, and carried on pikes through the ſtreets of the city.

The rage of the populace would not have ended here—the invalids who defended the fortreſs would all have been ſacrificed, had not the humanity of the French guards interpoſed, and inſiſted on their pardon. The keys of the Baſtile were carried to M. Briſſot de Warville, who had been a few years before an inhabitant of theſe caverns of deſpotiſm; and a guard of 3000 men was appointed over the fortreſs till the council at the Hotel de Ville ſhould decree its demolition. In the intoxication of ſucceſs, the priſoners were forgotten; and as the keys had been carried to Paris, the dungeons were forced open—ſeven priſoners only were found, three of whom had loſt their reaſon, having been detained there as ſtate priſoners from the reign of Louis XV.

M. de Launay's fate involved that of M. de Fleſſelles, the prévôt des marchands. He had been long ſuſpected of a deſign to betray the people; and all his manœuvres evidently tended to that point. In the pocket of M. de Launay a letter from him was diſcovered, which contained theſe remarkable words—"I will amuſe the Pariſians with cockades and promiſes. Keep your ſtation till the evening—you ſhall then have a reinforcement." At the ſight of this letter the unfortunate de Fleſſelles was ſtruck dumb—a voice was heard in the hall—"Be gone, M. de F. you are a traitor."—"I ſee," ſaid he, "gentlemen, that I am not agreeable to you—I ſhall retire."—He haſtened down the ſtairs; but as he croſſed the Grève, accompanied by a number of perſons to defend him, a young man, who had waited an opportunity, ſhot him with a piſtol. His head was cut off, placed on a pike, and carried through the ſtreets along with that of the governor.

There were found, in the priſon of the Baſtile, the moſt horrible engines for putting to the ſevereſt tortures thoſe unhappy perſons whom the cruelty or jealouſy of deſpotiſm had determined to deſtroy. An

iron

iron cage, about twelve tons in weight, was found with the ſkeleton of a man in it, who had probably lingered out a great part of his days in that horrid manſion. Among the priſoners releaſed by its deſtruction were major White a Scotſman, earl Mazarine an Iriſh nobleman, and the count de Lorges.—The former appeared to have his intellectual faculties almoſt totally deſtroyed by the long confinement he had endured; and by being unaccuſtomed to converſe with any human creature, he had forgotten the uſe of ſpeech. Earl Mazarine, on his arrival upon the Britiſh ſhore, eagerly jumped out of the boat, fell down on his knees, and, kiſſing the ground thrice, exclaimed, "God bleſs this land of liberty!" The count de Lorges, at a very advanced period of life, being alſo liberated, was exhibited to the public curioſity in the Palais Royal, or royal palace. His filthy appearance, his white beard which extended to his waiſt, and, above all, his extreme weakneſs, reſulting probably from ſuffering an impriſonment of thirty-two years, were objects highly calculated to operate upon the ſenſes and paſſions of every beholder. It is indeed impoſſible not to participate in the exultation which a capital and a country ſo highly illuminated, and ſo long oppreſſed, muſt have experienced, at the extinction of this deteſtable and juſtly dreaded priſon of ſtate.

This wonderful day was ſucceeded by a tumultuous night; and the ſongs of joy and triumph, which had celebrated the victory of the people, were converted into confuſed murmurs expreſſive only of anxiety and alarm. A report was ſpread that the troops were about to enter the city at the Barriere d'Enfer: thither the citizens crowded under the conduct of the French guards, and preceded by a train of artillery—the body of troops, however, that appeared in that quarter, were diſperſed by a ſingle volley. The alarm-bells were then ſounded; barricadoes were formed at the barriers; deep holes were dug in different parts, to prevent the approach of the cavalry; the tops of the houſes were manned; a general illumination was ordered; and the ſilence of the night was interrupted by the diſcharges of artillery, and by the warning voice of the patroles—"Citizens, do not go to bed; take care of your lights; on this night we muſt ſee clearly."

The court regarded the firſt news of the taking of the Baſtile as an impoſture of the popular party: it was, however, at length incontrovertibly confirmed. The firſt reſolves of the cabal are ſaid to have been deſperate, and orders were iſſued to the commanders to puſh their projected plot with all poſſible vigour. In the dead of the night, marſhal Broglio is ſaid to have arrived to inform them, that it was impoſſible to obey the mandate he had received of inveſting the hall of the national aſſembly with a train of artillery, as the ſoldiers would not comply with his orders.—"Preſs then the ſiege of Paris," was the anſwer. The general replied, for the execution of that project, he could not depend on the army.

The only perſon in the palace, who was kept totally ignorant of theſe tranſactions, was the king. The duke de Liancourt, a diſtinguiſhed patriot, who was then maſter of the wardrobe, ſaved the ſtate: he forced his way in the middle of the night into the king's apartment, informed him of every circumſtance, and announced to the count d'Artois that a price was ſet upon his head. The intelligence of the duke was ſupported by the authority of Monſieur, who accompanied him, and the king was immediately convinced that he had been deceived by evil councils. Early the next morning the monarch appeared in the aſſembly, but without the pomp and parade of deſpotiſm. His addreſs was affectionate and conſolatory. He "lamented the diſturbances at Paris; diſavowed all conſciouſneſs of any meditated attack on the perſons of the deputies; and added that he had iſſued orders for the immediate removal of the troops from the vicinity of the motropolis."

It is impoſſible to expreſs the feelings of the aſſembly on this affecting occaſion.—The tear of ſympathy ſtarted into almoſt every eye.—An expreſſive ſilence firſt pervaded the aſſembly, which preſently was ſucceeded by a burſt of applauſe and acclamation.

The city of Paris, which had, from the 12th of July, been an unhappy ſcene of commotion, of terror, and of bloodſhed, began on the 15th to aſſume ſome appearance of order and tranquillity. The livid and bloody heads were ſtill carried about the ſtreets as trophies of popular reſentment: but on the morning of that day, a ſenſible citizen perſuaded the multitude to liſten to the voice of humanity, and they were thrown into the Seine. The electors at the Hotel de Ville laboured inceſſantly in the organization of the civil eſtabliſhment, and in the regulation of the city militia. The odious name of Prévôt was aboliſhed; the more ancient and honourable appellation of Mayor was ſubſtituted in its place; and to this office M. Bailly, who had been preſident of the tiers état, was called by the unanimous voice of his fellow-citizens. We muſt not omit to notice, that the duc d'Orleans, having been elected preſident of the national aſſembly, had declined the honour, and that the venerable archbiſhop of Vienne had been choſen in his room. During the laborious ſeſſions which ſucceeded the diſgrace of M. Neckar, however, it was thought that his age and infirmities would ſcarcely allow him to exerciſe ſo difficult an office without the aſſiſtance of a younger perſon, and the marquis de la Fayette was unanimouſly nominated vice-preſident.

During the night, the troops which had aſſembled on the Champ de Mars had decamped, leaving their tents and the greater part of their baggage behind them: but a ſpectacle ſtill more intereſting to the citizens ſoon preſented itſelf:—this was a deputation of eighty-four of the moſt diſtinguiſhed members of the national aſſembly, accompanied by an immenſe crowd, who covered the road from Verſailles, to the capital, and loaded them with bleſſings, and the moſt unequivocal proofs of prodigal affection. The ſurpriſe and exultation of theſe patriots muſt have been extreme, when they beheld more than 100,000 citizens transformed into ſoldiers, all of them armed and already trained to military diſcipline. On their arrival at the Hôtel de Ville, the marquis de la Fayette, count Lally Tolendal, the marquis Clermont Tonnerre, the duc de Liancourt, and the archbiſhop of Paris, addreſſed the people.—From this place they adjourned to the church of Notre Dame, where *Te Deum* was ſung in celebration of the happy and chearful return of peace accompanied with liberty. As they returned from the church, the acclamations of the populace were occaſionally interrupted by the expreſſion of two further demands, the wiſh of ſeeing their beloved ſovereign in Paris, and the recall of the patriotic miniſtry. The deputies returned to Verſailles in the evening.

To circumſtances of ſuch importance as thoſe above related, it muſt be imputed that the public tranquility, when interrupted, was not eaſily reſtored. The miniſtry, which had ſhewn themſelves ſo inimical to the cauſe of the people, were not yet diſmiſſed, nor had the troops yet evacuated the environs of Paris: two freſh regiments had arrived at St. Denis; a ſtrange and unſucceſsful attack had even been made on the Baſtile, by a ſerjeant and two companies of guards; and a convoy of flour had been intercepted by the orders of a perſon well known. The night of the 15th, therefore, was ſpent with the ſame anxiety, and with the ſame warlike preparations, as the preceding; and in the morning a freſh deputation was ſent to the aſſembly, entreating them to intereſt themſelves in procuring the diſmiſſion of the miniſtry and the recall of M. Neckar.

The aſſembly were on the point of voting a ſpirited addreſs to the king, which had been propoſed by Mirabeau, when they were informed that the miniſters themſelves had anticipated the wiſh of the aſſembly, by giving in their reſignations. The ſame evening, a letter from his majeſty to M. Neckar, inviting him to return, was read by the preſident. It was received with the loudeſt acclamations, and was ſeconded by an addreſs from the aſſembly themſelves to that upright miniſter, couched in the ſtrongeſt terms of affection and reſpect. The king having at the ſame time intimated his intention of viſiting Paris the following day, the aſſembly immediately decreed a deputation to convey this exhilirating intelligence, and to calm the diſquietude that prevailed in the metropolis.

Thoſe who really loved him were apprehenſive for his ſafety; while others, who had been guilty of malverſion, were apprehenſive for themſelves. Rumours of projected aſſaſſinations were ſpread, and the leaſt conſequence that could enſue was ſuppoſed to be the detention of the ſovereign in Paris. The king, however, with a degree of courage and patriotiſm which does honour to his character, remained immovable in his determination.

On the morning of the 17th he left Verſailles, in a plain dreſs, and with no other equipage than two carriages with eight horſes each; in the firſt of which he rode himſelf—a part of the national aſſembly, in their robes, accompanied him on foot: and the militia of Verſailles compoſed his only guard till the proceſſion arrived at the Seve, where they were relieved by the Paris militia, with the marquis de la Fayette at their head: and from this place the ſuite of the monarch amounted to about 20,000 men. The horſe-guards led the proceſſion; and theſe were followed by the city cavalry; ſome battalions of the French guards and other ſoldiers, who had fought in defence of the nation, ſucceeded: then the different companies and corporations; and M. de la Fayette, with a large body of militia, brought up the rear.

A quarter of an hour before the arrival of the king, whether from accident, or from ſome plot concerted by the enemies of liberty, a woman was ſhot by a muſket-ball, from the oppoſite ſide of the river. The king looked pale and melancholy, and an expreſſion of anxiety was even apparent in the faces of the national aſſembly. The progreſs was remarkably ſlow; and no ſhout was heard but "Vive la nation.

At the Barriere des Conferences, the king was met by M. Bailly, who acted as mayor, with the other magiſtrates. On preſenting the keys of the city, M. Bailly addreſſed his majeſty in a ſhort but elegant ſpeech, the exordium of which was:—"Theſe, Sir, are the keys which were preſented to Henry IV. He came to reconquer his people; it is our happineſs to have reconquered our king." At the Pont Neuf the paſſage was lined by a numerous train of artillery; but in the true ſpirit of French gallantry, the mouths and touch-holes of the cannon were adorned with bouquets of flowers.

On their arrival at the Hôtel de Ville, the king ſolemnly confirmed the election of M. Bailly and the marquis de la Fayette; and on receiving the complimentary addreſſes of the mayor, the preſident of electors, count Lally Tolendal, &c. he exclaimed with an air of pathetic emotion, which ſcarcely allowed him utterance,—"My people may always rely upon my affection." He received from the hands of the mayor the national cockade; and when he ſhewed himſelf at the window with this badge of patriotiſm the joy of the people could be no longer reſtrained; the ſhout of *Vive le roi!* which had ſcarcely been heard in the former part of the day, filled the whole atmoſphere, and reſounded from one extremity of the city to the other. The return of the king to Verſailles was a real triumph. The citizens, almoſt intoxicated with joy, ſurrounded his carriage; his countenance, which in the morning bore the aſpect of melancholy, was now cheerful and ſmiling; and he appeared ſincerely to partake in the general ſatisfaction of the people.

An incident which occurred at Verſailles contributed to excite a moſt unhappy commotion. On the firſt of October an entertainment (the firſt that was ever given in public at Verſailles by that body) was given by the gardes-du-corps, or king's body guard, to the officers of the regiment of Flanders; and to augment the unpopularity of the circumſtance, it was given in the royal ſaloon. Several of the officers of the national guard, with others of the military, were invited. At the ſecond courſe, four toaſts were given: "The king, the queen, the dauphin, and the royal family." "The nation" was propoſed, but according to a number of witneſſes, expreſſly rejected by the gardes-du-corps. The king was juſt returned from hunting; and the queen, having been informed of the gaity of the ſcene, perſuaded his majeſty to accompany her with the heir apparent to the ſaloon, which was now filled with ſoldiers—the grenadiers of Flanders and the Swiſs chaſſeurs having been admitted to the deſert. The queen appeared with the dauphin in her arms, affectionate as ſhe was lovely, and carried the royal infant through the ſaloon, amidſt the acclamations and murmurs of the ſpectators. Fired with enthuſiaſm, the ſoldiers drank the health of the king, the queen, and the dauphin, with their ſwords drawn; and the royal gueſts bowed reſpectfully and retired.

It was not long before the entertainment, which had hitherto been conducted with ſome degree of order, became a ſcene of entire confuſion. Nothing was omitted to inflame the paſſions of the military. The muſic played the favourite air—"O Richard, O my king! the world abandons thee;" the ladies of the court diſtributed white cockades, the anti-patriot enſign; and even ſome of the national guard, it is ſaid, had the weakneſs to accept them.

The city of Paris, during theſe tranſactions, was afflicted with all the evils of famine. Either no bread was to be obtained, or bread of ſo bad a quality, that the populace, always miſtruſtful and ſuſpicious, were not without their alarms of a criminal deſign upon the lives, or at leaſt the health, of the inhabitants. Such was the ſtate of things when the news arrived of the fatal banquet at Verſailles. The circumſtances which we have related were ſtrangely magnified; and all the ſuſpicions which were entertained reſpecting the deſign of diſſolving the aſſembly, and carrying off the ſovereign, were added in exaggeration.

Early on the morning of the memorable fifth of October, a woman ſallied out from the quarter of St. Euſtacia, and entering the corps-de-garde, and ſeizing a drum, paraded the adjacent ſtreets beating an alarm, and exciting the people by clamours reſpecting the ſcarcity of bread. She was ſoon joined by a very numerous mob, chiefly of women, to the amount of 800, who proceeded to Verſailles, where the king, upon hearing their complaints, ſigned an order for bringing corn from Senlis, and de Lagni, and for removing every obſtacle which impeded the ſupply of Paris. This order being reported to the women, they retired with joy and gratitude.

No ſooner was this band of Amazons diſperſed, than it was ſucceeded by another. The national aſſembly continued ſitting; but the ſeſſion was tumultuous, and interrupted by the ſhouts and harangues of the Pariſian fiſh-women, who filled the galleries; their addreſs was mingled with affecting murmurs and complaints, the multitude crying out that they were actually ſtarving, and that the majority of them had eaten nothing for upwards of twenty-four hours. The preſident, therefore, humanely ordered that proviſions ſhould be ſought for in every part of the town, and the hall of the aſſembly was the ſcene of a miſerable, ſcanty, and tumultuous banquet. Indeed ſuch

was

was the dreadful famine, that the horſe of one of the gardes-du-corps, being killed in a tumult, he was immediately roaſted by the mob, and greedily devoured.

The wretched multitudes who had travelled from Paris were expoſed, almoſt famiſhed, to the inclemencies of the weather in the open ſtreets: within the caſtle all was trepidation; nothing was to be heard from without but imprecations, and the voice of enraged multitudes demanding the life of the queen and the gardes-du-corps. Towards midnight, however, all appeared tolerably ſtill and peaceable, when the beating of the drums, and the light of innumerable torches, announced the approach of the Pariſian army.

At about half paſt five, the day began to break; and at this period crowds of women and other deſperate perſons, breathing vengeance and thirſting for blood, advanced to the caſtle, which, in the fatal ſecurity which the arrival of the Pariſian militia inſpired, was left unguarded in ſeveral places. Some of the iron gates were ſhut, and ſome left open. An immenſe crowd found its way into the "cour des miniſtres," and immediately proceeded to the royal gate, which was ſhut, and a number of the invaders attempted to ſcale it. Another troop of ruffians proceeded to the chapel court, and another to that of the princes, and by both theſe avenues penetrated into the royal court. Some haſty diſpoſitions of defence were made by a M. Agueſſeau; the gardes-du-corps were ſoon under arms, and one man was wounded by them in the arm, and another ſhot dead. The croud immediately mounted the grand ſtair-caſe, where one of the gardes-du-corps, M. Miomandre, endeavoured to diſſuade them from their attempt; but he narrowly eſcaped with his life. M. Tardivet du Repaire haſted to the queen's apartment, in order to prevent the entrance of the banditti; but he was aſſailed by thouſands, and ſtretched upon the ground. A villain with a pike attempted to pierce him to the heart; but he had the good fortune to wreſt the weafrom his hand, with which he parried the attacks of his enemies, and at length effected his eſcape. M. Miomandre in the mean time made his way to the queen's apartment. He opened the door, and cried out to a lady, whom he ſaw in the inner chamber—"Save the queen, madam, her life is in danger—I am here alone againſt two thouſand tigers." He ſhut the door; and after a few minutes reſiſtance was deſperately wounded with a pike, and left for dead—though he afterwards recovered.

A quarter of an hour previous to this, the queen had been awaked by the clamours of the women who aſſembled upon the terrace; but her waiting woman had ſatisfied her by ſaying, "that they were only the women of Paris, who ſhe ſuppoſed, not being able to find a lodging, were walking about." But the tumult approaching, and becoming apparently more ſerious, ſhe roſe, dreſſed herſelf in haſte, and ran to the king's apartment by a private paſſage. In her way ſhe heard the noiſe of a piſtol and a muſket, which redoubled her terror. "My friends," ſaid ſhe to every perſon ſhe met, "ſave me and my children." In the king's chamber ſhe found the dauphin, who had been brought there by one of her women; but the king was gone. Awaked by the tumult, he had ſeen from a window the multitude preſſing towards the grand ſtair-caſe; and alarmed for the queen, he haſted to her apartment, and entered at one door in the moment ſhe had quitted it by the other. He returned without loſs of time; and having with the queen brought the princeſs royal into the chamber, they prepared to face the multitude. In the mean time the noiſe and tumult increaſed, and appeared at the very door of the chamber.

Nothing was now to be heard but the moſt dreadful exclamations, with violent and repeated blows againſt the outer door, a pannel of which was broken. Nothing but inſtant death was expected by the royal company. Suddenly, however, the tumult ſeemed to ceaſe—every thing was quiet; and a moment after a gentle rap was heard at the door. The door was opened, and in an inſtant the apartments were filled with the Pariſian guard. The officer who conducted them, ordered them to ground their arms. "We come," ſaid he, "to ſave the king;" and turning to ſuch of the gardes-du-corps as were in the apartments, "We will ſave you alſo, gentlemen; let us from this moment be united."

The national guard unfortunately arrived too late to prevent all the miſchief. Two of the gardes-du-corps were murdered by the mob before the troops could be rallied, and their heads fixed on ſpikes ſerved as the ſtandards of this deteſtable banditti. From the firſt moment of the alarm the marquis de la Fayette had even exceeded his uſual activity. He appeared in every quarter:—"Gentlemen," ſaid he to the Pariſian ſoldiers, "I have pledged my word and honour to the king, that nothing belonging to him ſhall receive injury. If I break my word, I ſhall be no longer worthy to be your commander." Captain Gondran, the officer who had driven the ruffians from the king's apartment, was not leſs conſpicuous for his activity. The Pariſians forced their way in every part through the almoſt impenetrable maſs—ſurrounded the gardes-du-corps, and placed them in ſafety under their own colours.

The banditti, whoſe great object was plunder, had already begun to ſtrip the palace, and to throw the furniture to each other out of the windows. M. Gondran purſued them from place to place, till the caſtle was at length completely cleared. Expelled from the palace, they repaired to the ſtables; but here a ſudden ſtop was put to their depredations by M. Doazon, a farmer-general, and captain of the Paris militia. The horſes were all recovered, and brought back in ſafety to their ſtalls. Diſappointed at length in every view, they departed in a body to Paris; and left Verſailles entirely free, and under the protection of the national guard. The moſt generous kindneſs and gratitude took place between the gardes-du-corps and the national guard. The former conſidered the others as their deliverers; while the latter evinced every inclination that they ſhould in future form one united corps.

At length the royal family now ventured to ſhew themſelves at a balcony, and received the moſt lively acclamations of reſpect from the ſoldiers and the people. But whether it had been planned by the popular party, or whether it was the immediate impulſe of the multitude—but the former is moſt probable—at the firſt a ſingle voice, or a few voices, exclaimed—"The king to Paris;" and this was inſtantly followed by an univerſal acclamation enforcing the ſame demand. After ſome conſultation with the marquis de la Fayette, the king addreſſed them: "You wiſh me to go to Paris—I will go, on the condition that I am to be accompanied by my wife and children." He was anſwered by reiterated acclamations of *Vive le roi!*

The national aſſembly was convened before the king's departure; and, on the motion of M. Mirabeau, paſſed a ſolemn decree, "that the aſſembly was inſeparable from the perſon of the king." A deputation of one hundred members was alſo appointed to accompany the king to Paris. During the preparations for the journey, the gardes-du-corps changed hats and ſwords with the grenadiers and national guards, and both they and the regiment of Flanders deſired leave to mix indiſcriminately in the ranks. It was two o'clock in the afternoon before the proceſſion ſet out. During the progreſs all was gaiety and joy among the ſoldiers and the ſpectators; and ſuch was the reſpect in which the French nation ſtill held the name and perſon of their king, that the multitude were ſuperſtitiouſly perſuaded that the royal preſence would actually put an end to the famine. On his arrival,

the king was congratulated by the municipality, and declared his approbation of the loyalty which the city of Paris manifeſted.

As the ſpirit of the nation was ſo entirely averſe to the principles of the high ariſtocratic party, numbers of them, particularly the king's two brothers, and ſome of the firſt rank and fortune, took refuge in foreign countries, where they applied themſelves indefatigably to the purpoſe of exciting war againſt France.

The preparations for the general confederation proceeded, in the mean time, with conſiderable rapidity. The Champ de Mars, ſo famous for having been the rendezvous of the troops which in the preceding year were intended to overawe the capital, was choſen for this ſolemnity. This piece of ground, which is about 400 toiſes, or 800 yards in diameter, is bounded on the right and left by lofty trees, and commands at the further extremity a view of the military academy. In the middle of this vaſt plain an altar was erected for the purpoſe of adminiſtering the civic oath; and round it an immenſe amphitheatre was thrown up, of a league in circumference, and capable of containing four hundred thouſand ſpectators. The entrance into the Champ de Confédération (as it was now called) was through triumphal arches. The king's throne was placed under an elegant pavilion in the middle, and on each ſide of it were ſeats for the members of the national aſſembly. Two thouſand workmen were employed upon this immenſe labour; but the citizens of Paris, fearing leſt the preparations ſhould not be completed at the appointed period, flocked from every quarter to aſſiſt in the patriotic undertaking. Not only the military, but the clergy, and even the ladies lent their cheerful aſſiſtance. With aſtoniſhment ſtrangers beheld the moſt delicate and elegant of the female ſex dragging the wheel-barrow, or handling with willing but ſometimes ineffective endeavours the weighty mallet or the ſpade. We further learn, that on the Friday before the 14th, his majeſty went to view the works at the Campus Martius, and, like the emperor of China, lent a hand, not indeed to the plough, but to the ſhovel; he filled a wheel-barrow, and would have wheeled away the load, had not one of his attendants taken the burden off his hands.—One of the ſpectators remarked, The king was digging his own grave—at leaſt, that of his late royal honours. The provincials, who came from the remoteſt parts of the kingdom to join in the confederation, emulated the citizens in the ardour and enthuſiaſm; and the work was completed, ſo as both with reſpect to time and manner to ſurprize every ſpectator.

At length the important 14th of July 1790 arrived. The national guards of the departments, diſtinguiſhed by their reſpective ſtandards, the battalions of infantry, and the different troops of cavalry, the marine of France, and the foreigners who ſerved under its banners, being all arranged in military order, the king and the national aſſembly took a ſolemn oath to maintain the conſtitution; the armed citizens repeated it amongſt the applauſes of innumerable ſpectators. They ſwore to live free, or die; and this oath was taken on the ſame day throughout the whole extent of the kingdom.

On the 20th of June 1791, France was menaced with the convulſions of anarchy, and the horrors of civil war, by the eſcape of the king and queen, with their infant children, and Monſieur and Madame. To favour their eſcape, the royal family had obtained a paſſport through the medium of the Ruſſian ambaſſador, in the name of a baroneſs de Kortz, with her ſuite, as travelling to Frankfort.

They travelled in the moſt private manner till they found themſelves at a conſiderable diſtance from the capital, when they were furniſhed by Bouillé with detachments of dragoons, under the pretence of guarding ſome treaſure for the pay of the ſoldiers. They proceeded without interruption for 156 miles, and were but a few leagues from the frontiers when they were arreſted. At St. Menehoud, the poſt-maſter, a M. Drouet, who had formerly been a dragoon in the regiment of Condé—He immediately recogniſed the queen, and was forcibly attracted by the reſemblance of the king to his portrait on the aſſignat of fifty livres. He was confirmed in his ſuſpicions, on ſeeing the detachment of dragoons relieved by a detachment of huſſars, and determined to ſtop them; but, being alone, was prudent enough not to expoſe himſelf to the oppoſition of the ſoldiers. He ſuffered the carriage to paſs, but mounted a ſwift horſe, and took a croſs-road to Varennes, which was their next ſtage. He communicated his ſuſpicions to the poſt-maſter there, who had alſo formerly been a dragoon; and they concluded that the only mode of effecting their purpoſe was, to barricade the ſtreet and bridge over which the carriages muſt neceſſarily paſs. Fortunately, on the bridge there ſtood at the moment a carriage loaded with furniture; they overſet it, and called together the mayor, the procureur de la commune, and the commandant of the national guard, and in a few minutes the number of the patriots was increaſed to eight men.

The commandant and the procureur approached the principal carriage, and aſked the names of the travellers. The queen petulantly anſwered, they were in haſte, and produced the paſſport, which was thought a ſufficient warrant by ſeveral perſons: but the poſt-maſters combated the opinion, on the ground of its not being counterſigned by the preſident of the national aſſembly; and aſked why a Ruſſian baroneſs ſhould be eſcorted by the military of France? It was determined therefore to ſtop the travellers; and as they entered the houſe of the procureurs, the king throwing off his diſguiſe reſumed his dignity.—"I am your king, it is true," ſaid he: "theſe are my wife and children. I charge you to treat us with that reſpect which the French nation have always manifeſted towards their ſovereign."

The national guard had now arrived in conſiderable numbers, and at the ſame moment the huſſars, who endeavoured ſword in hand to force the houſe where the king was; but were anſwered by the national guard, that they ſhould never carry him off alive. The commandant of the national guard had placed at each end of the ſtreet two field-pieces, which however were not charged; but they were ſufficient to intimidate the huſſars, who, upon the commandant ordering the artillery-men to their poſts with their matches in their hands, relinquiſhed their object, and quietly ſurrendered the king to the cuſtody of the national guard.

The aſſembly received the news of theſe tranſactions with inexpreſſible ſatisfaction. The perjured Bouillé was ſuſpended from his functions; and orders were given for arreſting him, and all who appeared to be concerned in the flight of the king; but Bouillé evaded for the preſent the axe of juſtice, by flying the kingdom. The aſſembly next appointed two commiſſioners to examine the inferior agents of the king's flight; and three commiſſioners, Meſſrs. Tronchet, d'André, and Duport, were appointed to receive the declaration of the king and queen.

A conſiderable body of the national guard eſcorted the royal family to Paris; and their numbers were increaſed as they approached the metropolis. Meſſrs. Barnave, Pethion, and Latour Maubourg had been diſpatched to Varennes for the purpoſe of accompanying them back to Paris; and public tranquility was ſo well preſerved, that they entered the Thuilleries on the 25th without any diſturbance, and with no apparent inconvenience but the fatigue of the journey. Monſieur and Madame, who had taken a different road, were more ſucceſsful in effecting their eſcape, and arrived ſafe at Bruſſels on the 23d.

The new conſtitution was preſented to the king on the 3d of September, 1791, who on the 13th ſignified his acceptance of it in writing, and the following day appeared in the aſſembly, introduced by a deputation of ſixty members, and ſolemnly conſecrated the aſſent which he had already given, and concluded with an oath, "To be faithful to the nation and to the law, and to employ the powers veſted in him for the maintenance of the conſtitution, and the due execution of the law." Soon after this, the ſecond national council aſſembled, with abilities far inferior to the firſt.

About this time, the dubious and undecided conduct of the emperor Joſeph, and the refuge and protection afforded in the German empire to the emigrant princes, excited France to vigorous reſolutions; and a celebrated manifeſto, addreſſed to all ſtates and nations, made its appearance. The forcible meaſures purſued had the effect of intimidating the German princes; and the emigrants were conſtrained to an ignominious diſperſion and retreat from the frontiers: but the protection of the emperor and the Pruſſian king provided them with an aſylum more remote and leſs obtruſive. Irreſolution ſeemed to preſide in the councils of the emperor, a monarch more diſtinguiſhed for the mild virtues of peace than for the ſtrenuous exertions of war. He had acknowledged the national flag; he had declared that he regarded the king of the French as abſolutely free, while the league of Pilnitz (which, as was avowed by the court of Vienna, was not only intended to ſecure Germany from ſuch a revolution as France had experienced, but even to extinguiſh the dreaded ſource) and the protection afforded to the emigrants, were infallible proofs that the emperor could not be regarded as a friend. His ſudden death, on the 1ſt of March, 1792, excited great conſternation among the ariſtocrats, and inſpired the ſupporters of the conſtitution with joy and exultation. Another event, no leſs unexpected, happened on the death of the Swediſh monarch, on the 29th of the ſame month. Freſh ſpirits were diffuſed through the nation; and the ſuperſtitious vulgar imagined, that, in the removal of the two chief foes of France in one month, they beheld the peculiar interpoſition of heaven.

In the ſubſequent negotiations between the national aſſembly and the court of Vienna, the young Hungarian king, excited by the influence of Pruſſia, began to exhibit more enmity and ſeverer terms. At length, on the 5th of April, M. de Noailles, in his diſpatches to the French miniſter for foreign affairs, explained the propoſitions of the imperial court—that ſatisfaction ſhould be given to the German princes, proprietors of Alſace—that Avignon, which had been appropriated by France, ſhould be reſtored to the pope—and that the internal government of France ſhould be inveſted with ſufficient efficiency, that the other powers may have no apprehenſions of being troubled by France. Thoſe terms produced a declaration of war againſt Francis I. king of Hungary and Bohemia, decreed by the aſſembly on the 4th of April, and ratified by the French king.

The beginning of the operations on the part of France was ſtained with defeat, and with the unpropitious murder of Theobald Dillon, who fell a prey to the ſuſpicions and ſavage ferocity of ſome of the ſoldiers, who fled from the enemy, but attacked their general. The court of Vienna had, in the beginning of July, publiſhed a declaration, explaining the cauſe of the war, and retorting on the French nation ſome of the heavy charges contained in its declaration of war againſt the king of Hungary and Bohemia, now emperor of Germany.

On the 26th day of the ſame month, the Pruſſian monarch iſſued a conciſe expoſition of the reaſons which determined him to take up arms againſt France. He pleads his alliance with the emperor; and that, as ſovereign of a German ſtate, he was bound to interfere to prevent the violation of the rights of the German princes of Alſace and Lorraine, and the invaſion of the territories of others: and he honeſtly concludes, by avowing that it is his intention to repreſs the too great liberty of France, which might afford a dangerous example to neighbouring countries.

At the ſame time the duke of Brunſwick, general of the combined armies of Auſtria and Pruſſia, publiſhed at Coblentz a declaration to the inhabitants of France, conceived in the moſt haughty and preſumptuous terms: he declared his intention of putting a ſtop to the anarchy which prevailed in France, and of reſtoring the king to his power; and yet he afterwards ſays his deſign was not to interfere in the internal government! It is not neceſſary to dwell on the other parts of this memorial, in which France is already regarded as a conquered country, and directions are given to the magiſtrates, national guards, and inhabitants at large: but the threat, that the city of Paris ſhould be given up to military execution, in caſe the leaſt outrage ſhould be offered to the king, queen, or royal family, is as vain as it is arrogant.

We relate with pain the exceſſes of the night between the 9th and 10th of Auguſt. The alarm-bell ſounded at midnight in every quarter of Paris; the generale was beat, and the citizens flew to arms.—The palace of the Thuilleries was attacked by the multitude; and the king, queen, and royal family, were forced to take refuge in the hall of the national aſſembly. At firſt the Swiſs guards (who were obnoxious to the people, and had been ineffectually proſcribed by repeated decrees of the aſſembly, the king not being allowed to have a foreign guard) repelled the populace; but theſe being reinforced by the Marſeillois and federates from Breſt, bodies which the Jacobins ſeemed to have brought to Paris to balance the Swiſs, and by national guards, the gates of the palace were burſt open. The artillery joined the aſſailants; and the conſequences were, that the Swiſs guards were exterminated, and the palace ranſacked, after a ſlaughter of about four hundred on each ſide.

Unhappily the month of September ſeemed pregnant with the total ruin of French freedom; but the three following months reverſed the ſcene, and exhibited a ſeries of ſucceſs, on the part of France, perhaps unexampled in modern hiſtory. We cannot without inexpreſſible concern direct the attention of our readers to the priſon ſcene, which occurred on the 2d and 3d of September. The horrid maſſacre of the defenceleſs priſoners, and other ariſtocrats, which took place at that period, ſtamps an eternal diſgrace on the Pariſian populace, who, in their fury, ſpared not even that gentle ſex which all civilized nations hold in the higheſt reſpect. The number of the ſlain has doubtleſs been exaggerated, as uſual; yet ſuppoſing that, by the moſt moderate account, only two thouſand periſhed, the enormity of the deed remains the ſame. Some extenuation might be offered for the affair of the 10th of Auguſt, in which a people, who ſuppoſed themſelves betrayed to ſlavery, and all its evils, ſo recently experienced and ſhaken off, aſſumed their revenge and their cauſe into their own hands; but no defence can be offered for this unneceſſary crime. Had the combined armies beſieged Paris, it is difficult to conceive what aid they could have found from two or three thouſand ariſtocrats, and many of theſe ſecured in chains, and confined in priſon.

In order to determine on the charges brought againſt the king, a national convention had been called. They met on the 24th of September; and on the firſt day of the meeting, the abolition of royalty in France was decreed by acclamation; and the following day it was ordered that all public acts ſhould be dated the firſt year, &c. of the French republic. But hardly was this convention conſtituted, when a

violent faction appeared, headed by Marat*, Robeſpierre, and others, who have repeatedly degraded their tranſactions by their violence and fanaticiſm; and, being ſupported by the Jacobins and Pariſian populace, have proved too powerful for the convention to puniſh as it wiſhed. Repeated inſtances have proved that the convention was not free, but compelled to vote as the mob of Paris dictated, the moderation of the members being often obliged to yield to the indecent applauſes and hiſſes of the gallery rabble.

The French arms were ſo rapid in their progreſs, and ſo great were the diſtreſſes in the combined armies, ariſing from a ſcarcity of proviſions, from a long rainy ſeaſon, and from a conſiderable mortality among the Pruſſians, eſtimated, by the French accounts, at one half, that the Pruſſians retreated from the dominions of France, and their example was ſoon followed by the Auſtrians.

The invaſion of Savoy was ordered, even at the very time that Paris was in the greateſt danger. On the 21ſt of September, general Monteſquieu entered the Savoyard territories, ſeized on the frontier poſts and caſtles without reſiſtance, and two days after took Montmelian. Chamberry and all Savoy ſoon followed; but the conqueſt, not being reſiſted, was productive of no military glory. The imprudence of the national convention, in permitting Savoy to incorporate itſelf with France, has created wonder.

After frequent declarations of the French, that they would enter into no war with any view to conqueſt, their conduct in this reſpect was abſurd and impolitic. It ſubjected them to the merited reproach, that, under the pretence of liberty, they maintained the deſtructive maxims of their ancient government; and that their wiſhes to increaſe their territory, perhaps to ſubjugate Europe, remained the ſame. Admiral Truguet, commanding a ſquadron in the Mediterranean, captured Nice, Villa Franca, and the fortreſs of Montalban, belonging to the king of Sardinia.

Moſt people regarded the conqueſt of Savoy as a trifle; but when Cuſtine began his acquiſitions in Germany, every eye was turned to the rapidity and importance of his progreſs, till diverted by the wonders of Dumourier. Spires yielded to the French arms on the 30th of September, and Worms ſoon after followed; ample ſupplies of proviſions and ammunition were found in theſe cities. Cuſtine, purſuing his courſe along the left ſhore of the Rhine, next captured Mentz, and afterwards Frankfort. He was eager to proceed to Coblentz, that noted ſeat of the counter-revolutioniſts; but the Pruſſians and Auſtrians at length indicating a renewal of hoſtilities by garriſoning that town, and encamping in the adjacent country, he relinquiſhed that deſign.

The next grand object was the conqueſt of the Auſtrian Netherlands. Dumourier had promiſed to paſs his Chriſtmas at Bruſſels; and what was regarded as an idle vaunt proved very modeſt; for that city was in his hands by the 14th of November. That able general, having entered the Netherlands on the 1ſt or 2d of that month, with an army of 40,000 men, ſince much increaſed, and with a moſt formidable train of artillery, the firſt five days were occupied with repeated engagements with the Auſtrian army commanded by the duke of Saxe-Teſchen, governor of the Auſtrian Netherlands, and by general Beaulieu, which however exceeded not 20,000. At length, on the 6th of November, a deciſive battle was fought at Jemappe, which decided the fate of the Netherlands. The conteſt was very general; all the points of the enemy's flanks and lines were attacked at once; all the bodies of the French were in action, and almoſt every individual fought perſonally. The cannonade began at ſeven in the morning; Dumourier ordered the village of Carignan to be attacked, becauſe he could not attempt the heights of Jemappe till he had taken that village: at noon the French infantry formed in columns, and rapidly advanced to decide the affair by the bayonet. At two o'clock the Auſtrians retired in the utmoſt diſorder, after an obſtinate defence. Dumourier immediately advanced, and took poſſeſſion of the neighbouring town of Mons, where the French were received as brethren.

The tidings arriving at Bruſſels, the court was ſtruck with an indeſcribable panic; and inſtantly fled to Ruremonde, whence it was again to be driven by the arms of Miranda. Tournay ſurrendered to a detachment on the 8th of November. Dumourier, having refreſhed his troops at Mons, advanced to Bruſſels, where, after an indeciſive engagement between his van and the Auſtrian rear, he was received with acclamations on the 14th of that month.—Ghent, Charleroi, Antwerp, Malines, or Mechlin, Louvain, Oſtend, Namur; in ſhort, all the Auſtrian Netherlands, except Luxembourg, ſucceſſively followed the example of the capital; and the conqueſts were not leſs rapid than thoſe of Louis XIV.

The national convention having baniſhed many of the prieſts, they came to England, and were received with great benevolence: this was followed by their decree againſt the emigrants, by which they are declared dead in law, their effects confiſcated, and themſelves adjudged to immediate death, if they return to France. Another decree of the 19th of November, attracted the attention of every nation in Europe; it is in the following terms: "The national convention declare, in the name of the French nation, that they will grant fraternity and aſſiſtance to all thoſe people who wiſh to procure liberty; and they charge the executive power to ſend orders to the generals to give aſſiſtance to ſuch people, and to defend citizens who have ſuffered, or are now ſuffering, in the cauſe of liberty." By this decree, and others of a ſimilar tendency, a political cruſade againſt all the powers of Europe, ſeems to be inſtituted.

Antwerp had no ſooner yielded to the French arms, than, in order to conciliate the Belgians, the opening of the navigation of the Scheldt, ſhut up the treaty of Munſter in 1648, was projected, and ordered; notwithſtanding this treaty, ſo far as it reſpects the ſhutting up of the navigation of that river, has been confirmed to the Dutch in ſucceeding treaties, guarranteed by the courts of Verſailles and London. The Dutch regarded this meaſure as injurious to their trade; for Antwerp might prove a dangerous rival to Amſterdam. The infraction of this treaty is one of the reaſons which has induced the parliament of Great-Britain to oppoſe the unwarrantable pretentions of the French republic, and to join its forces with thoſe of the allied powers, in defence of their common rights, and thoſe of Europe in general.

On the 11th of December 1792, the memorable trial of the king commenced. The iſſue is well known. The firmneſs of this unfortunate monarch during his trial, and at the place of execution, on the 21ſt of January 1793, increaſed the commiſeration of every indifferent ſpectator, and callous indeed muſt be the perſon who does not partake of the ſympathy which was felt through all Europe upon this tranſaction;

* This furious zealot fell by the hand of female vengeance. Marie-Anne-Charlotte Corday, ſtrongly impreſſed with the calamities which he had brought upon her country, took a journey to Paris, in July 1793, on purpoſe to put a period to his exiſtence.—Meeting Marat as he was coming from the Bath, and entering into converſation with him (more certainly to identify his perſon) ſhe plunged a dagger into his breaſt; upon which he fell, and ſoon expired. Glorying in having exterminated a monſter, ſhe delivered herſelf up to the officers of juſtice, and with the utmoſt firmneſs ſubmitted to her fate, in having her head ſevered by the guillotine, in the 25th year of her age.

action; and we muſt add, that the records of mankind exhibit no inſtance of crimes deliberately committed, attended with ſo many circumſtances of wanton, unrelenting cruelty, and ſo evidently pernicious to the cauſe of the unfeeling perpetrators.

An hour after Louis had been informed of the fatal doom, two municipal officers repaired to the queen's apartment, to ſignify what was to happen. The queen advanced towards the officers, with her hands uplifted, and cried, "O ye murderers! O ye murderers! for ten minutes—then in convulſive hyſteric fits dropped down on the floor: having recovered herſelf, ſhe looked with a ſtaring, ſignificant eye at the officers, who ſtood in a diſtant corner of the room, then turning round to the dauphin, ſhe ſhed a flood of tears, embraced him, and exclaimed, "My dear ſon, I do not know what I am doing—let us never confound the innocent with the guilty.

Soon after, the queen, madame Elizabeth, the king's ſiſter, and the dauphin, were conducted to the king's dining-room, where the unfortunate monarch embraced them with great ſerenity: the officers withdrew, and a ſcene enſued of tenderneſs and grief, which none but heaven and the parties preſent witneſſed.

Two hours after, the municipal officers were called in, and the king expreſſed a deſire of ſeeing his wretched daughter, who was in a ſeparate apartment. His demand was granted, and he and his family, under a proper eſcort, went to the ſpot. She was that day fourteen years and thirty-three days old. It is ſaid that ſhe expired ſoon after the king left her, but that is not true, ſhe being ſtill living; her devoted royal father embraced her; ſhe clung cloſe to him, he bedewed her with tears—ſhe was wreſted from him, and remained inſenſible for ſome time, when ſhe exclaimed, "O my father! O my tender father!" Paternal heroiſm made the king depart from his beloved daughter. Maternal feeling retained the queen and her ſiſter-in-law with the dauphin, who ſaid to Louis, "We will ſee you by-and-by—Adieu, huſband! Adieu, brother! Adieu, father!" The king wafted a kiſs to them with his right hand, but they ſaw him no more! Arrived in his room, the monarch proſtrated himſelf, and ſaid prayers with his confeſſor Edgeworth, an Iriſh prieſt, otherwiſe called De Fermond, for an hour and upwards, after which he had his beard ſhaved, and his hair turned up in a curl from behind, without powder.

In a previous decree made by the national convention, the place for putting their inhuman ſentence into execution, was to have been the Carouſel, fronting the palace of the Thuilleries. This was changed by the miniſters, to whom all the arrangements were confided, to the Place de la Revolution, heretofore the Place de Louis XV. The guillotine, or fatal inſtrument of execution, was placed upon a ſcaffold, between the Champ Elyſee and the pedeſtal, which was formerly ornamented with the magnificent equeſtrian ſtatue of Louis XV. his grandfather.

On Monday morning, the 21ſt of Jan. the king left the Temple, the mournful proceſſion ſet out a little after eight o'clock. The royal victim ſat in the mayor's carriage, with his confeſſor by his ſide, praying very fervently, and two captains of the national light-horſe on the front ſeat. The carriage was drawn by two black horſes, preceded by the mayor, general Santerre, and other municipal officers. One ſquadron of horſe, with trumpets and kettle-drums, led the van of the melancholy convoy: three heavy pieces of ordnance, with proper implements, and cannoneers, with lighted matches, went before the vehicle, which was eſcorted on both ſides by a treble line of troopers.

The train moved on with a ſlow pace from the Temple to the Boulevards, which were planted with cannon, and beſet with national guards, drums beating, trumpets ſounding and colours flying. The trotting and neighing of horſes, the ſhrill ſound of the trumpet, and the continual beating of drums, pierced the ears of every body, and heightened the terrors of the awful ſcene.

The ſcaffold was high and conſpicuous, and the houſes ſurrounding the place of execution were full of women, who looked through the windows; the very ſlates which covered the roofs, were raiſed up for the curious and intereſted to peep through.

At twenty minutes after ten, the king arrived before the ſcaffold in the Square of the Revolution, which was covered with cannon, and crowded with cavalry. His confeſſor, Mr. Edgeworth, wanted to go up the ſteps of the ſcaffold with him, but this was rudely refuſed by colonel Santerre. Louis pulled off his ſtock, coat, and waiſtcoat, and, with his neck and breaſt bare, aſcended the ſcaffold with intrepidity and undaunted fortitude; (it was only twenty minutes after ten o'clock) he wore a clean ſhirt and ſtock, white waiſtcoat, black florentine ſilk breeches, black ſilk ſtockings, and his ſhoes were tied with black ſilk ſtrings.

Having taken leave of his confeſſor, who ſhed a thouſand tears, he beckoned with his hand to be heard; the noiſe of the warlike inſtruments ceaſed for a moment; but ſoon after a thouſand voices vociferated, with deteſtable ferocity, "No harangues!—No harangues!"—The unfortunate monarch wrung his hands, lifted them up towards heaven, and with agony in his eye and geſture, exclaimed, diſtinctly enough to be heard by thoſe perſons who were next the ſcaffold, "To thee, O God, I commend my ſoul! I forgive all my enemies—I die innocent!" His head was immediately after ſevered from his body; whereupon the people waved their hats in the air, exclaiming, "God ſave the nation!" and the body was immediately removed in a black coffin.

The ſhort length of time in which he appeared on the ſcaffold, and the interval of the fatal blow, was no more than two minutes. Inſtantly the executioner lifted up his head, and amidſt the flouriſh of trumpets, exclaimed, "Thus dies a traitor!" Some of the guards puſhed forward to the ſcaffold, and dipped their pikes and their handkerchiefs in the blood, brandiſhed their ſwords, and vociferated, "God ſave the Republic!—God ſave the Nation!"

The body was conveyed to the Thuilleries; the executioner cut off the hair imbrued in blood, which was ſold for aſſignats, in ſmall locks;—The guards, the federates, and others, again dipped their handkerchiefs in the gore, hoiſted it on ſwords, pikes, and ſtaffs, and ſold it; and the banditti mob carried it triumphantly through the ſtreets till night, intoxicated, and hallooing—"Behold the blood of a tyrant."

The body was interred ſix hours after, in the churchyard De la Madelaine, adjacent to the place of execution, in a grave twelve feet deep, and filled with quck lime and mould, between the people who were ſtifled in the throng on the 19th of April 1770, when a brilliant illumination and fire-work were exhibited there in honour of his marriage, and the Swiſs and other victims ſlain at the Thuilleries on the 10th of Auguſt.

Thus periſhed Louis XVI. king of France and Navarre, in the 39th year of his age. Thus one of the beſt of kings fell a dreadful ſacrifice to the rage of the Briſſots, the Marats, the Paines, and other diſgraceful blots in the human creation! "The condemnation and execution of the king," ſaid a great ſtateſman in the Britiſh Houſe of Commons, "is an act as diſgraceful as any that hiſtory records; and I never can view, but with the greateſt deteſtation, the injuſtice and inhumanity that has been committed towards that unhappy monarch. Not only were the rules of criminal juſtice, rules that more than any other ought to be ſtrictly obſerved, overthrown; not only was he tried and condemned without any exiſting law to which he was perſonally anſwerable, and even contrary to laws that did actually exiſt; but the degrading circumſtances

of his impriſonment, the unneceſſary and inſulting aſperity with which he had been treated, the total want of republican magnanimity in the whole tranſaction, added every aggravation to the inhumanity and injuſtice."

Soon after, general Dumourier proceeded with a large body of troops to invade Holland, exhorting the Batavians, in a violent manifeſto, to reject the tyrannic ariſtocracy of the ſtadtholder and his party, and to become a free republic. The Dutch made preparations for defending themſelves; and the Engliſh cabinet ſeconded their efforts, by an immediate embarkation of troops, to the command of which the duke of York was appointed.

The ſubjugation of Holland was the firſt project of general Dumourier: and when the eaſe with which he had effected the conqueſt of the Netherlands, and the courage and ability diſplayed by him and his army at the famous battle of Jemappe, were conſidered, there ſeemed reaſon to apprehend that he would ſoon make an impreſſion on theſe provinces; and the eaſy ſurrender of Breda and Gertruydenberg encouraged him to boaſt that he would terminate the conteſt by a ſpeedy approach to Amſterdam. Certain events, however, enſued, which effectually prevented him from the performance of this promiſe.

General Miranda, who had beſieged the city of Maeſtricht, and ſummoned the governor to ſurrender, was attacked by prince Frederic of Brunſwick, and defeated with conſiderable loſs. The Auſtrians, after this, divided themſelves into three columns, two of which marched towards Maeſtricht, and the ſiege of that place was immediately raiſed. The third purſued the advanced guard of the republic; and the abſence of ſeveral commanding officers was ſuppoſed to have greatly facilitated the ſucceſs of the Pruſſians in theſe rencounters.

On the 14th of March, the Imperialiſts advanced from Tongres towards Tirlemont, by St. Tron, and were attacked by general Dumourier ſucceſſively on the 15th and following days. The firſt attempts were attended with ſucceſs. The Auſtrian advanced poſts were obliged to retire to St. Tron, through Tirlemont, which they had already paſſed. On the 18th, a general engagement took place, at Neerwinden, the French army being covered on the left by Dormael, and on the right by Landen. The action continued with great obſtinacy on both ſides, from ſeven in the morning till five in the afternoon, when the French were obliged to fall back, and the Auſtrian cavalry coming up, put them entirely to flight. The loſs in each army was great. The French diſplayed conſiderable courage and addreſs, but were overpowered by the ſuperior numbers, and perhaps by the more regular diſcipline, of their enemies.

Dumourier was now ſuſpected of treachery, and general Miranda intimated his ſuſpicions, in a confidential letter to Petion, dated the 21ſt of March.—Four commiſſioners were immediately ſent from Paris with powers to ſuſpend and arreſt all generals and military officers whom they ſhould ſuſpect, and bring them to the bar of the convention. Theſe commiſſioners, on the 1ſt of April, proceeded to St. Amand, the head-quarters of Dumourier, and being admitted to his preſence, explained to him the object of their miſſion. After a conference of ſome hours, the general, not finding that he could perſuade them to favour his intentions, gave the ſignal for a body of ſoldiers who were in waiting, and ordered the miniſter of war, Bournonville, who was ſent to ſuperſede him, and the commiſſioners Camus, Blancal, La Marque, and Quinette, immediately to be conveyed to general Clairfait's head-quarters at Tournay, as hoſtages for the ſafety of the royal family.

Dumourier, notwithſtanding his ſplendid talents, found himſelf groſsly miſtaken with reſpect to the diſpoſition of his army; they had reſented the affront ſo imprudently offered to their general; but when he came to explain to them his plan, and propoſe the reſtoration of royalty in the perſon of the prince, they all forſook him; and he was obliged to fly with a very few attendants, making his eſcape through a dreadful diſcharge of muſketry, which the whole column poured upon him and his aſſociates.

The latter end of June, and the beginning of July, were chiefly diſtinguiſhed, in the north, by ſome petty ſkirmiſhes between the two grand armies. In the latter part of July, the Auſtrians obtained ſome ſucceſſes of more importance. The garriſon of Condé, after ſuſtaining a blockade of three months, ſurrendered on the 10th, by capitulation, to the prince of Cobourg; and Valenciennes, on the 20th of the ſame month, to the duke of York, not without ſome ſuſpicions of treachery in both caſes.

Encouraged by theſe ſucceſſes, a large detachment from the combined army, under the command of the duke of York, proceeded, without loſs of time, to attack the port and town of Dunkirk. On the 22d of Auguſt, the duke of York marched from Furnes to attack the French camp at Ghivelde, which was abandoned at his approach, and he was almoſt immediately enabled to take the ground which it was his intention to occupy during the ſiege. On the 24th, he attacked the outpoſts of the French, who, with ſome loſs, were driven into the town. In this action, the famous Auſtrian general Dalton, and ſome other officers of note, were killed. The ſucceeding day, the ſiege might be ſaid regularly to commence. A conſiderable naval armament from Great-Britain was to have co-operated in the ſiege; but, by ſome neglect, admiral Macbride was not able to ſail ſo early as was expected. In the mean time, the hoſtile army was extremely haraſſed by the gun-boats of the French; a ſucceſsful ſortie was effected by the garriſon on the 6th of September; and the French collecting in ſuperior force, the duke of York, on the 7th, after ſeveral ſevere actions, in which the allied forces ſuffered very conſiderably, was compelled to raiſe the ſiege, and leave behind him his numerous train of artillery. General Houchard was afterwards impeached by the convention, and beheaded, for not having improved his ſucceſs to the beſt advantage, as it was aſſerted that he had it in his power to capture almoſt the whole of the duke of York's army.

The diſaffection of the ſouthern provinces of France was at this time productive of ſerious dangers to the new republic. It is well known that the deputies and people of theſe provinces were among the moſt active to promote the dethroning of the king on the 10th of Auguſt, 1792. It is, therefore, ſomewhat extraordinary, that the ſame men ſhould be among the firſt to rebel againſt the authority of the convention. The formidable union which took place, under the name of *federate republicaniſm*, between the cities of Marſeilles, Lyons, and Toulon, in the courſe of the months of June and July, ſeemed to threaten almoſt the diſſolution of the exiſting authorities. A conſiderable army was, however, diſpatched againſt Lyons, and the city cloſely beſieged. The Marſeillois, in the mean time, opened their gates on the approach of the republican army, and ſubmitted; but the people of Toulon entered into a negotiation with the Engliſh admiral, lord Hood, who was then cruiſing in the Mediterranean; and he took poſſeſſion both of the town and ſhipping, in the name of Louis XVII. and under the poſitive ſtipulation that he ſhould aſſiſt in reſtoring the conſtitution of 1789.

Among the victims of popular reſentment which fell about this period, was the celebrated general Cuſtine, whoſe former ſervices, whatever might have been his ſubſequent demerits, ought to have ſecured him more lenient treatment. He was recalled to Paris, from the command of the northern army, in the beginning of July, and on the 22d, committed, by a decree of the convention, a priſoner to the Abbey. He was tried by the revolutionary tribunal,

and accuſed of having maintained an improper correſpondence with the Pruſſians, while he commanded on the Rhine, and of having neglected various opportunities of throwing reinforcements into Valenciennes. It is needleſs to ſay that he was found guilty: to be ſuſpected was then to be condemned; and the populace of Paris, now accuſtomed to ſuch ſcenes, beheld the ſacrifice of their former defender, with calm indifference, or with blind exultation.

The trial and condemnation of the queen immediately followed that of general Cuſtine. She had been removed, on the night of the 1ſt of Auguſt, from the Temple to a ſmall and miſerable apartment in the priſon of the Conciergèrie, where ſhe remained till ſhe was brought before the revolutionary tribunal, on the 15th of October. The act of accuſation conſiſted of ſeveral charges, many of which were frivolous and incredible; and few of them appeared to be ſufficiently ſubſtantiated by evidence; but had the conduct of Marie Antoinette been more unexceptionable than there is reaſon to believe it was, it is not very probable but that ſhe would have eſcaped. After an hour's conſultation, therefore, the jury brought in their verdict—"Guilty of all the charges."

The queen heard the ſentence read with dignity and reſignation; ſhe did not ſhew the ſmalleſt alteration in her countenance, and left the hall without ſaying a ſingle word to the judges or to the people. It was then half paſt four o'clock in the morning, October 16. She was conducted to the condemned hole in the priſon of the Conciergerie.

At five o'clock the generale was beat. At ſeven, the whole armed force was on foot; cannon were planted upon the ſquares, and at the extremities of the bridges, from the palace to the ſquare de la Revolution. At ten, numerous patroles paſſed through the ſtreets. At half paſt eleven in the morning, Marie Antoinette was brought out of the priſon, dreſſed in a white deſhabille. Like other malefactors, ſhe was carried in a common cart to the place of execution. Her hair from behind was entirely cut off, and her hands were tied behind her back. Beſide her deſhabille, ſhe wore a very ſmall white cap. Her back was turned to the horſe's tail. During her trial, ſhe wore a dreſs of a black and white mixture. On her right was ſeated upon the cart the executioner; upon the left, a conſtitutional prieſt belonging to the Metropolitan church of Notre Dame, dreſſed in a grey coat, and wearing a bob-wig. The cart was eſcorted by numerous detachments of horſe and foot. Henriot, Ronſin, and Boulanger, generals of the revolutionary army, preceded by the reſt of their ſtaff-officers, rode before the cart.

An immenſe number of people crowded the ſtreets, and cried, "Long live the republic! The queen ſeldom caſt her eyes upon the populace, and beheld with indifference the great armed force of 30,000 men, which lined the ſtreets in double ranks. The ſufferings which ſhe ſuſtained during her captivity had much altered her appearance, and the hair on her forehead appeared as white as ſnow. She kept ſpeaking to the prieſt ſeated by her ſide. Her ſpirits were neither elevated nor depreſſed: ſhe ſeemed quite inſenſible to the ſhouts of "Vive la Republique!" When ſhe paſſed through the ſtreet called Rue St. Honorè, ſhe ſometimes attentively looked at the inſcriptions of the words *liberty* and *equality* affixed to the outſide of the houſes. She aſcended the ſcaffold with ſeeming haſte and impatience; and then turned her eyes with great emotion toward the garden of the Thuilleries, the former abode of her greatneſs.

At half paſt twelve, the guillotine ſevered her head from her body. The executioner lifted and ſhewed the head from the four different corners of the ſcaffold.—The ſpectators inſtantly cried, "Long live the Republic!" The corpſe was immediately after buried in a grave filled with quick-lime, in the church-yard de la Madelaine, where her unfortunate conſort was in like manner interred.

Soon after the convention entered upon the trial of Briſſot, and his ſuppoſed accomplices. Briſſot was charged with having ſaid and written, at the commencement of the revolution, that Fayette's retiring from the public ſervice was a national misfortune; that he diſtinguiſhed himſelf three times in the Jacobin club by ſpeeches, of which one provoked the ruin of the colonies, another the maſſacre of the patriots in the Champ de Mars, and the third the war againſt Auſtria.

Upon theſe and other vague accuſations, Briſſot, and twenty-one more of the convention, were brought to trial, before the revolutionary tribunal, on the 24th of October; a few days afterwards the jury declared all the accuſed members to be accomplices in a conſpiracy which had exiſted againſt the unity and indiviſibility of the French republic; and the tribunal immediately condemned them all to the puniſhment of death. Valazé, after he had heard his ſentence, ſtabbed himſelf; and the remaining twenty-one were executed on the 30th of October.

The wretched and intriguing Egalité (late duke of Orleans) was ſoon after brought to the block. He was accuſed of having aſpired to the ſovereignty from the commencement of the revolution; but how well founded the charge was, it is not eaſy to determine. He was conveyed in a cart, on the evening of the 6th of November, to the place of execution, and ſuffered with great firmneſs, amidſt the inſults and reproaches of the populace.

In the ſouth of France, neither the exertions of the allies, nor the ſurrender of the Touloneſe, were ſufficient to produce the expected conſequence of eſtabliſhing a monarchical government. On the 30th of November, the garriſon of Toulon made a vigorous ſortie, in order to deſtroy ſome batteries, which the French were erecting on certain heights within cannon-ſhot of the city. The detachment ſent for this purpoſe accompliſhed it, and the French troops were ſurpriſed, and fled. The allies, too much elated with their ſucceſs, purſued the fugitives till they unexpectedly encountered a conſiderable force, which had been ſent to cover their retreat. At this moment, general O'Hara, commander in chief at Toulon, came up, and, while he was exerting himſelf to bring off his troops with regularity, received a wound in his arm, and was made priſoner by the republicans. —Near a thouſand of the Britiſh and allied forces were killed, wounded, or taken priſoners, on this occaſion.

Soon after the capture of the Britiſh general O'Hara, the city of Toulon was evacuated by the allies. On the morning of 19th of December, the attack began before all the republican forces had time to come up. It was chiefly directed againſt an Engliſh redoubt (Fort Mulgrave) defended by more than three thouſand men, twenty pieces of cannon, and ſeveral mortars. This formidable poſt was attacked about five o'clock in the morning, and at ſix the republican flag was flying upon it.

The town was then bombarded from noon till ten o'clock the ſame evening, when the allies and part of the inhabitants, having firſt ſet fire to the town and ſhipping, precipitated their flight. Two chaloups, filled with the fugitives, were ſunk by the batteries. The precipitation with which the evacuation was effected, cauſed a great part of the ſhips and property to fall into the hands of the French, and was attended with the moſt melancholy conſequences to the wretched inhabitants, who, as ſoon as they obſerved the preparations for flight, crowded to the ſhores, and demanded the protection which had been promiſed them on the faith of the Britiſh crown. A ſcene of confuſion, riot, and plunder enſued, and though great efforts were made to convey as many as poſſible of the people into the ſhips, thouſands were left to all

the horrors of falling into the hands of their enraged countrymen. Many of them plunged into the ſea, and made a vain attempt to ſwim on board the ſhips; others were ſeen to ſhoot themſelves on the beach, that they might not endure the greater tortures they might expect from the republicans. During all this, the flames were ſpreading in every direction, and the ſhips that had been ſet on fire, were threatening every inſtant to explode, and blow all around them into the air. This is but a faint deſcription of the ſcene on ſhore, and it was ſcarcely leſs dreadful on board the ſhips. Loaded with the heterogeneous mixture of nations, with aged men and infants, as well as women; with the ſick from all the hoſpitals, and with the mangled ſoldiers from the poſt juſt deſerted, their wounds ſtill undreſt; nothing could equal the horrors of the fight, except the ſtill more appalling cries of diſtraction and agony, that filled the ear, for huſbands, fathers, and children, left on ſhore.

In the latter end of March, the party called the Hebertiſts, conſiſting of Hebert, Momoro, Vincent, and ſome others, were arreſted, brought to trial before the revolutionary tribunal, and twenty of them executed. A few days after, the celebrated Danton, Fabre d'Eglantine, Bazire, Chabot, and others, were arreſted as conſpirators againſt the republic, tried in a very ſummary way, and ſentenced to death; which ſentence was executed on the 5th of April, 1794.

In conſequence of theſe executions, the government of France, however nominally republican, became almoſt entirely veſted in one man, the uſurper Robeſpierre; a name which will probably be tranſmitted with infamy to late poſterity. Under his ſanguinary adminiſtration, the priſons of Paris, at one time, contained between ſeven and eight thouſand perſons. Of the number of thoſe tried and executed, we have no preciſe account: but they in general appeared rather to be ſacrified in multitudes to a jealous and cowardly cruelty, than condemned with even the ſhadow of juſtice. In one of theſe barbarous ſlaughers, the princeſs Elizabeth, the ſiſter of the late unfortunate monarch, having been condemned on the moſt frivolous pretexts, was executed the laſt of twenty-ſix perſons, who were carried to the ſcaffold on the ſame day.

But, after the death of Danton, the fall of this tyrannical demagogue rapidly approached. A ſtrong party was ſecretly formed againſt him in the convention, headed by Tallien, Legendre, and ſome others. Finding themſelves ſufficiently ſtrong, Tallien moved the arreſt of Robeſpierre and his creatures; which decree was paſſed with applauſes from every quarter. The preſident then ordered one of the uſhers of the hall to take Robeſpierre into cuſtody; but ſuch was the awe which the preſence of this man was accuſtomed to inſpire, that the officer heſitated to perform his duty, till Robeſpierre himſelf made a ſign of obedience; and followed the uſher out of the hall. The priſoners were conducted by a few peace-officers to the priſon of the Luxembourg; but the adminiſtrator of the police on duty there, who was one of their creatures, refuſed to receive them; and they were then conducted, rather in triumph, than as priſoners, to the Hotel de Ville.

In the mean time, Henriot, another leader of the party, had alſo been arreſted, but found means to eſcape and raiſe his partiſans, who took poſt with him and Robeſpierre, in the Hotel de Ville, where they pretended to form themſelves into a new convention, and declared the other repreſentatives traitors to their country. The people, however, did not eſpouſe their cauſe; the national guard, who had at firſt obeyed their orders with reluctance, forſook them; and the deputies who had been diſpatched for that purpoſe, attacked them in the Hotel de Ville. Bourdon de l'Oiſe, after having read the proclamation of the convention, ruſhed into the hall of the commune, with a ſabre and piſtols; the inſurgents were completed deſerted, and now endeavoured to turn their arms againſt themſelves. Robeſpierre the elder diſcharged a piſtol in his mouth, which, however, failed of its effect, and only wounded him in the jaw, while he received another wound from a gendarme in the ſide. The younger Robeſpierre threw himſelf out of a window, and broke a leg and an arm; Le Bas ſhot himſelf upon the ſpot; Couthon ſtabbed himſelf twice with a knife; and Henriot was thrown out of a window.

The priſoners were immediately conveyed before the revolutionary tribunal, and their perſons being identified, they were condemned to ſuffer death, in the Place de la Révolution, where the two Robeſpierres and nineteen others were executed at ſeven in the evening of the 28th of July, 1794.

In the campaign of this year, the arms of the new republic were ſucceſsful on every ſide againſt the allies. In Flanders, general Jourdan gained the battle of Fleurus; and Charleroi, Ypres, Bruges, and Courtray, ſurrendered to the French; Oſtend was evacuated; general Clairfait defeated near Mons, which immediately ſurrendered; and the prince of Cobourg compelled to abandon the whole of the Netherlands, while the victors, without oppoſition, entered Bruſſels and Antwerp. Landrecy, Queſnoi, Valenciennes, and Condé, were ſucceſſively retaken; and the French armies, purſuing their ſucceſs, took Aix-la-Chapelle, defeated Clairfait near Juliers, and made themſelves maſters of Cologn and Bonn. Maeſtricht and Nimeguen were likewiſe taken.

The United Provinces began now to be ſeriouſly alarmed. The ſtates of Frieſland were the firſt to feel their danger; and, in the month of October, theſe ſtates determined to acknowledge the French republic, to break their alliance with England, and to enter into a treaty of peace and alliance with France. In ſome other provinces, reſolutions hoſtile to the ſtadtholder and his government were likewiſe paſſed; and ſuch appeared to be the temper of the people, even at Amſterdam, that, on the 17th of October, the government of Holland publiſhed a proclamation, prohibiting the preſenting of any petition or memorial, upon public or political ſubjects, and all popular meetings or aſſemblies of the people, upon any occaſion.

On the 7th of December, the French made a feeble attempt to croſs the Waal, but were repulſed with loſs; but on the 15th, the froſt ſet in with unuſual rigour, and opened a new road to the French armies. In the courſe of a week, the Maes and the Waal were both frozen over; and on the 27th, a ſtrong column of French croſſed the Maes, near the village of Driel. They attacked the allied army for an extent of above twelve leagues, and, according to the report of general Pichegru, "were, as uſual, victorious in every quarter." The army of the allies retreated before them, and in its retreat, endured incredible hardſhips from the ſeverity of the weather and the want of neceſſaries. On the 10th of January, 1795, general Pichegru, having completed his arrangements, made his grand movement. The French croſſed the Waal at different points, with a force, according to ſome accounts, of 70,000 men. A general attack was made upon Walmoden's poſition, between Nimeguen and Arnheim. The allies were defeated in every quarter; and, utterly unprepared either for reſiſtance or for flight, ſuffered equally from the elements and the enemy.

It was in vain that the ſtadtholder iſſued manifeſtoes, proclamations, and exhortations to the Dutch peaſantry, conjuring them to riſe in a maſs for the defence of the country. The French continued to advance, and the allies to fly before them, till Utrecht ſurrendered to them on the 16th of January, Rotterdam on the 18th, and Dort on the ſucceeding day. The utmoſt conſternation now prevailed among the partiſans of the ſtadtholder. The princeſs of Orange, with

with the younger and female part of the family, and with all the plate, jewels, and moveables that could be packed up, eſcaped on the 15th. The ſtadtholder and the hereditary prince did not leave Holland till the 19th. His ſerene highneſs embarked at Schevelling, in an open boat, with only three men to navigate her, and arrived ſafe at Harwich. In England, the palace of Hampton-court was aſſigned him for his reſidence, where he ſtill remains.

On the 20th of January, general Pichegru entered Amſterdam in triumph, at the head of 5,000 men, and was received by the inhabitants with the loudeſt acclamations. The whole of the United Provinces either ſubmitted to or was reduced by the French, in a few weeks. An aſſembly of the proviſional repreſentatives of the people met on the 27th of January, and the whole government was changed, and modelled nearly after the French plan.

In the mean time, the king of Pruſſia, finding he could derive no advantage from the war, began to relax in his efforts. The Pruſſian and Auſtrian forces, as well as their leaders, were on bad terms with each other; but it was not ſuſpected that any defection was about to take place, on the part of the Pruſſians, till they began to retreat towards the Rhine, which they ſoon after paſſed. A negotiation between Pruſſia and France followed, which ended in a treaty of peace, ſigned at Baſle, on the 5th of April, 1795, by which his Pruſſian majeſty entirely abandoned the coalition.

The Pruſſian negotiation was followed by the treaty made between the French republic and Spain, in which country, the arms of France had made a progreſs equally ſucceſsful and rapid. Fontarabia, which guards the entrance of Spain, and which had coſt the duke of Berwick 8,000 men, had been taken, almoſt immediately, by a detachment from the French army; Roſas was likewiſe taken; and the troops of the republic had made themſelves maſters of the greater part of the rich provinces of Biſcay and Catalonia, and were, in fact, in full march for the capital of the kingdom. Orders were therefore diſpatched to M. D'Yriarte, at Baſle, immediately to conlude a treaty; which was accordingly ſigned by the Spaniſh miniſter and M. Barthelemi, at Baſle, on the 22d of July.

About the middle of this year, died the infant ſon of the unfortunate Lewis XVI. An unjuſt and cloſe impriſonment, if it did not produce, at leaſt, it is probable, haſtened his fate. He had always been an unhealthy child, and ſubject to a ſcrofulous complaint, a diſorder in which confinement and inactivity are frequently fatal. For ſome time previous to his deceaſe, he had been afflicted with a ſwelling in his knee, and another in his wriſt. His appetite failed, and he was at length attacked with a fever. It does not appear that medical aid was denied him, or neglected. The diſeaſe, however, continued to increaſe; and on the morning of the 9th of June, he expired in the priſon of the Temple, where he had been confined from the fatal autumn of 1792.

Moved perhaps by this event, or influenced by the general ſympathy of the people of France, the committee of public ſafety, in the beginning of July, propoſed the exchange of the princeſs, ſiſter of the dauphin, who was likewiſe a priſoner in the Temple, for the deputies delivered up to Auſtria by the treachery of Dumouriez, and the two ambaſſadors, Semonville and Maret, who had been ſeized, contrary to the law of nations, on a neutral territory, by an Auſtrian corps. The emperor, after ſome heſitation, acceded to the propoſal; and before the concluſion of the year, the princeſs was delivered to the Auſtrian envoy, at Baſle in Switzerland, and the deputies were reſtored to their country.

In the courſe of this year, an expedition was planned by the Engliſh miniſtry, to invade the coaſt of France, in that part where the royaliſts, known by the name of Chouans, were in arms againſt the republicans. The force employed conſiſted chiefly of emigrants, under the command of M. Puiſaye, M. D'Hervilly, and the count de Sombreuil. They landed in the bay of Quiberon, and took the fort of the ſame name; but ſoon after experienced a ſad reverſe; the fort being ſurpriſed by the republican troops, under the command of general Hoche, who killed or made priſoners the greater part of the emigrants, chouans, and Engliſh, in the fort, amounting to nearly 10,000 men. The count de Sombreuil, the biſhop of Dol, with his clergy, who accompanied him, and moſt of the emigant officers, who were made priſoners, were tried by a military tribunal, and put to death. Before the month of April, in the enſuing year (1796,) the force of the inſurgents in this part of France was entirely broken, and their chiefs, Charette and Stoflet, taken priſoners, and put to death.

In Germany, the French army had croſſed the Rhine, near Manheim, and blocaded Mentz, to which they had already laid ſiege for ſeveral months. In this attempt, however, they were unſucceſsful; they ſuffered a defeat from the Auſtrians, and were compelled to re-paſs the river. A ſuſpenſion of arms, for three months, was ſoon after agreed to by the generals of the contending armies, which was ratified by the reſpective powers.

In the ſucceeding year (1796,) the campaign opened in the ſouth, on the 9th of April, when the rapid and ſignal victories of the republican troops, under the command of the then obſcure and little known, but now juſtly celebrated Buonaparte, ended in little more than a month, the war with Sardinia. The battles of Milleſſimo, Dego, Mondovi, Monte Lerino, and Monte Notte, compelled his Sardinian majeſty to accept ſuch terms as the conquerors thought proper to offer; and a treaty of peace, by which he ceded Savoy and Nice to France, was ſigned on the 17th of May.

Buonaparte purſued his ſucceſs, and again defeating Beaulieu, the Auſtrian general at the battle of the bridge of Lodi, forced the ſhattered remains of the Auſtrian army to retire towards Mantua, purſued by one part of the republican forces, while the remainder entered Milan, on the 18th of May, without further reſiſtance, and the French armies gained poſſeſſion of the whole of Lombardy.

The armiſtice which had been concluded on the Rhine, was afterwards prolonged, but at length declared to be at an end on the 31ſt of May; when the army of the Sambre and Meuſe, under general Jourdan, gaining conſiderable advantages over the Auſtrians, advanced into the heart of the empire; while another army, under general Moreau, paſſed the Rhine at Straſbourg, took the fort of Kehl, a poſt of great importance, on the oppoſite bank, and penetrating through Bavaria, nearly to Ratiſbon, endeavoured to form a junction with the army of Jourdan. This attempt, however, did not ſucceed; both armies experienced a reverſe of fortune, and were obliged to retreat till they recroſſed the Rhine. The ſituation of general Moreau was highly critical, and his retreat is acknowledged on all ſides, to have been conducted with great military ſkill. The archduke Charles, who commanded the Auſtrian army, followed Moreau in his retreat, and laid ſiege to the fort of Kehl, which he re-took, after a moſt obſtinate reſiſtance on the part of the French.

To reſtore the affairs of Italy, the emperor aſſembled a new army, compoſed of the flower of the German troops ſerving on the Rhine, and gave the command of it to general Wurmſer, one of the oldeſt and ableſt of the imperial generals. This force, on its firſt arrival, was ſucceſsful. The French were repulſed, defeated, and compelled to raiſe the ſiege of Mantua. Buonaparte, however, ſoon returned to the charge; and, after a ſeries of hotly-conteſted actions, the army of Wurmſer was ſo reduced and haraſſed, that

that he was obliged to ſhut himſelf up in Mantua, where he was cloſely beſieged by the victors; who at the ſame time, made incurſions into the Tyrol, and, by the battle of Roveredo, and the poſſeſſion of Trent, became maſters of the paſſes that led to Vienna. The Auſtrians, at the ſame time, made a great effort, under general Alvinzy, to reſcue the gallant Wurmſer and his beſieged army; but the battle of Arcole completely defeated their deſign; and Mantua was ſoon after obliged to ſurrender.

The victories of Buonaparte compelled the pope, the king of Naples, and the inferior princes of Italy, to conclude ſuch treaties as the French thought proper to dictate. The victors likewiſe founded a new republic in Italy, at firſt called the Ciſpadane, but now the Ciſalpine republic, to which they have annexed ſuch parts of the papal territory as they have judged convenient.

After the taking of Mantua, the victorious Buonaparte penetrated into the Tyrol, and directed his courſe towards the imperial capital. The archduke Charles was oppoſed to him, but was unable to check his progreſs. The republican armies had at length advanced ſo near to Vienna, that the utmoſt alarm and confuſion prevailed in that city. The bank ſuſpended its payments, and the emperor was preparing to forſake his capital, and remove to Olmutz. In this critical ſituation of his affairs, his imperial majeſty opened a negotiation with Buonaparte; a ſhort armiſtice was agreed to, and the preliminaries of peace between the emperor and king of Hungary, and the French republic, were ſigned at Leoben, in the month of April, 1797.

In the mean time, a tumult having taken place at Venice, in which a number of the French ſoldiers were murdered in the hoſpitals of that city, the French armies, on their return, aboliſhed the ancient government of Venice, planted the tree of liberty in St. Mark's Place, eſtabliſhed a municipality, and propoſed to annex the city and territory to the new Ciſalpine republic. But the concluſion of the definitive treaty of peace with the emperor being protracted on account of the French refuſing to reſtore Mantua, as it is alleged it was ſtipulated they ſhould, in the preliminaries, they at length agreed to cede to him the city and a part of the territory of Venice in compenſation for Mantua.

The definitive treaty of peace between France and the emperor was ſigned at Campo Formio, on the 17th of October, 1797. By this treaty the emperor was to cede to France the whole of the Netherlands, and all his former territory in Italy. He was to receive in return the city of Venice, Iſtria, and Dalmatia, and the Venetian iſlands in the Adriatic: the French were to poſſeſs the other Venetian iſlands.

A congreſs was aſſembled at Ratſtadt, for the purpoſe of negociation; propoſals and demands were alternately made and alternately rejected by the parties, but with all due deference to the reſpective powers from whom the deputies derived their authority, till the conduct of the republican general Bernadotte, as well as thoſe attached to his ſuite, had been marked by an uncommon degree of inſolence ever ſince they arrived at Vienna. Their general language reſpecting the emperor and the Auſtrian government was indecent and undiſguiſed. Soon after Bernadott's arrival at Vienna, he imitated the conduct of Buonaparte at Rome, by demanding that the quarter of the city wherein he reſided ſhould be free, and that all Frenchmen living in Vienna ſhould be amenable to him only for their conduct. But the Auſtrian government, leſs acquieſcing than the weak and pliant government of the pope, repeatedly refuſed this application; upon which Bernadotte quitted Vienna, denouncing vengeance againſt the Auſtrians.

On the 19th of May, 1798, general Buonaparte embarked at Toulon, on board admiral Bruey's ſhip l'Orient (formerly the Sans Culottes) a three decker. The fleet ſet ſail with a favourable wind. The tranſports, with the infantry and cavalry, got under weigh at day-break with eight frigates. The fleet conſiſted of fifteen ſhips of the line and eighteen frigates. The tranſports, to the number of four hundred, were off Herries.

An immenſe number of infantry, with artillery, vaſt quantities of mortars, howitzers, furnaces, bombs, grape and canniſter ſhot, and other ammunition, were put on board. Men of letters, aſtronomers, geometricians, and artiſts of every ſort, alſo embarked. The convoy from Genoa conſiſted of thirty-eight ſail with 10,000 men on board. Kleber, Berthier, and other generals had alſo embarked.

The general in chief, Buonaparte, harangued the officers and ſoldiery, previous to their embarkation, in a very ſpirited manner. He informed them, that he was going to lead them into a country, where by their future exploits they would ſurpaſs even thoſe which then aſtoniſhed the world, and that would render to their country the ſervices ſhe had a right to expect from an army of invincibles, as he termed them. He promiſed to each ſoldier, that upon his return from this expedition, he ſhould have given him ſufficient to purchaſe ſix acres of land, and concluded with reminding them that they were going to brave freſh dangers, and would partake them with their brethren the ſailors.

The fleet arrived at Malta on the 9th of June, when a requeſt was made by the French general for water, which was refuſed by the grand maſter, who declared ironically, that he could not admit but two ſhips into the port. On the 10th the French were on ſhore early in the morning, and Malta was inveſted, and the town cannonaded on all ſides. The beſieged made a ſally, in which general Marmont, at the head of the 19th brigade, took the ſtandard of the order. On the 11th the knight ſurrendered the town and port, and renounced their property in the iſland to the French republic.

Buonaparte diſembarked at Alexandria, about the 8th of July, from fifteen to twenty thouſand men. His fleet, ſhips of war and tranſports, were ſtated to be near three hundred ſail.

The Engliſh after receiving intelligence of the conqueſt of Malta, and the departure of the French fleet from that iſland, diſpatched a ſquadron in queſt of them under the command of Sir Horatio Nelſon, who after ſome time fell in with them, when an action commenced, in which the French loſt ſeven ſhips of 74 guns, which was taken by the Engliſh, one of 80, and one of 74 were burnt; beſides a frigate of 36 guns, and another of the ſame force that was ſunk. The French on the onſet fought with great galantry: their admiral and commander in chief, Bruyes, was killed by a cannon ball; many officers of rank fell, and the general ſlaughter muſt have been immenſe, from the ſhattered ſtate of all the ſhips that were engaged.

In conſequence of this engagement, the army of Egypt was deprived of receiving the leaſt ſuccour from France; which, with the change of climate, and the deſerts they had to march through, rendered the army in a very perilous condition: however, after various ſucceſſes, Buonaparte at length privately returned to France, where he effected a Revolution, and was appointed the firſt Conſul of the Republic.

ASIA.

INTRODUCTION.

THOUGH this quarter claims a ſuperiority over the reſt; it muſt nevertheleſs be owned, that a conſiderable part of Aſia, particularly that called Turkey, has loſt much of its ancient ſplendor and fertility, and from the moſt populous and beſt cultivated ſpot in the whole territory, is now become a wild and uncultivated deſert. The other parts, however, are ſtill in a flouriſhing condition, which is rather to be attributed to the richneſs of the ſoil, than to the induſtry of the inhabitants, who are remarkable for their indolence, luxury, and effeminacy. This effeminacy is chiefly owing to the warmth of the climate, though in ſome meaſure heightened by cuſtom and education; and the ſymptoms of it are more or leſs viſible, as the ſeveral nations are ſeated nearer or further from the north. Hence the people of Tartary, and the Aſiatic parts of Ruſſia, are as brave, hardy, ſtrong, and vigorous, as thoſe who inhabit the ſame latitudes in Europe. What is wanting in the robuſt frame of their bodies among the Chineſe, Mogul Indians, and all the inhabitants of the more ſouthern regions, is in a great meaſure made up to them by the vivacity of their minds, and the ingenuity they poſſeſs in various kinds of workmanſhip, which our moſt ſkilful mechanics have long endeavoured to imitate, but without ſucceſs.

Aſia claims the firſt planting of cities, inſtitution of laws and government, civilization of manners, origin of arts and ſciences, and cultivation of human literature in general. To theſe diſtinguiſhed bleſſings of a ſpiritual or mental kind, may be added the bounties of Providence, which are here diſpenſed in vaſt variety, as well as ſuperabundance. In fine, if we advert to the ſerenity of its air, the fertility of its ſoil, the deliciouſneſs of its fruits, the ſalubrity of its drugs, the fragrance and balſamic qualities of its plants, gums, and ſpices; the quantity, beauty, and value of its gems, the fineneſs of its ſilks and cottons, and many other natural endowments, we cannot but admit of its decided ſuperiority, nor can we wonder at its ancient ſplendor, power, and opulence.

Aſia is ſituated between 25 and 180 deg. of eaſt long. and between the equator and 80 deg. of north lat. It is about 4740 Engliſh miles in length, from the Dardanelles on the weſt, to the eaſtern ſhore of Tartary, and about 4380 miles in breadth, from the moſt ſouthern part of Malacca, to the moſt northern cape of Nova-Zembla. It is bounded by the Frozen Ocean on the north; on the weſt, it is ſeparated from Africa by the Red Sea; and from Europe by the Levant or Mediterranean, the Archipelago, the Helleſpont, the Sea of Marmora, the Boſphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the river Oby, which falls into the Frozen Ocean; on the eaſt, it is bounded by the Pacific Ocean, or South Sea, which ſeparates it from America; and on the ſouth, by the Indian Ocean; ſo that it is almoſt ſurrounded by the ſea.

In ancient times, great part of this vaſt country was ſucceſſively governed by the Aſſyrians, Medes, Perſians, and Greeks; but the immenſe regions of India and China were little known to Alexander, or to any of the conquerors of the ancient world. Secluded by an almoſt impenetrable range of mountains and deſerts, they were free from the ſwords of European warriors, and enjoyed their delicious climates unenvied and unmoleſted. Upon the decline of the above-mentioned empires, great part of Aſia ſubmitted to the Roman arms; and afterwards, in the middle ages, the ſucceſſors of Mahomet, or, as they are uſually called, Saracens, founded in Aſia, Africa, and Europe, a more extenſive empire than that of Cyrus, Alexander, or even the Romans, when in its height of power. The Saracen greatneſs ended with the death of Tamerlane; and the Turks, on every ſide victorious, ſoon after poſſeſſed themſelves of the middle regions of Aſia, which they ſtill enjoy. Beſides the countries under the dominion of the Turks and Ruſſians, Aſia contains at preſent three large empires: the Chineſe, the Mogul, and the Perſian, upon which the leſſer kingdoms and ſovereignties generally depend.

The prevailing form of government in this diviſion of the globe, is abſolute monarchy; and here the people are the moſt abject ſlaves. If any of them can be ſaid to enjoy ſome ſhare of liberty, it is the wandering tribes, as the Tartars and Arabs. The latter alone poſſeſs liberty, on account of the ſterility of their ſoil; independent themſelves of revolution and change, they ſee, with unconcern, empires falling and riſing around them. They remain unconquered by arms, by luxury, by corruption; their language is permament; they adhere to their cuſtoms and manners, and retain their dreſs. Their whole property conſiſts of flocks and herds, tents and arms. They annually make a ſmall and voluntary preſent to the chief of their race. They revolt from oppreſſion, and are free from neceſſity, which they miſtake for choice. When men are obliged to wander for ſubſiſtence, deſpotiſm knows not where to find its ſlaves.

The Tartar, though a wanderer like the Arab, was never equally free. A violent ariſtocracy always pre-

vailed in the country of the former, except in a few ſhort periods, where the fortune of one eſtabliſhed a tranſient deſpotiſm over the whole. There man is armed againſt man, chief againſt chief, and tribe againſt tribe. War is no longer a particular profeſſion, but the conſtant occupation of all. Men are more afraid of men, in the ſolitudes of Tartary, than of beaſts of prey. The traveller moves with great circumſpection, and fears an enemy in every blaſt.—When he perceives a track in the ſand, he croſſes it, and begins to draw his ſword. The aſſaſſin is dignified with the name of conqueror, and robbery acquires the more honourable name of conqueſt.

Among the inhabitants of the mountains which ſeparate Perſia from India, the nature and face of the country have formed a different ſpecies of ſociety.—Every valley contains a community ſubject to a prince, whoſe deſpotiſm is tempered by an idea eſtabliſhed among his people, that he is the chief of their blood, as well as their ſovereign. They obey him without reluctance, as they derive credit to their family from his greatneſs. They attend him in his wars, with the attachment which children have for a parent; and his government, though ſevere, partakes more of the rigid diſcipline of the general, than of the caprice of an arbitrary ſovereign.

With regard to the great empires of Turkey, Perſia, Hindoſtan, and China, they are deſpotic in the ſtricteſt ſenſe of the word; and many of the Aſiatic nations, when the Dutch firſt came among them, could not conceive how there ſhould exiſt any other form of government than that of a deſpotic monarchy.

Turkey, Arabia, Perſia, part of Tartary, and part of India, profeſs Mahometaniſm. The Perſian and Indian Mahometans are of the ſect of Hali, and the others of that of Omar; but both own Mahomet for their law-giver, and the Koran for their rule of faith and life. In the other parts of Tartary, India, China, Japan, and the Aſiatic iſlands, they are generally heathens and idolaters. Chriſtianity, though planted here with amazing rapidity by the apoſtles and primitive fathers, ſuffered an almoſt total eclipſe by the conqueſts of the Saracens, and afterwards by the Turks. Incredible indeed have been the hazards, perils, and ſufferings of popiſh miſſionaries, to propagate their doctrines in the moſt diſtant regions, and among the groſſeſt idolaters; but their labours have hitherto failed of ſucceſs, owing in a great meaſure to their own avarice, and the rapacity and profligate diſpoſition of the Europeans, who reſort thither chiefly in ſearch of wealth and dominion. Jews are to be found every where in Aſia.

This fine and extenſive country being inhabited by a great variety of people, it is no wonder that the languages are alſo different. It would be a taſk at once both difficult and uſeleſs to enumerate them all: it will be ſufficient to obſerve, that the principal ſpoken in Aſia, are the modern Greek, the Turkiſh, the Ruſſian, the Tartarian, the Perſian, the Arabic, the Malayan, the Chineſe, and the Japaneſe. On the coaſts of India and China, moſt of the European languages are ſpoken.

A GENERAL TABLE OF THE CONTINENT OF ASIA.

CHAP. I.

TURKEY IN ASIA.

Turkey in general. Its Situation, Extent, Diviſions, Mountains, Rivers, Animals, &c.

THE eaſtern provinces of Turkey are, 1. Eyraca Arabic, or Chaldea, whoſe chief towns are Baſſora and Bagdad. 2. Diarbec, or Meſopotamia; chief towns, Diarbec, Orfa, and Mouſul. 3. Curdiſtan, or Aſſyria; chief towns, Nineveh and Betlis. 4. Turcomania, or Armenia; chief towns, Erzerum and Van. 5. Georgia, including Mingrelia and Imaretta, and part of Circaſſia; chief towns, Teflis, Amarchia, and Gonie.

Natolia, or the Leſſer Aſia, on the weſt, contains, 1. Natolia Proper, whoſe chief towns are Burſa, Nice, Smyrna, and Epheſus. 2. Amaſia; chief towns, Amaſia, Trapeſond, and Tocat. 3. Aladulia; chief towns, Ajazzo and Marat. 4. Caramania; chief towns, Satalia and Teraſſo.

Eaſt of the Levant, are Syria, with Paleſtine, or the Holy Land; the chief towns in which are Aleppo, Antioch, Damaſcus, Tyre, Sidon, Tripoli, Scanderoon, and Jeruſalem.

The mountains, which are many, have been the moſt celebrated, in ſacred and profane hiſtory, of any in the univerſe. The principal, which are ſituated in Leſſer Aſia, are Olympus, Ida, Tauris, Anti-Tauris, and the Carmanian Mountains. Beſides theſe, are Mount Caucaſus, or the Daghiſtan Mountains; Ararat, where the ark reſted, and the other Armenian Mountains; Curdiſtan and Paleſtine, Hermon and Lebanon.

Aſia is perhaps the beſt ſituated for navigation of any country in the univerſe; but the natives do not know how to make uſe of the uncommon natural advantages with which Providence has bleſſed them. The ſeas which border on it are the Euxine, or Black Sea; the Boſphorus, or Sea of Conſtantinople; the Propontis, or Sea of Marmora; the Helleſpont, and Ægean Sea, or Archipelago, which divide Aſia from Europe; the Levant, or White Sea, and the Perſian Gulf. The Red Sea likewiſe divides it from Africa, which occaſions the Grand Seignior, among his other titles, to ſtyle himſelf "Lord of the Black, white, and Red Seas."

The moſt remarkable rivers are the Euphrates, Tigris, Meander, Orontes, Sarabat, Jordan, Haly, and Kara; which will be particularly deſcribed as they occur.

With reſpect to the air and climate, both are moſt delightful, and naturally ſalubrious to the human conſtitution: yet ſuch is the equality with which the Author of nature has diſpenſed his benefits, that Turkey, both in Europe and Aſia, is often viſited by the plague, a dreadful ſcourge of mankind wherever it takes place, but here doubly deſtructive, from the native indolence of the Turks, and their ſuperſtitious belief in that kind of predeſtination which prevents them from uſing the proper precautions to defend themſelves againſt this calamity, and its fatal effects.

We need ſcarcely inform the reader, that this country, which contains the moſt fertile provinces of Aſia, produces all the luxuries of life in the utmoſt abundance, notwithſtanding the indolence of its owners. Raw ſilk, corn, wine, oil, honey, fruit of every ſpecies, coffee, myrrh, frankincenſe, and odoriferous plants and drugs, are natives found here almoſt without culture, which is practiſed chiefly by Greek and Armenian Chriſtians. Nature has here brought all her productions to the higheſt perfection. The olives, citrons, lemons, oranges, figs, and dates produced in theſe provinces, are highly delicious, and in ſuch plenty, that they coſt the inhabitants very little, and it is ſaid, in ſome places, nothing. Their aſparagus is often as large as a man's leg, and their grapes far exceed in ſize thoſe of other countries.

Their animal productions by ſea and land, are equally excellent and plentiful. The breed of Turkiſh and Arabian horſes (the latter eſpecially) are beyond any in the world, and have conſiderably improved that of the Engliſh. Camels are generally made uſe of for travelling and carrying burdens; that animal, beſides the advantage of ſtrength, being formed by nature to travel a conſiderable time without either provender or water. Their manufacture, known by the name of camblets, was originally made by a mixture of camels-hair with ſilk, though it is now often made with wool and ſilk. Oxen are generally uſed in tillage. Buffaloes are found in ſeveral parts of Turkey, the fleſh of which may be purchaſed at an eaſy rate; but it is very bad, nor is the beef much better. Vaſt flocks of ſheep, however, are fed all over the country, but particularly in the province of Lycaonia, where they are moſtly of the Syrian kind. The fleſh of theſe ſheep have an exquiſite taſte, and their tails are exceedingly long and thick, ſome of them having been known to weigh thirty pounds. Innumerable herds of goats are likewiſe kept here, eſpecially in Pamphylia, the hair of this animal being alſo of infinite uſe in the manufacture of their fine camblets, and great quantities of it are exported to Europe. Their kids are eſteemed delicate eating, and ſaid to ſurpaſs, in flavour and taſte, thoſe of Europe.

In Turkey, ſome of the birds are of an extraordinary ſize, particularly the oſtrich, but theſe are not very common. There is great plenty of wild-fowl, and the iſland of Cyprus produces a bird, about the ſize of a lark; many thouſands of them, when pickled down in barrels, are ſent annually to Venice, where they fetch a very good price. Great numbers of them are caught in the months of September and October.

Great quantities of fiſh are found in moſt of the rivers, particularly ſalmon and carp of an amazing ſize; but the fiſh on their ſea-coaſts are eſteemed far more delicate in their kind, viz. turbots, rets, ſoles, roaches, pilchers, tunnies, oyſters, herrings, &c.

This country contains all the metals that are to be found in the richeſt kingdoms and provinces of Europe; and its medicinal ſprings and baths exceed thoſe of any in the known world. Some of theſe are remarkable for their ſalubrity, and others for their coſtly decorations. Near the gulf of Nicomedia is a fountain much eſteemed by the Turks and Greeks for its medicinal virtues; as are ſeveral ſprings and rivulets in the neighbourhood of Coos. Therma, in Bithynia, is famous for its hot-baths. Near Burſa, is a large bath, the waters of which flow through mines of vitriol: near it is a warm bath; and at about a league diſtance is another, where the water is hot enough to boil an egg.

CHAP. II.

TURKEY.

Population, Inhabitants, Manners, Cuſtoms, Diverſions, Dreſs, Marriages, Funerals, Religion, Eccleſiaſtical Inſtitutions of Chriſtians, Learning and Learned Men, Antiquities, Curioſities, &c.

THE limits of this great country not being accurately fixed, geographers have not been able to aſcertain its population, which is by no means equal either to its extent or fertility. It certainly is not ſo great

great as it was before the Chriſtian æra, or even under the Roman emperors, owing to various cauſes; and above all, to the tyranny under which the natives live, and their polygamy, which appears to be an enemy to population, if we may conclude from the ſtate of the Greeks and Armenians, among whom it is not practiſed, as they are more prolific than the Turks, notwithſtanding the rigid ſubjection in which they are kept by the latter; but the plague is the greateſt cauſe of depopulation. The Turkiſh monarch, however, has more ſubjects than any two princes of Europe.

With reſpect to the inhabitants, the men, in general, are well made and robuſt: when young, their complexions are fair, and their faces handſome: their hair and eyes are black, or dark brown. The women, when young, have delicate complexions, and regular features, but they generally look old at thirty. They are ſaid to be exceeding amorous, lively, and witty. The Turks are rather hypochondriac, grave, ſedate, and paſſive; yet, when agitated by paſſion, become furious, raging, ungovernable; ſometimes are big with diſſimulation, jealous, ſuſpicious, and vindictive beyond conception. In matters of religion, they are tenacious, ſuperſtitious, and moroſe. Though the greater part of them ſeem hardly capable of much benevolence, or even humanity, with regard to Jews, Chriſtians, or any who differ from them in point of opinion; yet they are far from being devoid of ſocial affections for thoſe of their own religion. But intereſt is their ſupreme good; and when that comes in competition, all ties of religion, conſanguinity, or friendſhip, are with the generality ſpeedily diſſolved.

The morals of the Aſiatic Turks are, however, in many reſpects, preferable to thoſe of the Europeans: they are hoſpitable to ſtrangers, and the vices of avarice and inhumanity reign chiefly among the great: they are likewiſe ſaid to be charitable to one another, and punctual in their dealings. Their benevolence and public ſpirit is moſt conſpicuous in their building caravanſeras, or places of entertainment, on roads that are deſtitute of accommodations, for the refreſhment of poor pilgrims or travellers. With the ſame laudable view, they ſearch out the beſt ſprings, and dig wells, which in thoſe countries are a luxury to weary travellers.

The Turks ſit croſs-legged upon mats, not only at their meals, but in company. Their ideas, except what they acquire from others, are ſimple and confined, ſeldom reaching without the walls of their own houſes: where they ſit converſing with their women, drinking coffee, ſmoking tobacco, or chewing opium.

They have little curioſity to be informed of the ſtate of their own, or any other country. If a vizier, baſhaw, or other officer, is turned out, or ſtrangled, they ſay no more on the occaſion, than that there will be a new vizier or governor, ſeldom inquiring into the reaſon of the diſgrace of the former miniſter. They are perfect ſtrangers to wit and agreeable converſation. They have few printed books; and the Koran, with the comments upon it, form the chief part of their ſtudy. Nothing is negotiated in Turkey without preſents; and even juſtice may be purchaſed by a well-timed bribe.

About eleven o'clock in the forenoon, they dine; but ſupper is their principal meal, which they eat at five in the winter, and ſix in the ſummer. Among the great people, their diſhes are ſerved up one by one; but they have neither knife nor fork, and are not permitted by their religion to uſe gold or ſilver ſpoons. Their victuals are always high-ſeaſoned. Rice is the common food of the lower ſort, and ſometimes it is boiled up with gravy; but their chief diſh is pilau, which is mutton and fowl boiled to rags, and the rice being boiled quite dry, the ſoup is high-ſeaſoned, and poured upon it. They drink water, ſherbet, and coffee; and the greateſt indulgence they are addicted to, is the chewing vaſt quantities of opium, which gives them ſenſations reſembling thoſe of intoxication. Gueſts of higher rank ſometimes have their beards perfumed by a female ſlave of the family. They are temperate, and ſober, from a principle of their religion, which forbids them the uſe of wine; though many of them, notwithſtanding this injunction, indulge themſelves in ſtrong liquors to exceſs. Their common ſalutation is by bowing the head a little, and laying the right-hand on the breaſt; but to perſons of rank, they ſtoop ſo low as to kiſs the border of their veſt. They ſleep in linen waiſtcoats and drawers, upon mattreſſes, and cover themſelves with a quilt. Few or none of the conſiderable inhabitants of this vaſt empire have any notion of walking, or riding, either for health or diverſion: the moſt religious among them find, however, ſufficient exerciſe, when they conform themſelves to the frequent ablutions, prayers, and rites preſcribed them by Mahomet.

They are falſely accuſed of cruelty toward their ſlaves or ſervants; for they frequently behave with more lenity to them than the Chriſtians; eſpecially if they are acquainted with any art or trade that may be uſeful to the community.

Their uſual amuſements within doors are the cheſs, or draught board; and if they play at chance-games, they never bet money, that being prohibited by the Koran. Their active diverſions conſiſt in ſhooting at a mark, or tilting with darts, at which they are very expert. Some of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purpoſes, that they may know the ſtrength of their dependents.

As to their dreſs, the men ſhave their heads, leaving a lock on the crown, and wear their beards long, except the military, and thoſe in the ſeraglio, who wear only whiſkers: they cover their heads with a turban, which they never put off but when they ſleep: they ſuffer no Chriſtians, or other people, to wear white turbans. Their ſhirts are without collar or wriſtband, and over them they throw a long veſt, which they tie with a ſaſh, and over the veſt they wear a looſe gown ſomewhat ſhorter. Their breeches or drawers are of a piece with their ſtockings; and, inſtead of ſhoes, they wear ſlippers, which they put off when they enter a temple or houſe. The dreſs of the women differs little from that of the men, only they wear ſtiffened caps upon their heads, with horns reſembling a mitre, and wear their hair down. When they appear abroad, which is but ſeldom, they are ſo muffled up as not to be known to their neareſt relations. Such of the women as are virtuous, make no uſe of paint to heighten their beauty, or to diſguiſe their complexions; but they often tinge their hands and feet with kenna, which gives them a deep yellow. The men, in colouring their beards, make uſe of the ſame expedient.

In Turkey, marriages are chiefly negotiated by the ladies; and when the preliminaries are adjuſted, and terms agreed upon, the bridegroom elect pays down a ſum of money, which is generally employed in furniſhing the houſe of the young couple; a licence is obtained from the cadi, or proper magiſtrate, and the parties are married. The wedding is celebrated, as in other nations, with mirth and jollity. They are not allowed by their law more than four wives, but they may have as many concubines as they can maintain; in conſequence of this permiſſion, the wealthy Turks, beſides their wives, keep a kind of ſeraglio of women; but all theſe indulgences are ſometimes not ſufficient to gratify their unnatural deſires. The women are kept under a rigorous confinement. Divorces are allowed; but no man is allowed to take back again the woman he has once repudiated, till ſhe has been married to another, and divorced by him alſo; which is ſometimes done as a mere form, where the parties agree to live together again.

Their funerals are exceedingly decent. The corpſe

is

is attended by the relations, chanting paſſages from the Koran; and after being depoſited in a moſque (as they call their temples) they are buried in a field by the iman or prieſt, who pronounces a funeral oration at the time of the interment. The male relations expreſs their ſorrow by alms and prayers; the women, by decking the tomb on certain days with flowers and green leaves. A widow leaves off all finery for twelve-months, and in mourning for her huſband, wears a particular head-dreſs.

The eſtabliſhed religion of the Turks is the Mahometan, ſo called from Mahomet, the author of it; ſome account of which the reader will find in the following hiſtory of Arabia, the native country of that impoſtor. The Mahometans are divided into two great ſects, thoſe of Ali and Omar: the Perſians being of the former, and the Turks of the latter; but theſe are again ſubdivided into many others. There is no ordination among their clergy; any perſon may be a prieſt that pleaſes to take the habit, and perform the functions of his order: he may alſo lay down his office when he thinks proper. That the Mahometans believe women poſſeſs no ſouls, is a vulgar error, ſince many paſſages in the Koran prove the contrary opinion.

With reſpect to the eccleſiaſtical inſtitutions of Chriſtians, the Turkiſh government has formed theſe into part of its finances, and tolerated them where they are moſt profitable; but the hardſhips impoſed upon the Greek church are ſuch, as muſt always diſpoſe that people to favour any revolution of government. Conſtantinople, Jeruſalem, Alexandria, and Antioch, are patriarchates; and their heads are indulged, according as they pay for their privilege, with a civil as well as an eccleſiaſtical authority over their votaries. The ſame may be ſaid of the Neſtorian and Armenian patriarchs; and every great city that can pay for the privilege, has its archbiſhop or biſhop. All male Chriſtians, according to their ſtations, pay alſo a capitation-tax, from ſeventeen years old to ſixty.

In this empire, the radical languages are the Sclavonian, which ſeems to have been the mother tongue of the ancient Turks; the Greek modernized, but ſtill bearing a relation to the old language; the Arabic, and the Syriac, a dialect of which is ſtill ſpoken. Their pater-noſter is expreſſed in the following ſpecimen:

" Pater hemas, opios iſo ees tos ouranous; hagia
" ſthito to onoma ſou; na erti he baſilia ſou: to the-
" lema ſou na genetez itzon en te ge, os is ton oura-
" non: to ptſomi hemas doze hemas ſemoren: hæ
" ſi choraſe hemos ta crimata hemon itzone, kæ he-
" mas ſichoraſomen, ekinous opou: mas adikounkæ
" menternes hemais is to piraſmo, alla ſoſon hemas
" apo to kaxo. Amen."

Till of late, the Turks profeſſed a ſovereign contempt for our learning. Greece, which was the native country of genius, arts, and ſciences, produces at preſent, beſides Turks, numerous bands of Chriſtian biſhops, prieſts, and monks, who, in general, are as ignorant as the Turks themſelves, and are divided into various abſurd ſects of what they call Chriſtianity. The education of the Turks ſeldom extends further than reading the Turkiſh language, and the Koran, and writing a common letter. Some of them underſtand aſtronomy, ſo far as to calculate the time of an eclipſe; but the number of theſe being very ſmall, they are looked npon as extraordinary perſons. There are, however, ſome ſchools, colleges, and accademies to be met with in Turkey, but they are on a very different footing from thoſe among us; and ſome years ago, a printing-houſe was opened at Conſtantinople, where books of all kinds, except on matters of religion, were allowed to be printed.

Their natural and artificial antiquities and curioſities are ſo various, that they have furniſhed matter for many voluminous publications, and others are appearing every day. Theſe countries contained all that was rich and magnificent in architecture and ſculpture; and neither the barbarity of the Turks, nor the depredations they have ſuffered from the Europeans, ſeem to have diminiſhed their number. They are more or leſs perfect, according to the air, ſoil, or climate in which they ſtand; and all of them bear deplorable marks of neglect. Many of the fineſt temples are converted into Turkiſh moſques, or Greek churches, and are more disfigured than thoſe which remain in ruins. Amidſt ſuch a group of curioſities, all that can be done here, is, to ſelect ſome of the moſt ſtriking; and as Palmyra and Balbec form the pride of all antiquity, we ſhall therefore begin with them:

" Palmyra, in the deſerts of Arabia, or, as by the ſcripture ſtyled, Tadmor in the wilderneſs, is ſituated in the wilds of Arabia Petræa, about 33 deg. north lat. and 200 miles to the ſouth of Aleppo. Its preſent appearance affords a moſt awful ſpectacle. As you approach, the firſt object which preſents itſelf is a ruinated caſtle, on the north ſide of the city. From it you deſcry Tadmor, encloſed on three ſides by long ridges of mountains; ſouthward of it is a vaſt plain, extending far beyond the ſight. The city muſt have been of large extent, from the ſpace now taken up by its ruins; among which live about thirty or forty miſerable families, in huts of dirt, within a ſpacious court, which once encloſed a magnificent temple. This court hath a ſtately high wall, of large ſquare ſtone, adorned by pilaſters both within and without; there are about ſixty on each ſide. The beautiful cornices have been beaten down by the Turks. Towards the centre, are the remains of a caſtle, ſhrouding the fragments of a temple of exquiſite beauty, as appears by what is ſtill ſtanding of its entrance, viz. two ſtones thirty-five feet long, carved with vines, and cluſters of grapes. In the great court are the remains of two rows of very noble marble pillars, thirty-ſeven feet high, with capitals finely carved, and the cornices muſt have been of equal elegance; fifty-eight of theſe pillars are entire: there muſt have been many more, as it appears they went quite round the court, ſupporting a moſt ſpacious double piazza. The walks on the weſt ſide of this piazza, which face the front of the temple, ſeem to have been grand and ſpacious; and at each end are two niches for ſtatues at length, with pedeſtals, borders, ſupporters, canopies, &c. carved with inimitable art. The ſpace within this once beautiful encloſure, is (or rather was) encompaſſed by another row of pillars of a different order, fifty feet high; ſixteen of which are yet ſtanding. The temple was about ninety feet long, and forty broad: its grand entrance on the weſt appears, by what remains of it, to have been the moſt magnificent in the world. Over a door-way in the remaining walls, you trace a ſpread-eagle, as at Balbec; and here are the fragments of cupids, as well as of eagles, moſt finely imitating nature, on large ſtones mouldering on the earth. Nothing of the temple ſtands but the walls, the window-places of which are narrow at top, but richly adorned with ſculpture. In the middle is a cupola, all one ſolid piece. Leaving this court and temple, your eyes are ſaluted with a great number of pillars of marble, ſcattered for near a mile. To the north, you have a ſtately obeliſk before you, conſiſting of ſeven large ſtones, beſides its capital, grandly ſculptured: it is more than fifty feet high, and is twelve feet and a half in circumference juſt above the pedeſtal; and it is imagined a ſtatue once ſtood upon it. Eaſt and weſt of this, at the diſtance of about a quarter of a mile, is another obeliſk, that ſeems to have correſponded with the firſt-mentioned; and, according to the fragment of a third, it ſhould ſeem that there was a continued range of them. On one of them, which is about forty feet high, there is a Gothic inſcription, commemorating two patriots; and about an hundred paces from it, is a large and

lofty entrance, leading to a grand piazza, adorned with marble pillars, on moſt of which there are inſcriptions. A little further onward, to the left, are the remains of a ſtately pile of remarkably fine marble, twenty-two feet long. On the weſt ſide of the piazza, are ſeveral openings for gates; two of them appear to have been the moſt ſuperb that ever captivated the human eye, both in point of grandeur of work in general, and the beautiful porphyry pillars with which they were adorned. Eaſtward of the piazza, are a great number of ſcattered marble, pillars, moſt of which have been deprived of their elegant capitals. A little ruined temple lies mouldering at a ſhort diſtance, which appears to have been a very curious ſtructure. But of all the venerable remains, none more attract the admiration, than the magnificent ſepulchres towards the north of the city, extending a mile and more, and which, at a diſtance, have the appearance of tops of decayed churches, or baſtions of ruined fortifications."

Nothing but ocular proof could convince any man, that ſo ſuperb a city, formerly ten miles in circumference, could exiſt in the midſt of what now are tracts of barren, uninhabitable ſand. Nothing, however, is more certain, than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eaſtern world; and that its merchants dealt with the Romans, and the weſtern nations, for the merchandiſes and luxuries of India and Arabia. Its preſent altered ſtate, therefore, can be only accounted for by natural cauſes, which have turned the more fertile tracts into barren deſerts. The Aſiatics think that Palmyra, as well as Balbec, owes its original to Solomon; and in this they receive ſome countenance from ſacred hiſtory. In profane hiſtory, it is not mentioned before the time of Marc Antony; and its moſt ſuperb buildings are thought to be of the lower empire, about the time of Gallienus. Odenathus, the laſt king of Palmyra, was highly careſſed by that emperor, and even declared Auguſtus. His widow Zenobia reigned in great glory for ſome time; and Longinus, the celebrated critic, was her ſecretary. Not being able to brook the Roman tyranny, ſhe declared war againſt the emperor Aurelian, who took her priſoner, led her in triumph to Rome, and put to death her principal nobility, and among others, the excellent Longinus. He afterwards deſtroyed her city, and maſſacred its inhabitants, but expended large ſums out of Zenobia's treaſures, in repairing the temple of the Sun, the majeſtic ruins of which are hereunder mentioned. Travellers give but an imperfect account of that celebrated city; nor do any of the Palmyrene inſcriptions reach above the Chriſtian æra, though there can be no doubt that the city itſelf is of much higher antiquity. The emperor Juſtinian made ſome efforts to reſtore it to its ancient ſplendor, but without effect, for it dwindled by degrees to its preſent wretched ſtate. It has been very juſtly obſerved, that its architecture, and the proportions of its columns, are by no means equal to thoſe of Balbec; which we ſhall now give an account of.

The venerable ruins of Balbec (called by the Greeks Helipolis, or The City of the Sun) evince, that it was one of the moſt magnificent cities in the univerſe; at preſent it is not above a mile and a half in circumference, and the poor inhabitants, who are about 5000 in number, chiefly Greeks, live in or near the circular temple, in mean houſes, built out of the ancient ruins. The Hon. Van Egmont ſays,

"Balbec, now called Baalbec, is probably the ancient Heliopolis, or City of the the Sun; and its new name ſeems to correſpond with the ancient Baal, in the Phœnician language, ſignifying an idol, particularly that of the ſun. And what ſeems to confirm me in my opinion, that Balbec is the ancient Heliopolis, or City of the Sun, was a medal of Philippus Cæſar, which I found here. He is on one ſide repreſented as a youth without beard, or crown; and on the reverſe are two eagles, with the ends of their beaks joined; and between them is inſcribed, COL. HEL. whence it is plain, that this city was at that time a Roman colony." It is ſituated in one of the moſt delightful plains in the world, at the foot of Mount Antilibanus towards the weſtward: it is about 30 miles north of Damaſcus, and the ſame eaſt from the ſea-coaſt, in 33 deg. north lat. and 37 deg. 30 min. eaſt. long. This place was by the Arabians called the Wonder of Syria; and the magnificent ruins are certainly the admiration of all travellers who behold them. A ſuperb palace, a noble temple, and ſome other ruins, ſtand at the ſouth-weſt of the town; and having been patched and pieced in later times, are converted into a caſtle, as it is called. In approaching theſe venerable edifices, a rotunda or round pile attracts the view, encircled with pillars of the Corinthian order, which ſupport a cornice that runs all around the ſtructure. The whole, though greatly decayed, exhibit marks of aſtoniſhing elegance and grandeur, being built of marble, circular without, and octangular within. The Greeks, by whom it hath been converted into a church, have taken infinite pains to ſpoil its beauty, by daubing it with plaſter. There is a ſuperb lofty building contiguous to the rotunda, which leads to a noble arched portico, of 150 paces in length, that conducts you to a temple of aſtoniſhing magnificence, which to a miracle hath withſtood the injuries of time. It is an oblong ſquare, of 192 feet in length on the outſide, and 120 within. The breadth on the outſide is ninety-ſix feet, and within ſixty. The whole is ſurrounded by a noble portico, ſupported by pillars of the Corinthian order, each of which conſiſts only of three ſtones, though the height is fifty-four feet, and the diameter ſix feet three inches; they are nine feet diſtant from each other, and from the wall of the temple: their number on each ſide of the temple is fourteen, and at each end eight; the architrave and cornice are exquiſitely carved and embelliſhed. Round the temple, between the wall and pillars, is an arcade of large ſtones, hollowed out archwiſe, in the centre of each of which is a god, goddeſs, or hero, executed with ſuch animation as is ſcarce conceivable. Round the foot of the temple wall is a double border of marble, whoſe lower parts are filled with baſſo relievo miniatures, expreſſive of heathen ceremonials and myſteries. The entrance to the temple is the moſt auguſt imaginable, the aſcent being by thirty ſteps, bounded by a wall on each ſide that leads to a pedeſtal, on which a ſtatue formerly ſtood. The front is compoſed of eight Corinthian pillars, fluted like thoſe that go round the temple, and a nobly-proportioned triangular pediment; in the midſt of theſe pillars, at ſix feet diſtance, are four others, reſembling the former, and two more, with three faces each: all theſe form a portico ſixty feet broad, and twenty-four deep, before the door of the temple. Under the vault of the portico, the entrance of the temple appears through theſe pillars in admirable proportion. The portal is ſquare, and of marble, forty feet high, and twenty-eight wide, the aperture being about twenty; from this portal the bottom of the lintel is ſeen, embelliſhed by a piece of ſculpture not to be paralleled in the univerſe; it repreſents a prodigious large eagle in baſſo relievo, his wings are expanded, and he carries a caduceus in his pounces; on either ſide a cupid appears, holding the one end of a feſtoon by a ribbon, as the eagle himſelf holds the other in his beak, in a manner inimitably fine.

The temple is divided into three ailes, two narrow on the ſides, and one broad in the middle, by three rows of fluted Corinthian pillars, of near four feet in diameter, and about thirty-ſix feet in height, including the pedeſtal: the pillars are 12 in number, ſix of a ſide, at 18 feet diſtance from each other, and 12 from the walls. The walls themſelves are decorated by two

rows

rows of pilaſters, one above the other, and between each two of the lowermoſt is a niche 15 feet high; the bottoms of the niches are upon a level with the baſes of the pillars, and the wall to that height is wrought in the proportion of a Corinthian pedeſtal: the niches themſelves are Corinthian, and executed with inimitable delicacy. Over the round niches are a row of ſquare ones between the pilaſters of the upper order: the ornaments are marble, and the pediment triangular. At the weſt end of the middle aile, you aſcend to a choir by 13 ſteps: the choir is diſtinguiſhed from the reſt of the fabric by two large ſquare columns adorned with pilaſters, which form a ſuperb entrance. The profuſion of admirable ſculpture here is aſtoniſhing; but the architecture is the ſame as in the body of the temple, except that the niches ſtand upon the pavement, and the pillars are without pedeſtals. The principal deity formerly worſhipped here ſtood in a vaſt niche at the bottom of the choir. The choir is open towards the middle. The whole pile ſtands upon vaults of ſuch excellent architecture, and ſo bold in their conſtruction, that it is imagined they were deſigned for ſomething more than merely to ſupport the ſuperincumbent building. This temple anciently was accompanied by ſome other magnificent buildings, as is evident from four aſcents to it, one upon each angle, with marble ſteps long enough for ten people to go up abreaſt.

The palace, which is in what the Turks call the Caſtle, muſt have been one of the moſt ſuperb ſtructures that imagination can conceive, but it is much more decayed than the temple. It ought to be obſerved, that the old wall which encloſes both theſe ſtructures is compoſed of ſuch prodigious blocks of ſtone as almoſt tranſcends belief; three in particular that lie cloſe to each other in a line extend 183 feet, one being 63 feet in length, and the other two 60 feet each. A dark arched vault, containing many buſts, leads to an hexagonal building which forms a ſpacious theatre; the end opens to a terrace which is aſcended by marble ſteps; you then enter a ſquare court ſurrounded by magnificent buildings: on each hand are double rows of pillars, which form galleries of 66 fathoms in length and eight in breadth. The bottom of this court is occupied by a building amazingly ſumptuous, which appears to have been the body of the palace; the columns are as large as thoſe of the Hippodrome at Conſtantinople, nine of them are ſtanding, and a good piece of the entablature. But it is ſurpriſing that each of theſe large columns is made of one entire block only. All the buildings in this caſtle front the eaſt, and the Corinthian order prevails throughout the whole; there is no place where ſuch precious remains of architecture and ſculpture are to be found; as the fine taſte of Greece, and the magnificence of Rome, ſeem to be blended; the ornaments are at once innumerable and exquiſite. Beneath the whole are vaults, in which vaſt flights of marble ſtairs, of 200 ſteps in a flight, are frequently found. The turn and elevation of theſe vaults are bold and ſurpriſing; they contain many noble halls and ſuperb apartments, admirably decorated. Some of theſe vaults are dark, others receive light from large windows which ſtand on the level of the ground above: but the moſt ſingular circumſtance is, that all theſe aſtoniſhing edifices are built with ſuch enormous ſtones as thoſe before-mentioned, without any viſible ſigns of mortar, or any kind of cement whatever. The preſent city is ſurrounded with a wall of ſquare ſtones, and ſome towers in good condition; the gardens in the environs are pleaſant, fruitful, and well watered. Many houſes which contain various apartments, are cut out of the ſolid rocks. Conjectures of a very different nature have been formed concerning the founders of theſe immenſe buildings. The inhabitants of Aſia aſcribe them to Solomon, but ſome make them ſo modern as the time of Antoninus Pius. Perhaps they are of different æras; and though that prince and his ſucceſſors may have rebuilt ſome part of them, yet the boldneſs of their architecture, the beauty of their ornaments, and the ſtupendous execution of the whole, ſeem to fix their foundation to a period before the chriſtian æra, but without going back to the ancient times of the Jews or Phœnicians, who probably knew little of the Greek ſtyle in building and ornamenting. Balbec is at preſent a little city, encompaſſed with a wall. A free-ſtone quarry in the neighbourhood furniſhed the ſtones for the body of the temple; and one of the ſtones, not quite detached from the bottom of the quarry, is 70 feet long, 14 broad, and 14 feet five inches deep, which, reduced to our meaſure, is 1135 tons. The ornamental parts were furniſhed from a coarſe white marble quarry, at a greater diſtance.

The cities of Mecca and Medina are curioſities only through the ſuperſtition of the Mahometans. Their buildings are mean, when compared to European houſes or churches; and even the temple of Mecca, in point of architecture, makes but a ſorry appearance, though erected upon the ſpot where the great prophet is ſaid to have been born. The ſame may be ſaid of the moſque at Medina, where that impoſtor was buried; ſo that the vaſt ſums ſpent yearly by Mahometan pilgrims, in viſiting thoſe places, are undoubtedly converted to temporal uſes. The different ruins, ſome of them inexpreſſibly magnificent, that are to be found in thoſe immenſe regions, cannot be appropriated with any certainty to their original founders; ſo great is the ignorance in which they have been buried for theſe thouſand years paſt. It is indeed eaſy to pronounce whether the ſtyle of their buildings be Greek, Roman, or Saracen; but their inſcriptions will give the beſt information concerning theſe particulars.

The ſeat of Old Troy cannot be diſtinguiſhed by the ſmalleſt veſtige, and is known only by its being oppoſite to the iſle of Tenedos, and the name of a rock, which the poets magnified into a river. A temple of marble built in honour of Auguſtus Cæſar, at Miliſſo in Caria, and a few ſtructures of the ſame kind, in the neighbourhood, are among the antiquities that are ſtill entire. Three theatres of white marble, and a noble circus near Laodicea, now Latichea, have ſuffered very little from time or barbariſm; and ſome travellers think that the ruins of the celebrated temple of Diana, near Epheſus, may be diſcerned.

CHAP. III.

The Provinces and chief Towns of Turkey.

THE province of Eyraca-Arabic, Yerack, or Irack-Arabi, hath been anciently termed Shinaar, Babylonia, and Chaldea. It lies between 30 and 40 deg. north latitude; and is bounded on the north by Diarbec; on the weſt, by the deſerts of Sham; on the ſouth, partly by the ſame deſerts, as thoſe of Arabia; and by the Median and Aſſyrian mountains, on the eaſt.

The air of this country is in general very ſerene and temperate, but at certain times is ſo extremely dangerous, and the heats ſo exceſſive, that formerly many of the inhabitants uſed to ſleep in ciſterns of water; and this pernicious practice is at preſent not entirely diſcontinued. The inhabitants are ſometimes viſited by a peſtilential wind, which has greatly excited the attention of travellers and philoſophers. As they have no rains for eight months in the year, and ſometimes much longer, the land is watered from the Euphrates, and other rivers, by means of a great number of engines admirably conſtructed for that purpoſe.

The

The country, in general, yields grain two hundred fold, and frequently three hundred; and its fertility is ſuch, that it would aſtoniſh a traveller who had ſeen all the reſt of the known world. The palms, particularly thoſe of the date kind, afford the inhabitants meat, wine, and honey. The millet and ſeſame ſhoot up to the ſize of trees, and the barley and wheat have leaves of four fingers in breadth. They have neither olives nor grapes; but the ſeſame is an excellent ſubſtitute to furniſh oil where olives are wanting, and, in lieu of grapes, the palm ſupplies them with wine.

The Tigris and Euphrates uſed formerly to overflow in the months of June, July, and Auguſt, and cover the whole country with water; and the inundations were generally increaſed by torrents of melted ſnow, which poured down from the Armenian mountains: but thoſe floods proving very detrimental in various caſes, the inhabitants guarded againſt them by cutting a great number of artificial canals, rivers, and rivulets, which they effected with infinite aſſiduity and labour. Thus the waters were properly diſtributed, an eaſy communication made betwixt every part of the country, and the people univerſally benefited. The paſture being exceedingly rich, great numbers of cattle are fed, which not only plentifully ſupply the inhabitants with meat, but with milk, butter, and other uſeful neceſſaries.

This country is famous for the great plain of Shinaar, or Senaar, where the whole race of mankind were collected together after the flood, and from thence diſperſed over the face of the whole earth; which was the place where the tower of Babel was built, and the renowned city of Babylon, of which the veſtiges, or what are ſhewn for ſuch, are very inconſiderable.

Bagdad, the capital of the ancient Chaldea, was the metropolis of the caliphate under the Saracens in the 12th century. This city is built upon the Tigris, not far, it is ſuppoſed, from the ſite of the ancient Babylon; few marks of its ancient grandeur are now remaining. It is in the form of an irregular ſquare, and rudely fortified; but the conveniency of its ſituation renders it one of the ſeats of the Turkiſh government, and it has ſtill a conſiderable trade, being annually viſited by the Smyrna, Aleppo, and weſtern caravans. The houſes of Bagdad are generally large, built of brick and cement, and arched over to admit the free circulation of the air: many of their windows are made of elegant Venetian glaſs, and the ceiling ornamented with chequered work. Moſt of the houſes have alſo a court-yard before them, in the middle of which is a ſmall plantation of orange-trees. The number of houſes is computed at 80,000, each of which pays an annual tribute to the baſhaw, which is calculated to produce 300,000l. ſterling. Their bazars, in which the tradeſmen have their ſhops, are tolerably handſome, large, and extenſive, filled with ſhops of all kinds of merchandize, to the number of 12,000. Theſe were erected by the Perſians, when they were in poſſeſſion of the place, as were alſo their bagnios, and almoſt every thing here worthy the notice of a traveller. In this city are five moſques, two of which are well built, and have handſome domes, covered with varniſhed tiles of different colours. Two chapels are permitted for thoſe of the Romiſh and Greek perſuaſions. On the north-weſt corner of the city ſtands the caſtle, which is of white ſtone, and commands the river, conſiſting of curtains and baſtions, on which ſome large cannon are mounted, with two mortars in each baſtion; but in the year 1779 they were ſo honey-combed and bad, as to be ſuppoſed not able to ſupport firing. Below the caſtle, by the water-ſide, is the palace of the Turkiſh governor; and there are ſeveral ſummer-houſes on the river, which make a fine appearance. The Arabians, who inhabited this city under the caliphs, were remarkable for the purity and elegance of their dialect. The pilgrims, who viſit Mecca by land, paſs through Bagdad, and pay four piaſtres by way of tribute, which brings a conſiderable revenue to the grand ſeignior.

Baſſora, or Baſrah, on the frontiers of Duſia, lies in 30 deg. 17 min. north lat. and 9 deg. 10 min. eaſt longitude, being about 250 miles ſouth-eaſt from Bagdad, and 240 ſouth-weſt from Iſpahan: it was built A. D. 636, by Ormar the ſecond caliph, in order to cut off the communication between Perſia and India. This city is 12 miles in circumference, opulent and populous, but the buildings have nothing extraordinary in them, the houſes being only two ſtories high, built with bricks dried in the ſun, and flat on the tops. The circumjacent country is exceedingly fertile and delightful. It is ſubject to an Arabian prince, who is tributary to the grand ſeignior.

The Province of Diarbec, or Meſopotamia.

This country extends about 600 miles along the banks of the Euphrates and Tigris, from Mount Tauris, on the north, to the Perſian gulph on the ſouth. The breadth is in ſome places 300, and in others 150 miles. The air is exceedingly temperate and ſerene. The country produces ſilk; and is fertile with very little cultivation, being rich in grain, fruits, and paſturage. Numerous flocks and abundance of cattle feed on the latter; yet there are conſiderable uninhabited deſerts in ſome parts. The celebrated rivers Euphrates and Tigris flow through this country, and not only ſupply it with with excellent fiſh, but contribute exceedingly to its beauty and fertility.

The Tigris riſes in the Armenian mountains; and acquired its name from its rapidity, the word, in the Median language, ſignifying a dart or arrow. It paſſes through the lake Arethuſa, and afterwards ſinking into the earth, riſes on the other ſide of Mount Tauris. It proceeds from thence to the lake Theſpites, but, in the way, hides itſelf for the ſpace of 25 miles, and afterwards proceeds with great rapidity. Between Aſſyria and Meſopotamia, it receives ſeveral rivers; and below Bagdad branches into two channels, both which diſembogue themſelves into the Euphrates, and form an iſland by that means.

But the moſt conſiderable river in Aſia is the Euphrates, which takes its ſource in Mount Tauris; proceeding weſterly, it croſſes Turcomania, then turning ſouthward, it divides Syria from Diarbec. Afterwards running along the weſtern limits of Arabia Deſerta, it waters a great number of towns, and then flows ſmoothly to the city of Aſia, where the reflux, or tides of the Perſian gulph, diſturb its ſtream, and diſcolour its waters, though ninety miles diſtance from it. At about 60 miles from the Perſian gulph it unites with the Tigris. In general it flows gently, and waters a great number of fertile and delightful plains; its banks are embelliſhed with perpetual verdure, and adorned by many trees, particularly palms; it is neither deep nor wide, except when the melting of the ſnows on the Armenian mountains occaſions it to ſwell; but the waters are deemed very ſalubrious.

Diarbec is the chief city of this province; it is ſituated in 37 deg. 35 min. north lat. and 40 deg. 50 min. eaſt longitude, and encompaſſed by two walls, the outermoſt of which is defended by 72 towers; there are but three gates, over that towards the weſt ſome Latin and Greek inſcriptions are ſeen, though many of the letters are almoſt obliterated. The name, however, of Conſtantine is ſtill viſible, and frequently repeated, which gives occaſion to ſurmiſe that it was either originally built, or greatly repaired and improved by that emperor. The Tigris forms a half moon about it, and from its wall to the water ſide there is a ſteep precipice. It contains about 20,000 inhabitants, and upon the whole is one of the moſt commercial, ſtrong, opulent, and populous cities of all

all Aſiatic Turkey. It is ſupplied with water from the Tigris by means of an artificial canal, and embelliſhed with many noble piazzas or market places, and other elegant buildings, particularly a ſpacious grand moſque, which was once a chriſtian church. On the ſides of the river are ſeveral caravanſeras or inns; and near the town is a chapel, in which the Turks affirm that Job lies buried; about a league from the city the Tigris is fordable, nevertheleſs there is a ſtone bridge over this very part, on account of the floods, which are occaſioned by the exceſſive rains and melted ſnows, and which often render the ford impaſſable. The neighbouring country is pleaſant and fertile. The pigeons are larger and more delicate than any in Europe. The meat, bread, and wine, are admirable, and the fruits excellent.

The men are more affable here, and the women are treated with much more politeneſs, and have greater indulgence granted them, than in any other part of the Turkiſh empire. The chief manufactories carried on here are dyeing, dreſſing, and tanning, particularly goats ſkin, which is commonly known by name of Turkey leather, of which immenſe quantities are vended in all parts of Aſia and Europe: they likewiſe dye linen and cotton to great perfection. The waters of the Tigris are ſaid to be admirably adapted to dyeing, and give the leather a finer grain, and leather, linen, and cotton, a livelier colour than any other waters.

The governor of this city, who is a baſſa, is exceedingly powerful, and uſually has a body of 20,000 cavalry under his command, that he may be the better enabled to repel the incurſions of the Curdes and Tartars, who in great companies of horſe attack and rob the caravans.

Orſa, or Orpha, lies in 37 deg. 16 min. north latitude, and 39 deg. 15 min. eaſt longitude; and is ſituated at the head of the river Scirtas, on the eaſt ſide of the Euphrates, and about 60 miles from it. The inhabitants affirm, that it was the place where the city of Edeſſe ſtood, and where Abraham dwelt. The city is ſurrounded by a good ſtone wall, and is about two leagues in compaſs, but the houſes in general are deſerted, and in a ruinous condition, and thoſe that are inhabited are but low and ill built; upon the whole the place reſembles more a wilderneſs than a metropolis, though Tavernier is inclined to deem it the capital of Meſopotamia; the inhabitants carry on a great trade in ſome excellent tapeſtries and yellow leather.

The neighbouring country is exceedingly rich in corn, wine, fruits, &c. the city is governed by a beglerberg, who has 150 janiſſaries, and 600 ſpahis under his command, to awe the Arabian free-booters. Several pleaſant gardens ſurround the walls of the city, and are watered by ſmall artificial canals, which flow through cuts from one that is pretty large; in the time of our Saviour, this city and territory had a prince of its own, named Agbarus.

Moſul, or Mouſſul, ſtands on the banks of the Tigris, and is ſituated in 36 deg. 59 min. north latitude, and 43 deg. eaſt longitude, oppoſite to the ruins of the ancient city of Nineveh. It is ſurrounded by handſome ſtone walls, and is very ſpacious, being about a league in circumference, but the number of inhabitants are not proportionable to the extent. The people have great commercial connections with the inhabitants of Bagdad, and the merchants of Curdiſtan. Caravans likewiſe paſs through it to and from Perſia. The baſſa, whoſe reſidence is in the caſtle, has always 3000 men under his command. It is ſingular, that the ſoil on the city ſide of the river is exceedingly barren, but on the oppoſite it is very fertile. The heat is ſo exceſſive in ſummer, that none go out of doors from two hours after ſun riſe till an hour after ſun ſet. There is likewiſe a malignant and dangerous wind called Samiel, which reigns from hence to Surat, and is ſuppoſed to be the ſame eaſt wind mentioned by Job. It is impregnated with little ſtreaks of fire as ſmall as hairs, which immediately kill thoſe who breathe or inhale them, and turn them as black as a coal. When the people perceive them coming, they fall flat on their faces, and ſometimes eſcape. This wind is felt chiefly on the banks of the river, but not on the water, and is deemed to proceed from ſulphurous vapours, which are kindled by agitation. Independent of this wind the hot air is often dangerous, and injures the lungs, inflames the blood, and parches the ſkin, or raiſes it into bliſters, and occaſions it to peel off. On this account travellers wear a kind of maſk made of a ſoft black crape to preſerve their eyes. But if after all their precaution they become inflamed, the afflicted perſon anoints them with a mixture of ſugar and long pepper ſifted very fine, and made into a ſalve.

In Diarbec are a few other leſs conſiderable cities and towns; namely,

Bir, or Beer, in 37 deg. 15 min. north latitude, and 38 deg. 15 min. eaſt longitude. It is ſituated on the ſide of a hill to the eaſt of the Euphrates, and defended by two large old caſtles, the one on the land ſide, and the other on the banks of the river. The garriſon conſiſts of about 200 janiſſaries, and 400 ſpahis, commanded by a ſangiac. The neighbouring territory is pleaſant, fertile, and well cultivated, except to the eaſtward, where it is rough, hilly, and rather ſterile.

Gezira, in 37 deg. 30 min. north lat. and 39 deg. 10 min. eaſt long. It is ſituated in an iſland in the Tigris; and is a ſmall, but rich commercial city, governed by a bey.

Amadia, or Amad, is about 72 miles eaſt from Gezira, and the ſame weſt from Moſul.

Zibin, in the midway between Orfa and Maſul, is a tolerable town, ſituated on an aſcent. It is ſurrounded with good walls and ditches, well ſupplied with ſprings and fountains, and is furniſhed with proviſions in great plenty.

Niſbin, or Naſbin, about 35 miles from the Tigris, is divided into two wards, each on an eminence, with a large tract of ploughed land between. Several arches, gates, and the remains of a noble church are ſtill viſible.

The Province of Curdeſtan, or Aſſyria.

This diviſion lies on the eaſt ſide of the Tigris, towards Perſia, which bounds it on the eaſt; it hath the Tigris on the weſt, Eyraca-Arabic on the ſouth, and Turcomania on the north. It is not above 90 miles broad towards the ſouth, but to the northward it extends near 200 miles from eaſt to weſt. From north to ſouth it reaches from 53 deg. 30 min. to 27 deg. 20 min. north latitude.

The country of Aſſyria derives its name from Aſſur, or Aſhur, the ſon of Shem, and grandſon of Noah. The firſt great monarchy in the univerſe was founded here; and here ſtood the once magnificent city of Nineveh. It was built upon the Tigris, oppoſite to where Moſul at preſent ſtands. The walls were 60 miles in circumference, and ſufficiently thick to admit three chariots to go a-breaſt upon them: they were flanked with 1150 turrets, each of which roſe 200 feet above the walls. At a ſmall diſtance from the ruins there is a Turkiſh moſque upon the hill, on the ſpot where it is ſaid the prophet Jonas was buried. His tomb is always covered with a rich carpet, and ſome tapers and lamps are kept continually burning over it. Here two Turkiſh prieſts are continually employed to read the alcoran, which draws a great number of Turks, Perſians, &c. to the place.

In the territory between Nineveh and Bagdad are ſeveral hills of ſulphur, to which ſome travellers impute the pernicious qualities of the hot winds, or ſamiel, with which the country about Old Bagdad is particularly infected. There are likewiſe ſome ſul-

phurous hot baths at a village called Alchamam, which is about a day's journey from Moſul; and at Attendachi there is a hill, from which the Arabs dig gold.

In the ſame territory tamariſks, liquorice and ſumach are produced in great plenty: the latter, together with ſalt, being infuſed in water, gives it a red tinge, and renders it cool, ſweet and ſalubrious: if taken in broth it is a remedy for the bloody flux.

This part of the country is greatly infeſted with wild beaſts, particularly lions, jackalls, and ceracoulacks, or wild cats, which are remarkable for having large black ears of half a foot in length. Thoſe who navigate the rivers in boats always go well armed on account of the lions, who will plunge into the water, and attack the paſſengers with great fury.

The weſtern ſkirts of this province are waſhed by the Tigris. Three other rivers, viz. the Lycus, Caprus, and Gorgus, flow through it at almoſt equal diſtances: the firſt derives its name from a wolf; the ſecond from a goat; and the third is the Zerben of Pliny.

The Curdes are ſuppoſed to be the lineal deſcendants of the ancient Chaldeans: they inhabit this country and ſome parts of Perſia, and ſubſiſt principally upon rapine and plunder. They are continually upon the watch for caravans, and when they meet with one, if they are ſtrong enough, they uſually rob and murder the whole company. While the weather permits they dwell in tents upon the plains, and do not retire to the villages till the ſnows compel them. They range from Moſul to the Euphrates, and acknowledge no ſubjection either to Turks or Perſians. In fine weather they drive their herds and flocks about in ſearch of paſture, and while the men look out for plunder, the women manage the cattle, and make butter and cheeſe. Their drink is either milk or water. The men ride upon very fine ſwift horſes, their only weapon being a lance: their tents are large, and made of coarſe brown cloth, that ſerves likewiſe as a covering to their portable houſes, which are ſquare, and made of cane hurdles. The floor is covered with mats, and ſerves both for the purpoſes of bed and table. When they remove, they load their oxen with their wives, children, and houſes, the latter of which are taken to pieces for that purpoſe. They are very diſagreeable to look at, having ſmall eyes, dark complexions, wide mouths, black hair, and ferocious aſpects: nevertheleſs they are very ſtout and nimble, and, while children, uſually go naked, which renders them very hardy.

Chereſoul, the capital of Curdeſtan, is ſituated in 36 deg. north latitude, and 45 deg. eaſt longitude, and is about 150 miles north of Bagdad. The houſes are all hewn out of a rock on the ſide of a hill, which extends a mile in length, and there is an aſcent to them of about twenty ſteps. The baſhaw, or governor of the province, reſides here, and hath ſeveral ſangiacs under him.

Abela is celebrated in hiſtory for the famous battle fought in a plain near it, between Alexander the Great and Darius: it is in 35 deg. north latitude, and 77 deg. 20 min. eaſt longitude, and ſituated between the Cyprus and Lycus, or the two Zabs, as ſome writers term thoſe rivers. The natives ſhew a mountain in the neighbourhood, where the ruins of a caſtle are yet to be ſeen, in which tradition ſays, Darius ſtood to ſee the ſucceſs of the battle. The mountain itſelf was named Nicatorius by Alexander, in commemoration of the above victory.

Betlis is ſituated in 37 deg. 55 min. north latitude, and 43 deg. 30 min. eaſt longitude, and is the reſidence of a prince of the Curdes, who is indpendent both of the Turks and Perſians, and ſo powerful, that he can raiſe a body of 25,000 horſe, beſides a conſiderable number of foot, among the ſhepherds of the mountains, who are trained to arms: ſo that though his dominions are ſurrounded by Turks and Perſians, they are both obliged to keep fair with him from motives of policy; becauſe it is at all times in his power to ſtop and plunder the caravans that go between Aleppo and Taurus, the road from the former being within a day's journey from the town, cut in ſeveral places out of the rocks between two mountains, and only broad enough for one camel to paſs. Both the town and caſtle are ſo ſtrongly ſituated, that the only paſs may be defended by ten men againſt a thouſand: ſo that this prince is really formidable, and cannot be robbed of his independency. The city is built between two high mountains, diſtant from each other about a cannon-ſhot. The caſtle is ſituated upon a hill that reſembles a ſugar-loaf; and there is no coming at it but by a winding path cut in a rock, which is exceedingly ſteep, rugged, and difficult to aſcend. Before the caſtle can be entered, three draw-bridges muſt be paſſed, and afterwards three courts, previous to the approach to the palace. The city extends on each ſide of the other two mountains, from the top to the bottom, containing many houſes, and two caravanſeras.

Harpel is ſituated on the river Caprus, and is ſurrounded by a mud wall. The houſes are miſerably built. It is, however, a large town, and the reſidence of a ſangiac.

Holwan, in 35 deg. north latitude, and 47 deg. 10 min. eaſt longitude, is ſituated between the mountains that divide the Perſian, Irack, Curdeſtan, and Chaldæa. The Mahometans, who believe that Elijah is ſtill alive, affirm that he lives in one of the mountains near this town.

Turcomania, or Armenia.

This province is bounded on the north by Georgia; on the ſouth, by Meſopotamia; on the eaſt, by Perſia; on the weſt, by Cappadocia and the Leſſer Armenia, from which it is ſeparated by the Euphrates. It extends from 38 deg. 20 min. to 42 deg. north latitude, and from 39 to almoſt 42 deg. eaſt longitude. It is about 300 miles in length, and 200 in breadth.

The country, which, in general is exceedingly mountainous, produces nothing without the moſt indefatigable induſtry; every kind of grain is but indifferent: the wine is likewiſe bad. The cold being very intenſe, occaſions the fruit to be extremely backward. There are, however, ſome fine dales and pleaſant vallies interſperſed among the hills.

Ararat, the Paryadræ, Maruſius, Antitaurus, Abus, Niphates, Moſchick, and Gordyæan, are the principal mountains. The rivers which water this country are the Cyrus, Lycus, Phaſis, Araxes, Tigris, and Euphrates.

The capital city of Turcomania is called Arzerum, or Erzeron. It is ſituated on the northern extremity of the province, about ten days journey from the frontiers of Perſia, and five from the Black Sea. It is the reſidence of a Turkiſh baſhaw, is defended by a good caſtle, and has a ſtrong garriſon of janiſſaries, commanded by an aga. It contains about 18,000 Turks, who, in general, purchaſe of the baſhaw the name and privileges of janiſſaries, or a diſpenſation for committing all kinds of diſorders with impunity. The pay of a janiſſary from the government is from about two-pence halfpenny to ten-pence per day. In this city about 8000 Armenians, and 500 Greeks, reſide. The Armenians have two churches, ſeveral monaſteries, and a biſhop.

Arzerum is a place of great trade, which principally conſiſts of copper and braſs wares, the ore of which is found in the neighbouring mountains; printed callicos, red and yellow leather, ſilk, madder, caviare, gall nuts, and beautiful furs, particularly ſables. It is likewiſe a repoſitory for vaſt quantities of merchandize, which come from the Eaſt Indies, and

and a great thoroughfare. All who go from hence to Perſia, except Turks, pay a capitation tax of five crowns, and five per cent. for all ſpecie which they carry with them. Every ſtranger who enters the town is obliged to pay five crowns, and all merchandize is taxed at nine per cent. ſix of which goes to the Grand Seignior, and three to the beglerberg.

Fuel is very ſcarce, which is a great inconvenience in a place where the winters are ſo ſevere. In lieu of wood, they are under the neceſſity of ſubſtituting cow-dung to burn. The ſummers are ſhort and hot; and the country near Arzerum is tolerably fertile, but produces no good wine. The wheat is ripe in about two months after it is ſown, and the barley in about four weeks. In the neighbourhood of this city a vaſt quantity of poppies grow, out of which the Turks extract their opium. The caviare is made of the ſpawn of ſturgeons brought from the Caſpian Sea, where theſe fiſh are remarkably fine; yet it is inferior to that made near the Baltic.

The piles of cow-dung, which is made into turfs, and the perpetual burning of that excrement, occaſion a ſcent throughout the city which is very offenſive to ſtrangers. Every thing you eat or drink, even the very cream is tainted with this vapour; yet travellers aſſert that there are coals in the neighbouring hills, but the inhabitants neither underſtand their nature, or how to dig for them. The water is excellent, rivulets of which run through moſt of the ſtreets, but the wine and brandy are difficult to be got at, though they are abominably bad when procured, for the ſale of them is ſtrictly prohibited.—The Greeks are obliged to inhabit the ſuburbs, becauſe, being tinkers, they make ſuch a perpetual clattering with the hammer, that it would diſturb the tranquility of the Turks, who are ſo very delicate and indolent, that they cannot bear the thoughts of a noiſy trade.

The city of Van, or Wan, is ſituated on a lake of the ſame name, one of the largeſt in Aſia, in 38 deg. 12 min. north latitude, and 44 deg. 55 min. eaſt longitude. It is large, and ſtands at the foot of a high craggy mountain, in which there is a fortreſs deemed impregnable, that commands the town and country, and has a ſtrong Turkiſh garriſon. The lake is 150 miles in circumference, receives many rivers into its boſom, and contains ſeveral iſlands; two of theſe, viz. Limdaſi and Adaſeton, are conſiderable, each having little villages and a monaſtery of Armenian monks on it. Here are a great variety of fine fiſh, particularly one of the pilchard kind, large quantities of which are exported to many diſtant places, as well as conſumed at home, being uſed in ſauces, and eaten in the ſame manner as anchovies.

Cars, or Kars, called by the Turks Azem, is in 40 deg. north latitude, and 43 deg. 20 min. eaſt longitude, about 150 miles north of Arzerum. The city is defended by a ſtrong caſtle built upon a ſteep rock: the houſes are mean, and in a ruinous condition.—The country about it, though naturally fertile, is but very little cultivated. The baſhaw of Cars is ſubject to the governor of Arzerum.

Irvan, Erivan, or Chirvan, is ſituated in 40 deg. 10 min. north lat. and 45 deg. 30 min. eaſt long. It is about 180 miles eaſt of Arzerum, and has been alternately poſſeſſed by the Turks and Perſians. It is a ſpacious place, but ill built, and very dirty. The town is watered by two rivers, and the neighbouring country is extremely fertile in corn, wine, rice, cotton, &c. Here proviſions are exceedingly cheap, particularly game, and the fruits and wine are admirable. The public ſquare, or piazza, is handſome; and the bazar, or market, capacious. The baths and caravanſeras, as well as the governor's palace, are elegant and roomy buildings. The river Zangeric iſſues from the lake of Erivan, which is about 25 miles in circumference, and contains an iſland with an Armenian monaſtery, the monks of which lead a life uncommonly auſtere, never ſpeaking to each other but four times a year.

Nackſivan ſtands about 63 miles ſouth of Erivan, and about ſeven leagues from the Araxes, in 39 deg. north lat. and 75 deg. eaſt long. It contains many bazars, caravanſeras, public baths, coffee-houſes, handſome ſtreets, &c. The celebrated battle between Lucullus and Mithridates was fought near it.

Zulpha (or Old Zulpha, to diſtinguiſh it from New Zulpha, near Iſpahan, in Perſia) ſtands on the Araxes, which begins to be navigable about ſix miles below the town. Near it are ſeveral Armenian monaſteries, the monks of which are Roman Catholics of the Dominican order. The diſtrict contains about 6000 ſouls, who are all Roman Catholics, whoſe mode of worſhip is the ſame with thoſe of Europe, except that maſs is celebrated in the Armenian inſtead of the Latin tongue. Their archbiſhop is choſen by themſelves; but he is obliged to go to Rome to be confirmed by the pope before he can officiate. At the foot of a high mountain near Zulpha are ſome medicinal ſprings, particularly celebrated (among their other virtues) for curing perſons bit by any venomous animal.

Georgia, including Mingrelia and Imaretta.

Georgia, or Gurgiſtan, (for the termination of Tan is a Celtic word, and ſignifies country,) is bounded on the north by Circaſſia, on the ſouth by Armenia, on the eaſt by Dagheſtan, and on the weſt by the Euxine or Black Sea. It includes Colchis, Iberia, and Albania.

Georgia, which is partly ſubject to the Turks, and partly to the Perſians, abounds with mountains and woods, which are interſperſed with a variety of beautiful vales, and fertile plains.

Georgia has a dry air, cold in winter, and hot in ſummer. It produces all kinds of fruits, which are excellent, and the bread is hardly to be paralleled. There is plenty of fine cattle. The pork is admirable; The wild and tame fowl incomparable; and the fiſh, both ſea and river, equal to any in the univerſe. The country likewiſe produces great quantities of excellent ſilk.

A late traveller ſays, that the Georgians are robuſt, valiant, and of a ſociable temper; great lovers of wine, and very truſty and faithful; endowed with good natural parts, but, for want of education, vicious; that the women are in general ſo fair and comely, that the wives and concubines of the king of Perſia, and his court, are for the moſt part Georgian women.

Georgia formerly contained many large cities, as hiſtory informs us, and their ruins evince: but at preſent there are but few cities and towns, in proportion to the uncommon fertility, and great extent of the country, and thoſe few are but thinly inhabited, which is, perhaps, owing to the barbarous cuſtom of ſelling the juvenile inhabitants for ſlaves: for the lords ſell their tenants and vaſſals, parents their children, and maſters their ſervants, as they think proper. The principal factors in this unnatural buſineſs are Jews, who purchaſe the boys and girls when very young, give them a ſuitable education, and, when they arrive at a proper age, diſpoſe of them to the Turks and Perſians, by whom they are employed in their armies and ſeraglios, as concubines, ſlaves, mutes, eunuchs, and ſoldiers, and many have been raiſed to the rank of ſtateſmen.

In defence of the above-mentioned cuſtom, the Georgians plead, that it is for the benefit of their children; for if they ſtay in their native country, they are ſure of being hard-working ſlaves: but when they are ſold, they are more careſſed, live better, do leſs, and have a greater chance of advancement than they could have at home. Many of both ſexes, indeed, who have obtained the favour of the great, both

both in the Ottoman and Perſian courts, have had intereſt ſufficient to ſend for their parents and relations, and get them promoted to places of great truſt and importance.

The Georgians are, in general, implacable in their hatred, and unforgiving to thoſe who have offended them. They do not deem drunkenneſs, luxury, or libertiniſm, crimes, or even follies. The women hurt their beauty with paint, and their minds by the moſt licentious behaviour. They are uſerers, and affect a grave deportment. All religions are tolerated in Georgia, every one being at liberty to think, pray, and ſpeak, as he pleaſes. Many individuals of the ſurrounding nations reſide here; and the Armenians in particular, are more numerous than the Georgians themſelves. They are likewiſe richer, and occupy the principal places of truſt and power.

All the public edifices, and the houſes of the great, are built after the model of the Perſian houſes. They likewiſe imitate them in eating, ſitting, and lying.—They have buttons and loops to their veſts, and wear them open at their breaſts. The habits of the women are entirely Perſian. The men's covering for the legs and feet is in the Perſian faſhion; but their bonnets or hats reſemble thoſe of the Polanders.

The Georgian nobles are all tyrants, and exerciſe the moſt deſpotic cruelty over their vaſſals, and dependents.

The ſovereignty of the Turks and Perſians over Georgia is rather nominal than real; for as they are a hardy, warlike people, and can eaſily retire to and defend the paſſes of their mountains, it is rather dangerous to quarrel with them, as no army can ſubdue them; and, from the nature of their country, they might become exceeding troubleſome, by making incurſions into the neighbouring Turkiſh and Perſian provinces.

Though the prince of Georgia is a Mahometan, the generality of the people are Chriſtians, or at leaſt pretend to be ſo; for they are ſo extremely ignorant, that they ſcarce underſtand the meaning of what they profeſs. A late traveller mentions an abſurd cuſtom which prevails in this country, the reaſon of which he could never find out; that is, the building their churches upon high and almoſt inacceſſible places, where they are abandoned to the injuries of the weather, and ſuffered to be the habitations of birds.—From their ſituation, the Georgians can ſee them at a great diſtance, when they never fail to ſalute them with great reſpect, but take care ſeldom to enter them. In ſome of the towns, however, the churches are kept pretty decent. Beſides the patriarch, there are ſeveral biſhops, and a great number of inferior clergy.

Some Georgians, who have more decency and conſcience than their neighbours, follow the Armenian cuſtom of marrying their daughters when infants, to prevent their being ſold for ſlaves, or taken away by the great lords as concubines.

The only conſiderable and fortified towns in Georgia are five in number, viz. Teflis, Gory-Caket, Zagan, Suram, and Aly: and the principal rivers are, the Kur, or Cyrus, and the Aragus. The firſt riſes in the Moſchian mountains, and diſcharges itſelf into the Caſpian Sea; the latter ſprings from the mountains which ſeparate Iberia from Colchis, and falls into the Cyrus.

Teflis, the capital of Georgia, is one of the beſt cities in the oriental regions. It is watered by the river Kur. The walls are ſtrong and handſome.—It contains fourteen churches; ſix belong to the Georgians, and eight to the Armenians. The cathedral, called Sion, is a ſtone church, built near the river. A large dome, ſupported by four maſſy pillars, riſes in the middle; and adjoining to it is the biſhop's palace.

On the declivity of the mountain there is a large fortreſs, containing an arſenal, a market, and a public ſquare.

The Georgians uſe bells in their churches, ſell pork in the markets, and vend wine in the ſtreets. The bezars, caravanſeras, and ſome other of the houſes, are built of ſtone, but the generality are only erected of mud and bricks, and are low and dark. The ſtreets are very badly paved, and conſequently diſagreeable either in wet or dry weather. The palace of the prince is a ſuperb building. It is adorned with extenſive and beautiful gardens, aviaries, falconries, &c. and before it there is a large ſquare ſurrounded with ſhops.

Teflis is ſituated in 42 deg. 47 min. north latitude; and 47 deg. 5. min. eaſt longitude. It is very populous. The ſtaple commodity is furs; but great quantities of raw ſilk are ſent to various places, as the Georgians know nothing of weaving. The inhabitants of the city are thought to amount to about 20,000. Many tolerable houſes, and fine gardens, render the environs very pleaſant for ſeveral miles round.

The principal amuſements of the inhabitants of Teflis is bathing. The baths are agreeable places, and contain fine ſprings, ſome hot, others cold, and others lukewarm. The Grand Vizir's houſe is the fineſt in the city, and the Capuchins' monaſtery is pleaſant. Theſe Itatian fathers receive from Rome annually but 25 Roman crowns each to maintain them: but they are permitted to practiſe phyſic, of which they know very little. If the patient dies they receive no pay; if he recovers, ſlaves, wine, cows, ſheep, &c. are ſent to the convent by way of gratuity. The Georgians make but little uſe of money, rather chuſing to deal by way of barter. Travellers have, therefore, an opportunity of procuring the moſt excellent proviſions in great quantities, in exchange for trifles, ſuch as neck-laces, rings, bracelets, knives, pins, needles, &c. They uſe neither weights or meaſures; and are ſuch bad arithmeticians that they cannot count an hundred.

In Georgia a merchant is leſs reſpected than a mechanic, and a mechanic leſs than a huſbandman. The principal merchants and traders are Armenians, whom the Georgians naturally hate, and look upon in the ſame deſpicable light as Jews are conſidered in Europe. One of the moſt reſpectable employments in Georgia is that of a public executioner. The profeſſion is deemed reſpectable and honourable, and the profeſſors are all rich. If a man can trace a hangman amongſt his anceſtors, he is extremely proud of it, and never fails to mention it frequently with exultation; at the ſame time obſerving, that nothing is ſo noble as executing juſtice, and that the ſafety of the ſtate depends on the extermination of criminals.

With reſpect to Turkey and Perſia, Georgia is in much the ſame predicament as Flanders is in Europe; for when a war happens between thoſe empires, this country is uſually the ſeat of it.

The Prince of Georgia, beſides what is uſually allowed him by the Emperor, has the cuſtoms of Teflis, the duties upon brandy and melons, and one ſheep for every fire-hearth in the whole country, which amounts to 40,000 ſheep. The crown eſtates ſupply him with wine, butter, wax, grain of all kinds, vegetables, fruits, &c. A great deal of gunpowder is made in Georgia, particularly at Teflis, the mountains near that city producing large quantities of nitre. The people eat and burn a great deal of linſeed oil, which they have in great plenty, but they value only the ſeed, as they have no idea of beating the ſtalk for ſpinning.

When a Georgian dies, a biſhop ſays maſs over the corpſe, for which he receives an hundred crowns. If the defunct has not left money ſufficient to diſcharge this exorbitant demand, ſome of his quondam friends

very

very obligingly ſell his wife and children for ſlaves, to raiſe the money; for the clergy muſt not go unpaid. The biſhop then ſays maſs, and afterwards lays a letter upon the breaſt of the corpſe, which is only a complimentary card to St. Peter, to inform him that the funeral expences have been honeſtly paid, and to entreat him, therefore, to be ſo obliging as to open the gates of paradiſe to the deceaſed. The body is then wrapt up in linen and buried. The Mahometans here have the ſame abſurd cuſtom of ſending a note by the dead to Mahomet.

The Georgian men are uſually more ignorant than the women; for the girls are, in general, brought up in monaſteries, where they learn to read and write. If any of the girls chuſe to become profeſſed nuns, they are authoriſed to baptize, and apply holy oil.

The language of the Georgians is remarkable for its beautiful ſimplicity.

Mingrelia, known to the ancients by the appellation of Colchis, is bounded on the eaſt by Georgia, properly ſo called; on the weſt by the Euxine Sea; on the north by mount Caucaſus; and on the ſouth by Armenia, and part of Pontus.

Mingrelia is watered by many rivers, viz. the Corax, Hippus-Cyaneus, Chariſtus, Abſarus, Ciſſa, Ophis, and Phaſis, where the Argonauts landed. All the above rivers empty themſelves into the Euxine Sea; but none of them are conſiderable except the Phaſis, which riſes in mount Caucaſus. The inhabitants of this celebrated mountain are ſaid, by the moſt authentic writers, to have little, beſides ſpeech, which can entitle them to humanity. They are tall and well made; but their looks are fierce, and indicate the ſavage diſpoſition of their minds. They are, in fact, the moſt daring, ferocious, and determined robbers in the world.

The country is, in general, extremely woody, very uneven, full of hills, and but little cultivated. The ſoil is bad and ſterile; and the fruits are all ill taſted and unwholeſome, except the grapes, which might be converted into ſome of the beſt wine in the univerſe, if the natives did but know how to make it. Rains almoſt continually fall, which occaſion ſuch a quantity of humid vapours to mingle with the hot exhalations natural to the climate, that peſtilence, and a variety of other diſeaſes, afflict the natives almoſt continually. The earth is ſo moiſt, that the few who turn their thoughts to agriculture ſow their wheat and barley without ploughing: and, for their other ſeeds, they turn up the land with little wooden ploughs, which are ſufficiently ſtrong to make furrows in ſo ſoft a ſoil. Colchis was ſaid, by the ancients, to be exceedingly pleaſant and fertile, and even to abound in mines of gold, which gave riſe to the celebrated fable of the golden fleece, and the Argonautic expedition; for the inhabitants uſed to catch the gold duſt, which was brought down by the torrents from mount Caucaſus, by ſetting fleeces of wool acroſs ſome of the narrow paſſages of thoſe torrents.

The country abounds in beeves, hogs, wild boars, ſtags, partridges, pheaſants, quails, &c. On mount Caucaſus, falcons, eagles, pelicans, tygers, lions, leopards wolves, and jackals breed.

Their bread is made of a ſmall grain, called *goomi:* it is agreeable to the taſte, ſalubrious, cooling, and laxative. The people of quality, however, eat wheaten bread; not that they like it better, but becauſe it is more ſcarce. Their principal food is beef and pork, the latter being excellent. The nobility ſpend a great deal of their time in catching and killing game, ſuch as pheaſants, water fowl, &c. But their favourite diverſion is flying the falcon at the heron, which is no ſooner taken, than they cut the beautiful tuft of feathers from its head, and let it go again. They have a great number of excellent horſes, which are never ſhod or fed with corn.

The country is every where interſperſed with houſes. The caſtles there are about ten in number; in the principal of which, named Rues, the prince keeps his court, and depoſits his treaſures; though the garriſon conſiſts only of about ſixty perſons. Near the caſtle are ſeveral magazines for proviſions, which ſerve for places of retreat upon emergencies. They have many huts made of the branches of trees, canes, and reeds; and are ſo ſecure in theſe retreats, that none can come at them, but by one winding narrow paſſage, which is always ſtopt up when they apprehend an attack.

As the Mingrelians have great plenty of timber, they build their houſes of wood, but never raiſe them above two ſtories. They have neither windows nor chimnies, but are furniſhed with beds and couches. At night, not only the whole family, but the cattle, all lie in one room.

The men are well proportioned, and the women pretty; but they paint their faces and eye-brows. They wear their hair in curled ringlets; are witty and polite; but vain, luxurious, treacherous, and ferocious; dextrous thieves, and glory in theft. They think it prudent, as well as lawful, to have many wives, becauſe they bring them many children, whom they can ſell for money, or barter for neceſſaries. When children, however, come too quick, they do not heſitate to murder them. They likewiſe murder the ſick and aged, and pretend they do it with the benevolent deſign of putting them out of their miſery. Adultery is thought but a trifle: for when a man catches another in familiarity with his wife, he obliges him to pay a hog, which is immediately dreſſed, and all three ſit down very lovingly to feaſt upon it.

The lords are the umpires in all diſputes between their vaſſals: but when there is a quarrel between any of the great lords, they have recourſe to arms.

The eccleſiaſtics have long beards; but the laity ſuffer very little of their beards to grow. They ſhave the head, leaving only a little hair upon the forehead and round the ears. Their bonnet is made of felt, and in winter is lined with fur, but is not of much uſe to them, for when it rains they put it in their pockets, and go bareheaded to ſave it. They are ſo poor that the common people go almoſt naked, and have only a covering of a triangular form, which they turn againſt wind or rain. They wear a ſhirt, but have ſeldom more than one at a time, and that they only waſh three times in a year. The ſhirt is tucked into a pair of breeches; and on the feet they wear ſandals made of the untanned hide of a buffalo, which are faſtened with thongs of the ſame. In winter they wear ſnow ſhoes.

The whole of every family of both ſexes eat together. On holidays they eat veniſon, beef, and pork; but at other times the maſters have fiſh and pulſe, and the inferiors nothing but *gomms*. If the weather will permit, they dine in the open court. Both ſexes uſually get drunk at their entertainments, when the men boaſt of their thefts, and the women of their debaucheries.

The continual ſale of the Mingrelians to the Turks and Perſians, and their perpetual ſquabbles among themſelves, have greatly depopulated the country. The revenues of the prince are eſtimated at about 20,000 crowns per annum, which are raiſed by fines, impoſitions, the ſale of ſlaves, and duties on all imports and exports. Of this money he ſpends very little; for his crown lands are more than ſufficient to maintain him, and the people are obliged to work for him for nothing. His forces are principally cavalry, and do not amount to above 4000 effective men. Every lord leads his own people to battle, but they are ſo badly diſciplined, that they march, charge, and retreat without order. All commerce is carried on by barter; though they have money which bears the Perſian ſtamp, but is coined in Georgia, the value of which is always fluctuating.

The Mingrelians profeſs themſelves Chriſtians, but are exceedingly ignorant in all religious matters. Few of the clergy can either read or write, but they greatly impoſe upon the laity, by pretending to divination. Moſt eccleſiaſtical writers ſay, that a Chriſtian converted theſe people in the reign of Conſtantine the Great: but the Mingrelians themſelves attribute that work to St. Andrew, who, they affirm, came and preached among them, at a place called Piguitas, where there is at preſent a church. The head of their religion is called Catholicos, who is obliged to go once in his life to the above-mentioned church, to make holy oil.

When a Mingrelian is ſick, a prieſt is ſent for, not to pray by him, but to predict whether he will live or die. Having opened a book he looks gravely in it; then ſhutting the book ſuddenly, he declares that the patient will inevitably die, unleſs a very handſome preſent is made to himſelf. The ſick perſon being greatly terrified, entreats the prieſt to take what he pleaſes.

The cathedral is a tolerable building, and the images within are finely adorned with gold and jewels. The ſuperior clergy wear long beards, black bonnets, and robes of ſcarlet and velvet; but thoſe of the inferior claſs make but a deſpicable appearance, and are obliged to work for their great lords as hard as the laity. The generality of their other churches are very naſty, and their images filthy, though their worſhip of them is exceeding idolatrous. Having no bells, when they call the people to church, which is but ſeldom, they ſtrike againſt the board with a great ſtick. They pay the greateſt reſpect, and make the largeſt preſents to thoſe ſaints who have the character of being the moſt cruel and ſavage. St. Giobas is the greateſt favourite, becauſe they think he would kill all who came near him; they therefore only peep at him at a diſtance, and lay down their preſents. Their maſs is after the Greek manner, with this difference, the Greek prieſts repeat the whole perfectly, but the Mingrelians only mumble the ceremony. For their chalice they have a wooden bowl, and a wooden diſh for their paten. They conſecrate both leavened and unleavened bread, and drink the wine without its being mixed with water.

They baptize by immerſion; and as ſoon as the child is chriſtened, the prieſt, parents, godfathers and gueſts, indulge themſelves to the greateſt exceſs. When a man want's a wife he muſt buy her: a tolerable good price is given for a virgin, leſs for a widow, and leaſt of all for a woman who has been divorced. When the nuptial contract is made, the couple may cohabit together previous to the payment of the money. They may alſo divorce their wives, either for barrenneſs or ill-nature.

They keep their dead forty days above ground, during which time they mourn. At firſt they make a terrible howling and ſcreaming, tearing their cloaths all into tatters, beating their breaſts, ſcratching their faces, and tearing off their hair; but their lamentations gradually diminiſh till the fortieth day, when the body is buried; an entertainment is made, the moſt extravagant mirth is encouraged, and the mourners get drunk in order to forget the deceaſed. Whenever any of the laity die, a biſhop always performs the funeral ſervice, and then lays claim to all that belonged to the deceaſed; but when a biſhop dies, the prince himſelf ſays maſs, in order to have the privilege of plundering his houſe. Thus a burial is generally the ruin of a whole family.

The Mingrelians, when they eat pork, or drink wine, make the ſign of the croſs, for which none of them can give the leaſt reaſon. All their prayers are addreſſed to their ſaints, to whom they ſacrifice; and their greateſt feſtivals are when theſe images are carried about in proceſſion, in order to get money from the people. At Chriſtmas and Eaſter they do not work, but labour all the reſt of the year. They keep four great lents, viz. 48 days before Eaſter, 40 days before Chriſtmas, St. Peter's faſt, which holds a month, and the faſt of the Virgin Mary, which laſts 15 days.

In Mingrelia are ſome monks of the order, of St. Baſil. They obſerve the faſts with great punctuality, but are very little ſolicitous about any other point of religion. They ſuffer their hair to grow, eat no fleſh, and wear black bonnets. There are nuns of the ſame order, who are neither confined to any particular place of reſidence, nor reſtricted by any vows, but become ſeculars when they pleaſe, and reſemble nuns in nothing but wearing black veils.

In ancient times there were ſome cities of note in this country, particularly Pityus, Dioſcurias, and Aea on the Phaſis, ſo named from the river in which it ſtood. Cyta, at the mouth of the river Cyaneus, the birth place of the famous Medea, called from thence by the poets, Cytæis, Saracæ, Zadnis, Surinum, Media, and Zaliffa.

Immaretta is about 120 miles in length, and 60 in breadth. It contains many hills and woods, but the plains produce corn, cattle, pulſe, &c. It is, upon the whole, more fertile and plentiful than Mingrelia. They have ſome excellent iron mines, carry on a great deal of commerce, and coin money. The principal towns are Cotatis and Akalziki.

Cotatis was the reſidence of the prince or king of Immaretta, but is now only the reſidence of a Turkiſh baſhaw. It is ſituated at the foot of a mountain, on the top of which there is a ſtrong caſtle to command and defend it. It is watered by the Phaſis. The town has no walls, and contains only about 200 houſes. It lies open on all ſides, exeept where the rivers and mountains ſurround it. On the oppoſite ſide of the river there is a citadel on an eminence, which has a double wall, and is flanked with high towers, It lies in 42 deg. 23 min. north latitude; and 43 deg. 54 min. eaſt longitude.

Alkalziki is likewiſe the reſidence of a Turkiſh baſhaw. It is ſituated in a hole, ſurrounded by about twenty hills, in 41 deg. 55 min. north latitude; and 44 deg. 55 min. eaſt longitude. The river Kur flows very near it. The town contains about 400 houſes. The inhabitants are a mixture of Georgians, Armenians, Jews, Turks, Greeks, &c. who have ſeveral churches, and a ſynagogue. The houſes are built of wood, and the walls and fortifications are old and ruinous.

Abaſcia is the northenmoſt of theſe countries, having the Euxine Sea to the ſouth, Circaſſia, on the weſt, and mount Caucaſus on the north and eaſt. The principal traffick is in ſlaves. The inhabitants, however, deal in the ſkins of tygers, deer, &c. boxwood, honey, wax, and thread, which they exchange with the merchants who come upon the coaſt, for many things which they have occaſion for. They were once Chriſtians, but at preſent are exceedingly ignorant, and little better than ſavages. They go almoſt naked, and live in little, mean, low huts.

Moſt geographers include Comania in Georgia; which is bounded by the Caſpian Sea to the eaſt: by a ridge of mountains, which part it from Circaſſia, to the weſt; by Aſiatic Muſcovy to the north; and by Georgia on the ſouth. The country is thinly inhabited, and badly cultivated; but the ſoil is flat, low, and fertile. It is watered by ſeveral rivers, which deſcend from the mountains about Caucaſus. The climate is rather cold, and pretty much ſubject to rains. The inhabitants, who are called Comani, or Kamouche, live principally by plunder. They wear Perſian linens and ſilks, but dreſs like the natives of Little Tartary. The men wear ſhort jackets and drawers, and the women long looſe gowns, which reſemble ſhifts. They have no place that can be called a town, but their little hamlets conſiſt of about ſixty huts.

*

huts. Their food is milk, game, the fleſh of their cattle, honey, ſuch fruits as their country ſpontaneouſly produces, and rice, which they have from Perſia.

CHAP. V.

NATOLIA, OR THE LESSER ASIA, IN THE WEST.

Chief Towns, Inhabitants, Buildings, Rivers, &c.

NATOLIA, or Anatolia Proper, is the neareſt to Europe, and the largeſt of the four provinces into which Aſia Minor is divided. It extends almoſt from 26 to 35 deg. of eaſt longitude, and from 37 to 41 deg. of north latitude; being bounded on the weſt by the Archipelago and Propontis; on the north, by the Euxine ſea; on the ſouth, by Caramania; and, on the eaſt, by Amaſia and Aladulia; and contains the provinces of Bithynia, Myſia, the Leſſer Phrygia, Æolis, Ionia, Caria, Doris, Lydia, Phrygia, Paphlagonia, and Galatia.

The chief towns in Natolia, which merit our notice, are, Burſa, Nice, Smyrna, and Epheſus.

Burſa is the capital of Bithynia, and was the metropolis of the whole Ottoman empire before the Turks poſſeſſed themſelves of Conſtantinople. It lies in 40 deg. 16 min. north lat. and 29 deg. 35 min. eaſt long. and is ſituated at the foot of Mount Olympus, twenty miles from the ſea of Marmora, and fifty-eight ſouth of Conſtantinople: it is exceeding well built, and deemed one of the beſt paved cities in all the Turkiſh empire; the ſtreets are ſpacious, the caravanſeras noble and convenient, and the moſques magnificent. This city ſtill preſerves a ſhare of its ancient grandeur, beauty, and opulence: it is likewiſe a place of conſiderable traffick. In the Bezeſtine all kinds of commodities of home manufactory, and others from the Levant, are expoſed to ſale. The workmen here manufacture the beſt ſilks, hangings, carpets, tapeſtries, &c. in Turkey.

The city is about three miles in circumference, but the walls are falling to decay. It is computed to contain 40,000 Turks. The ſuburbs, which are more ſpacious and handſome than the city itſelf, are inhabited by 4000 Jews, 500 Armenians, and 300 Greek families, independent of many foreigners who are ſettled here. The fine orchards, gardens, plantations of mulberry, plantain, and other trees, &c. afford ſome of the moſt delightful, pleaſant, and ſhady walks that imagination can conceive. All the neceſſaries, and even luxuries of life, are excellent in their kinds, very plentiful, and quite reaſonable: the wine in particular is exquiſite, and the fiſh of an excellent taſte and flavour.

There is a caſtle in the middle of the city: it was once the palace, but is now running to decay. The ſeraglio, built by Mahomet IV. is a noble edifice. —There are ſome excellent hot baths in the city; and in the ſuburbs the Greeks have three handſome churches, the Armenians one, and the Jews four ſynagogues.

Nice, called by the Turks Nickor, ſtands about thirty miles from Conſtantinople, in 40 deg. 32 min. north lat. and 29 deg. 40 min. eaſt long. being ſituated near a gulph of the ſea of Marmora, called Aſcanio or Aſcu; though its ancient ſplendour is much diminiſhed, it is ſtill a conſiderable place, and contains about 10,000 inhabitants, Turks, Greeks, Armenians, and Jews, whoſe commerce is very great in corn, fruit, tapeſtries, fine cloths, and other merchandize brought from the Levant. The ſtreets are large and well built: there is a ſeraglio in the higheſt part of the town.

Smyrna, which the Turks call Iſmir, lies in 38 deg. 15 min. north lat. and 27 deg. 10 min. eaſt long. It is the beſt ſea-port town in the Levant, and the moſt populous and opulent city of Aſia Minor; being about eight days journey by land from Conſtantinople, and about 133 leagues by water. In the time of the Romans, it was looked upon as the moſt beautiful of the Tenian cities, and was called, The Ornament of Aſia.

The commodious harbour and advantageous ſituation of Smyrna have rendered it one of the moſt opulent cities in Turkey. The haven is defended by a ſtrong caſtle, and ſheltered from all winds except the weſterly, by high mountains. There is an aſtoniſhing conflux of people in Smyrna, of ſeveral nations, who differ in manners, dreſs, language, religion, &c. The Turks occupy the greateſt part of the town; the Proteſtants and Roman Catholics have their chapels, and the Jews a ſnagogue or two. The Armenians have a large handſome church, with a contiguous burying-ground.

The principal buildings are the moſques, baths, market, and khans, and ſome of theſe are very noble; the ſtreets in general are narrow, inconvenient, and intricate; but the moſt diſagreeable circumſtance to thoſe who live here is the great heats, which commence in June, and continue till September: this city is likewiſe annually viſited by the plague.

Proviſions are extremely plenty in Smyrna: the tails of ſome of the ſheep weigh ten pounds, and are deemed a great dainty. The fiſh taken in the bay are excellent; wild hogs, hares, and all other kinds of game, fowls, &c. may be had in abundance; the wine, olives, fruits, &c. are all admirable. The muſquetoes, as well as a much ſmaller fly, of which the name is unknown, are extremely troubleſome, but more ſo to ſtrangers than natives; lemon juice is the beſt remedy for the fiery tumours which enſue.

In the harbour are always ſhips of almoſt all nations, and all burdens. The European merchants bring hither a great variety of goods from Europe, the Eaſt and Weſt Indies, &c. export fine and coarſe wool, ſilk, cotton, mohair, wax, rhubarb, gall-nuts, opium, aloes, ſcammony, tutty, galbanum, tacamahac, gum-tragacanth, ammoniac, and arabic, myrrh, frankincenſe, zedoar, &c. The town is ſuppoſed to contain about 15,000 Turks, 10,000 Greeks, and 2000 Jews, beſides Armenians, Franks, &c. The whole country is exceedingly rich and fertile. In the neighbourhood a kind of earth is found, which being boiled with oil makes excellent ſoap.

Epheſus is in 18 deg. 16 min. north latitude, and 27 deg. 3 min. eaſt longitude. It lies about fifty miles ſouth of Smyrna, twenty-three of Miletus, and ſixty-three from Laodicea, and was anciently the metropolis of all Aſia; Epheſus and Smyrna having been termed the eyes of Aſia Minor: but of this once ſplendid, opulent, and magnificent city, nothing remains but about thirty houſes, inhabited by Greek families, who are miſerably poor, and ſo exceedingly ignorant, that none of them are able to read the admirable epiſtle with which St. Paul honoured them. Its firſt biſhop was Timothy, whom St. Paul appointed to that miniſtration. St. John the Evangeliſt was buried here. The Greeks call this city Efeſo, and the Turks have given it the name of Ajeſalouch. There are many noble ruins, particularly of an aqueduct, a theatre, and a circus. The celebrated painter Parrhaſius, and the weeping philoſopher Heraclitus, were natives of this place. The principal ornament of Epheſus was the celebrated temple of Diana, one of the wonders of the world. It was built at the foot of a mountain, and the head of a marſh; which ſituation was choſen, as Pliny informs us, becauſe leſs ſubject to earthquakes. Four hundred years were ſpent in building this wonderful temple. It was 405 feet in length, and 200 in breadth,

breadth, ſupported by 117 pillars, 70 feet in height, of which 27 were moſt curiouſly carved, and the reſt admirably poliſhed. The temple of Diana was burnt by Eroſtratus, through no other motive, as he himſelf confeſſed upon the rack, than to eternize his name. This remarkable tranſaction happened the very day on which Alexander the Great was born, in the year of the world 3648, and 356 before the birth of Chriſt. There is yet ſtanding a church dedicated to St. John, which was erected by the primitive Chriſtians, but is at preſent converted into a Turkiſh moſque.

Lydia, or Mæonia, is bounded on the eaſt by Phrygia, on the weſt by the Archipelago, on the north by Myſia, and on the ſouth by Caria. It was anciently called Mæonia, and was once the kingdom of the celebrated Crœſus. It is a fine fertile country, being watered by the Caicus, Heymen, Cayſter, Meander, and the Pactolus, ſo celebrated by the ancient poets for its ſand of gold. Tmolus, famed for its wine and ſaffron, is the principal mountain in this country. At preſent the indolent Turks ſuffer this fine country to be over-run with brambles, and lie entirely uncultivated. The chief places are,

Sardis, formerly the metropolis of Lydia, and the ſeat of the rich king Crœſus, is now a very inconſiderable village, ſeated on the banks of the Pactolus, at the foot of mount Tmolus. It is about forty-eight miles eaſt of Smyrna, and only inhabited by ſhepherds. It, however, contains a large caravanſera for the accommodation of travellers and caravans, who paſs through it from Smyrna and Aleppo in their way to Perſia. The magnificent ruins that are ſtill viſible give, however, an idea of its ancient ſplendour to the beholder. It had one of the ſeven Aſiatic churches.

Philadelphia had another of the ſeven churches, was formerly a very populous city, and is ſtill a tolerable town, containing about 7000 inhabitants, who are principally Greeks. It is filled with the ruins of many ſuperb edifices. Here are four churches; and as the neighbouring country is very fertile, proviſions are pretty plenty. The Turks call it Alla-Scheur, or the City of God.

Thyatira, or, as the Turks call it, Akiſhar, had another of the ſeven churches. It ſtands upon the banks of the Hermus, on the confines of Myſia, about twenty-ſix miles north from Sardis, and fifty-ſix north eaſt of Smyrna. The houſes are low and mean, being built with mud and turf. It contains about 500 inhabitants, who are chiefly Turks. The only manufacture is that of cotton. The neighbouring plains are full of cotton trees and tamariſks.

Ancyri, or, as the Turks call it, Angouri, or Angora, is in 40 deg. north lat. and 32 deg. 58 min. eaſt long. 250 miles eaſt of Smyrna. It is a very populous and trading place. The inhabitants are eſtimated at 40,000 Turks, 5000 Armenians, and 1000 Greeks. The chief manufacture was camblets; the evidences of its primitive grandeur are innumerable; the ſtreets, piazzas, &c. being full of ſtately remains, columns, &c. of the fineſt marble, porphyry, red jaſper, and other beautiful ſtones, elegantly wrought; the modern buildings, however, are mean, low, and formed only of mud and turf. The ſheep bred here are ſome of the fineſt, and the goats the moſt beatiful in the univerſe; the hair of the latter is of a dazzling whiteneſs, as fine as ſilk.

Natolia is excellently well watered; the principal rivers are the Zanthus, Cydnus, Meander, Granicus, Scamander, Cayſter, Hermus, Pactolus, and Caicus, which diſcharge themſelves into the Mediterranean and Euxine ſeas, the Archipelago, and the Euphrates. The principal lake is Gool-Bug-Shaw, 50 miles long, and 20 broad.

*

Amaſia.

This province is bounded on the north by the Euxine ſea; on the ſouth, by Caramania and Aladulia; on the eaſt, by Armenia; and on the weſt, by Natolia Proper.

The capital city, called alſo Amaſia, and by the Turks Amnaſan, is about 60 miles from the Euxine ſea, and 40 eaſt of Tocat, ſituated on the river Iris, or Caſalmach, as it is now called. Though the place is large, the commerce is inconſiderable; the river, however, is navigable for ſhips of great burthen up to the town itſelf. On a mountain to the eaſt there is a ſtrong caſtle, and a wooden bridge over the river.—There are only two caravanſeras at preſent in the city. This was formerly a place of great beauty and importance.

Trapezonde, or Trebizonde, called by the Turks Tarabozan, is ſituated in the ancient Pontus Cappadocia, on the eaſtern parts of Amaſia, at the foot of a hill. It is a kind of peninſula, running into the Euxine ſea. It lies in 41 deg. 5 min. north lat. and 39 deg. 22 min. eaſt long. at about eighteen miles diſtance from Tocat. The walls of this city are high and ſtrong, defended by towers, battlements, &c.—The environs, though little cultivated, are very fertile; the neighbouring mountains are covered with ſtately woods of various trees, ſuch as oaks, elms, beech, &c. which are of an aſtoniſhing height, and the whole face of the country forms an agreeable landſcape. In the city, the gardens and groves are as numerous as the houſes; but the ſuburbs, which are inhabited by Greeks and Armenians, are more extenſive and populous than the city itſelf. A great deal of rock-honey is found in the adjacent parts, which is ſo exceedingly luſcious as to render the eating much of it dangerous.

Tocat, or New Cæſarea, lies in 38 deg. 48 min. north lat. and 30 deg. 58 min. eaſt long. and is a conſiderable thoroughfare for the caravans to Smyrna. It ſtands partly at the foot, and partly on the ſides of two very high hills, on the river Toſanlu. The environs are extremely fertile, ſome excellent plants are produced, and curious foſſils found, particulatly many ſubterraneous vegetations of admirable beauty. The garriſon conſiſts of about 1000 janiſſaries and ſpahis. Here are twelve moſques with minarets, and many without; ſeven Armenian churches, and one Greek chapel. The city and ſuburbs are ſuppoſed to contain 20,000 Turkiſh, 4000 Armenian, and about 500 Greek families.

Aladulia, or Anadulia.

This country, which is the third diviſion of Aſia Minor, is called, by the Turks, Dulgadir. It is unfit for the purpoſes of agriculture, being rough and hilly; but abounds in excellent paſture, and produces abundance of excellent fruit, wines, and cattle, particularly horſes and camels, beſides vaſt herds of goats and ſheep; veniſon, all kinds of game, &c. There is ſilver, copper, iron, alum, &c. in the mountains.

Ajazzo, or Lajazzo (placed by ſome geographers in Caramania) was formerly called Iſſus, and is ſituated in a gulph of the Mediterranean, to which it gives its name. It is a neat, ſtrong, opulent, ſea-port town, and was antiently a place of very great importance.

Marat, Mars, or Maraph, is a large well-built city, in the ſouth-eaſt boundaries of the province. It is ſituated on a ſmall river, which falls into the Euphrates about 180 miles to the ſouthward of Trebizonde: it is a place of ſome commerce, and a baſhaw reſides here.

Caiſa, the ancient Cœſærea, is a large town on the banks of the Milas, near mount Argæus, and about 70 miles weſt of Seiſas. The walls are ſtrong, and flanked

flanked with towers. The caſtle is in the centre of the city. The baza is handſome, and well furniſhed with all ſorts of merchandize, the houſes in its neighbourhood are built either in the form of a tower with a cupola, or they reſemble a ſugar-loaf. Their principal trade is in cotton. The city is well ſupplied with water from the river.

Caramania.

The province of Caramania extends itſelf along the Mediterranean coaſt from north to ſouth, compriſing the ancient Pamphylia, Piſidia, Lycaonia, and Cilicia, with part of Iſauria, Phrygia, Pacatiana, Cappadocia, &c. It reaches from the neighbourhood of Alexandretta to the gulph of Macri, at the mouth of which lies the iſland of Rhodes. The Turks call this country Caraman-Ili: it is divided into the Greater and Leſſer; the latter lying along the ſea-coaſt, and the former to the north of Mount Tauris. The principal town is

Satalia, anciently called Attalia, and by the Turks Sataliah. It was formerly an important city in Pamphylia, at the bottom of the gulph of its name, in 36 deg. 45 min. north lat. and 31 deg. 20 min. eaſt long. It is the ſtrongeſt place the Turks have upon this coaſt. The harbour would be commodious, if the entrance was not difficult and dangerous. This is one of the moſt ſingular places in the univerſe, being divided into three diſtinct towns, each of which is divided from the others by its own ſtrong walls, and the gates are ſhut up preciſely at noon every Friday till one o'clock, from a pretended prophecy, that on ſuch an hour the Chriſtians are to ſurpriſe it. The whole is about ſix miles in circumference; the buildings are good, the place populous, and the trade conſiderable. The caſtle, which commands the town, is a very good one. The neighbouring country is very fertile and delightful, being covered with citron and orange-trees, which afford an exquiſite fragrancy. The ſummers are ſo hot, that they who can afford it retire towards the mountains, where there is more air and ſhade.

Teraſſo, Tarſon, or Horn, the ancient Tarſus, is ſituated upon the Cydnus, about ſix miles from its mouth. If we may venture to judge by the ruins of the old wall, it appears to have been near 12 miles in circumference. At the mouth of the river there is a commodious harbour. The lake Rhegium is about a mile below the town, through which the Cydnus runs; but, this place is at preſent quite decayed.

The Xanthus, Lamus, Ceſtrus, Eurymedon, Cydnus, Sarus or Smarus, Pyramus, Simyras, Latamao, &c. are the principal rivers. Caramania contains alſo many celebrated mountains, viz. Olympus (of which name there are many in Aſia) Cragus, and Antigragus, all in Lycia; Amanus in Cilicia; the great chain called Mount Tauris; and the celebrated Lycian volcano mountain, called by the ancients Chimæra.

Syria, with Paleſtine, or the Holy Land, Eaſt of the Levant Sea.

This diviſion of Turkiſh Aſia, called by the Turks Sourie and Souriſtan, was originally ſo named from its capital Tzor or Tzur, which the Greeks ſoftened into Sur and Tyre. This country includes Syria, properly ſo called, Phœnicia or Phenice, and Judea or Paleſtine. It extends from north to ſouth about 400 miles, and about 200 from eaſt to weſt, being bounded on the north by Mount Amanus and a branch of Mount Tauris, which ſeparates it from Armenia Minor and Cilicia; on the weſt, by Arabia the Deſert; and on the eaſt by the Euphrates, which divides it from Meſopotamia or Diarbec.

Libanus, Anti-Libanus, Gilead, Tabor, Carmel, Caſſius, Amanus, and Alſadaurus, with ſome ſmaller in Judea, viz. Sion, Hermon, Ebal, Olivet, Calvary, Gerizim, and Moriah, are the principal mountains.

The chief rivers are the Euphrates, Jordan, Caſſimeor, Licomes, Chryſorrhoas, Orontes, Odonis, Cherſeus, and Coik.

The air of Syria is the moſt ſerene, temperate, and healthful imaginable; during the hot months of June, July, and Auguſt, it is agreeably refreſhed by cooling breezes from the mediterranean. The face of the country is delightful and level, the ſoil rich and fertile. It abounds not only with all the neceſſaries of life, but with all the delicacies that can gratify the moſt luxurious appetite; and is ſuperior, in point of climate and produce, to all other countries that even lie under the ſame parallel of latitude. In ſhort, though Syria contains ſome rocky mountains, it would be the fineſt and moſt deſirable country in the univerſe, were it not under ſuch a deſpotic government as that of the Turks.

In this part of Turkey, we meet with the following principal cities and towns:

Aleppo, the fineſt and moſt opulent city in all Syria, lies in 36 deg. 30 min. north lat. and 37 deg. 50 min. eaſt long. It ſtands on four hills, about 60 miles to the eaſtward of Scanderoon, is about three (including the ſuburbs, ſeven) miles in circuit, has twelve gates, and the walls, which are tolerably ſtrong, are flanked with towers. Moſt of the ſtreets are well paved, and the houſes in general better built than they commonly are in other towns in Turkey. On a hill, in the centre of the city, ſtands a large caſtle well mounted with cannon, and has a large garriſon. Here are about 120 moſques, ſome of them very magnificent, ſeveral Turkiſh monaſteries, colleges, khans or inns, bazars, divans, and other public edifices, which, in general, make a better figure within than without. The town is well ſupplied with proviſions of all ſorts; and water is brought to it by aqueducts, from a river near two days journey from the city. The whole number of the inhabitants, Jews, Turks, and Chriſtians, in the city and ſuburbs, is about 250,000. In the ſerene months of May and September, the people lie all night on the tops of their houſes, without danger.

A baſhaw governs this city, and commands the whole country from Scanderoon to the Euphrates; under him are three agas or governors of the city and caſtle, together with the ſub-baſhaw, whoſe office is to go the rounds every night, as captain of the watch, and to execute the ſentence of the baſhaw on criminals and dilinquents. The cadi is the ſole judge in all civil matters, he makes and diſſolves all marriage contracts, confirms acts of ſale and purchaſe, and, in order to prevent frauds and abuſes, creates maſters of every trade.

Here is a very conſiderable traffic carried on, for hither are brought all the commodities of Europe and Aſia; and from hence they are again exported, the former into Aſia, and the latter to Europe. In Aleppo are ſeveral manufactures, particularly thoſe of fine Turkey leather, ſilk, camblet, and ſoap. The principal commodities brought from hence to Europe are raw ſilk, cotton, grogram, galls, and a great variety of drugs. The Engliſh, French, Dutch, Italians, Arabians, Perſians, Indians, &c, have their reſpective conſuls reſiding here.

What remains of the ancient city of Antioch, is ſituate about 22 miles from Scanderoon, in a fine plain of 18 miles in extent, on the river Haſi or Orante: the Turks call it Antackia. It has a caſtle which commands the town and river, and ſome conſiderable remains of ancient temples, walls, churches, &c. together with an extenſive canal. The vaſt number of plantains, poplars, ſycamores, fruit-trees, &c. in the gardens of the town, make it at a diſtance look like a foreſt.

Damaſkus, now called Sham, is ſituated on the river Barada, and was formerly a very celebrated city,

ty, having eight gates, with ſtrong walls. It is of an oblong figure, about two miles in length, and was long the reſidence of the Syrian kings, and afterwards of the caliphs of the Saracens. Moſt of the private houſes here are low, and make a very mean appearance, being built with nothing but ſun-burnt bricks, or mud; but the public buildings, in general, are very handſome. In the centre of the city is a caſtle, of an oval form, the walls of which are fourteen feet thick, flanked with ſquare towers, mounted with cannon, and well furniſhed with arms and water: in this place is kept a conſtant garriſon of fifteen thouſand janiſſaries. In the neighbourhood of the city is an hoſpital for pilgrims and ſtrangers of all religions, who are maintained at the grand ſeignior's expence. The great moſque, formerly a chriſtian church, is a very magnificent edifice, into which it is death for any but Muſſulmen to enter. The bagnios here are generally noble buildings, and moſt of the ſtreets are arched, to keep off the ſun and rain.

The chief trade of this city conſiſts in ſcymitars, ſword-blades, knives, bridle-bits, and all kinds of iron and ſteel wares, in which it is ſuppoſed above twenty thouſand of the inhabitants are employed. They likewiſe manufacture thoſe beautiful ſilks, which from this city obtained the appellation of damaſks; and carry on a conſiderable traffick in raw and worked ſilk, otta of roſes, which is one of the moſt fragant ſcents in nature, fruits and wine. The merchandizes of Turkey, Arabia, and India, are brought hither by caravans, which are continually going and coming from Egypt, Aleppo, Bagdad, Mecca, &c. The country round this place is very pleaſant and fertile; it is remarkable for fine grapes, ſome of the bunches weighing between thirty and forty pounds. There is a ſpecies of alabaſter found near the city, and a red earth, both in great eſteem; the latter is ſaid to be good againſt the bite of venomous creatures. Some of the ſheep here are ſurpriſingly large. The inhabitants of this place do not threſh their corn, as in moſt other countries, but cut the ſtraw off with iron pincers, faſtened to wooden rollers, drawn over the corn by a horſe. All ſorts of Chriſtians in this city are allowed their churches and particular worſhip, and the Jews have ſome noble ſynagogues.

Tyre and Sidon, formerly ſo diſtinguiſhed by their grandeur and opulence, are almoſt entirely decayed: the latter, indeed, has a good harbour, and ſtill carries on a trifling trade. The houſes are built chiefly of ſtone, and are two ſtories high. The inhabitants are about 16,000, chiefly Greeks: it has two public baths, and two moſques.

But Tyre, which is now called Sur, is only inhabited by a few miſerable fiſhermen, who live in the ruins of its primitive ſtate. On the land ſide there are ſtrong walls of ſtone eighteen feet high, and ſeven broad. The circumference is about a mile and a half: here are 500 Chriſtians and Mahometans. Some of the ruins of ancient Tyre are ſtill to be ſeen.

Tripoli ſtands in the Levant ſea, in 34 deg. 30 min. north lat. and 36 deg. 15 min. eaſt long. at the foot of Mount Libanus. It is extenſive, ſtrong, populous, and opulent, adorned with fine gardens and orchards, plantations of mulberry trees, &c. The walls are ſtrong, and fortified with ſeven towers. The caſtle is the reſidence of the beglerberg, and garriſoned by 200 janiſſaries. It is a ſtrong fortreſs, ſituated on an eminence, and well ſtored with cannon. This city is commodious, and watered by a little river: on account of its importance, they deem it the capital of Phœnicia. The harbour is very open, but it is in ſome meaſure defended by two ſmall iſlands at about two leagues from it. There are ſix ſquare towers or caſtles along the ſhore, well fortified with artillery. The town contains about 8000 houſes, and 60,000 inhabitants, who conſiſt of Jews, Turks, or Chriſtians. There is a large handſome moſque, which was once a chriſtian church. The Jeſuits have a handſome college, and the Chriſtians in general ſome monaſteries and chapels.

The air is clear and healthy, the country rich and fertile, and the town plentifully ſupplied with all kinds of proviſions. The gardens have all caſcades and fountains, and even the chambers have water conveyed to them. In the gardens the people ſpend moſt of their ſummer, being buried in their ſilk-worm manufactory.

Acca, or, as the Franks call it, Acra, or Acre, was anciently called Ace, or Accho, then Ptolemais, and afterwards St. John D'Acre, while it was in the poſſeſſion of the knights of St. John of Jeruſalem. It is about 28 miles from Tyre, in 32 deg. 55 min. north lat. and 35 deg. 47 min. eaſt. long. and on the Levant Sea; but is at this time a very inconſiderable place. It was for ſome time a ſubject of contention between the infidels and Chriſtans, during the cruſades, or holy wars. In the year 1191 Richard I. king of England, conquered it, and gave it to the before-mentioned knights, who held it 100 years with great bravery. The Turks, however, inveſted it with an army of 150,000 men, and took it May 19, 1291. Many of the inhabitants had previouſly retired to the iſland of Cyprus; thoſe who remained behind were maſſacred by the infidels, who razed the fortifications, deſtroyed its noble edifices, and reduced it to the moſt deplorable ſtate.

Scanderoon (anciently called Alexandretta, or Little Alexandria, to diſtinguiſh it from Alexandria in Egypt) lies in 36 deg. 34 min. north lat. and 36 deg. 40 min. eaſt long. about 60 miles from Aleppo, to which it is the port town: it ſtands near the ſea on the gulph of Ajazzo; but its marſhy ſituation renders the town ſo unhealthy, that it only contains at preſent a confuſed and ſtraggling heap of mean wretched houſes built of wood, or huts formed of the boughs of trees interwoven and covered with mud, inhabited principally by Greeks. It is defended only by an old decayed caſtle, and a few ſoldiers, under the command of the governor. The adjacent country is in general rich, level, and fruitful.

PALESTINE, or Judea, is ſituated between 31 deg. 30 min. and 32 deg. 20 min north lat. and from 34 deg. 50 min. to 37 deg. 15 min. eaſt long. being bounded by the Mediterranean ſea on the weſt, Syria and Phœnicia on the north, Arabia Deſerta on the eaſt, and Arabia Petræa on the ſouth. It is therefore near 200 miles in length, and about 80 in breadth towards the middle, but increaſes or diminiſhes 12 or 15 miles in other places; the longeſt day is about 14 hours 15 minutes.

The air of Judea is the moſt ſalubrious and pleaſant imaginable; neither heat nor cold are felt in the extreme, but an agreeable ſerenity diffuſes itſelf throughout the year, which puts the ſtranger in mind of the golden age.

The city of Jeruſalem is at preſent about three miles in circumference, and lies in 31 deg. 50 min. north lat. and 36 deg. eaſt long. being ſituated on a rocky mountain. Dr. Shaw, ſays, "The hills which ſtand about Jeruſalem make it appear to be ſituated, as it were, in an amphitheatre, whoſe area inclineth to the eaſtward. We have no where, as I know of, any diſtinct view of it: that from the Mount of Olives, which is the leaſt, and perhaps the furtheſt, is notwithſtanding at ſo ſmall a diſtance, that when our Saviour was there, he might be ſaid, almoſt in a literal ſenſe, "to have wept over it." There are very few remains of the city, either as it was in our Saviour's time, or as it was afterwards rebuilt by Hadrian, ſcarce one ſtone being left upon another; even the very ſituation is altered; for Mount Sion, the moſt eminent part of the Old Jeruſalem, is now excluded, and its ditches filled up; whilſt the places adjoining to Mount Calvary, where Chriſt is ſaid to have ſuffered without

without the gate, are now almoſt in the centre of the city."

With reſpect to its preſent ſtate, the Turks call it Cudſembaric: it is thinly inhabited; the walls are weak, and without baſtions; the ditch inconſiderable; the gates are ſix in number, viz. Damaſcus, St. Stephen's, Herod's, Sterquilina, Bethlehem, and Mount Sion Gate; beſide the Golden gate, which is ſhut up, on account of a prophecy which the Turks have among them, that by that gate the Chriſtians are to take Jeruſalem. The ſtreets are narrow, and the houſes mean. Pilgrims and travellers, who flock from all parts, either through devotion or out of curioſity, are the principal ſupport of the city. A Turkiſh baſſa reſides here, to keep good order, collect the grand ſeignior's revenues, and protect the pilgrims from the inſults of the Arabs.

No European Chriſtian is permitted to enter the city till the requiſite duties are diſcharged; nor can a ſtranger ſafely ſtay here, without being upon good terms with the Latin fathers; theſe eccleſiaſtics ſubſiſting by their forgeries, and pretending to guide travellers to every ſpot mentioned in the Old and New Teſtament.

The principal object of the pilgrims is the church of the Holy Sepulchre, ſituated upon Mount Calvary. It is 100 paces in length, and 60 in breadth: the workmen were obliged to reduce the hill to a plain area, in order to lay the foundation; but great precaution was uſed not to alter any part of it, where our Saviour's Paſſion was concerned. The ſcene of of the Crucifixion is left entire, being about 12 yards ſquare, and ſtands at this day ſo much higher than the floor of the church, that it is aſcended to by 21 ſteps. The Holy Sepulchre, which was originally a cave hewn out in the bottom of the rock, may be now compared to a grotto ſtanding above ground, and having the rock cut away, and levelled all round. The walls of the church of the Holy Sepulchre are of ſtone, and the roof of cedar; the eaſt end encloſes Mount Calvary, and the weſt the Holy Sepulchre; the former is covered with a ſuperb cupola, ſupported by 16 large columns, and open at top. Over the altar there is another fine dome; the nave conſtitutes the choir, and the iſles of the church contain the moſt remarkable places where the circumſtances of our Saviour's Paſſion were tranſacted, together with the tombs of Godfrey and Baldwin, the two firſt Chriſtian kings of Jeruſalem. In the church of the Crucifixion, the hole is ſhewn in which it is ſaid the croſs was fixed. The altar has three croſſes richly adorned on it, particularly with four lamps of immenſe value, which are kept conſtantly burning. The cloiſter round the ſepulchre is divided into ſundry chapels. The Latins, who take care of the church, have apartments on the north-weſt ſide, but they are never ſuffered to go out; the Turks keeping the keys, and furniſhing them with proviſions through a wicket. Some grand ceremonies are performed at Eaſter, repreſenting Chriſt's paſſion, crucifixion, death and reſurrection.

On Mount Moriah, in the ſouth part of the city, ſtands the edifice called Solomon's Temple, which is ſituated upon the ſame ſpot as the ancient temple ſtood; but it is uncertain by whom it was erected. The middle part, where the Jewiſh Sanctum Sanctorum was ſuppoſed to have ſtood, is converted into a Turkiſh moſque.

It is to be obſerved, that the Turkiſh ſangiac who governs this city reſides in the very houſe where Pontius Pilate is ſuppoſed to have formerly lived. The principal part of the churches have been converted into moſques. The prieſts and other Chriſtians, are kept miſerably poor, by the tyranny of the government, and have ſcarce any ſubſiſtence but what they procure by accommodating ſtrangers with food and lodging, and ſelling them relics.

In the neighbourhood of Jeruſalem, the moſt remarkable antiquities are,

The pools of Betheſda and Gihon. The former is 120 paces long, 40 broad, and 8 deep. It is at preſent dry, and the arches dammed up. But Gihon, which is about a quarter of a mile from Bethlehem gate, is a magnificent relic, 106 paces long, 60 broad, lined with a wall and plaſter, and ſtill ſtored with water.

The tomb of the Virgin Mary, in the valley of Jehoſhaphat, has a deſcent to it by a flight of 47 magnificent ſteps. On the right hand is the Sepulchre of St. Anne, the mother of the Bleſſed Virgin; and on the left hand is that of Joſeph her huſband. The whole is cut in the ſolid rock.

Abſalom's pillar or place, which it is ſaid was erected by that prince, in order to perpetuate his memory, as he had no male iſſue, reſembles a Sepulchre, though it is not known that he was buried here. There is a great heap of ſtones about it, which are always increaſing; for all Jews and Turks who paſs by it make a point of throwing a ſtone each upon the heap, as a token of abhorrence to Abſalom for his unnatural rebellion againſt his father. The ſtructure itſelf is 20 cubits ſquare, and 60 high, adorned below with four columns of the Ionic order. From the height of 20 to 40 cubits it grows leſs, and is plain, a ſmall fillet at the upper end excepted; from thence to the top it is circular, and runs up ſpirally to a point; the whole being cut out of a ſolid rock. There is a room within conſiderably higher than the level of the ground without, on the ſides of which are niches, probably to receive coffins.

To the eaſtward of the above is the tomb of Zechariah, the ſon of Barachiah, whom the Jews ſlew between the temple and the altar, as it is commonly ſuppoſed. It is cut out of the rock 18 feet high, as many ſquare, and adorned with Ionic columns on each front, cut out of the ſame rock, and ſupporting a cornice. The whole ends in a pointed top like a diamond.

The royal ſepulchres without the walls of Jeruſalem are ſome of the moſt elaborate, curious, and magnificent antique remains that imagination can conceive. By whom they were built is uncertain, but they conſiſt of a great number of apartments, moſt of which are ſpacious, and all cut out of the marble rock.

Near Jeruſalem is a ſpot of ground, 30 yards long, and 50 broad, which is now the burial place of the Armenians. It was formerly the Aceldama, *field of blood*, or *potter's field*, purchaſed with the price of Judas's treaſon, as a place of interment for ſtangers. It is walled round, to prevent the Turks from abuſing the bones of the Chriſtians; but one half of it is occupied by a charnel-houſe.

At Bethany, which ſtood in the road between Jeruſalem and Jericho, the remains of an old caſtle are ſhewn, which it is affirmed, belonged formerly to Lazarus. There is a deſcent of 25 ſteps to the room where he was laid, and the tomb out of which he was raiſed.

Jericho is reduced from a magnificent city to a little mean village, without any veſtiges of its former ſplendour, except ſome grand arches of an old conduit. It is about twenty-three miles from Jeruſalem, and was remarkable for being the firſt city invaded by the Iſraelites after their paſſage over Jordan, when it was taken by the ſingular fall of its walls.

Bethlehem is diſtant between ſix and ſeven miles from Jeruſalem, to the ſouth-weſt, in the way to Hebron. It lies in 31 deg. 35 min. north latitude; and in 65 deg. 50 min. eaſt longitude. Anciently it was called the City of David, having been the birth-place of the Royal Pſalmiſt. It was otherwiſe called Ephram, or Ephrata; Gen. xxxv. 19. It was originally built by the Jebuſites; and both Jerom and Euſebius aſſure us, that the monument of Jeſſe, the father

father of David, was here ſhewn in their time. Bethlehem is ſeated on a pleaſant hill, in a fine fertile plain, and enjoys a moſt excellent air. It contains a convent of the Latins, another of the Greeks, and another of the Armenians, and is annually reſorted to by a great number of pilgrims and travellers. All the convents have doors which open into the Chapel of the Holy Manger: for the place where the bleſſed Redeemer was born, and the manger in which he was laid, are ſhewn to this day. The manger is adorned with three pillars, one in the middle, and the others at the ends: in the angle, a ſtep lower, are two other ſmall pillars of an equal bigneſs, between which there is a marble manger, big enough to hold a new born infant: and oppoſite to it is a ſtone, whereon the bleſſed Virgin ſat when the wiſe men came to adore the heavenly infant. The whole is become entirely black through time.

At the diſtance of about forty yards from one of the convents, there is a grot hollowed in a chalky rock, where, tradition ſays, the bleſſed Virgin hid herſelf and her divine babe, from the malice of Herod, ſome time previous to her departure into Egypt. Eaſtward, at the diſtance of about half a mile, the pilgrims are ſhewn the field where the ſhepherds were watching their flocks, when they received the glad tidings of the birth of a bleſſed Redeemer. The magnificent church built over the grot were the divine infant was born, is one of the moſt ſuperb in the eaſt, being divided into five aiſles, formed by four rows of elegant marble pillars, to the amount of 40 in number, that is, ten in a row. Beſides theſe, 10 more ſupport the whole choir, which is encloſed by a wall. The pavement is beautiful, and the cedar roof proportionably high. The noble portico by which you enter the church is ſupported by 16 handſome marble pillars. The choir, which is covered by a noble cupola, terminates in a ſemicircle that contains the altar: not far from which are two marble ſtair-caſes, conſiſting of thirteen ſteps each: by one of theſe the pilgrims deſcend to the Chapel of the Nativity, where there is an altar under a concave, with a repreſentation of the nativity: the whole being illuminated by lamps continually kept burning.

This magnificent edifice was built by the pious empreſs Helena, in commemoration of the birth of Chriſt. At a ſmall diſtance to the ſouthward of Bethlehem, the famous fountains, pools, gardens of Solomon are ſhewn. The pools are three in number, lying in a row and ſo diſpoſed, that the waters of the uppermoſt fall into the ſecond, and thoſe of the ſecond into the third. They are of a quadrangular figure, equal in breadth; but differing in length; the breath of each being 450 feet; but the length of the firſt is 800 feet; of the ſecond 1000 feet, and of the third 1100 feet. They are very deep, and lined with a plaſtered wall. Cloſe to the pools is a pleaſant caſtle of a modern ſtructure: and at about the diſtance of 700 feet is a fountain, from which they receive their waters. On the eaſtward of the city the well of David is ſhewn, for the waters of which that monarch ſo paſſionately longed, according to the inſpired writer, 2 Sam. xxiii. 14, &c. "And David was then in the hold, and the garriſon of the Philiſtines was then in Bethlehem; and David longed, and ſaid, O that one would give me drink of the water of the well of Bethlehem, which is by the gate. And three mighty men broke through the hoſt of the Philiſtines, and drew water out of the well of Bethlehem, that was by the gate." And about two furlongs from this well are the remains of an old aqueduct, which anciently conveyed the waters of Solomon's pools to Jeruſalem. Beſides the above-mentioned chapels in Bethlehem, are the Chapel of St. Joſeph, the huſband of the Holy Virgin the Chapel of the Innocents, and thoſe of St. Jerome, St. Paul, and Euſtochium.

§

The moſt judicious travellers, upon an attentive ſurvey of many of the countries contained in Aſia Minor, and which are celebrated in the Greek and Roman hiſtory; fully vindicate all that has been ſaid by ſacred and profane writers, of their beauty, ſtrength, fertility, and population; though it muſt be confeſſed, that at preſent, through the Turkiſh indolence and tyranny, they are either totally forſaken, or a theatre of ruins. The ſites of ancient cities are diſcernible, and ſo luxurious is nature in thoſe countries, that in many places ſhe triumphs over her forlorn condition. Even Paleſtine and Judea, the moſt deſpicable at preſent of all thoſe countries, lie buried within the luxuries of their own ſoil.

The Turks ſeem particularly fond of repreſenting Judea in the moſt deſpicable colours, and have formed a thouſand falſehoods concerning it, which, being artfully propagated among ourſelves, have impoſed upon weak Chriſtians. The late Rev. Dr. Shaw, profeſſor of Greek, at Oxford, who ſeems to have examined that country with an uncommon degree of accuracy, and was qualified by the ſoundeſt philoſophy to make the moſt judicious obſervations, ſays, that were the Holy Land as well cultivated as in former times, it would be more fertile than the very beſt parts of Syria and Phœnicia, becauſe the ſoil is generally much richer, and, every thing conſidered, yields larger crops. Therefore the barrenneſs, he further remarks, of which ſome authors complain, does not proceed from the natural unfruitfulneſs of the country, but from the want of inhabitants, the indolence which prevails among the few who poſſeſs it, and the perpetual diſcords and depredations of the petty princes who ſhare this fine country. Indeed the inhabitants can have but little inclination to cultivate the earth. "In Paleſtine," ſays Mr. Wood, "we have often ſeen the huſbandman ſowing, accompanied by an armed friend, to prevent his being robbed of the ſeed." And, after all, whoever ſows, is uncertan whether he ſhall ever reap the harveſt.

Some part of Paleſtine revived under the government of Sheik Daher, the ally of the famous Ali Bey. He enlarged the buildings and walls of St. John de Acre, formerly Ptolemais, and ſhewed great indulgence to the Chriſtians. Its inhabitants were lately computed at 40,000. Caifa, which ſtands on the declivity of Mount Carmel, diſtant about twenty miles from Acre, was alſo new built and enlarged by Daher.

The ancient Joppa, now Jaffa, 50 miles weſt from Jeruſalem, ſtands on a rocky hill, hath an harbour for ſmall veſſels, and its circumference is about two miles. The number of inhabitants is 7000. The weſtern part of the town is inhabited by Chriſtians.

The preſent ſtate of Ramah is deplorable, its walls being in decay, and moſt of the houſes empty, although the number of inhabitants is ſtill between 3 and 4000.

Not a houſe is ſtanding of the once magnificent city of Cæſarea, but the remains of the walls teſtify its former grandeur.

Azotus is about two miles in circumference; the inhabitants are near 3000, and moſtly Mahometans. An old ſtructure is ſhewn here, with fine marble pillars, which is ſaid to be the houſe that Sampſon pulled down, when inſulted by the Philiſtines.

Gaza is ſtill reſpectable; it extends from eaſt to weſt three miles, and is a mile in breadth, divided into the old and new town. The laſt is inhabited by the inferior Turks and Arabs: the number of the inhabitants is reckoned to be 26,000. It is about five miles from the ſea, and outſide the town is a market for the country people to diſpoſe of their commodities to the inhabitants, for they are not permitted to enter the town. The country around is very fertile; but corn, oil, wine, honey, bees-wax, flax, and cotton, are its chief produce.

It

It may be a queſtion with ſome, whether thoſe countries of Aſia could ever be reſtored to their ancient grandeur, trade, and population; but I apprehend that it would now be impoſſible, let the Turkiſh government be ever ſo beneficent, to divert commerce, (without which all attempts of that kind muſt be feeble) from its European channels. There can, however, be no queſtion, that a government leſs brutal and bigoted than that of the Turks might make the natives a powerful, as well as a happy people within themſelves: the misfortune is, that the Greeks, Armenians, and other ſects of Chriſtians there, partake but too much of the Turkiſh ſtupidity. Though they are not ſuffered to wear white turbans, or to ride on horſeback, and are ſubjected to a thouſand indignities and miſeries, and are even, in many places, far more numerous than their oppreſſors; yet ſo abject is their ſpirit, that they make no efforts for their own deliverance, and are contented under all their mortifications. If they are leſs indolent than their oppreſſors, it is becauſe they muſt otherwiſe ſtarve; and they dare not enjoy even the property they acquire, leſt it ſhould be diſcovered to their tyrants, who would convert it to their own uſe, as though they were lawfully entitled to it.

With reſpect to their commerce and manufactures, there are no people in the world, who, from advantage of ſituation, and vaſt extent of empire, ſeem more calculated for monopolizing the trade of the whole eaſt, than the Turks. They poſſeſs the navigation of the Black Sea, the Levant, and the Red Sea, which undoubtedly affords them greater opportunities of importing the rich merchandizes of the Eaſt, and diſtributing them all over Europe, than any other power. But ſuch is the indolence of this people, that thoſe great objects are little attended to. The cities of Tyre, Sidon, and Alexandria, formerly the chief emporiums for trade in the univerſe, are now of no conſequence, but are entirely overlooked.

The Turks have but few merchant ſhips, and never attempt diſtant voyages; ſo that the Engliſh, French, Dutch, and other European nations, reſort thither with the commodities of their reſpective countries, and return laden with thoſe of Turkey: even the inland trade of the empire, which is exceeding trifling, is carried on by Jews and Armenians.

Their articles for export are coffee, rhubarb, turpentine, ſtorax, gums, opium, galls, maſtic, emery, Lemnian-bole, pomegranate-ſhells, ſponges, dates, wine, oil, figs, raiſins, mother of pearl, box-wood, ſaffron, and ſome other articles; to which may be added, the produce of their manufactures, conſiſting of ſilks, burdets, cottons, dimities, waxed-linen, ſhagreen-ſkins, blue, red, and yellow Morocco-leather, carpets, and ſoap.

The traffic of the human ſpecies, though ſhocking to human nature, is carried on in a very extraordinary degree in Turkey; for they not only ſell their ſlaves of both ſexes, but alſo beautiful young girls, who are purchaſed, particularly by the Jews in Circaſſia, Georgia, and other parts, and again ſold to ſupply the ſeraglios of the grand ſeignior, and other great men.

By the conſtitution and government eſtabliſhed in Turkey, the grand ſeignior is one of the moſt deſpotic princes upon earth, having an abſolute power of life and death over all his ſubjects; of the juſtice of which they are ſo entirely perſuaded, that they never make any reſiſtance, but ſubmit with mildneſs to the firſt order he iſſues for taking away their goods, and even their lives. This exceſs of obedience is taught them by their religion; and, labouring under the force of this prejudice, even the chief officers of the empire conclude it to be their higheſt good-fortune and glory to end their days by the hand or command of their ſovereign. The whole extent of the Turkiſh empire, lands, and houſes, are his property, and at his ſole diſpoſal, except lands annexed to the church; which is a law that the Jews and chriſtians avail themſelves of, to ſecure the enjoyment of their eſtates to poſterity: and ſo ſacred and inviolable has it been held, that there is no inſtance recorded in hiſtory of a ſultan's having even attempted to violate it.

The Aſiatic Turks hold their lands by a kind of military tenure, being obliged to maintain horſes and men always in readineſs, againſt the grand ſeignior ſhall call them forth to ſerve in the wars. At his inauguration, this prince obliges himſelf to govern within the compaſs of the Mahometan law; which is in fact no reſtriction at all, for this very law ſtyles him the mouth and interpreter of it, and endows him with a power to alter and annul the moſt fixed and ſettled rules, or at leaſt to diſpenſe with them when they prove an obſtacle to his government. But notwithſtanding this deſpotic power, if he acts contrary to the humours of the people, particularly the janiſſaries, he is in danger of being depoſed, and alſo put to death, therefore upon the leaſt ſuggeſtion of the diſaffection or miſconduct of his miniſters, he cauſes them to be murdered, or at leaſt diſgraced; and frequently ſaves himſelf from the general fury, by throwing the whole blame of any mal-adminiſtration upon the grand vizier, and ſacrificing him to the public reſentment.

There is a gradation of the great officers of ſtate in Turkey; of whom are the grand vizier, or prime miniſter; the captain-baſhaw, or admiral; the mufti, or high-prieſt; the viziers of the bench, or of three baſhaws tails, ſo denominated from three horſes tails being carried before them when they march; theſe ſit in the divan, or courts of juſtice, with the mufti; the kadilaſquiers, or chief juſtices of provinces; the beglerbegs, or viceroys; the baſhaws, or governors of towns and diſtricts under the beglerbegs; the kaimacan, or governor of Conſtantinople; the grand vizier has a deputy, who is likewiſe ſtyled kaimacan: the reis-effendi, or lord-chancellor and ſecretary of ſtate; and the teſterdar, or lord-treaſurer. There are likewiſe the aga of the Janiſſaries, the aga of the Spahis, the aga of the Siluds, and ſome others. The chief officers of the ſeraglio are, the kiſlar aga, who is ſuperintendent of the women, and has the command of all the black eunuchs; the capi-aga, who has the command of all the white eunuchs, and to whom all petitions intended for the ſultan are firſt delivered.

The officers, both civil and military, with the beſt part of their forces, are ſeldom compoſed of Turks, but conſiſt chiefly of the children of Tartar or Chriſtian ſlaves taken in war, or renegadoes. The moſt beautiful, well-made, and ſprightly of theſe, while exceeding young, are preſented to the grand ſeignior; and ſuch as he approves of, are admitted into the ſeraglios of Conſtantinople, Adrianople, and Pera, where they are educated under the appellation of Ichoglans. Being circumciſed, they are firſt taught ſilence, and a modeſt, humble behaviour; and as they advance in years, they are inſtructed in the Mahometan religion, the Turkiſh language, and afterwards the Perſian and Arabic. When fit for manly exerciſes, they are taught the uſe of arms, and ſuch other ſciences as may render them ſerviceable to the ſtate, and are advanced, and their ſalaries augmented, according to their proficiency. When any poſt becomes vacant, it is filled by one of theſe; but none are preferred out of the ſeraglio before they have attained the age of forty. Theſe men, however, being tutored in the ſchool of adverſity, and arriving at preeminence, are generally as diſtinguiſhed for abilities, as deficient in virtue. They poſſeſs all the diſſimulation, intrigue, and corruption, which often accompanies ambition in an humble rank; and they have a further reaſon for plundering the people, becauſe they are uncertain how long they may poſſeſs the dignities to which they are arrived. The adminiſtration of juſtice, therefore, is extremely corrupt over

the whole empire, which is owing, not to the laws of the kingdom, which are very equitable, but to the iniquitous conduct and manners of the judges. Beſides theſe Ichoglans, there are children in theſe ſeraglios called Azamoglans, who are trained up for inferior employments. Among the ſultan's attendants, are a number of mutes and dwarfs, the former of which converſe by ſigns with great readineſs, and the latter divert the court by their buffoonery.

The revenues of the grand ſeignior are immenſe, but it is impoſſible to aſcertain the exact ſum. According to Baron de Tott, they are eſtimated on the records to amount to 25,400,000l. but produce effectively only 3,200,000l. to the public. They ariſe from the cuſtoms, the produce of the demeſne lands, the capitation or poll-tax, impoſed on every ſubject of the empire who is not a Mahometan; towards which the rich pay thirty ſhillings a year, tradeſmen fifteen ſhillings, and common labourers ſix ſhillings and tenpence halfpenny. Beſides this, are the annual tributes paid by the Cham of the Crim Tartars, the princes of Moldavia, Walachia, the little republic of Raguſa, and part of Mingrelia, together with half a million annually from Egypt. All theſe, however, are inconſiderable, when compared to the vaſt ſums extorted by the ſultan from his viceroys and great officers of ſtate, under the plauſible appellation of preſents. He alſo raiſes vaſt ſums by the confiſcations of the eſtates and effects of his miniſters, whom, if they happen to be immoderately rich, he frequently puts to death, under pretence of miſconduct. He is likewiſe heir to all his officers and miniſters; who, after diſtreſſing the people they are appointed to govern, in order to amaſs prodigious wealth, are obliged to leave it at his diſpoſal when they die; and it is ſeldom that generoſity prompts him to beſtow any conſiderable part on the relations of the deceaſed.

In Turkey, the current coin conſiſts of gold and ſilver, there being no copper or braſs money. The gold coins are the altines or ducats, and the zechinos. The former are worth about ſeven ſhillings and ſixpence, and the latter about nine ſhillings. The ſilver coins are, the aſper, worth three halfpence; the para, worth four-pence halfpenny; the groſh, about threepence; the krip, about eleven-pence; and the ſolga, about two ſhillings and two-pence farthing. The gold and ſilver of all countries go for their full value.—A kize is a bag of fifteen thouſand ducats; a purſe is worth five hundred thouſand crowns, and of theſe the ſultan makes his common preſents; but thoſe he preſents to his ſultanas or favourites, are called golden purſes, and contain thirty thouſand crowns.

As to the Turkiſh military and marine ſtrength, their armies, even in time of peace, are very numerous; and the chief part of them conſiſt of a kind of militia, amounting to ſeveral hundred thouſand men, whom their leaders are obliged to conduct into the field, whenever the government requires their ſervice; they are termed the Timar-ſpahis, and are in fact light-horſe; theſe amount to about 268,000 effective men: but there is another body of cavalry, called Spahis, who are about 12,000 in number, and form the grand ſeignior's horſe-guard. The chief dependence of the empire, however, is upon the janiſſaries, or infantry, who are eſteemed the beſt ſoldiers in the Turkiſh armies, and on whom they principally depend in an engagement: their number is about 25,000 men, who are quartered in and near Conſtantinople. Theſe frequently grow mutinous, and have ſometimes proceeded ſo far as to depoſe the ſultan. They receive their pay from the treaſury, are educated in the ſeraglio, and trained up from their infancy to the uſe of arms. There are not leſs than 100,000 foot ſoldiers, ſcattered over every province of the empire, who procure themſelves to be regiſtered in this body, in order to enjoy the privileges of janiſſaries, which are very great, being ſubject to no juriſdiction but that of the aga, or chief commander of their corps.

The titles of the emperor are ſwelled with all the pomp of eaſtern magnificence. He is ſtyled by his ſubjects, "The Shadow of God, a God on Earth, Brother to the Sun and Moon, Diſpoſer of all Earthly Crowns," &c. The grand ſeignior's arms are, Vert, a creſcent argent, creſted with a turban, charged with three black plumes of heron's-quills, with this motto, DONEC TOTUM IMPLEAT ORBEM, i. e. *Until he ſhall fill the whole world.*

The grand ſeignior's ſeraglio conſiſts of a collection of beautiful young women, chiefly ſent as preſents from the provinces and Greek iſlands, moſt of them being the children of Chriſtian parents. The brave Prince Heraclius hath for ſome years paſt aboliſhed the infamous tribute of children of both ſexes, formerly paid every year by Georgia to the Porte. The number of women in the harem depends on the taſte of the reigning monarch, or ſultan: Selim had 2000, Achmet had but 300, and the preſent ſultan hath nearly 1600. On their admiſſion, they are committed to the care of old ladies, taught to ſew and embroider, muſic, dancing, and other accompliſhments, and furniſhed with the richeſt clothes and ornaments. They all ſleep in ſeparate beds, and between every fifth there is a preceptreſs. Their chief governeſs is called Katon Kiaga, or governeſs of the noble young ladies. There is not one ſervant among them, for they are obliged to wait on one another by rotation; the laſt that is entered, ſerves her who preceded her and herſelf. Theſe ladies are ſcarcely ever ſuffered to go abroad, except when the grand ſeignior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are encloſed with lattices and linen curtains; and when they go by land, they are put into cloſe chariots, and ſignals are made at certain diſtances, to give notice, that none approach the roads through which they march. The boats of the harem, which carry the grand ſeignior's wives, are manned with twenty-four rowers, and have white covered tilts, ſhut alternately by Venetian blinds.

Whenever the ladies are permitted to walk in the gardens of the ſeraglio, all people are ordered to retire, and on every ſide there is a guard of black eunuchs, with ſabres in their hands, while others go their rounds, in order to hinder any perſon from ſeeing them. If unfortunately any one is found in the garden, either through ignorance or inadvertence, he is undoubtedly killed, and his head brought to the feet of the grand ſeignior, who gives a reward to the guard for their vigilance. Sometimes the ſultan goes into the gardens to amuſe himſelf when the women are there; and it is then that they make uſe of their utmoſt efforts, by dancing, ſinging, ſeducing geſtures, and amorous blandiſhments, to enforce the affections of the monarch. He is not allowed to take a virgin to his bed, except during the ſolemn feſtivals, and on occaſion of ſome extraordinary rejoicings, or the arrival of ſome good news. Upon ſuch occaſions, if the ſultan chooſes a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governeſſes, to whom he ſpeaks, and intimates the perſon he likes beſt; but does not throw the handkerchief to her, as is generally aſſerted and believed.

As ſoon as the grand ſeignior has choſen the girl that he has deſtined to be the partner of his bed, all the others follow her to the bath, waſhing and perfuming her, and dreſſing her ſuperbly, conducting her, ſinging, dancing, and rejoicing, to the bedchamber of the ſultan, who is generally, on ſuch an occaſion already in bed. Scarcely has the new-elected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than ſhe kneels down; and when the ſultan calls her, ſhe creeps into bed to him at the foot of the bed, if he does not order

order her, by ſpecial grace, to approach by the ſide: after a certain time, upon a ſignal given by the ſultan, the governeſs of the girls, with all her ſuite, enter the apartment, and take her back again, conducting her with the ſame ceremony, to the women's apartments; and if by good fortune ſhe becomes pregnant, and is delivered of a boy, ſhe is called aſaki-ſultaneſs, that is to ſay, ſultaneſs-mother. For the firſt ſon, ſhe has the honour to be crowned, and ſhe has the liberty of forming her court, by way of diſtinction. Eunuchs are alſo aſſigned for her guard, and for her particular ſervice. No other ladies, though delivered of boys, are either crowned or maintained in ſuch a coſtly manner as the firſt; however, they have their ſervice apart, and handſome appointments.

After the death of the ſultan, the mothers of the male children are ſhut up in the old ſeraglio, from whence they can never come out any more, unleſs any of their ſons aſcend the throne. A writer of credit informs us, that the female ſlave who becomes the mother of a ſultan, and lives long enough to ſee her ſon mount the throne, is the only woman who, at that period alone, acquires the diſtinction of ſultana-mother: ſhe is till then in the interior of her priſon with her ſon. The title of Bache-Kadun, principal woman, is the firſt dignity of the grand ſeignior's harem; and ſhe hath a larger allowance than thoſe who have the title of ſecond, third, and fourth woman, which is the number of free women allowed by the Koran.

Hiſtory of the Origin, Progreſs, and Eſtabliſhment of the Turks.

The ſouthern and more fertile parts of Aſia have, at different periods, been conquered by that warlike and hardy race of men who inhabit the vaſt country known to the ancients by the name of Scythia, and among the moderns by that of Tartary. One tribe of theſe people, called Turks, or Turcomans (which name ſignifies wanderers) extended its conqueſts under various leaders, and during ſeveral centuries, from the ſhore of the Caſpian-Sea, to the Streights of the Dardanelles. Having been long reſident in the capacity of body guards about the courts of the Saracens, they embraced the doctrine of Mahomet, and acted for a conſiderable time as mercenaries in the armies of contending princes. Their chief reſidence was in the neighbourhood of Mount Caucaſus, from whence they removed to Armenia-Major, and after being employed as mercenaries by the ſultans of Perſia, they ſeized that kingdom about the year 1037, and ſpread their ravages over all the neighbouring countries. Bound by their religion to make converts to Mahometaniſm, they never were without a pretence for invading and plundering the dominions of the Greek emperors, and were ſometimes commanded by very able generals. On the declenſion of the caliphate, or empire of the Saracens, they made themſelves maſters of Paleſtine; and the viſiting the holy city of Jeruſalam being then part of the Chriſtian exerciſes, in which they had been tolerated by the Saracens, the Turks laid the European pilgrims under ſuch heavy contributions, and exerciſed ſuch horrible cruelties upon the Chriſtian inhabitants of the country, as gave riſe to the famous cruſades.

The Greek emperors were unfortunately more jealous of the Chriſtians than of the Turks; and though after oceans of blood were ſpilt, a Chriſtian kingdom was erected at Jeruſalem, under Godfrey of Boulogne, neither he nor his ſucceſſors were able to maintain it, by any real power they poſſeſſed. About the year 1129, the Turks had extended their dominions on every ſide, and poſſeſſed themſelves, under Othman, of ſome of the fineſt provinces in Aſia, of Nice, and Pruſa, in Bithynia, which Othman made his capital, and, as it were, firſt embodied them into a nation; hence they took the name of Othmans from that leader, the appellation of Turks, as it ſignifies in the original wanderers, or baniſhed men, being conſidered by them as a term of reproach.

Othman may with propriety be ſtyled the founder of the Turkiſh empire, and was ſucceeded by a race of the moſt warlike princes that are mentioned in hiſtory. About the year 1357 they paſſed the Helleſpont, and got a footing in Europe, and Amurath ſettled the ſeat of his empire at Adrianople, which he took in the year 1360: under him the order of janiſſaries was eſtabliſhed. Such were their conqueſts, that Bajazet I. after conquering Bulgaria, and defeating the Greek Emperor Sigiſmund, laid ſiege to Conſtantinople, in hopes of ſubjecting all the Greek empire to his obedience. His greatneſs and inſolence provoked Tamerlane, a Tartarian prince, who was then juſt returned from his eaſtern conqueſts, to declare war againſt him. A deciſive battle was fought between thoſe rival conquerors, in Natolia, in the plain where Pompey defeated Mithridates, when Bajazet's forces were cut to pieces, and he himſelf taken priſoner, and ſhut up in an iron cage, where he ended his days.

This was a dreadful blow to the Othmans; but the ſucceſſors of Tamerlane, by declaring war againſt one another, gave the Turks an opportunity of recovering the prodigious loſs they had ſuſtained, and of becoming more powerful than ever; and though their career was in ſome meaſure checked by the valour of the Venetians, Hungarians, and the famous Scanderbeg, a prince of Epirus, nevertheleſs they gradually reduced the dominions of the Greek emperors; and, after a long ſiege, Mahomet II. took Conſtantinople in 1453. Thus, after an exiſtence of ten centuries, from its firſt commencement under Conſtantine the Great, ended the eaſtern empire; an event which had been long foreſeen, and was owing to many cauſes; the chief was, the total degeneracy and luxury of the Greek emperors themſelves, their courts and families; the diſlike their ſubjects had to the popes, and the weſtern church, one of their patriarchs having declared publicly to a Romiſh legate, "That he would rather ſee a turban than the pope's tiara upon the great altar of Conſtantinople." But as the Turks, when they extended their conqueſts, did not exterminate the conquered nations, but reduced them to ſubjection, the remains of the ancient Greeks ſtill exiſt, as we have already obſerved, particularly in Conſtantinople, and the neighbouring iſlands, where, though grievouſly oppreſſed, they profeſs Chriſtianity under their own patriarchs of Conſtantinople, Alexandria, Antioch, and Jeruſalem; and the Armenians have three patriarchs, more wealthy than thoſe of the Greek church, on account of their people being richer, and more converſant in trade. It is ſaid that the modern Greeks, though pining under the the tyrannical yoke of the Turkiſh government, ſtill preſerve ſomewhat of the exterior appearance, though nothing of the internal principles, by which their anceſtors were ſo long and ſo eminently diſtinguiſhed.

The conqueſt of the capital was followed by the ſubmiſſion of all Greece; and from this time the Turks have been looked upon as an European power, and as having acquired a conſiderable weight in the political balance of affairs.

In 1481, Mahomet paid the debt of nature, and was ſucceeded on the Othman throne by Bajazet II. That prince carried on a war againſt the Hungarians and Venetians, as well as againſt the Perſians and Egyptians; but falling ill of the gout, he became indolent, was haraſſed with family differences, and at length, by order of his ſecond ſon, Selim, he was poiſoned by a Jew phyſician.

Selim, perſuaded that he could never poſſeſs the throne

throne in peace, while any other prince of the Othman race ſubſiſted, purſued the barbarous policy of the eaſt, and cauſed his eldeſt brother, Achmet, to be ſtrangled, with many other princes of the Othman race. He continued the war againſt the Sophis of Perſia, and the Prince of Mount Taurus, and defeated their forces; but finding himſelf unable to penetrate into the Perſian dominions, he turned his arms againſt Egypt, which, after many bloody battles, he ſubdued, in the year 1517. He was alſo ſucceſsful in the Leſſer Aſia; where he made himſelf maſter of Aleppo, Antioch, Tripoli, Damaſcus, Gaza, and ſeveral other places. He was ſucceeded, in 1520, by his ſon

Soliman the Magnificent, the greateſt prince that ever filled the throne of Othman. Availing himſelf of the fatal differences which prevailed among the Chriſtian powers, he beſieged and took Rhodes, driving the knights from that iſland to Malta, which was given them by the Emperor Charles V. The reign of Soliman, after this, was a continual war with the Chriſtian powers, and generally ſucceſsful, both by ſea and land. He took Buda, the metropolis of Hungary at that time, and Belgrade, and carried off near 200,000 captives. This happened A. D. 1526; and two years afterwards, he advanced into Auſtria, and beſieged Vienna, but retired on the approach of Charles V. he miſcarried alſo in an attempt he made to take the Iſle of Malta. Dying in 1566, he was ſucceeded by

Selim, the ſon and ſucceſſor of Soliman, who continued the wars begun by his father againſt the Chriſtians, but without his good fortune. The Turkiſh fleet, which was now very powerful, was totally defeated by the Chriſtians, in the battle of Lepanto, This blow almoſt annihilated the Turkiſh navy, and had the victory been properly purſued by the Chriſtians, eſpecially the Spaniards, Selim had tottered on his throne. But differences and jealouſies prevailing among them, the panic of the Turks ſubſided, they ſoon recovered their ſpirits, and their army again became formidable; but their marine has never ſince been able to face that of the Chriſtians. Selim died in 1575, and was ſucceeded by his ſon,

Amurath III. who carried on a ſucceſsful war againſt the Perſians, and obliged them to cede Tauris, Teflis, and many other cities to the Turks. He was alſo fortunate in his wars againſt the Hungarians, and made himſelf maſter of the fortreſs of Raab. His whole reign was indeed a continual war, the operations of which were various; ſometimes fortune attended the Othman ſtandards, and ſometimes thoſe of the enemy. After a reign of eighteen years, Amurath paid the debt of nature, and his ſon,

Mahomet III. aſcended the Turkiſh throne. The moſt memorable tranſactions of the reign of this prince are his cruelties. At this acceſſion to the throne, he cauſed nineteen of his brothers to be ſtrangled: and as ten of his father's concubines were ſuppoſed to be pregnant, he cauſed theſe unhappy victims of his jealouſy to be thrown into the ſea. But though he waded to the throne through a ſea of blood, he did not long enjoy it. He died of the plague in the year 1604.

Achmet ſucceeded to the Turkiſh throne on the death of his brother, and carried on an unſucceſsful war againſt the Perſians: but though his army was defeated in Aſia, and ſeveral towns taken from him, yet his forces in Hungary were victorious, and obliged the Auſtrians to ſign a peace in 1606, by which Achmet was allowed to retain all the conqueſts he had made. Soon after this peace, Achmet died, and

Oſman, his ſon, then only ſixteen years of age, ſucceeded him. He was a prince of great hopes, and ſeemed formed for governing a turbulent people; but being unſucceſsful in his wars againſt Poland, he was put to death by the Janiſſaries, whoſe power he intended to have reduced. He was ſucceeded by

Morad IV. who, after a long conteſt with the Perſians, made himſelf maſter of the city of Bagdad.

Ibrahim, his brother, ſucceeded him in the Othman throne, in 1640, but being a worthleſs, inactive prince, he was ſtrangled in the ſeraglio by the Janiſſaris, in 1648.

Mahomet IV. ſucceeded Ibrahim, and carried on a long war againſt the Venetians. During his reign, Candy was taken by the Turks, after a ſiege of thirty years, and the loſs of 180,000 men. A bloody war ſucceeded between the Turks and Imperialiſts, in which the former were ſo ſucceſsful, that they laid ſiege to Vienna; but were forced to raiſe it with great loſs, by John Sobieſki, King of Poland. This misfortune cauſed a ferment in Conſtantinople, Mahomet was ſhut up in priſon, and

Soliman II. Mahomet's brother, was placed upon the throne. The ſtandards of this prince were equally unfortunate, nor was his brother, Achmet II. more ſucceſsful: the Turks were beaten in almoſt every action, and victory ſeemed to have totally deſerted the Othman forces. Perſuaded that many of the late misfortunes were owing to the want of abilities in the Turkiſh generals,

Muſtapha II. who mounted the throne in 1696, headed his armies in perſon. But he was ſoon convinced that his opinion was too precipitately formed; the celebrated Prince Eugene, who then commanded the Imperial armies, totally defeated him, and a peace was concluded between the Imperialiſts and Turks, in the year 1699. This defeat terminated the reign of Muſtapha; he was depoſed, his mufti beheaded, and his brother,

Achmet III. was placed upon the throne. This prince was more ſucceſsful; he gave ſhelter at Bender to Charles XII. and terminated a ſucceſsful war againſt the Ruſſians, by a peace concluded at Pruth. He alſo declared war againſt the Venetians; but the numerous armies he levied for attacking the territories of that republic alarmed all Europe, ſo that the ſcene of action was tranſlated to Hungary. Eugene then commanded the Imperial army, and gave the Turks ſo many repeated defeats, that Achmet was forced to conclude an inglorious peace at Paſſarowitz, in 1718. Nor were the Turkiſh armies more ſucceſsful in Aſia; they were defeated by Kouli Khan, who had ſeized the throne of Perſia. Enraged at theſe repeated misfortunes, and alarmed at the progreſs of the Perſians, the populace demanded the heads of the vizier, the chief admiral, and the ſecretary. Theſe were accordingly ſtruck off; but even this ſacrifice was not ſufficient to appeaſe the clamours of the people, Achmet himſelf was depoſed, and

Mahomet V. advanced to the throne. This total change in the government did not however recall victory to the ſtandards of Othman. Mahomet was as unſucceſsful as his predeceſſor, and at laſt obliged to acknowledge the uſurper Kouli Khan as Sophi of Perſia.

The war being thus terminated in Aſia, Mahomet turned his arms againſt the Imperialiſts and Ruſſians; he was victorious in ſeveral actions with the former: Eugene was dead, and there was no other general of equal talents to ſupply his place: but his forces were not a match for the latter. Defeat ſucceeded defeat, and the progreſs of the Ruſſians was ſo rapid, that Conſtantinople itſelf was threatened with a ſiege. Reduced to this extremity, a haſty peace was concluded with the emperor, and ſoon after another with the Ruſſians, both diſadvantageous to the Turks. Mahomet died in 1754, and was ſucceeded by his brother,

Oſman III. who after a ſhort reign of three years, paid the debt of nature, and the crown was placed upon the head of Muſtapha III. This prince was born in 1723, and died on the 21ſt of January 1774, whilſt engaged in an unſucceſsful war againſt the Ruſſians.

Abdul

†

Abdul Hamed, or Achmet IV. grand ſeignior, was born in 1710, and ſucceeded to the throne of Turkey on the death of Muſtapha, his brother: he had three ſons and three daughters.

In the courſe of the war between Muſtapha and the Empreſs of Ruſſia, a conſiderable Ruſſian fleet was fitted out, which ſet ſail from the Baltic, with a view of ſhaking the remote parts of the Archipelago. This fleet firſt ſailed to Minorca, and departing from thence in the beginning of February 1770, ſhaped its courſe for the Morea. Count Orlow, the Ruſſian admiral, having debarked ſuch land forces as he had with him at Maina, which lies a little to the weſtward of Metapan, and about fifty miles to the ſouth-weſt of Miſitra, the ancient Sparta, the Marriotes, the deſcendants of the Lacedæmonians, and who ſtill poſſeſſed the country of their anceſtors, under ſubjection to the grand ſeignior, immediately flew to their arms in every quarter, and joined the Ruſſians by thouſands, from their averſion to the tyranny of the Turks. The other Greeks followed their example, or rather only waited to hear the arrival of the Ruſſians, to do what they had long intended; and the whole Morea ſeemed every where in motion. The open country was quickly over-run, and Miſitra, Arcadia, and ſeveral other places as ſpeedily taken, while the Ruſſian ſhips that had been ſeparated, or that put into Italy, arrived ſucceſſively, and landed their men in different quarters, where every ſmall detachment ſoon ſwelled to a little army, and the Turks were every-where attacked or intercepted. In the mean time the Greeks gave the utmoſt looſe to their revenge, and every where ſlaughtered the Turks without mercy; and the rage and fury with which the inhabitants of the continent were ſeized, extended itſelf to the iſlands, where alſo the Turks were maſſacred in great numbers. They were, indeed, unable to make head againſt the Ruſſians and Greeks in the field; their only protection was found within their fortreſſes. The mal-contents had ſo much increaſed ſince the firſt debarkation of the Ruſſians, that they inveſted Napoli di Romania, Corinth, and the caſtle of Patras, with ſeveral other places of leſs note.

Whilſt they were employed in theſe enterprizes, an army of 30,000 men, compoſed chiefly of Albanians and Epirotes, entered the Morea, commanded by Sereſkier, Baſhaw of Boſnia. This Turkiſh general recovered all the northern part of the peninſula, as ſoon as he appeared in it; and all the Greeks that were found in arms, or out of their villages, were inſtantly put to death. The Ruſſians were now driven back to their ſhips; but about the ſame time another Ruſſian ſquadron, commanded by Admiral Elphinſton, arrived from England, to reinforce Count Orlow's armament. The Turkiſh fleet alſo appeared, and an obſtinate engagement was fought in the channel of Scio, which divides that iſland from Natolia, or the Leſſer Aſia.

The Turkiſh fleet was conſiderably ſuperior in force, conſiſting of fifteen ſhips of the line, from ſixty to ninety guns, beſides a number of chebeques and gallies, amounting in the whole to near thirty ſail; the Ruſſians had only ten ſhips of the line, and five frigates. Some of the ſhips engaged with great reſolution, whilſt others, on both ſides, found various cauſes for not approaching ſufficiently near. But Spiritoff, a Ruſſian admiral, encountered the captain-pacha, in the Sultane, of ninety guns, yard-arm and yard-arm. They both fought with the greateſt fury, and at length ran ſo cloſe, that they locked themſelves together with grappling-irons, and other tackling. In this ſituation, the Ruſſians, by throwing hand granades from the tops, ſet the Turkiſh ſhip on fire, and as they could not now be diſentangled, both ſhips were in a little time equally in flames. Thus dreadfully circumſtanced, without a poſſibility of ſuccour, they both at length, blew up with a moſt terrible exploſion. The commanders and principal officers on each ſide were moſtly ſaved, but greateſt part of the crews were loſt.

The dreadful fate of theſe ſhips, as well as the danger to thoſe that were near them, produced a kind of pauſe on both ſides; after which the action was renewed, and continued till night, without any material advantage on either ſide. When it became dark, the Turkiſh fleet cut their cables, and ran into a bay on the coaſt of Natolia: the Ruſſians ſurrounded them thus cloſely pent up, and in the night ſome fire-ſhips were ſucceſsfully conveyed among the Turkiſh fleet, by the intrepid behaviour of lieutenant Dugdale, an Engliſhman in the Ruſſian ſervice, who, though abandoned by his crew, himſelf directed the operations of theſe veſſels of deſtruction. The fire took place ſo effectually, that in five hours the whole fleet, except one man of war, and a few gallies that were towed off by the Ruſſians, was totally deſtroyed; after which, they entered the harbour, and bombarded and cannonaded the town, and a caſtle that protected it, with ſuch ſucceſs, that a ſhot having blown up the powder-magazine in the latter, both were reduced to a heap of rubbiſh. Thus of a town, a caſtle, and a fine fleet, which had made a formidable appearance at one o'clock, there was ſcarcely left a veſtige at nine the ſame morning.

As we have, in our account of Ruſſia, given ſome of the military tranſactions by land, in the war between that empire and Turkey, we ſhall only add here, that after a moſt unfortunate war on the ſide of the Turks, peace was at length concluded between them and the Ruſſians, on the 21ſt of July, 1774, a few months after the acceſſion of the late grand ſeignior, Achmet IV. The emperor, Muſtapha III. left a ſon, then only in his 13th year; but as he was too young to manage the reins of government, in the then critical ſituation of the Turkiſh affairs, Muſtapha appointed his brother to ſucceed him in the throne; and to this prince he entruſted the care of his infant ſon, under the ſtrongeſt terms of recommendation. The preſent grand ſeignior is Selim III. born in 1761.

The great ſprings of thoſe ſucceſſes which have rendered the empire of the Turks ſo formidable, have been aſcribed to their perſeverance, their numerous Aſiatic armies, and an implicit ſubmiſſion to their officers, rather than to any excellency in military diſcipline, or courage in war. The extenſion, as well as duration of their empire, may indeed, in ſome meaſure, be owing to the military inſtitution of the Janiſſaries, a corps originally compoſed of the children of ſuch Chriſtian parents as could not pay their taxes. Theſe being collected together, were formed to the exerciſe of arms under the eyes of their officers in the ſeraglio; they were generally in number about 40,000, and ſo excellent was their diſcipline, that they were deemed to be invincible, and they ſtill continue to be the flower of the Turkiſh armies. But the Ottoman power is in a declining ſtate: the political ſituation of Europe, and the jealouſies that ſubſiſt among its princes, are now the ſureſt baſis of this empire, and the principal reaſon why theſe once haughty infidels are ſuffered to remain any longer in poſſeſſion of the fineſt provinces in the world.

CHAP. V.

EASTERN TARTARY.

Extent, Boundaries, Diviſions, Mountains, Rivers, Produce, Animals, Inhabitants, &c.

THESE vaſt regions are 4000 miles in length, and 2400 in breadth; being ſituated between 50 and 150 deg. eaſt long. and 30 and 72 deg. north latitude.

Taken in its fulleſt extent, Tartary is bounded by the Frozen Ocean on the north; by the Pacific Ocean on the eaſt; by China, India, Perſia, and the Caſpian Sea, on the ſouth; and by Muſcovy on the weſt.—But the accounts given us by geographers, reſpecting the extent, limits, and ſituation of this country, are not to be depended upon entirely, ſince the emperor of Ruſſia and his miniſtry are ignorant of his preciſe limits with the Chineſe, Perſians, and other nations.

One part of this extenſive territory is ſubject to the Chineſe empire, another is under the dominion of Ruſſia; and the third is independent.

Its grand diviſions, ſubdiviſions, and chief towns, are as follow:

The north-eaſt diviſion contains the Kamtſchatka Tartars, whoſe chief town is Kamtſchatka; and the Jakutſkoi-Tartars, whoſe chief town is Jakutſkoi.

The ſouth-eaſt diviſion includes the Thibet and Mogul-Tartars, whoſe chief towns are Bratſki, Thibet, Polon, Kudak, containing 985,380 ſquare miles.

The north-weſt diviſion compriſes Samoieda and Oſtiack: their chief towns are Mangaſia and Kortſkoi.

The ſouth-weſt diviſion contains Circaſſian and Aſtrachan-Tartary, whoſe chief towns are Terki and Aſtrachan.

The middle diviſion includes Siberia, with its chief town, Tobolſk; Kalmuck-Tartary, and its chief town, Bokharia; and Uſbeck-Tartary, whoſe chief town is Samercand; Kalmuck-Tartary contains 850,000 ſquare miles, and Uſbeck-Tartary 339,840.

The chief mountains of Tartary are Caucaſus in Circaſſia, and the mountains of Taurus and Ararat, ſo contiguous to it, that they appear like a continuation of the ſame mountain, which croſſes all Aſia from Mingrelia to the Indies; and the mountains of Stolp, in the north.

Its ſeas are, the Frozen Ocean, the Pacific Ocean, and the Caſpian.

There are ſeveral lakes in Tartary, the moſt conſiderable of which are the Baikal, the Kiſan, and the Kologal.

The moſt remarkable rivers are, the Wolga, which runs a courſe of 2000 miles; the Obey, which divides Aſia from Europe, the Tabol, Irtis, Geneſa or Jenſka; the Argun, which divides the Ruſſian and Chineſe empires; the Burrumpooter, and the Lena.

As this country is of a vaſt extent from north to ſouth, conſequently the air, climate, ſoil, and produce, muſt be very different; the ſouthern parts being in the ſame latitudes with Spain, France, Italy, and part of Turkey; and the northern reaching beyond the arctic polar circle.

The moſt uncomfortable regions are Nova Zembla and Ruſſian Lapland; the earth, which is covered with ſnow nine months in the year, being extremely barren, and every where incumbered with unwholeſome marſhes, uninhabited mountains, and impenetrable thickneſſes.

Mr. Bell, who travelled with the Ruſſian ambaſſador to China, repreſents ſome parts of Tartary as fertile and deſirable countries, which, when cultivated, yield excellent fruits, particularly very large grapes; and the graſs grows ſpontaneouſly to an amazing height; but the Tartars have no idea of making it into hay. The common productions are, ſome wheat, rice, barley; ſeveral kinds of roots, and pulſe, coffee, aloes, and various other drugs. Their method of procuring early graſs for their cattle, particularly in Mongalia, is very extraordinary: during the high winds which blow here in ſpring, they ſet fire to the rank graſs; this runs in a moſt amazing manner, and the flames frequently ſpread till their progreſs is ſtopped by ſome river or barren hill. The following year the aſhes of this conſumed graſs, waſhed into the earth by the ſnow as it melts, prove ſuch excellent manure, that the young graſs ſprings thicker than wheat, on the land thus prepared.

Beſides other land and amphibious animals common in the north parts of Europe, ſuch as bears, wolves, &c. there are, in ſome parts of Tartary, camels, dromedaries, goats with yellow hair, ſquirrels, foxes, an animal called hautchan, reſembling an elk; another called chulon or chaliſon, which ſeems to be a ſort of lynx, a little creature called tael-pe, and marmots. The laſt of theſe animals are chiefly found on the hills in Mongalia, where they burrow under the broad ſpreading leaves of the rhubarb plants; to the growth of which it is ſaid their dung, and their caſting up the earth about the roots, greatly contribute. Their horſes are of a good ſize for the ſaddle, and are very hardy; as they run wild till they are five or ſix years old, they are generally headſtrong.

Near Aſtrachan, there is a bird (by travellers taken to be the pelican) called by the Ruſſians Baba, of a grey colour, and ſomething larger than a ſwan; he has a broad bill, under which hangs a bag that may contain a quart or more; he wades near the edge of a river, and, on ſeeing a ſhoal or fry of ſmall fiſhes, ſpreads his wings, and drives them to a ſhallow, where he gobbles as many of them as he can into his bag, and then going aſhore, eats them, or carries them to the young.

The population of Tartary can never be aſcertained; but from ſome circumſtances we muſt conclude, that the number of inhabitants are by no means proportioned to the extent of their country. Theſe people, originally deſcended from the Scythians, are now generally divided into three diſtinct powers; the firſt are thoſe known by the name of Tartars, the ſecond are the Calmucks, and the third the Monguls. The Tartars, properly ſo called, live to the weſt of the Caſpian ſea. The moſt conſiderable of them are the Uſbecks, ſubject to Perſia; the Kara Kallpacks, the Nogais, and the Baſkirs, the two laſt being ſubject to Ruſſia; and the Dagheſtans, who depend on no power, and are more ſavage and untractable than any of the reſt.

In their perſons they are generally ſhort and ſtout, with broad faces, flat noſes, and ſmall but quick black eyes. They continually thin their beards by plucking the hairs out by the roots, ſo that they are ſcarcely viſible. The women bear a ſtrong reſemblance to the men, except in Circaſſia, where they are eſteemed as remarkable beauties, and are admired for their wit and addreſs. Many of them are found in the ſeraglios of the grand ſeignior, and other great perſonages, both in Turkey and Perſia; being purchaſed of their parents, while exceeding young, by merchants, who cauſe them to be inſtructed in ſuch accompliſhments as may tend to enhance their value when offered to ſale. The Tartarian women are famed for being honeſt, ſincere, and in general very modeſt. Adultery is a crime ſcarce ever heard of among them.

In their diſpoſitions the Tartars are naturally eaſy and cheerful, always diſpoſed to laughter, and ſcarce ever experience either care or melancholy. They are extremely hoſpitable to each other, and likewiſe to ſtrangers, who put themſelves under their protection. Their ideas of filial duty cannot be exceeded, and ſcarcely equalled, by more poliſhed nations; but they ſometimes carry them to what we muſt term, a cruel height, for if any of them are rendered infirm by age, or ſeized with an incurable diſtemper, they build a ſmall hut, near ſome river, into which they put the patient with a quantity of proviſions, and then quitting him, ſeldom or never return to know his fate. The reaſon they aſſign for this ſtrange conduct is, that they do their parents a good office in ſending them to a better world; for they believe in a future ſtate, and that virtue leads to happineſs, and vice to miſery: therefore, when tempted by another to commit a bad action, they uſually, if well-diſpoſed, reply in the following

lowing proverb: "Though a knife be ſharp, it cannot cut its own handle." Their only employment is tending their flocks, hunting, and managing their horſes; for, being inured to horſemanſhip from their infancy, they ſeldom appear on foot; their dexterity in ſhooting at a mark is inconceivable, and frequently while in full gallop, they will cleave a pole, at a conſiderable diſtance from them, with an arrow. They avoid all kind of labour, and have few mechanics among them, except thoſe who make arms. In general, they lead a wandering life, ſetting out in the ſpring, frequently ten thouſand in a body, preceded by their flocks and herds; and when they come to an inviting ſpot, they pitch their tents, and ſtay there till all the graſs is conſumed, when they again ſet forward in ſearch of another fertile plain. Some of them live in huts half ſunk under ground, the fire being in the centre, with a hole juſt over it in the roof to let out the ſmoke, and round it are benches to ſit or lie upon. This ſeems to be the common method of living among all the northern nations, from Lapland eaſtward, to the Japaneſe ocean. In the northern provinces, as ſoon as the winter ſets in, every family burrows itſelf under ground, nor do they emerge again till the ſucceeding ſpring.

Their favourite food is horſe-fleſh, which they broil and roaſt, and ſometimes large pieces of it are ſmoked or dried in the ſun; but they never eat it raw, as is commonly believed, unleſs compelled to it by neceſſity. On long marches, all their proviſions conſiſt of cheeſe, or rather dried curd, made up into little balls, which they pound, and, mixing the powder with water, drink it.

Some of the tribes are far more filthy than others, but in this particular none exceed the Kamtſchatkans, who are ſaid never to waſh their hands or face, nor cut their nails: they eat out of the ſame diſh with the dogs, without ever being waſhed every thing about them ſtinks of fiſh, and they never comb their heads. Both men and women plait their hair in two locks, binding the ends with ſmall cords. If any hair happens to ſtart out, they ſew it down with thread, to make it lie cloſe, by which means their heads ſwarm with vermin, which they ſcrape off with their hands.

The Tartars have very little money except what they get from the Ruſſians, and their other neighbours, in exchange for cattle: and with this they ſometimes buy meal, but it is more frequently expended in cloths, ſilks, ſtuffs, and other apparel for their women, whom they likewiſe purchaſe with cattle.

They are not very nice in their marriages, it not being uncommon, in ſome of the more barbarous tribes, for a father to marry his own daughter; and there is very little difference made between the child of a concubine or ſlave, and that of a wife, except that, among the heads of tribes, the wife's ſon is always preferred in the ſucceſſion. But what is ſtill a greater hardſhip, every wife when turned of forty, is degraded to the menial offices of a ſervant, and, as ſuch, muſt wait on the young wife who ſucceeds to her place.

The Tartarian dreſs is very ſimple; that of the men conſiſts of a ſhort jacket, with narrow ſleeves, made of deer-ſkins, with the fur outward, and trowſers and hoſe all of one piece. Moſt of the tribes ſhave their heads, except a lock behind, which is plaited, and hangs down their backs. They wear a cap turned up with fur, adorned on the top with a taſſel of red ſilk. The women are dreſſed in looſe gowns, ornamented and bordered with different colours; they all wear ear-rings, and their hair plaited in ſeveral locks. Thoſe of moſt conſequence among them, wear ſilk garments in the ſummer.

The inhabitants of Siberia are, like their anceſtors, moſt of them idolaters. They conſiſt of many nations, entirely differing from each other in their manner of living, religion, language, and countenances. But in this they agree, that none of them follow agriculture, which is carried on by ſome Tartars, and ſuch as are converted to Chriſtianity. A few of them breed cattle, and others follow hunting. The population of Siberia has been much increaſed ſince it became a Ruſſian province; for the Ruſſians have built therein a number of towns, fortreſſes, and villages. Notwithſtanding which, it preſents but a void and deſert appearance; ſince, by its extent, it is capable of ſupporting ſeveral millions more than it at preſent contains.

The religion of the Circaſſians is Paganiſm; for, notwithſtanding they uſe circumciſion among them, they have nither prieſt, koran, or moſque, like other Mahometans. Every body here offers his own ſacrifice at pleaſure, for which, however, they have certain days, eſtabliſhed more by cuſtom than any poſitive command. Their moſt ſolemn ſacrifice is offered at the death of their neareſt friends, upon which occaſion both men and women meet in the field to be preſent at the offering, which is a he-goat: this being killed, they flay it, and ſtretch the ſkin, with the head and horns on, upon a croſs at the top of a long pole, placed commonly in a quickſet hedge (to keep the cattle from it) and the ſacrifice is offered near the place, by boiling and roaſting the fleſh, which they afterwards eat. When the feaſt is over, the men riſe, and having paid their adoration to the ſkin, and muttered over ſome certain prayers, the women withdraw, and the men conclude the ceremony with drinking a great quantity of aqua vitæ, and this generally ends in a quarrel before they break up the meeting.

We ſhall now proceed to give an account of the religion and government of the kingdom of Thibet, and Laſſa, a large tract of Tartary bordering upon China, which is conſidered as the moſt remarkable, and moſt worthy of attention. The Thibetians are governed by the Grand Lama, or Delai Lama, who is not only ſubmitted to, and adored by them, but is alſo the great object of adoration for the various tribes of heathen Tartars, who roam through the vaſt tract of continent which ſtretches from the banks of the Wolga, to Korea on the ſea of Japan. He is not only the ſovereign pontiff, the vicegerent of the deity on earth; but, as ſuperſtition is ever the ſtrongeſt, where it is moſt removed from its object, the more remote Tartars abſolutely regard him as the Deity himſelf. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up from different parts, to worſhip and make rich offerings at his ſhrine: even the emperor of China, who is a Manchon Tartar, does not fail in acknowledgments to him in his religious capacity, though the Lama is tributary to him, and actually entertains, at a great expence, in the palace of Pekin, an inferior Lama, deputed as his nuncio from Thibet. The opinion of thoſe who are reputed the moſt orthodox among the Thibetians, is, that when the Grand Lama ſeems to die, either of old age or infirmity, his ſoul in fact only quits a crazy habitation, to look for another younger or better, and it is diſcovered again in the body of ſome child, by certain tokens known only to the Lamas or prieſts, in which order he always appears.

In 1774 the Grand Lama was an infant, which had been diſcovered ſome time before the Tayſloo Lama, who in authority and ſanctity of character is next to the Grand Lama, and during his minority acts as chief. The Lamas, who form the moſt numerous as well as the moſt powerful body in the ſtate, have the prieſthood entirely in their hands; and, beſides, fill up many monaſtic orders, which are held in great veneration among them. The reſidence of the Grand Lama is at Patoli, a vaſt palace on a mountain near the banks of the Barampooter, about ſeven miles from Laſſa. The Engliſh Eaſt-India company made a treaty with the Lama in 1774, in conſequence

of the fort of Dellamcotta, the principal pafs through the ridge of the Bootan mountains, being taken by ftorm by Capt. Jones, in 1773, which made the Thibetians fue for peace. The people at Thibet have great veneration for the cow, and alfo highly refpect the waters of the Ganges, the fource of which they believe to be in heaven. The Sunniaffes, or Indian pilgrims, often vifit Thibet as an holy place, and the Lama always entertains a body of two or three hundred in his pay. Befides his religious influence and authority, the Grand Lama is poffeffed of unlimited power throughout his very extenfive dominions.

The religion of Schamanifm is alfo very prevalent among the Tartars. The profeffors of this religion believe in one fupreme God, the creator of all things. They believe that he loves his creation, and all his creatures; that he knows every thing, and is all-powerful; but that he pays no attention to to the particular actions of men, being too great for them to be able to offend him, or to do any thing that can be meritorious in his fight. But they alfo maintain, that the Supreme Being has divided the government of the world, and the deftiny of men, among a number of inferior divinities, under his command and control, but who nevertheleſs generally act according to their own fancies; and therefore it is incumbent on mankind to ufe all the means in their power for obtaining their favour. They likewife fuppofe, that, for the moft part, thefe fubordinate deities abominate and punifh premeditated villainy, fraud, and cruelty. They are all firmly perfuaded of a future exiftence; but they have many fuperftitious notions and practices. Among all the Schamanes, women are confidered as beings vaftly inferior to men, and are thought to have been created only for their fenfual pleafure, to people the world, and to fuperintend and manage houfehold affairs; in conſequence of thefe principles, it is no wonder they are treated with that contempt and feverity they commonly meet with.

Among a nation of Tartars, the reader cannot expect to find a very fatisfactory account on the article of learning; it is, however, very certain, that under Jenghis Khan and Tamerlane, and their early defcendants, Aftrachan and the neighbouring countries were the feats of learning and politeneſs, as well as empire and magnificence. Modern luxury, be it ever fo fplendid, falls fhort of that of thofe princes; and there are ftill extant fome remains of their taſte in architecture, but thefe are only to be found in deſolate and almoft inacceffible places. The cultivation of learning was the firft care of the prince, and generally committed to the care of his own relations. They wrote in the Perfian or Arabic tongues; and their hiftories carry with them the ftrongeft marks of authenticity: many of thefe are ftill extant in manufcript.

Their curiofities are comprehended in the remains of the buildings left by the above-mentioned great conquerors, and their fucceffors. Here are remains of ditches and ramparts, which heretofore either furrounded fmall towns, now quite demolifhed, or were deſigned for the defence of camps, forts, or caftles, the veſtiges of which are often to be difcovered upon the fpot, as well as other traces of buildings, &c. which ftrongly indicate their priſtine importance. Many of them are in tolerable preſervation, and make ſome figure even at preſent.

The Slabode, or Tartarian fuburb of Kafimof, on the Oha, ſeems to have been the reſidence of ſome khan. In the midft of the ruins of that city is a round and elevated tower, called in their language Mifquir, a ſort of temple, or building dedicated to devotion. Here are alſo the remains of the walls of a palace; and in one of the maſarets, or burial-places, is a very conſiderable mauſoleum; all of which edifices are built of hewn ſtone and bricks. From an Arabic inſcription we learn that the khan of Schagali was buried there in the nine hundred and ſixty-ſecond year of the hegira, or the one thouſand five hundred and twentieth of the chriſtian æra. Near Mount Caucaſus are ſtill very conſiderable remains of Madſchar, a celebrated city of former times. Near Derbent are numerous tombs covered with cylindrical ſtones, exceeding the uſual ſtature of men, with Arabic inſcriptions.

In the environs of Aſtrachan, the ruins of ancient Aſtrachan are very viſible, and the rubbiſh and ramparts of another reſpectable town ſtill exiſt near Tzantzin, on the left ſhore of the Wolga. A little below the mouth of the Kama, which empties itſelf into the above-mentioned river, are many ſuperb monuments of the ancient city Bulgaria, conſiſting of towers, moſques, houſes, and ſepulchres, all built of ſtone or brick. The oldeſt epitaphs have been there more than eleven centuries, and the moſt modern at leaſt 400 years. Not far from hence, on the Tcheremtſcham, a little river that runs into the Wolga, are found ruins ſomewhat more injured by the depredations of time: they are thoſe of Boulymer, an ancient and very conſiderable city of the Bulgarians. The ſmall town of Bilyairſk has been erected by the Tartars upon its ruins.

There is a monument, in the fortreſs of Kaſan, of the ancient Tartarian kingdom of that name. Its lofty walls are ſo broad, that they ſerve at preſent for ramparts: the turrets of which, as well as the old palace of the khan, are built of hewn ſtone. In going up the river Kaſanha, we meet with epitaphs, and the ſtrong ramparts of the old Kaſan. Near the Oufa are cemeteries full of innumerable inſcriptions, and ſeveral ſepulchral vaults. The ramparts of Sibir, the ancient capital of Tartary, are ſtill ſeen about Tobolſk upon the Irtiſch. The lofty walls of Tontoura appear yet in the Baraba, a little gulph in the river Om; and near the mouth of the Oural are the ditches of the city Saratſchik. Not to mention a great number of other cities and ruins in Siberia; and eſpecially all thoſe that are to be met with in the deſert of Kirgius, which abounds in the relics of opulent cities. Some gold and ſilver coins have likewiſe been found, with ſeveral manuſcripts neatly written, which have been carried to Peterſburg.

About eighty miles from Laſſa is the lake Palte, or Jangſo; of that extent, the natives ſay it requires eighteen days to walk round it. In the middle of it are iſlands, one of which is the ſeat of the Lamiſſa Turcepama, or the great regenerate, in whom the Thibetians think a divine ſpirit reſides, as in the Great Lama. M. Voltaire, in his Hiſtory of Peter the Great, informs us, that there were found in Kalmuc Tartary a ſubterraneous houſe of ſtone, ſome urns, lamps, and ear-rings, an equeſtrian ſtatue, an oriental prince with a diadem on his head, two women ſeated on thrones, and a roll of manuſcript, which was ſent by Peter the Great to the Academy of Inſcriptions at Paris, and proved to be in the language of Thibet. Hair, fine wool, coarſe cloths, rock ſalt, muſk, and gold, are their ſtaple commodities.

CHAP. VI.

DESCRIPTION OF VARIOUS ISLANDS

DISCOVERED OF THE RUSSIANS.

THOUGH the voyagers of Columbus and Vaſquez de Gama had diſcovered a new world in the weſt, and proved the cauſe of exploring many countries little known, but by hearſay, in the oriental quarter of the world; yet it was ſtill ſuppoſed, by many who curiouſly contemplated the figure of the globe, that there were many iſlands in the eaſtern ocean.

ocean, and much land to the ſouthward yet remaining undiſcovered; and ſome for a long time entertained the idea of a vaſt ſouthern continent, or firſt diviſion of the world, which they contended was neceſſary to keep up the due balance of the terraqueous globe.

While theſe things were yet in contemplation, the Ruſſians diſcovered the northern Archipelago, a vaſt number iſlands ſituate between the eaſtern coaſt of Kamtſchatka and the weſtern part of the continent of America; the firſt project for making which diſcoveries was actually conceived and ſet on foot by the Czar Peter the Great. The firſt group of theſe iſlands called Saſignan, comprehends (partly under the name of Aleutian Iſles.) 1. Beering's-Iſland. 2. Copper-Iſland. 3. Orma. 4. Samyra. 5. Anakta. The ſecond group, called Khao, contains eight iſlands. 1. Immaak. 2. Kiſka. 3. Ichetchia. 4. Ava. 5. Kavia. 6. Iſchangulak. 7. Ulagama. 8. Amtſchkidga. The third, under the general name of Negho, comprehends a number of iſlands, ſixteen of which are thus denominated. 1. Amatkinak. 2. Ulak. 3. Unalga. 4. Navoltſha. 5. Uliga. 6. Anagin. 7. Kagulak. 8. Illak. 9. Takavanga. 10. Kanaga; on both which are volcanos. 11. Leg. 12. Sketſkuna. 13. Tugaloon. 14. Goreloi. 15. Ochtu. 16. Amla. The fourth group, which is called Kavalang, and by the Ruſſians the Fox-Iſlands, contains: 1. Amuchta. 2. Ttſchigama. 3. Iſchegula. 4. Uniſtra. 5. Ulaga. 6. Tauagulana. 7. Kagamin. 8. Kigalga. 9. Skelmaga. 10. Umnak. 11. Agun-Alaſhka. 12. Unimga. 13. Uligan. 14. Anturo-Leiſume. 15. Semidit. 16. Senagak.

The natives of theſe iſlands (ſome of which are only occaſionally inhabited) are, in general, ſtrong and robuſt, but ſhort in ſtature. They have little beards, lank black hair, and flat faces, with a fair complexion. The inhabitants of the Aleutian Iſles generally live upon wild animals and roots which grow ſpontaneouſly, little troubling themſelves to catch the fine fiſh with which the rivers abound.

Copper-Iſland takes its name from the quantity of copper which the ſea throws upon its coaſts. The Fox-Iſlands receive their appellation from the number of black, grey, and red foxes which are found there. The inhabitants are the moſt numerous and warlike of all theſe Tartars, they generally wear a cap, and a coat that reaches to the knee. Some of them adopt caps of a party-coloured bird-ſkin, on which they ſuffer part of the wings and tail to remain. They often ornament theſe on the fore part with a board ſet with jaw-bones of ſea-bears, and ornamented with beads. They generally eat their fleſh and fiſh raw, and ſo they feed their children with it; but when they think proper to dreſs their food, they chooſe a hollow ſtone in which they put the viands, cloſing the interſtices with clay or lime; then laying that horizontally on two other ſtones, kindle a fire beneath. What they intend for keeping, they do not ſalt, but dry it freſh in the open air.

They uſe bows and arrows, darts, and wooden targets in war. They live together either in families, or ſocieties of ſeveral families united, which they call a race; and theſe are in a ſtate of alliance, though without any ſettled form of government. Nor does it appear that they have either eſtabliſhed laws or puniſhments, but property in each iſland is held in common among every ſociety, and ſo enjoyed without diſturbance. The conſequence is a perfect equality, that child of the ſimplicity of nature, never to be expected in mighty ſtates or in great republics, and ſo often conſidered as a mere Utopian ſcheme and idle dream by European politicians.

Theſe people are deſcribed as poſſeſſing, with but little acuteneſs, a good portion of natural ſenſe; in general, ſlow and phlegmatic, but capable of being rouſed by injuries to a moſt implacable fury, and ſuſceptible of apprehenſions of evil, which will often drive them to the commiſſion of ſuicide, which they perpetrate with great apparent indifference. They ſeem much averſe to the viſits of their powerful neighbours the Ruſſians.

As a race of Tartars, delicacy is not to be expected among theſe iſlanders; and they may well be concluded ſtrangers to what is termed the refinement of manners. They ſeldom heat their dwellings, but when they are neceſſitated to warm themſelves, they either fire train oil, and pour it into a hollow ſtone, or ſtand over a bundle of burning hay, and this they think ſufficient. They endure the cold the more eaſily becauſe they are inured to it from early youth: a mother will carry her infant when it cries to the ſea-ſide, though in winter, and hold it in the water till it is quiet; by which means the child, as it grows up, can walk barefooted at all ſeaſons, and never experiences any ſenſible inconvenience from the ſeverity of the weather. Trees are not found on theſe iſlands, but drift wood is brought on ſhore in great quantities.

Being of an hoſpitable diſpoſition, the natives of the northern Archipelago make frequent feaſts, at the celebration of which they put on their moſt ſhewy caps, and advance in proceſſion to meet their gueſts with drums beating, preceded by ſinging and dancing women, eſpecially if the people of one iſland are viſited by thoſe of another; and theſe feaſts form the principal part of their recreation.

Such are the manners of the inhabitants of a cluſter of iſlands which were diſcovered at various times; and, as we have already obſerved, on a plan conceived by Peter the Firſt, that famous reformer and enlightener of his people. But great projects do not always meet with immediate ſucceſs.

It was in the year 1728 that Beering and Tſchirichoff, two Moſcovite navigators, ſailed firſt on a voyage of diſcovery, which, however, produced nothing worthy of notice. A ſecond expedition ſucceeded no better; and in a third voyage, in 1741, Beering's ſhip was caſt away, and he died on an iſland not far from Kamtſchatka; and ſo little did the Ruſſians poſſeſs of nautical knowledge, that notwithſtanding all encouragements given by their government, and though theſe iſlands were in their own neighbourhood, no perfect idea of them was obtained till ſo late as the year 1750. The account which we have here given, is from the authority of Mr. Muller, who conſulted many journals of voyages, by the direction of the late Empreſs of Ruſſia, to which he added the ſubſtance of further information received from a native and chief of one of the iſlands, who was brought to Peterſburgh in the year 1751.

CHAP. V.

KAMTSCHATKA.

Extent, Boundaries, Inhabitants, &c.

THIS is a great peninſula, extending from north to ſouth about 7 deg. 30 min. It is divided into four diſtricts, Bolchereſk, Tigilſkaia Krepoſt, Verchnei, or Upper Kamtſchatkoi Oſtrog, and Niſhnei, or Lower Kamtſchatkoi Oſtrog. The eaſtern ocean ſeparates it from America; on the weſt, it has Penſchinſka for its boundary, commencing near the ſouthern point of the Cape of Kamtſchatka, and extending northerly between Ochotſkoy and the weſtern coaſt of Kamtſchatka. The ſouthern part is 51 deg. north lat. and 143 deg. long. eaſt of London.

The inhabitants have no one fixed general name for this country, though the Ruſſians call the whole of it Kamtſchatka: it has the ſeveral names of Kurilſki, Bolſcheretſki, Awatcha Koreki, Ukoi, and Tegil, ſome from the names of the natives, and others from

ſome particular or memorable circumſtance. The three divided nations have different languages.

The Kamtſchadales are ſhort in ſtature, have dark hair, hollow eyes, ſharp noſes, and tawny complexions. Their dreſs conſiſts of deer-ſkins, with the fur outwards; alſo of dog-ſkins, and thoſe of other animals. They often wear two coats, the ſleeves of the outer coat reaching down to the knees; they have a hood to it, which in bad weather ſerves to cover the head: and they ornament the back part with ſhreds of ſkins, and ſometimes with ſilk of different colours.

The men wear a leather belt round them, and their legs are covered with different coloured ſkins; they wear ſeal-ſkin caps or hats, and ſometimes a hat or cap of birch bark: ſome have caps of graſs plaited.

The women wear the ſame ſorts of garments as the men; though their coats, or rather waiſtcoats, ſit cloſer to their bodies, and are decorated with ſlips of red, blue, and yellow cloth, and ſometimes ribband, or woollen liſt. They have fur caps, that are white within, and black without: they let their hair grow much longer than the men, plait it, and hang braſs trinkets to it.

There are three volcanoes in Kamtſchatka. The firſt is that of Awatcha, to the northward of the bay of that name. The ſecond iſſues from ſome mountains ſituated between the river of Kamtſchatka and that of Tabolſki. The third volcano iſſues from the higheſt mountain in Kamtſchatka on the banks of the river of that name.

The Kamtſchadales live ſome of them in huts, others in the woods, and on the banks of rivers.—The men, when not employed in hunting or fiſhing, weave nets, and conſtruct ſledges or boats: in the ſpring and ſummer they procure the neceſſaries of life, and lay up a ſtore for the ſucceeding winter, which is not very inclement, though their ſpring and ſummer do not continue more than four months.

The Province of Jakutſkoi.

In this country, and the northern parts of Siberia, the cold ſometimes increaſes ſo conſiderably in a few hours as to ſtrike men and cattle dead, who happen to be at too great a diſtance from any habitation to ſhelter themſelves from it: but when ſome parts of the body are only frozen, they rub them with ſnow, by which the circulation is immediately reſtored. This ſevere weather is ſucceeded by ſo hot a ſummer, that the inhabitants are obliged to go partly naked.

In the northern parts, beyond the ſixtieth degree of latitude, the earth produces neither corn nor fruit; they are however, ſupplied with thoſe neceſſaries from the ſouthern parts; and they are in want of neither fiſh nor animal food; for they have a great diverſity of the former, and a plenty of tame and wild animals; and as to fuel, they have alſo a ſufficiency of that neceſſary article.

There is ſome corn in the country of the Jakutſkoi, but they pay little regard to it, as their chief attention, like that of their neighbours, is employed in hunting animals.

The town of Jakutſkoi, on the river Leno, is the capital of the province, and is about 400 miles from the Frozen Ocean.

Theſe people form one of the moſt conſiderable and numerous Pagan nations in this vaſt country: they are divided into ten tribes, making in the whole not leſs than 30 or 40,000 perſons, all under the dominion and taxation of Ruſſia.

The Jakuti believe in a Supreme Being, and have attempted to give an image of him; the image, however, hath a very hideous aſpect, with a big head, and large eyes of coral. They place it in a tree, and cover it with furs: once a year they aſſemble together, and ſacrifice horſes, &c. to this image, ſticking up the horſes heads all round the tree. Then ſitting down in a circle, they drink of a liquor which they call cumoſe, and get intoxicated with it. They alſo throw ſome of the liquor into the air, and into a fire which they light on the occaſion.

When Captain Cook firſt made the land of the Jakutſkoi, in Auguſt 1778, it was ſuppoſed by ſome, on board the Reſolution, to be a part of the iſland of Alaſchka, laid down in Mr. Stæhlin's map; but, from the appearance of the coaſt, and other circumſtances, it was ſoon conjectured to be rather the country of the Jakutſkoi, or the eaſtern extremity of Aſia, explored by Beering in 1728. In admitting this, however, without farther examination, we muſt have pronounced Mr. Stæhlin's map, and his account of the new Northern Archipelago, to be either remarkably erroneous, even in latitude, or elſe to be a mere fiction; a judgment which we would not preſume to paſs upon a publication ſo reſpectfully vouched, without producing the moſt deciſive proofs.

This country, lying on the eaſtern coaſt of Aſia, is bounded on the ſouth by the river Anadir, and extends along the ſhore, to the north and north-eaſt, to 74 deg. of latitude.

Upon Captain Cook's landing, with a party of our people, at this place, thirty or forty men, each of whom was armed with a ſpontoon, a bow, and arrows, ſtood drawn up on an eminence near the houſes. Three of them came down towards the ſhore, on the approach of our people, and were ſo polite as to pull off their caps, and make them low bows. Though this civility was returned, it did not inſpire them with ſufficient confidence to wait for their landing; for, the inſtant the boats put aſhore, the natives retired. Captain Cook followed them alone, without any thing in his hand, and, by ſigns and geſtures, prevailed on them to ſtop, and accept ſome trifling preſents. In return for theſe, they gave him two fox-ſkins, and a couple of ſea-horſe teeth. The captain was of opinion, that they had brought theſe articles down with them, for the purpoſe of preſenting them to him, and that they would have given them, even if they had expected no return.

They diſcovered manifeſt tokens of apprehenſion and fear, intimating their deſire, by ſigns, that no more of our people ſhould be ſuffered to come up. On the captain's laying his hand on the ſhoulder of one of them, he ſtarted back ſeveral paces. In proportion as he advanced, they retreated, always in the attitude of being ready to make uſe of their ſpears; while thoſe on the eminence were ready to ſupport them with their arrows. Inſenſibly, however, the captain, and two or three of his companions, introduced themſelves among them. The diſtribution of a few beads among ſome of them ſoon created a degree of confidence; ſo that they were not alarmed, when the party was joined by a few more; and, in a ſhort time, a kind of traffick was entered into. In exchange for tobacco, knives, beads, and other articles, they gave a few arrows, and ſome of their clothing: but nothing that our people had to offer, could induce them to part with a ſpear or a bow. Theſe they held in continual readineſs, never quitting them, except at one time, when four or five perſons laid theirs down, while they favoured our people with a ſong and a dance; and even then, they placed them in ſuch a manner, that they could lay hold of them in a moment.

Their arrows were pointed either with ſtone or bone, but very few of them had barbs; and ſome of them had a round blunt point. What uſe theſe are applied to could not be determined, unleſs it be to kill ſmall animals without damaging the ſkin.

Their ſpontoons, or ſpears, were of iron or ſteel, and of European or Aſiatic workmanſhip; and conſiderable pains had been taken to embelliſh them with carving, and inlayings of braſs, and of a white metal. Thoſe who ſtood with bows and arrows in their hands, had the ſpear ſlung by a leathern ſtrap over their right ſhoulder. A leathern quiver, ſlung over their left ſhoulder,

ſhoulder, ſerved to contain arrows; and ſome of theſe quivers were exceedingly beautiful, being made of red leather, on which was very neat embroidery, and other ornaments. In this and ſome inſtances of their clothing, they gave proofs of a degree of ingenuity, not to be expected among the inhabitants of ſo northern a region. The natives were robuſt and well proportioned. No women or children, of either ſex, were obſerved, nor any aged perſons, except one man, whoſe head was bald, and he was the only one who bore no arms: the others ſeemed to be ſelect men, and rather under than above the middle age. The elderly man had a black mark acroſs his face, which was not perceived in any others. All of them had their ears perforated, and ſome had glaſs beads hanging to them. Theſe were the only fixed ornaments ſeen about them, for they wore none to their lips.

The dreſs of theſe people conſiſted of a frock, a pair of breeches, a pair of boots, and a pair of gloves, all made of the ſkins of deer, dogs, ſeals, and other animals, extremely well dreſſed, ſome with the hair or fur on, and others without it. Their hair was apparently black; but their heads were either ſhaved, or their hair cut cloſe off; and none of them wore beards.

They have their winter and ſummer habitations: the former are like a vault, the floor of which is ſunk below the ſurface of the earth. One of them examined by Captain Cook's people, was of an oval figure, about twenty feet in length, and twelve or more in height; the framing conſiſting of wood and the ribs of whales, judiciouſly diſpoſed, and bound together with ſmaller materials of the ſame kind. Over this framing, a covering of ſtrong coarſe graſs was laid, and that again was covered with earth; ſo that on the outſide the houſe had the appearance of a little hillock, ſupported by a wall of ſtone, of the height of three or four feet, which was built round the two ſides, and one end. At the other end of the habitation the earth was raiſed ſloping, to walk up to the entrance, which was by a hole in the top of the roof, over that end. The floor was boarded, and under it was a ſort of cellar, in which was ſeen nothing but water. At the end of each houſe was a vaulted room, which was ſuppoſed to be a ſtore-room.

Their ſummer huts were of a tolerable ſize, and brought to a kind of point at the top. Slight poles and bones, covered with the ſkins of ſea-animals, compoſed the framing. The inſide of one being examined, there was a fire-place juſt within the door, where a few wooden veſſels were depoſited, all very dirty. Their bed-places were cloſe to the ſide, and occupied about one half of the circuit: ſome degree of privacy ſeemed to be obſerved; for there were ſeveral partitions made with ſkins. The bed and bedding conſiſted of deer ſkins, and moſt of them were clean and dry.

When a viſiter comes to ſee them, he is always preſented with the maſter of the hut's wife or daughter, who hands to him a baſon of her own urine, with which the viſitor (if among their own people) waſhes his mouth; and this he is obliged to do, or he is not looked upon as a friend.

About the houſes were erected ſeveral ſtages ten or twelve feet in height. They were compoſed entirely of bones, and were apparently intended for drying their fiſh and ſkins, which were thus placed out of the reach of their dogs, of which they had great numbers.

Theſe dogs are of the fox kind, rather large, and of different colours, with long ſoft hair reſembling wool. They are, in all probability, uſed for the purpoſe of drawing their ſledges in winter; for it appears that they have ſledges, as many of them were ſeen laid up in one of their winter huts. It is likewiſe not improbable that dogs conſtitute a part of their food, for ſeveral lay dead, which had been recently killed.

The canoes of theſe people reſemble thoſe of the northern parts, the form being ſimple, but calculated for every uſeful purpoſe.

From the large bones of fiſh, and other ſea animals, it appeared, that the ſea furniſhed them with the greater part of their ſubſiſtence. The country ſeemed exceeding barren, as our people ſaw not a tree or ſhrub. At ſome diſtance towards the weſt they obſerved a ridge of mountains covered with ſnow, that had fallen not long before.

Such of theſe people as live to the northward of the Anadir not being under the dominion of the Ruſſians, are inimical to thoſe who are. The Ruſſians, indeed, have made many ſtrenuous but unſucceſsful efforts to bring them under a general ſubjection.

Our people, on leaving this country, ſteered to the eaſtward, in order to make a nearer approach to the American coaſt; and arriving in their paſſage at the latitude of 70 deg. 6 min. north, ſaw an amazing number of ſea-horſes on the ice, and as they were in want of freſh proviſions, the boats were diſpatched from each ſhip to procure ſome. Nine of theſe animals were brought on board the Reſolution, and which, till this time, were ſuppoſed to have been ſea cows; nor would the difference have been known, had not two or three men on board, who had been in Greenland, declared what animals theſe were, and that no perſon ever eat of them. Notwithſtanding this, they ſerved for proviſions, and there were few of our people who did not prefer them to ſalt meat.

The fat of theſe animals, at firſt, is as ſweet as marrow; but in a few days, it becomes rancid, unleſs it is ſalted, in which ſtate it will keep much longer. The lean fleſh is courſe and blackiſh, and has a ſtrong taſte; but the heart is almoſt as well taſted as that of a bullock. The fat when melted, affords a great quantity of oil, which burns very well in lamps; and their hides, which are of great thickneſs, were very uſeful about the rigging. The teeth, or tuſks, of moſt of them were, at this time, of a very ſmall ſize; even ſome of the largeſt and oldeſt of theſe animals had them not exceeding ſix inches in length. Hence it was concluded that they had lately ſhed their old teeth.

They lie upon the ice in herds of many hundreds, huddling, like ſwine, one over another; and they roar very loud; ſo that in the night, or when the weather was very foggy, they gave our people notice of the vicinity of the ice, before they could diſcern it. It was never found that the whole herd were aſleep at the ſame time, ſome of them being conſtantly on the watch. Theſe, on the approach of the boat, would awake thoſe that were next to them; and the alarm being thus gradually communicated, the whole herd would preſently be awake. However, they were ſeldom in a hurry to get away, before they had been once fired at. Then they would fall into the ſea, one over the other in the utmoſt confuſion; and if our people did not happen, at the firſt diſcharge, to kill thoſe they fired at, they generally loſt them, though mortally wounded.

They did not appear to be ſo dangerous as ſome authors have repreſented them; even when they were attacked. They are, indeed, more ſo in appearance, than in reality. Vaſt multitudes of them would follow, and come cloſe up to the boats; but the flaſh of a muſket in the pan, or even the mere pointing one at them, would ſend them down in a moment. The female, however, will defend her young ones to the very laſt, and at the expence of her own life, whether upon the ice or in the water.

There appeared ſome ſtriking inſtances of parental affection in theſe animals. All of them, on the approach of the boats towards the ice, took their young ones under their fins, and attempted to eſcape with them into the ſea. Some, whoſe cubs were killed or wounded,

wounded, and left floating upon the ſurface of the water, roſe again, and carried them down, ſometimes juſt as the men were on the point of taking them into the boat; and could be traced bearing them to a conſiderable diſtance through the water, which was ſtained with their blood. They were afterwards obſerved bringing them, at intervals, above the ſurface, as if for air, and again plunging under it, with a horrid bellowing. The female, in particular, whoſe young one had been killed, and taken into the boat, became ſo furious, that ſhe even ſtruck her two tuſks through the bottom of the cutter. Nor will the young one quit the dam though ſhe has been killed; ſo that if you deſtroy one, you are ſure of the other. The dam when in the water, holds her young one between her fore fins.

Why this animal ſhould be called a ſea-horſe is difficult to determine, unleſs the word be a corruption of the Ruſſian name *Morſe*; for they do not in the leaſt reſemble a horſe. It is, doubtleſs, the ſame animal that is found in the Gulph of St. Lawrence, and there called a ſea-cow. It is certainly more like a cow than a horſe; but this reſemblance conſiſts in nothing but the ſnout. In ſhort, it is an animal not unlike a ſeal, but incomparably larger. The length of one of them, which was none of the largeſt, was nine feet four inches from the ſnout to the tail; the circumference of its body at the ſhoulder was ſeven feet ten inches; its circumference near the hinder fins were five feet ſix inches; and the weight of the carcaſe, without the head, ſkin, or entrails, was eight hundred and fifty-four pounds. The head weighed forty-one pounds and an half, and the ſkin two hundred and five pounds.

Captain Cook's people, in a ſhort time, began to reliſh theſe animals, ſo that the whole ſtock they had procured was ſoon expended.

The Province of Thibet.

This diviſion of Tartary is ſituated in an excellent climate, between 30 and 40 deg of north lat. but it is ſurrounded with very extenſive mountains, and is bounded, on the Eaſt, by China; on the weſt, by Indoſtan; on the north, by the country of the Moguls; and on the ſouth by Ava. The whole country extends in length, from eaſt to weſt, upwards of 1700 miles, and the broadeſt part of it, from north to ſouth is about 1780. It is divided into three principal parts, namely, Great Thibet, Little Thibet, and Laſſa. This laſt diviſion, being the moſt rich, as well as the moſt plentiful province, and the reſidence of the grand lama, frequently gives name to the whole country.

In general, the climate of this country is very temperate and healthful; but in the weſtern parts it is cold, eſpecially on the tops of the mountains. The ſoil is for the moſt part fertile, and produces great plenty of rice and pulſe. It is particularly famous for the produce of rhubarb and muſk, the latter of which is eſteemed the beſt of any to be met with in India.

There are many rivers in Thibet, ſome of which produce great quantities of gold, particularly the Kinchakyang, which enters the Chineſe province of Yunnan, whoſe name ſignifies the river with golden-ſand: here is alſo the Nukyang, a very principal one; the Lantſankyang, which alſo enters Yun-nan, and flows into the kingdom of Tonquin; and the great river called Yorutſan-pu, or Dſan-pu.

The towns in this province are for the moſt part exceeding ſmall, and very poorly inhabited; nor is even Laſſa, the principal place in the country, in the leaſt fortified. There is indeed but little occaſion for fortifications here, the Tartars, in their wars, chooſing rather to fight in the open fields, than to undertake ſieges.

The natives of Thibet are in general a very robuſt and healthy people. They have an olive or tawney complexion, their noſes are flat, and their faces very broad; but the women are much handſomer in their features than the men. They are naturally very indolent, and the common people in particular are exceeding filthy. The garments of both ſexes are alike, conſiſting of a large piece of coarſe cloth, faſtened round the body with a girdle, and on their heads they wear a kind of bonnet, which is decorated with pieces of tortoiſe-ſhell, and other trifling baubles; but the better ſort adorn them with coral, and beads of amber. Both ſexes wear bracelets on their left arms, faſtened with beads.

The poor people live principally on rice and pulſe, though they have various kinds of fleſh: they are in general very temperate in their diet; but, as they are extremely fond of ſpirituous liquors, will often drink to exceſs.

The houſes of the better ſort are tolerably handſome, and chiefly built of wood; but thoſe of the common people are low, mean huts, made of ſtones rudely piled together.

The country of the Mogul Tartars, or Mongols, is bounded on the eaſt by the territories of the Mantchews, the Kalkas on the weſt, China on the ſouth, and by Eaſtern Tartary and the Kalka Tartars on the north.

Here the climate is exceedingly ſevere, and ice lies on the ground eight or nine months together. It is a country not very well known, except that part of it which the caravans paſs in travelling from Muſcovy to China.

The Bratſki Tartars dwell near the Lake Baikal, many of whom are good mechanics, and others well ſkilled in huſbandry. Some of theſe Bratſki are people of conſiderable property: it is not uncommon for a man to be proprietor of five or ſix hundred horſes, as well as of numbers of other cattle. The food of theſe people is veniſon and horſe-fleſh, the latter of which they prefer.

Samoieda, or, Samoidia.

This country is ſituated north-weſt of Siberia: it is divided into Obdora on the weſt, and Manamo and Loppo eaſt of the river Oby: the Riphæan mountains, ſurrounding the river Potzor, are its weſtern limits.

Their dwelling-places are caves, in which they live nine months in the year, and make ſubterraneous paſſages for the purpoſe of viſiting each other. They burn lamps fed with a ſtinking fiſh-oil.

The Oſtiocs live along the rivers Oby, Jeniſay, &c. Theſe people dry their fiſh in the ſummer, which ſerves them in the winter: they have no rice, but ſubſiſt on roots, fiſh, wild-fowl, &c. Their winter-huts are low in the ground, with a roof of bark or ruſhes; in ſummer, they build on the banks of the rivers, and employ themſelves in fiſhing. Their ſledges are drawn by dogs, four of which will draw a ſledge with 300 pounds weight upon it, fifteen leagues in a day. What is remarkable, they have poſts in this country for ſledges, as regular as the poſts of Europe, with relays of dogs for travellers to change on their journey at ſet diſtances: they increaſe the number of dogs, in proportion to the hurry a paſſenger is in. Theſe people worſhip and offer ſacrifices to ſmall braſen idols, placed in groves, or on the tops of houſes.

They are one of the moſt numerous nations in Siberia, and are likewiſe ſprung from the Finns. Before they were ſubjected to Ruſſia, they were governed by their own princes, whoſe deſcendents are ſtill reputed noble. Theſe people divide themſelves into different ſtocks or tribes, and chooſe their chiefs from among the progeny of their ancient rulers. Theſe ſuperintend the payment of the taxes, and preſerve peace and good order. They are extremely ignorant, and entirely unacquainted with the uſe of letters or figures, and like the other Finniſh nations, can only reckon as far as ten. A ſingular cuſtom among them is that the

the daughter-in-law never uncovers her face in the preſence of her father-in-law; nor is the ſon-in-law allowed to appear before the mother-in-law till his wife has had a child. The greateſt part of them are idolaters; and one of their ſtrange notions is, that bears, after death, enjoy a happineſs equal to that which they expect for themſelves; and are ſo fixed in the belief of this, that whenever they kill one of theſe animals, they ſing ſongs over him, in which they aſk his pardon for the injury he has received at their hands: they alſo hang up his ſkin, to which they ſhew many civilities, and addreſs with many fine compliments, in order to avert his vengeance from them in the world of ſpirits. It appears, indeed, that among all the Pagan nations of the north and north-eaſt, bears are in great eſtimation.

WESTERN TARTARY.

CIRCASSIA AND ASTRACHAN.

CIRCASSIA is that country lying between the Caſpian-Sea on the eaſt; Aſoph, and the Palus-Mæotis on the weſt; the high mountains of Caucaſus on the ſouth; and Aſtrachan on the north. The ſouthern diviſion is claimed by the Perſians, the weſtern is under the dominion of the Turks, and the eaſtern pays obedience to Ruſſia.

Kizlaar is the capital of Circaſſia. This town being only in 44 deg. north lat. the air is conſequently ſerene and wholeſome. It was built by the Ruſſians: the citadel is only formed of earth, but the garriſon conſiſts of about 500 regulars, and 3000 Coſſacks; the latter whom are permitted by the Ruſſian government to erect habitations on the banks of the Terek, which flows from eaſt to weſt, and affords a great variety of fiſh, as ſturgeon, ſalmon, &c.

The Circaſſians are lovely in their features, majeſtic in their perſons, and agreeable in their deportment. In their ſtature they are large, and the men make excellent ſoldiers.

The country abounds in wild ſwine, wolves, and foxes; produces vines, whoſe grapes are excellent, and here is a great variety of game.

Terki, the capital of Circaſſian Tartary, is ſeated in a ſpacious plain, on an iſland formed by the rivers Terki and Buſtrow, and is garriſoned by 2000 regulars, and 1000 Coſſacks. It is well fortified with ramparts and baſtions in the modern ſtyle, well ſtored with cannon, and has always a conſiderable garriſon in it, under the command of a governor. The Circaſſian prince, who reſides here, is allowed 500 Ruſſians for his guard, but none of his own ſubjects are permitted to dwell within any part of the fortifications. Ever ſince the reduction of theſe parts to the obedience of Ruſſia, they have put in all places of ſtrength, not only Ruſſian garriſons and governors, but magiſtrates, and prieſts for the exerciſe of the Chriſtian religion: yet the Circaſſian Tartars are governed by their own princes, lords, and judges; but theſe adminiſter juſtice in the name of the emperor, and, in matters of importance, not without the preſence of the Ruſſian governors, being all obliged to take the oath of allegiance to his imperial majeſty.

This city has a great number of ſerpents about it, which make holes in the ground that are extremely dangerous. Theſe ſerpents are about ſix or ſeven feet in length, and about the thickneſs of a man's arm. There are likewiſe mice as large as ſquirrels, which are called Jerhuah. Their ears are long, and their fore-feet ſhorter than thoſe behind, which prevents their running ſwiftly; they, however, can leap to a conſiderable height or diſtance, by laying their tail over their backs.

The kingdom of Aſtrachan lies between 44 deg. 10 min. and 52 deg. north latitude; the longitude eaſt is 62 deg. 30 min. being bounded on the eaſt by the country of the Coſſacks; on the north, by the kingdom of Cazan, and part of Siberia; and towards the ſouth by Circaſſia. The eaſtern boundaries being deſerts very little known and uninhabited, cannot be aſcertained.

The habitants and manner of living of the Tartar citizens and villages of Aſtrachan, are perfectly ſimilar with thoſe of the Tartars of Kaſon. In the city of Aſtrachan, they have a large magazine for goods, built of brick, and ſeveral ſhops upon arches. They carry on an important commerce with the Armenians, Perſians, Indians, and Bukharians; and manufacture Morocco-leather, cottons, camblets, and ſilks.

The metropolis, called alſo Aſtrachan, is built upon an iſland in the Volga, known by the name of the Iſle of Hares. It is in 46 deg. 13 min. north latitude, and 68 deg. eaſt longitude. This city is commonly ſuppoſed to contain 100,000 inhabitants. It abounds in well-furniſhed magazines, and hath a citadel ſurrounded by a thick brick wall, of about thirty feet in height; though this citadel, which lies towards the weſt of the city, is irregularly built, the baſtions are ſtrong, and the cannons numerous. Here is a palace for the governor, and another for the archbiſhop. In the court of chancery, all civil and military affairs are heard and adjuſted, and the records are kept. The citadel hath three gates, one opens to the city, another to the Volga, and the third to the Tartar ſuburbs. It contains likewiſe a guard-houſe a metropolitan-church, and a monaſtery.

This city is ſurrounded by a wall, between which and the houſes is a large intermediate ſpace, upon which none are permitted to build. It conſiſts principally of three long ſtreets from eaſt to weſt, which are interſected by many others, and is upon the whole about a mile in length. The houſes are built of timber, the ſuburbs are extenſive, and more populous than the city. There are four churches and a monaſtery belonging to thoſe of the Greek perſuaſion. The reformed have a church built of wood; the Roman Catholics have a monaſtery, and the Armenians a church of ſtone. Without the ſuburbs, are a naval and military-hoſpital, and a large monaſtery.

No Tartar is permitted to ſtay all night in the city. Armenian and Ruſſian merchants inhabit the eaſtern ſuburbs, and the Indians are permitted to live in guarded Caravanſeras.

Aſtrachan is garriſoned by five regiments of infantry and one of dragoons; many field regiments and Coſſacks, excluſive of the Tartar militia, winter here, beſides the garriſon itſelf.

The uſe of the regulars is to march againſt the wild Tartars whenever they attempt to make any incurſions into this kingdom, and the irregulars are employed to ſcour the deſerts, in order to trace out the lurking-places of the banditti.

The commerce of Aſtrachan conſiſts chiefly in ſilks, brocades, velvets, ſatins, drugs, copper, cotton, Perſian fruits, wines, ſweetmeats, &c. which they import; and in return, export meal, fiſh, ſalt, woollen, &c. All naval and military ſtores are prohibited from being exported to Perſia.

The Ruſſians, who compoſe a principal part of the inhabitants, are in the chief offices of ſtate. The Georgians, who profeſs the Greek religion, are fond of ſerving in the army; and the Armenians, who, in in perſon, diſpoſition, and features, very much reſemble the Jews, have no other object but ſcraping money together by means of traffic. As for the Perſians and Tartar inhabitants, they are too fond of indolence and roving to think of any thing elſe, unleſs compelled to it by abſolute neceſſity. Their huts, which are about twelve feet in diameter, are formed of canes or bulruſhes, at the top of which a hole is made to let out the ſmoke: their fuel is turf, or cow-dung.

The ſoil is light and ſandy, but ſo much impregnated with ſalt, as greatly adds to its ſterility. The

earth produces no grain, unleſs it has been overflowed during the winter ſeaſon. Its natural productions are reeds, liquorice, kal, guriſtar-aculeata, the herb aſtrachania-nitraria, &c. The inhabitants likewiſe raiſe melons and pompions, which they eat with bread. The wine made of their grapes is too ſharp, which proceeds from the ſalt of the earth, though their grapes are fine, and delicious to the taſte. The mulberries are unwholeſome, but the garden vegetables tolerably good.

CHAP. VIII.

SIBERIA,

INCLUDING

KALMUCK AND USBECK-TARTARY.

SIBERIA, extends from 50 to 68 deg. north lat. and is bounded on the weſt by Ruſſia, from which it is ſeparated by the mountains of Werkhotauria, which extend from Mount Caucaſus, and divide Aſia from Europe quite to the Frozen-Ocean, which bounds it on the north; on the eaſt it is bounded by the Japaneſe-Ocean, and part of Tartary; and on the ſouth, by the ſame. It is upwards of 3000 miles in length, from eaſt to weſt, and about 760 in breadth. The ſouthern is the only part fit for human beings to live in: here the climate is mild, and the ſoil appears as if it would be fertile, if cultivated. The northern part exhibits nothing but impenetrable woods, ſnow-topt mountains, fens, lakes, marſhes, &c. and is withal ſo much expoſed to the bleak winds, that it is quite barren and deſolate. To theſe dreary regions, the czars of Muſcovy baniſh their courtiers and other great perſons who incur their diſpleaſure.

The climate of Siberia is cold, but the air pure and wholeſome; and Mr. Tooke obſerves, that its inhabitants, in all probability, would live to an extreme old age, if they were not ſo much addicted to an immoderate uſe of intoxicating liquors.

Siberia contains mines of gold, ſilver, copper, iron, jaſper, lapis-lazuli, and loadſtones. Naturaliſts have long diſputed, whether a ſubſtance found there, reſembling elephants-teeth, are really ſuch, or whether they are a marine production: when poliſhed with art and ſkill, their appearance is certainly whimſical and curious.

A great variety of animals range the foreſts of Siberia, ſome of which are not to be found in other countries. Theſe ſupply the inhabitants with food and clothes, and at the ſame time furniſh them with commodities for an advantageous trade. This territory may alſo be conſidered as the native country of black foxes, ſables, and ermines, the ſkins of which are ſuperior to thoſe of any other part of the world. Horſes and cattle are in great plenty, and may be had cheap.

Tobolſki, the capital, is ſituated in 58 deg. north lat. and 67 deg. eaſt long. from London, and contains about 15,000 inhabitants, almoſt all Ruſſians, or naturalized. The city is divided into two parts; the larger being ſituated on the banks of the river Irtiſz, and the other upon a hill. This part is fortified, both eaſt and north, by a rampart, baſtions, and a ditch ſix feet broad, bordered with paliſadoes.

This city has a governor, whoſe prerogative reaches almoſt all over Siberia: here too is a court of equity, compoſed of fifteen counſellors, who conduct both civil and military affairs. In the lower town are ſeven churches, and a convent built of ſtone; and there are three different communications from the upper to the lower town. It has a garriſon, conſiſting of two regiments of infantry. A conſiderable traffic was once carried on between this place and the Chineſe, by means of caravans; but the reciprocal knavery of the Chineſe and Ruſſian merchants reduced it in a ſhort time to a very languiſhing ſtate.

The KALMUCKS are the inhabitants of a prodigious deſert, which lies between the rivers Don and Volga. Theſe people are continually roving about: in the winter, they uſually reſide on the borders of Circaſſia; they proceed northerly in the ſpring, and return back again at the latter end of autumn. They never cultivate any land, their only riches being their flocks and cattle, on whoſe account they principally roam about in ſearch of freſh paſture. Their temporary habitations are huts, covered with reeds, ruſhes, or felt.

They are for the moſt part raw-boned and ſtout, and have reddiſh and yellowiſh-brown complexions, a flat viſage, thick lips, a ſmall noſe, and ſhort chin. The women are ſhaped like the men, have a wholeſome white and red in their faces, and are lively, agreeable, and induſtrious. The ſole profeſſion among them is the breeding of cattle; they purſue hunting as an amuſement; live in tents, or yourts of felt, which they call *gar*, and the Ruſſians *kibitka*, and in many reſpects reſemble Kirguiſians. Their clothing is after the eaſtern manner, and they dreſs their heads exactly like the Chineſe: ſome of their women wear a large golden ring in their noſtrils. They are great eaters, but can endure want for a long time without complaint. Their principal food is animals tame and wild, and even their chiefs will feed upon cattle that have died of age or diſtempers, though it ſtink ever ſo much; ſo that the fleſh market in every herd hath the appearance and ſcent of a lay-ſtall of carrion: they eat likewiſe the roots and plants which grow in the deſerts. Both ſexes ſmoke continually. As their courſes are regulated by neceſſity, they keep to the north in the ſummer, and to the ſouthern deſerts in the winter. They ſleep upon felt or carpeting, and cover themſelves with the ſame. They are characterized as a rough kind of people, but are leſs baſe and diſſolute than they are repreſented to be. Their attachment to their chiefs or maſters is very great; but their active ſpirit, together with their improvidence and careleſſneſs, render them thieviſh and dirty. In their robberies, they prefer ſtratagem to violence, and are ſeldom known to commit murder, from their belief in the nocturnal wandering of dead men's ſpirits. Their code is very favourable to females, to whom they never impute any crime. A rape and adultery is puniſhed with a mulct of nine herd of cattle. They affect to profeſs the Chineſe religion, but know very little of its principles. They are ſuperſtitious about good and bad days; and have written laws which are founded on reaſon, cuſtom, and the will of the prince. Their ſpeech is a mongrel dialect with many Tartarian words; but their religious books are in the Tangut or Tibotan.

Theſe people are divided into different hordes, each of which hath its chief, but all are ſubject to one ſovereign, called khan, who has an agent or envoy at Aſtrachan.

USBECK-TARTARY is ſituated between the Great Mogul's dominions, which bound it on the ſouth, and the Caſpian Sea, which, with Perſia, are the weſtern confines. It has the country of the Kalmucks on the north, and Thibet towards the eaſt.

The country of Uſbeck-Tartary was once the ſeat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite reſidence of Zingis or Jenghis Khan, and Tamerlane, who enriched it with the ſpoils of India and the eaſtern world.

The Uſbecks are generally eſteemed the moſt civilized of all the Mahometan Tartars; not but they can

can pillage and rob their neighbours as well as any other Tartarian tribe. They nearly reſemble the Perſians in their dreſs, their boots, which are uncommonly large, excepted: the chiefs wear a plume of feathers on their turban, and as well as their khan, pride themſelves much on being the deſcendants of the renowned Tamerlane.

Their common food is pilau, or boiled rice, but their greateſt delicacy is horſe-fleſh. They drink a kind of arrack, or fermented liquor, made of mare's milk. Their language is a mixture of the Turkiſh, Perſian, and Mongol; but they are well acquainted with the Perſian language in its purity.

The capital of this country is called Bukharia, and lies in 39 deg. 15 min. north latitude, at the diſtance of thirteen miles from the once famous city of Samarcand. It is ſurrounded by a mud wall; the houſes are built of wood, but the moſque and caravanſeras are of brick. It is tolerably populous, but not equal to what it was formerly. The khan is permitted to ſeize upon the property of whom he pleaſes, which damps the ſpirit of cultivation, and greatly injures commerce.

Laſſa is a ſmall city, but the houſes, which are of ſtone, are ſpacious and lofty.

The city of Derbent, ſituated on the Caſpian ſhore, is called the frontier of Perſia. It is ſaid to have been the firſt built by Alexander the Great, and that he here received the viſit from the Amazonian queen Thaleſtris. It is now encloſed with a ſtrong broad wall, built with large ſquare ſtones, hard as marble, from the quarries in Caucaſus.

Tarku is the capital of Dageſtan, and contains three thouſand houſes, two ſtories high, platformed at top for walking. The Tartars of this province are numerous and Mahometans, governed by a ſhefkal, whoſe office is elective.

With reſpect to commerce and manufactures, we muſt confeſs that this head makes but an inconſiderable figure in the deſcription of Tartary, their chief traffic conſiſting in cattle, ſkins, beavers, rhubarb, muſk, and fiſh. The Aſtrachans, notwithſtanding their interruptions by the wild Tartars, carry on a conſiderable traffic into Perſia, to which they export red leather, woollen, and linen cloth, and ſome of the manufactures of Europe.

We ſhall conclude our account of this country with ſome few particulars concerning its inhabitants, who are generally allowed to be the deſcendants of Japheth.

Though it is certain that Tartary, formerly known by the name of Scythia, peopled the northern parts of Europe, and furniſhed thoſe amazing numbers who, under various names, deſtroyed the Roman empire, yet it is now but very thinly inhabited; and thoſe fine provinces, where learning and the arts once reſided, are now ſcenes of horror and barbarity. This muſt have been owing to the dreadful maſſacres made among the nations by the victorious Jenghis Khan, and Tamerlane, and their deſcendants; for nothing is more common in their hiſtories, than their putting to the ſword three or four hundred thouſand people in a few days. Some authors indeed have abſurdly queſtioned the veracity of the hiſtorians of theſe great conquerors, though it be better eſtabliſhed than that of the Greek and Roman writers. The former, about the year 1200, made himſelf maſter of thoſe regions which form at this day the Aſiatic part of the Ruſſian empire; and his ſon, Batou Sagin, made himſelf maſter of the ſouthern Ruſſia, and peopled it with Tartar colonies, which are now confounded or blended with the Ruſſians. Long and heavily did the Tartar yoke gall the neck of Ruſſia, till alleviated by the diviſions amongſt themſelves: but they were not delivered from theſe warlike invaders till the time of Ivan III. who aſcended the Ruſſian throne in 1462. He repeatedly defeated them, ſubdued the kingdom of Kaſan and other provinces, and made his name reſpected in all that quarter. Tamerlane's memory hath been more permanent than that of Zingis Khan: his defeat of the Turkiſh emperor, Bajazet, hath been before noticed in the hiſtory of that nation, and great were his conqueſts, and his name far-beyond the limits of his proper dominions. His deſcent is claimed not only by all the khans and petty princes of Tartary, but by the emperor of Indoſtan himſelf.

It may not be amiſs to mention, that, among the Tartars, the ſtandard or colours of the reſpective tribes form a diſtinct mark, whereby each Tartar knows the tribe to which he belongs. Theſe marks of diſtinction conſiſt of a piece of Chineſe linen, or other coloured ſtuff, ſuſpended on a lance twelve feet in length, among the Pagan Tartars. The Mahometan Tartars write upon their ſtandards the name of God, in the Arabic language. The Kalmucks and the Mogul Tartars, diſtinguiſh theirs by the name of ſome animal; and as the branches or diviſions of a tribe preſerve always the figure drawn upon the ſtandard of that tribe, adding only the particular denomination of each branch, thoſe ſtandards anſwer the purpoſe of a genealogical table or tree, by which the origin and deſcent of each individual may be aſcertained.

The khans pay a tribute, or acknowledgment of their dependence upon one or other of their powerful neighbours, who treat them with caution and lenity; as the friendſhip of theſe barbarians is of the utmoſt conſequence to the powers with whom they are allied. Some tribes, however, affect independence; and, when united, they form a powerful body, and of late have been very formidable to their neighbours, particularly to the Chineſe, of which we ſhall give ſome account in the deſcription of that empire.

The method of carrying on war, by waſting the country, is very ancient among the Tartars, and practiſed by all of them, from the Danube eaſtward. This circumſtance renders them a dreadful enemy to regular troops, who muſt thereby be deprived of all ſubſiſtence, while the Tartars are at no loſs for proviſions, having always many ſpare horſes to kill and eat.

CHAP. IX.

CHINA.

Extent, Boundaries, Diviſions, Climate, Soil, Produce, Rivers, Inhabitants, &c.

THIS vaſt and opulent empire, is 1450 miles in length, and 1260 in breadth, and is ſituated between 20 and 42 deg. north lat. and between 98 and 123 eaſt long. It contains 1,110,000 ſquare miles, to which if we add Chineſe Tartary, containing 644,000, the whole will amount to 1,754,000.

China is bounded by the Chineſe Tartary, and an amazing ſtone wall, on the north; by the Pacific Ocean, which divides it from North America, on the eaſt; by Tonquin, and the Tartarian countries and mountains of Thibet and Ruſſia, on the weſt; and by the Chineſian Sea, on the ſouth.

According to the authors of the Univerſal Hiſtory, the great diviſion of this empire is into fifteen provinces, excluſive of that of Lyau-tong, which is ſituated without the great wall, though under the ſame dominion; each of which might, for their largeneſs, fertility, populouſneſs, and opulence, paſs for ſo many diſtinct kingdoms. But it is neceſſary to acquaint the reader, that the informations contained in Du Halde's voluminous account of China, are drawn from the papers of jeſuits, and other religioniſts ſent thither

thither by the pope, but whoſe miſſions have been at an end for above half a century. Some of thoſe fathers were men of penetration and judgment, and had great opportunities of procuring information about a century ago; but even their accounts of this empire, are juſtly to be ſuſpected. They had powerful enemies at the court of Rome, where they maintained their footing only by magnifying their own labours and ſucceſſes, as well as the importance of the Chineſe empire, ſo that their exaggerated accounts ought to be read with great caution.

The name of this empire is probably derived from a Chineſe word, ſignifying central or middle; for the natives, till they were convinced to the contrary by the European mathematicians, fancied that the world was flat; and that their country not only occupied the beſt part, but lay exactly in the middle.

China is a plain country, and contains no remarkable mountains except to the north, where thoſe which ſeparate it from Tartary are craggy, ſteep, and almoſt inacceſſible; but many hills are ſcattered throughout the whole empire, which in general are cultivated by the admirable contrivances and indefatigable induſtry of the natives. Numbers of theſe are, with infinite labour, cut into the moſt whimſical figures, ſo as to reſemble, at a diſtance, elephants, camels, leopards, boars, bears, tigers, &c.

The principal rivers are, 1. the Hoambo, or Yellow River, ſo called from being tinged with a yellow colour, owing to the peculiar quality of the ſoil through which it flows. It riſes towards the frontiers of Indoſtan, in the intermediate mountains between Tartary and the province of Suechan, and after purſuing a winding courſe of near 1900 miles, it falls into the Eaſtern Ocean: this river is exceedingly rapid. 2. The Ky-am, or Blue River, riſes in Thibet, flows from eaſt to weſt, and diſembogues itſelf into the Eaſtern Ocean: it is remarkably broad and deep. 3. The Bloody River, ſo called from the redneſs of its ſand. 4. The Pearl River, ſo denominated, on account of the number of precious ſtones found among its gravel. 5. A river near Somin, which in harveſt-time turns blue, when its waters give an admirable tinge of that colour. 6. A river near Pemgau, whoſe waters are ſo thin, that even timber will ſink in them. 7. A ſeventh, in the neighbourhood of Ching-tien, the waters of which are odoriferous. 8. The Kin-xa, which contains gold ſand. 9. The Xo, of a medicinal quality, on which account many flock to its banks for the cure of various diſorders. 10. The river near the city Hangchen, which annually, on a certain day, riſes to an aſtoniſhing height; a phænomenon not yet accounted for either by Aſiatic or European philoſophers. By theſe rivers, and the canals, the people are plentifully ſupplied with excellent fiſh in the greateſt variety.

The chief bays of this country, are thoſe of Nankin and Canton.

The canals of this mighty empire are perhaps the moſt uſeful and ſtupendous works that ever the imagination of man conceived, or the exertion of human induſtry executed, and are ſufficient to entitle the ancient Chineſe to the character of being the wiſeſt and moſt induſtrious people in the world. The commodiouſneſs and length of them is incredible. The chief of them are lined with hewn-ſtone on the ſides; and they are ſo deep, that they carry large veſſels, and ſometimes extend above 1000 miles in length. Thoſe veſſels are fitted up for all the conveniencies of life; and it has been thought by ſome, that in China the water contains as many inhabitants as the land. They are furniſhed with ſtone quays, and ſometimes with bridges of an amazing conſtruction. The navigation is ſlow, and the veſſels ſometimes drawn by men. No precautions are wanting, that could be obtained by art or perſeverance, for the ſafety of the paſſengers, in caſe a canal is croſſed by a rapid river, or expoſed to torrents from the mountains. Theſe canals, and the variety that is ſeen upon their borders, render China the moſt delightful to the eye of any country in the world, as well as fertile, in places that are not ſo by nature. Innumerable bridges paſs over theſe canals, the centre arches of which are ſufficiently high to admit of a veſſel paſſing without lowering the maſt.

Though no country is better fitted than China for producing timber of all kinds, yet ſuch is the induſtry of the inhabitants, that they are not incumbered with foreſts or woods. They ſuffer no timber to grow, but for ornament and uſe, or on the ſide of mountains, from whence the trees, when cut down, can be conveyed by water to any place.

The air of China differs according the ſituation of the places. Towards the north, it is ſharp; in the middle, mild; and in the ſouth, hot. The ſoil is, either by nature or art, fruitful in every thing that can adminiſter either to the neceſſities, conveniencies, or luxuries of life. The culture of the cotton and the rice fields, from which the bulk of the inhabitants are clothed and fed, is ingenious almoſt beyond deſcription. The rare trees and aromatic productions, either ornamental or medicinal, that abound in other parts of the world, are to be found in China, and ſome are peculiar to itſelf.

Gardening is placed in China at the head of the ſciences: the profeſſion is honourable; the profeſſors men of the greateſt abilities; and a kind of degree is taken, ere they can be admitted to practiſe this moſt ancient and moſt uſeful art. But, for all their ſkill, they are unacquainted with the nature of grafting trees, or of meliorating the earth where they are planted; on which account the fruit in general is of an inferior flavour, and leſs delicious than the European fruit. The principal trees are orange, lemon, and citron; the li-tchi, a kind of date-tree; the pea-tree, which produces a fruit that reſembles, and is as delicate to the taſte, as the pea of Europe; the meal-tree, the pulp of which yields excellent flour; the hermaphrodite-tree, which is half cypreſs, and half juniper; the pepper-tree, the berries of which are ſo ſtrong, that the ſmell frequently overcomes thoſe that pluck them; the varniſh-tree, which is of two ſpecies, viz. the tſi-chu, and the tong-chu; the former produces that admirable varniſh, which is ſo much admired in moſt parts of the univerſe; the latter bears a nut, from which an oil is extracted, that furniſhes a varniſh of an inferior kind: the kou-chu, or ſize-tree, yields a matter reſembling milk, which is of admirable uſe in gilding: the weeping willow-tree is much admired by the Chineſe, who plant it on the ſides of all their canals and rivers, and near moſt of the ponds in their gardens. They deem its ſhade the moſt pleaſing of any, and their paſtoral poets mention it with peculiar reſpect in all their compoſitions. The tallow-tree has red leaves and white fruit, which form a lively contraſt, and greatly pleaſe the eye of the beholder: of the kernels, which have all the properties of tallow, candles are made; the flame is yellow, the ſmell ſtrong, and the light rather dim. The white wax-tree is periodically covered with ſwarms of inſects, who leave on its branches thin threads of wax. The mango and long-yeu-trees yield fine fruits, that ſerve as delicate pickles, and the produce of the tſe-tſe-tree is an admirable ſweetmeat.

The polomie-tree, which is not peculiar to China alone, bears the largeſt fruit in the world, the kernel of which is delicious when roaſted, and makes an admired diſh when dreſſed in cocoa-nut milk; but the moſt ſingular particular of this tree is, that the fruit grows from the trunk of the tree, and not from the branches, which, indeed, would not be able to ſuſtain it.

The wood of the iron-tree is ſo hard, that whatever is made of it is exceedingly durable; of this, anchors are formed, and the Chineſe affirm, that they are more

more laſting than thoſe that are made of the metal from which the tree receives its name.

The tſet-ham is admired for the beauty of its wood, which is of an admirable red, beautifully variegated with fine veins, which produce ſuch an effect, that it ſeems to the eye to be elegantly painted.

The bamboo, or cane-tree, is pretty high and thick, the bud has an excellent flavour, and the pith is fine eating; it grows in marſhy grounds, is uſed in buildings, and the tubes are often converted into water-pipes; baſkets are fabricated of its ſplinters, and when it grows old and rotten, the Chineſe reduce it to a paſte, of which paper is made. Here is likewiſe a reed, of which not only baſkets and mats are made, but ropes, pack-thread, &c. The nan-mu-tree, however, furniſhes the principal wood for the purpoſes of building; nevertheleſs, they have oak, pine, ſanders-wood, ebony, camphire, &c.

But one of the moſt remarkable and profitable productions of this country, is the tea-tree; and this being almoſt as generally uſed at preſent in many parts of Europe as in China, we ſhall be the more particular in our deſcription of it. All the various kinds of tea are produced by the ſame ſort of ſhrub, only the leaves are gathered at different periods; indeed the ſoil where the tea-tree grows, makes ſome little difference in the flavour of the leaves: its taſte is bitter, and its qualities aſtringent; the little oil it contains is reſinous, and its ſalt fixed; it purifies, dilutes, invigorates the brain and ſtomach, promotes digeſtion, perſpiration, &c. The Chineſe uſe it in fevers, cholics, and other acute diſorders, chronic diſeaſes, ſcorbutic habits, &c. Its virtues are not local, though they are perhaps more efficacious in China than other places.

The general diviſion of teas is into two ſorts, viz. green and bohea; but theſe are again diſtinguiſhed by other appellations, according to the time of gathering, province where produced, or method of curing: as congo, ſouchong, ſinglo, bloom, imperial, hyſon, &c. &c. the ſinglo is deemed the moſt delicate, and the bohea the moſt wholeſome: the bohea is gathered in March, the imperial in April, the ſinglo in May, and the green in June. After the leaves are firſt plucked, perſons are employed to infuſe them for a certain time in water, by which the reſinous particles are diſſipated, and they are rendered palatable; for without ſuch a preparatory prelude, they would be ſo exceedingly bitter, that ſcarce any quantity of ſugar would prove ſufficient to correct the taſte, or render them agreeable to the palate; after infuſion, the bohea, which is made of the leaves when in maturity, is dried by the fire, or in the ſun; but the green, after being expoſed for a ſhort ſpace to the rays of the ſun, and aſſiduouſly turned and ſtirred about the whole time, is ſtrewed upon the ſheets of copper (which are gently warmed by embers beneath them) and rolled up and down by proper perſons, whoſe hands are defended by thick leather gloves from the effluvia, which would, without ſuch precaution, prove of the moſt pernicious conſequence.

The tea receives the principal part of its green tincture, and fine flavour, from the baleful vapours that exhale from the heated copper; yet theſe very circumſtances, that ſhould render it obnoxious, are its principal recommendations, not only with the Europeans, but the Aſiatics; who are ſo infatuated, as to pleaſe the eye and gratify the palate at the expence of their conſtitutions; and to prefer the unwholeſome green to the more ſalubrious bohea. Green is conſiderably dearer than bohea, on account of the greater trouble in preparing it, which is already mentioned, and becauſe when the young leaves are plucked, the tree receives ſo much injury, that it is allowed two or three years to regain its ſtrength and vigour, during which time, the leaves that accidentally fall, are gathered up and converted into bohea. Mr. Bell, however, the lateſt traveller who hath given us any authentic account of China, affirms, that the bohea, in curing, is mixed with another herb; this is probably only an adulteration, of which the Chineſe, who are exceedingly avaricious, and practiſed in every artifice to defraud, may be juſtly ſuſpected.

Dr. Quincy calls tea the moſt ſalubrious of all vegetables that were ever introduced into food or medicine; and Dr. Cheyne recommends green-tea as a fine diluter; while Dr. James, on the contrary, ſays, "Whatever virtues are aſcribed to tea, or however uſeful it may be in China, it is very certain that either the tea, or the water, or both, are extremely prejudicial, as an habitual drink in England;" but, with ſubmiſſion to theſe great phyſicians, we rather think they have carried their reſpective opinions too much into extremes. Tea hath, doubtleſs, many of the virtues which the Chineſe aſcribe to it, without being an univerſal medicine, as Doctor Quincy would have us believe; it may likewiſe have its bad qualities, without being ſo exceedingly pernicious as Doctor James would perſuade us. Beſides, if we conſider the probable adulterations of the Chineſe merchants, and our own domeſtic dealers, with the virtues it may loſe in the voyage, and by the length of time it lays by previous to conſumption, it is natural to conclude, that the latter gentleman drew his inferences, not from the effects of the genuine, but of a ſpurious and adulterated kind of tea.

The Chineſe drink their tea without ſugar, though the latter, as well as the former, is a produce of their country, and exceedingly cheap. The very beſt green tea is ſold at Pekin at the rate of two ſhillings Engliſh per pound; and it is obſervable, that the tea-tree degenerates when tranſplanted, even in countries under the ſame parallel of latitude. The Dutch dry and prepare ſage as tea is in China, of which the Chineſe are ſo fond, that they give four pounds of the latter for one of the former.

The culture of this plant ſeems to be very ſimple; and it is certain that ſome kinds are of a much higher and more delicious flavour than others. It is thought that the fineſt, which is the flower of the tea, is imported over-land to Ruſſia; but we know of little difference in their effects on the human body.

The Portugueſe, it is ſuppoſed, had the uſe of tea long before the Engliſh; but it was introduced among the latter before the reſtoration, as mention of it is made in the firſt act of parliament, that ſettled the exciſe on the king for life in 1660. Catharine of Liſbon, wife to Charles II. rendered the uſe of it common at court.

The ginſeng (a native of Chineſe Tartary) ſo famous among the Chineſe as the univerſal remedy, and monopolized even by their emperors, is now found to be but a common root, and is plentiful in Britiſh America. When brought to Europe, it is little diſtinguiſhed for its healing qualities; and this inſtance alone ought to reach us with what caution the former accounts of China, penned by the jeſuits, are to be read. It grows in moſt grounds, is many years maturing, has ſmall leaves, pointing upwards, a bluiſh flower, and, when dried, is of a greyiſh caſt. Several other vegetables of a medicinal nature are alſo found in China, particularly rhubarb, tou-ling, or China-root; the tiho-hang, a reſtorative; the ſant-ſi, a purifier; and tobacco.

Naturaliſts affirm, that China produces all metal and minerals that are known in the world. They procure gold, which is the natural produce of the country, by gathering the larger particles which are waſhed down the rivers, catching the ſmaller by means of fleeces, or ſearching for what accidentally ſticks in the banks. They have alſo gold mines; but as one of the fundamental maxims of the Chineſe government, is, that of not introducing a ſuperabundance of gold and ſilver, for fear of hurting induſtry, theſe are therefore but ſlightly worked, and the cur-

rency of that metal is ſupplied by the grains the people pick up in the ſands of rivers and mountains. The ſilver ſpecie is furniſhed from the mines of Honan. The mountains are ſtored with iron, copper, quick-ſilver, lead, white copper, or tutenage, which the natives call pe tong, loadſtones, pit-coal, ſalts of various kinds, and quarries of ſtone, particularly marble, many veins of which are finely variegated with land-ſcapes; and ſome of the other ſtones, when burnt, produce a metal of which they make excellent ſwords, and other weapons.

The meadows and paſtures are fat and rich, and feed prodigious quantities of cattle.

No country is better furniſhed with horſes, the breed of which, though ſmall, hath been greatly improved by the introduction of the Tartarian, Arabian, and Perſian.

Here likewiſe great numbers of oxen, buffaloes, ſwine, game, &c. Their tygers are exceedingly fierce and dangerous, for they ſearch for their prey in droves, and when preſſed by hunger, will enter villages, and attack the inhabitants with great fury.

The bears in China naturally walk upon their hind-legs, have faces reſembling thoſe of monkies, long beards, and great ſagacity: they are taught a variety of tricks, and are rendered very entertaining by the addreſs of their tutors. The Chineſe camel is about the bigneſs of a middle-ſized horſe, of a dun or aſh colour; it is well made, and has two bunches upon its back. Here are no lions, and but few elephants, but many rhinoceroſſes and wild boars: ſtags alſo, and hares are in great plenty. The dwarf ſtag is a great curioſity, being in form exactly like a ſtag, and in ſize no bigger than a dog: this is accounted a domeſtic animal, as few perſons of any conſideration are without them in their houſes or gardens. The muſk-cat is likewiſe found here, from a bag under the navel of which is taken that noble perfume called muſk, which makes a valuable article of Chineſe commerce. Their wild mules can never be ſo far broken as to become ſerviceable; they are therefore only caught to be killed, as their fleſh is a delicacy.

With reſpect to the population of China, ſome accounts inform us, that there are in this vaſt empire fifty-eight millions of inhabitants; and all between twenty and ſixty years of age pay an annual tax; but in a work publiſhed at Berlin in 1786, by Profeſſor Herrmann, the population of China (including Chineſe Tartary) is ſettled at 104,096,254 ſouls, allowing 946 inhabitants to every ſquare mile. Of this amazing number, one-fourth part, he ſays, contributes to the public taxes; and the army is computed at one-ſeventieth. Notwithſtanding the induſtry of the people, their amazing increaſe frequently occaſions a ſcarcity of proviſions. As next to being barren, they count it the greateſt ſcandal to bring females into the world; therefore if a woman of a poor family happens to have three or four girls ſucceſſively, it not unfrequently happens that ſhe will expoſe them on the high roads, or caſt them into a river, which they are allowed to do; but then they faſten a gourd to the child, that it may float on the water; and there are often compaſſionate people of fortune, who are moved by the cries of the children, to ſave them from death.

The Chineſe, in their perſons, are middle-ſized, their faces broad, their eyes black and ſmall, their noſes rather ſhort. The Chineſe have particular ideas of beauty: they pluck up the hairs of the lower part of their faces by the roots with tweezers, leaving a few ſtraggling ones by way of beard. Their Tartar princes compel them to cut off the hair of their heads, and, like Mahometans, to wear only a lock on the crown. Their complexion towards the north, is fair; towards the ſouth, ſwarthy; and the fatter a man is, they think him the handſomer. Men of quality and learning, who are not much expoſed to the ſun, are delicately complexioned; and they who are bred to letters, let the nails of their fingers grow to an enormous length, to ſhew that they are not employed in manual labour.

As to the Chineſe women, they have little eyes, plump roſy lips, black hair, regular features, and a delicate though florid complexion. The ſmallneſs of their feet is reckoned a principal part of their beauty, and no ſwathing is omitted, from their earlieſt age, to give them that unnatural accompliſhment; ſo that when they grow up, they may be ſaid to totter rather than to walk. This abſurd cuſtom is ſaid by ſome to have been invented by the ancient Chineſe to palliate their jealouſy, by reſtraining women from viſiting, and rambling abroad too much.

It would give little information, and leſs amuſement to the reader, were we to enter into all the ridiculous formalities of the Chineſe, eſpecially of their men of quality, when paying or receiving viſits; and this very probably would come too late, as the manners of the Chineſe, ſince they fell under the power of the Tartars, are greatly altered, and daily vary. It is ſufficient to obſerve, that the legiſlators of China, looking upon ſubmiſſion and ſubordination as the corner-ſtones of all ſociety, deviſed thoſe outward marks of reſpect, ridiculous as they appear to us, as the teſt of duty and reſpect from inferiors or ſuperiors; and their capital maxim was, that the man who was deficient in civility, was void of good ſenſe.

From the general mode of behaviour, and the compliments uſed by the Chineſe on every occaſion, they ſeem to be a polite and affable people: but view them, independent of the ceremonials preſcribed by law, and they will appear to be the moſt diſhoneſt, low, thieving ſet in the world, employing their natural quickneſs only to improve the arts of cheating the European nations they deal with, eſpecially the Engliſh: but it has been remarked, that none but a Chineſe can over-reach a Chineſe. They are fond of law-diſputes beyond any people in the world. Their hypocriſy is without bounds; and the men of property among them practiſe the moſt avowed bribery, and the loweſt meanneſſes, to obtain preferment. It ſhould however be remembered, that ſome of the late accounts of China have been drawn up by thoſe who were little acquainted with any part of that empire, but the ſea-port towns, in which they probably met with many knaviſh and deſigning people. Some of the jeſuit miſſionaries ſeem to have too much extolled the Chineſe, who are, on the other hand, too much degraded by later writers. Upon the whole, it ſeems not juſt to attempt to characteriſe a great nation by a few unfavourable inſtances, though well atteſted; and we appear not to be ſufficiently acquainted with the interior parts of China, to form an accurate judgment of the manners and characters of the inhabitants.

The dreſs of the Chineſe varies according to the degrees among them. The men wear caps on their heads, of the faſhion of a ball; thoſe of quality are ornamented with jewels: the reſt of their dreſs is eaſy and looſe, conſiſting of a veſt and ſath, a coat or gown thrown over them, ſilk boots, quilted with cotton, and a pair of drawers. The ladies towards the ſouth wear nothing on their head; ſometimes their hair is drawn up in a net, and ſometimes it is diſhevelled: their dreſs differs but little from that of the men, only their gown or upper garment has very large open ſleeves. The dreſs, both of men and women, varies, however, according to the temperature of the climate. On paying a viſit, they envelope themſelves entirely with a blue ſilk looſe habit, which they cover with a black or purple cloak, that reaches to the mid-leg, they uſually wear a ſcymetar by their ſide, and carry a fan in their hand, but never forget the ſilk buſkins which cover their pink ſtockings. Elderly women generally dreſs in black or purple, but the youthful in whatever colours they pleaſe, except yellow,

yellow, which none but the royal family are permitted to wear.

Marriages in China are concluded on by the parents, and that is generally when the parties are perfect children, who never ſee each other till the day of their nuptials; and though in other countries it is the cuſtom for women to bring portions to their huſbands, here huſbands pay a ſum of money to the parents of the bride, which is generally laid out in clothes, &c. for her: then follow certain ceremonies, the chief of which conſiſt in the relations on both ſides ſending to demand the name of the intended bridegroom and bride, and in making them preſents. The relations of the bride, who fix the day of the nuptials, frequently conſult the calendar for a fortunate day; mean-while the man ſends his intended bride ſome jewels, pendants, and the like; at leaſt this is the cuſtom among the rich. When the nuptials are ratified, the bride goes among the ladies, and ſpends the day with them, while the bridegroom treats his friends in a ſeparate apartment, and at night the couple repair to bed.

No man, except the emperor, can marry more than one wife; he however has the privilege of taking as many concubines into his houſe as he pleaſes, but theſe muſt be obedient to the wife, and treat her as their miſtreſs, though the children are not deemed baſtards, but ſhare the father's eſtate in common with thoſe of the lawful wife, who permits them to ſtyle her mother, and treats them as ſhe does her own children. The emperor has three wives, and about 3000 concubines.

As to the funerals of theſe people, a great perſonage is always buried with a peculiar ſolemnity and pomp: they firſt waſh the corpſe, and after embalming it, dreſs it in the richeſt robes, and then expoſe it to view in a raiſed alcove, before which the wives, children, relations, and friends proſtrate themſelves: near the coffin, ſtands an image of the deceaſed, or elſe ſome carved work, with his name in large characters, and with flowers, perfumes, and flambeaux. The coffin is made of precious wood, varniſhed and gilt. People of note, and even ſome of the poorer ſort, will have their coffins made in their life-time. Before the corpſe is put into the coffin, a quantity of lime is ſtrewed at the bottom of it. Every Chineſe keeps in his houſe a table or altar, upon which are written the names of his father, grandfather, and great-grandfather, before which they frequently burn incenſe, and proſtrate themſelves; and when the father of a family dies, the name of the great-grandfather is taken away, and that of the deceaſed is ſubſtituted.

The mourning of the Chineſe is white, which is worn three years for a parent; wives mourn three years for their huſbands, but huſbands only one year for their wives. Children, mourning for their parents, wear coarſe white cloth the firſt year, a better ſort the ſecond year, and the third year white ſilk if they pleaſe. The firſt hundred days are ſpent in ſolitude, lamentation, and abſtinence; and during the whole peroid of their mourning, they are forced to refrain from holding any public employment; even a mandarin quits all buſineſs on ſuch an occaſion.

The two principal public feſtivals or rejoicings in China, are celebrated, one in the beginning, and the other about the middle of January. The former is kept in viſiting, feaſting, making preſents, &c. that of the middle of the month, is called the Feaſt of the Lanterns.

The Chineſe language contains only 336 words, all of one ſyllable; but then each word is pronounced with ſuch various modulations, and each with a different meaning, that it becomes more copious than could eaſily be imagined, and enables them to expreſs themſelves very well on the common occaſions of life. The miſſionaries, who adapt the European characters, as well as they can, to the expreſſion of Chineſe words, have deviſed eleven different, and ſome of them very compounded, marks and aſpirations, to ſignify the various modulations, elevations, and depreſſions of the voice, which diſtinguiſh the ſeveral meanings of the ſame monoſyllable. The Chineſe oral language, being thus barren and contracted, is unfit for literature, and therefore their literature is all compriſed in arbitrary characters, which are amazingly complicated and numerous: according to ſome of their writers, they amount to 25,000, to 30 or 40,000 according to others; but the later writers ſay, they amount to 80,000; though he is reckoned a very learned man who is maſter of 15 or 20,000. This language being wholly addreſſed to the eye, and having no affinity with their tongue, as ſpoken, the latter hath ſtill continued in its original, rude, uncultivated ſtate, while the former has received all poſſible improvements.

A modern writer obſerves, that the Chineſe characters, which are by length of time become ſymbolic, were originally irritative; they ſtill partake ſo much of their original hieroglyphic nature, that they do not combine into words like letters or marks for ſounds; but we find one mark for a man, another for a horſe, a third for a dog, and in ſhort a ſeparate and diſtinct mark for each thing which hath a corporeal form. The Chineſe alſo uſe a great number of marks entirely of a ſymbolic nature, to impreſs on the eye the conceptions of the mind, which have no corporeal forms, though they do not combine theſe laſt marks into words, like marks for ſounds or letters; but a ſeparate mark is made to repreſent or ſtand for each idea, and they uſe them in the ſame manner as they do their abridged picture-characters, which were originally imitative or hieroglyphic.

The Chineſe do not write with a reed like the Arabians, or with a crayon like the Siameſe, or with a pen like the Europeans, but with an hair-pencil.—They make uſe of a piece of poliſhed marble, hollowed at one end to hold water, wherein they dip their ſtick of ink, and then gently rubbing it, there is in a few moments produced a fluid ink. They do not hold their pencils ſloping as we do our pens, but perpendicular to the paper: they write from top to bottom in columns, and begin their books where ours end; that is, they begin at the right-hand ſide of the paper, and proceed to the left, like the Hebrews: but their paper being very thin, it will not bear writing on both ſides of it. Sometimes a title is placed horizontally, and this is likewiſe read from the right-hand.

They lay claim to the invention of printing at leaſt four hundred years before it was practiſed by the Europeans; but that can only be applied to block-printing; and their method is not at all like ours.

The genius and learning of the Chineſe is peculiar to themſelves. They have no conception of what is beautiful in writing, regular in architecture, or natural in painting; and yet in their gardening, and planning their grounds, they hit upon the true ſublime and beautiful. They perform all the operations of arithmetic with prodigious quickneſs, but differently from the Europeans. Till the latter came among them, they were ignorant of mathematical learning, and all its depending arts. They had no proper apparatus for aſtronomical obſervations; and the metaphyſical learning, which exiſted among them, was confined to their philoſophers; but even the arts introduced by the Jeſuits were of very ſhort duration among them, and laſted very little longer than the reign of Cang-hi, who was co-temporary with our Charles II. nor is it very probable they ever will be revived.

The progreſs of the Chineſe erudition is greatly retarded by the difficulty of maſtering and retaining ſuch a number of arbitrary marks and characters as there are in what may called their written language. But there is no part of the globe where learning is attended with ſuch honours and rewards, and where there

there are more powerful inducements to cultivate and purſue it. The literati are reverenced as men of another ſpecies, and are the only nobility known in China. If their birth be ever ſo mean and low, they become mandarins of the higheſt rank, in proportion to the extent of their learning. On the other hand, how exalted ſoever their birth may be, they quickly ſink into poverty and obſcurity, if they neglect thoſe ſtudies which raiſed their fathers; ſince there is no nation in the world where the firſt honours of the ſtate lie ſo open to the loweſt of the people, and where there is leſs of hereditary greatneſs.

The Chineſe range all their works of literature in four claſſes. The firſt is the claſs of King, or the ſacred books, which contains the principles of the Chineſe religion, morality, and government, and ſeveral curious and obſcure records, relative to theſe important ſubjects. Hiſtory forms a claſs apart; yet, in the firſt claſs, there are placed ſome hiſtorical monuments on account of their relation to religion and government, and among others the Tekun-tficou, a work of Confucius, which contains the annals of twelve kings of Low, the native country of that illuſtrious ſage. The ſecond claſs is that of the Su, or Che, that is, of hiſtory and the hiſtorians. The third claſs, called the Tſu, or Tſe, comprehends philoſophy and the philoſophers, and contains the works of the Chineſe literati, the productions alſo of foreign ſects and religions, which the Chineſe conſider only in the light of philoſophical opinions, and all books relative to mathematics, aſtronomy, phyſic, military ſcience, the art of divination, agriculture, and the arts and ſciences in general. The fourth claſs is called Tcie, or Miſcellanies, and contains all the poetical books of the Chineſe, their pieces of eloquence, their ſongs, romances, tragedies, and comedies.

The Chineſe literati, in all the periods of their monarchy, have applied themſelves leſs to the ſtudy of nature, and to the reſearches of natural philoſophy, than to moral enquiries, the practical ſcience of life, and internal polity and manners. It is ſaid, that it was not before the dynaſty of the Long, in the tenth and eleventh centuries after Chriſt, that the Chineſe philoſophers formed hypotheſes concerning the natural ſyſtem of the univerſe, and entered into diſcuſſions of a ſcholaſtic kind; and this was perhaps in conſequence of the intercourſe they had long maintained with the learned among the Arabians, who ſtudied aſſiduouſly the works of Ariſtotle; and the progreſs of the Chineſe in natural philoſophy has been much inferior to that of the Europeans, ſince they have begun to pay ſome attention to that ſcience.

The Chineſe have juſtly claimed the invention of gunpowder, which they made uſe of againſt Zinghis Khan and Tamerlane. They ſeem to have known nothing of ſmall fire-arms, and to have been only acquainted with the cannon, which they call the fire-pan.

Their induſtry and ingenuity in the manufactures of porcelain, ſilks, ſtuffs, japanning, and the like ſedentary trades, is amazing, and can be equalled only by their labours in the field, in making canals, levelling mountains, raiſing gardens, &c.

The Chineſe porcelains, which they call Tſe-ki, is made of the Pe-tun-tſe and Kaolin, the former of which is a fine white earth, and the latter an earthy kind of ſtone with bright particles like thoſe of ſilver. After they have waſhed and purged the ſtone from its ſandy and foul matter, they break it into pieces with hammers in mortars, and with ſtone peſtles reduce it to a fine powder. Theſe peſtles, which are capped with iron, are worked perpetually, either by man's labour, or by means of water, in the ſame manner as the hammers of paper-mills. The powder is put into a veſſel, and briſkly ſtirred about; when, after it has reſted a few minutes, a thick cream riſes on the ſurface, which they take off, and pour it into a ſecond veſſel of water; this cream is not leſs than four or five inches thick. The groſs part of the powder that remains in the firſt veſſel they take out and pound afreſh. With regard to what is put into the ſecond veſſel, they wait till it has formed a kind of paſte at the bottom; and when the water is clear, they pour it gently off, and caſt the paſte into large moulds, in which it is dried. It is remarkable that neither the Pe-tun-tſe nor Kaolin are to be got in the neighbourhood of King-te-tching; they are obliged to fetch them from the province of Chan-ſi, twenty or thirty leagues off, where the inhabitants know not how to uſe them: of theſe are made cups and vaſes of various kinds, ſizes, and colours; ſome red, ſome yellow, ſome grey, ſome blue, and others white, but none of a perfectly black ground: red and ſky-blue are the moſt common colours.

The whole proceſs of painting the porcelain is long and laborious, and employs a great number of hands: it is the buſineſs of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third; a fourth is employed in the formation of birds and other animals; a fifth forms rivers, rocks, &c. and a ſixth is engaged in the figures of men and women.

They uſe all colours in painting their china ware; ſome quite red with ſmall ſpots, others entirely blue, others ſtreaked or chequed with ſquares, like moſaic work, which is reckoned among the moſt beautiful. Some of their china is mixed with various colours, like jaſper; and ſome is adorned with flowers, landſcapes, dragons, and frequently human figures. Theſe figures are often relievo, which is thus effected: they firſt delineate the figure with a pencil, and then pare down the contiguous ground, ſo that it appears raiſed or emboſſed on the ſuperficies. They make every kind of repreſentation in this ſort of ware, as idols, animals, &c. Many of thoſe figures known in Europe by the name of Chineſe baboons are images of the gods they worſhip.

The ſilks moſt eſteemed either for richneſs or beauty, are the Nan-king damaſks of various colours, ſatins, taffeties, brocades, gauzes, &c. Theſe, when quite new, have a very fine and handſome appearance; but their beauty ſoon fades. A ſtrong durable ſatin called Touan-tſe is much eſteemed: it is ſometimes plain, and ſometimes figured with repreſentations of birds, trees, flowers, and particularly dragons; for the figure of a dragon is a very favourite repreſentation with the Chineſe, on account of the peculiar veneration they have for the memory of a celebrated dragon, which, agreeable to their fabulous antiquity, inſpired their great legiſlator Fo-hi. Theſe figures are not raiſed upon the ſilk after the European manner; the texture is even throughout, the figures being diſtinguiſhable by difference of colour, and not by their projecting from the ground of the ſilk, after the manner of baſſo relievo: theſe colours conſiſt of the juices of herbs and flowers, which ſo effectually penetrate the ſilk, that the ſtain always remains in it; and ſo admirable is the deception, that the figures appear as if actually projecting from the ground of the ſilk.

The Chineſe, however, are ignorant of the art of wire-drawing, and conſequently have no gold and ſilver thread; to ſupply this defect, they roll their ſilk in thin wire plates, to give it the tinge; and ſometimes, inſtead of gilding the thread, they apply the leaf gold to the ſilk in the piece. This ſplendid finery ſoon tarniſhes, and is worn only by mandarins of the firſt conſequence, and their ladies. Having thus far treated of the ſilks, we ſhall now ſay ſomething of the ſilk-worm.

The worm, when it leaves its egg, is no bigger than the head of a common pin; it feeds upon the mulberry leaf, and grows to the ſize of a caterpillar, after which it no longer eats, but prepares for its diſſolution: it wraps itſelf in a kind of ſilken ball ſpun from its own bowels, and its head ſeparating from its body,

body, the inſect now no way reſembles its original form; it hath apparently neither life nor motion; however, after remaining in this ſtate ſome time, it awakes to a new being, and appears a different kind of inſect. It reſembles a large moth or butterfly; and in this laſt ſtage the female propagates the ſpecies by laying a prodigious number of eggs, after which ſhe dies. This valuable worm is compoſed of ſeveral elaſtic ſprings; from one extremity to the other it has a kind of little nerve, which we will call the ſpine; this ſpine, placed in the centre of its body, and continued through its whole length, ſuſtains two other nerves or ſtrings; one of theſe is the heart, which is compoſed of many oval veſſels; the other, which is the lungs, is double, and appears to be an aſſemblage of ſeveral rings extending towards the two ſides of the inſect, and between which are certain orifices that correſpond with thoſe diſtributed along the exterior ſides. It is through theſe apertures that the air flows to the lungs, and by its ſpring and expanſion promotes the circulation of the chyle or humour which nouriſhes the inſect.

It is neceſſary to add, that the worm is perfectly black when it firſt comes out of the egg. In a few days it begins to aſſume a whitiſh hue, or aſh grey; after this its coat ſullies, and becomes ragged; at which time the inſect caſts it off, and appears in a new habit. It increaſes in bulk, and becomes more white, though a little inclining to a blueiſh caſt; then diveſting itſelf of its ſkin, it appears in its third habit; when its colour, head, and whole form are ſo metamorphoſed, that it appears quite another inſect. In a few days it becomes changed to a bright yellow; ſo that, from the time of its leaving the egg, it hath diveſted itſelf of three different coverings. It continues feeding a ſhort time longer, and then renouncing all ſociety, wraps itſelf in its little ſilken ball as already mentioned.

With reſpect to the natural curioſities in China, ſeveral of theſe have been already mentioned under the preceeding articles: to which we ſhall add, under this head, the volcano of Lineſung, which is ſaid ſometimes to make ſo furious a diſcharge of fire and aſhes, as to occaſion a tempeſt in the air; and ſome of their lakes are ſaid to petrify fiſhes when put into them. Their curioſities, effected by art and labour, are ſtupendous.

The great Wall in China was built ſome centuries before Chriſt's time, by the Chineſe Emperor Chien-chu Voang (according to Du Halde by Tſin-Shi-Wan, who makes it two hundred and twenty-one years before the birth of Chriſt), to prevent the incurſions of the reſtleſs weſtern Tartars. It is extended from the Oriental ſea far beyond the middle of Shen-ſi, and includes the provinces of Pekin, and almoſt the whole of Shen-ſi. Its length, in a direct line, is computed at ſix hundred and fifty-four French miles; but reconed as a curved line, amounts to upwards of one thouſand. It has three or four lofty towers or forts within the compaſs of every mile, many of which are ſituated upon the higheſt mountains; and the Wall is broad enough upon the top for eight horſes to gallop a-breaſt without any danger.

The gates of the Great Wall are all defended, on the ſide of China, by pretty large forts: the firſt of them, to the eaſt, is called Shang-hay-Quan; it ſtands near the Wall, which extends, from the bulwark above mentioned, the ſpace of a league along a country perfectly level, and does not begin to aſcend the mountains till after it has paſſed that place.

Many of the ſquare towers are large and lofty, ſome of two ſtories high, built of brick, upon a foundation of ſtone, which riſes about four feet above the ground. Each ſide of the ſquare, at the baſe, meaſures from thirty-five to forty feet, and their height is nearly the ſame dimenſions. The ſide of the ſquare at the top is from twenty-eight to thirty feet. The firſt ſtory is upon a level with the platform of the wall, in which there are embraſures.

The foundation of the wall, formed of large ſquare ſtones, which project about two feet beyond the brickwork, is about twenty-five feet thick at its baſe, and riſes not leſs than two feet above the ſurface of the ground. The reſt is caſed both inſide and outſide with brickwork, each of the thickneſs of five feet, having the intermediate ſpace filled up with earth or tempered clay, and terraced upon the top with a platform of ſquare bricks. The parapets, about eighteen inches thick, are a continuation of the brickwork above the terreplain.

To raiſe men for building this Wall, which is ſtated to have been completed in five years, the Emperor commanded that three out of every ten men throughout his dominions ſhould work at it; and afterwards, two out of every five were compelled to labour at this vaſt undertaking. It is alſo ſaid, that though the inhabitants of each province worked as near their own abode as they could, yet, either by the length of their journey, or the difference of climate, almoſt all thoſe employed in its conſtruction died unexpectedly. This raiſed a tumult in the empire, which proceeded to the length of murdering the Emperor, and his ſon Agutzi, in the fortieth year of his reign.

When it is conſidered, that this ſtructure, upwards of a thouſand French miles in length, beſides being extended along dreary waſtes, and even ſurfaces, is carried over expanſive rivers in the form of bridges, ſome having two tiers of arches; and alſo, in the ſame ſhape, acroſs deep and wide-extended vallies, uniting, as it were, the mountains which form them; that it aſcends the higheſt, and deſcends the ſteepeſt precipices; and with all this, conſidering the immenſity of labour, the ingenuity of the artiſts, the difficulty of tranſporting materials, and the ſhort time of its completion, the imagination is loſt in the contemplation of an object whoſe grandeur is not ſurpaſſed by any of the ſeven wonders of the world.

Their triumphal arches are amongſt the moſt famous buildings of the Chineſe: they are called by the natives Pay-leou, and are in every city or large town in the empire. Though they are not built in the Greek or Roman ſtyle of architecture, yet they are ſuperb and beautiful, and erected to the memories of their great men, with vaſt labour and expence. They have commonly three gates, formed by columns, the baſes of which are without moulding or embelliſhment; neither have they capitals or cornices: the frize is high even to an abſurdity, to admit ſpace for inſcriptions, as well as borders of ornaments, conſiſting of birds, flowers, human figures, &c. They are ſaid in the whole to be 1100, two hundred of which are particularly magnificent.

The Chineſe bridges cannot be ſufficiently admired. They are built ſometimes upon barges ſtrongly chained together, yet ſo as to be parted, and to let veſſels paſs that ſail up and down the river. Some of them run from mountain to mountain, and conſiſt only of one arch; that over the river Saffrany is 400 cubits long, and 500 high, though a ſingle arch, and joins two mountains; and ſome in the interior parts of the empire are ſaid to be ſtill more ſtupendous.

Their towers, the models of which are now ſo common in Europe under the name of Pagodas, are vaſt embelliſhments to the face of this country. They ſeem to be conſtructed by a regular order, and all of them are finiſhed with exquiſite carvings and gildings, and other ornaments. The moſt remarkable of theſe is that at Nan-kin, called the Porcelain Tower, from its being covered from top to bottom with porcelain tiles, finely painted: it is of an octangular figure, contains nine ſtories, is about 200 feet high, and 40 in diameter. It is raiſed on a very ſolid baſe of brickwork, the wall at the bottom being at leaſt twelve feet thick. The ſtructure leſſens all the way to the top, which is terminated by a ſort of ſpire or

pyramid, having a large golden ball or pine-apple on its ſummit. Between every ſtory there is a kind of penthouſe or ſhed on the outſide of the tower, at each corner whereof are hung little bells, which, being moved by the wind, make a pleaſant jingling. The ceilings of the rooms are adorned with paintings, and the light is admitted through windows of lattice-work. There are alſo abundance of niches in the wall, filled with images of their deities; and the amazing variety of ornaments that embelliſh the whole, render it one of the moſt beautiful ſtructures in the kingdom.

The Chineſe are remarkably fond of bells, which has given name to one of their principal feſtivals. A bell of Pekin weighs 120,000lb. but its ſound is ſaid to be diſagreeable.

Their temples are chiefly remarkable for the diſagreeable taſte in which they are built, and the uglineſs of the idols they contain. Their ſepulchral monuments have a pompous appearance.

The laſt curioſity we ſhall mention, is the fire-works of the Chineſe, which exceed thoſe of all other nations, both in beauty and variety.

It would take a volume to deſcribe all the buildings and other objects deſerving attention in this empire, where every province is a ſcene of curioſities. Their ſtructures, except thoſe above-mentioned, are confined to no order; and, being ſuſceptible of all kind of ornaments, exhibit a wild variety of pleaſing elegance, very agreeable to the eye and imagination, by preſenting a diverſity of objects not to be found in European architecture; though none of theſe ſtructures, ſingly conſidered, has the leaſt claim to true beauty and juſt proportion.

From the ſituation of China, and its producing ſuch a variety of materials for TRADE and MANUFACTURES, it may with propriety be denominated the land of induſtry; but it is an induſtry without taſte or elegance, though carried on with a great degree of art and neatneſs. They make paper of the bark of bamboo, and other trees, as well as of cotton; but not comparable to the European for records or printing. Their ink, for the uſe of drawing, is well known in England, and is ſaid to be made of oil and lamp-black. We have already mentioned the antiquity of their printing, which they ſtill perform by cutting their characters on blocks of wood.

The manufacture of that earthen ware, generally known by the name of china, was long a ſecret in Europe, and brought immenſe ſums to that country. The ancients knew and eſteemed it highly under the name of porcelain, but it was of a much better fabric than the modern. Though the Chineſe affect to keep that manufacture ſtill a ſecret, yet it is well known that the principal materials are prepared pulverized earth, and that ſeveral European countries far exceed the Chineſe in manufacturing this commodity. The Engliſh in particular have carried this branch to a high degree of perfection, as appears from the commiſſions which have been received of late from ſeveveral princes of Europe; and we hope that a manufacture ſo elegant and generally uſeful, will meet with encouragement from every true patriot. The Chineſe ſilks (which, as well as the china-ware, have been noticed in a preceeding article) are generally plain and flowered gauzes, and they are ſaid to have been originally fabricated in that country, where the art of rearing ſilk-worms was firſt diſcovered. They manufacture ſilks of a more durable kind; and their cotton, and other cloths, are famous for furniſhing a light warm wear. Their manufactures in amber, ivory, coral, ebony, ſhells, &c. are alſo extremely ingenious.

It is well known that the Chineſe trade is open to all the European nations, with whom they deal for ready money; for ſuch is the pride and avarice of theſe people, that they think no manufactures equal to their own: but it is certain, that the Chineſe commerce has been on the decline ſince the diſcovery of the porcelain manufactures, and the vaſt improvements the Europeans have made in the weaving branches.

The Conſtitution and Government of the Chineſe, before the conqueſt of their empire by the Tartars, formed an inſtructive leſſon to the reſt of the world; and though their princes retain many fundamental maxims of the old Chineſe, they have obliged the inhabitants to deviate from the ancient diſcipline in many reſpects. Perhaps their acquaintance with the Europeans may have contributed to their degeneracy.

The original plan of the Chineſe government was patriarchal, almoſt in the ſtricteſt ſenſe of the word. Duty and obedience to the father of each family was recommended and enforced in the moſt rigorous manner; but, at the ſame time the emperor was conſidered as the parent of the whole. His mandarins, or great officers of ſtate, were looked upon as his ſubſtitutes, and the degrees of ſubmiſſion which were due from the inferior ranks to the ſuperior, were ſettled and obſerved with the moſt ſcrupulous preciſion, and in a manner that to us ſeems highly ridiculous. This ſimple claim of obedience required great addreſs, and knowledge of human nature, to render it effectual.

The chineſe legiſlators, Confucius particularly, appear to have been men of wonderful abilities. They enveloped their dictates in a number of myſtical appearances, ſo as to ſtrike the people with awe and veneration. The mandarins, or great lords, had modes of ſpeaking and writing which differed from thoſe of other ſubjects; they were ſeldom ſeen, and more ſeldom approached, as the people were taught to believe that their princes partook of divinity.

But notwithſtanding this ſyſtem preſerved the public tranquility for an incredible number of years, yet it had a fundamental defect that often convulſed, and at laſt proved fatal to the ſtate, becauſe the ſame attention was not paid to the military as to the civil duties. The Chineſe had paſſions like other men, and ſometimes a weak or wicked adminiſtration drove them to arms, and a revolution eaſily ſucceeded, which they juſtified, by ſaying that their ſovereign had ceaſed to be their father. During thoſe commotions, one of the parties naturally invited their neighbours the Tartars to their aſſiſtance; and it was thus that thoſe barbarians, who had great ſagacity, became acquainted with the weak ſide of their conſtitution, which they availed themſelves of, by invading the country, and reducing the whole of it to their obedience.

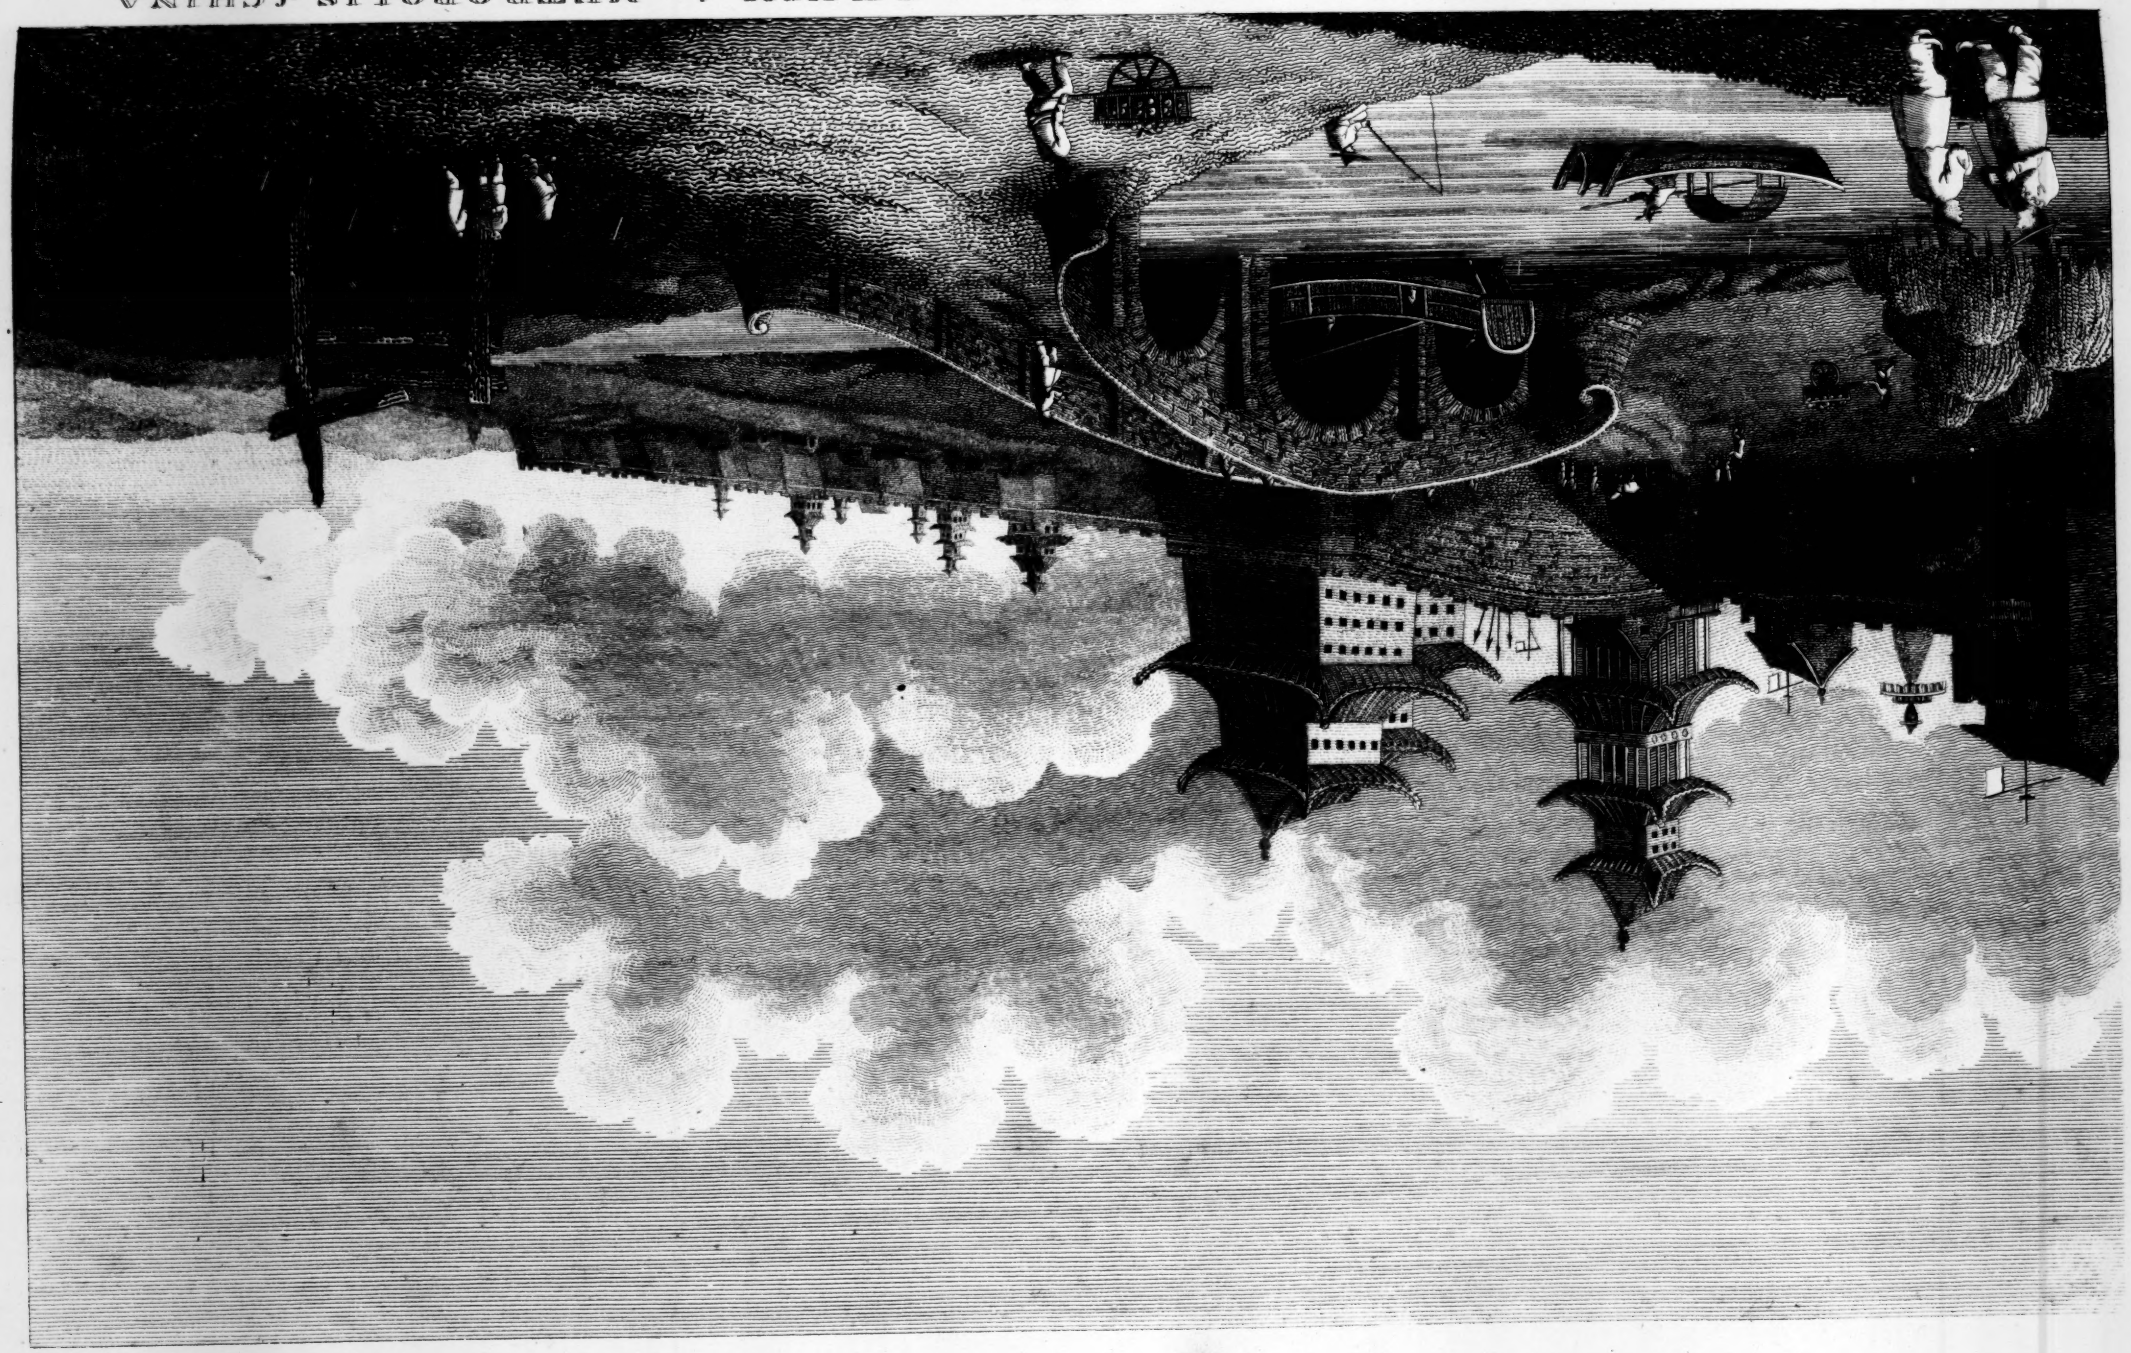
The Chineſe, beſides the great doctrine of patriarchal obedience, had ſumptuary laws, and regulations for the expences of all degrees of ſubjects, which were uſeful in preſerving public order, and preventing the pernicious effects of ambition. By their inſtitutions, likewiſe, the mandarins might remonſtrate to the emperor, but in the moſt ſubmiſſive manner, upon the errors of his government; and when he was a virtuous prince, this freedom was often attended with the moſt ſalutary effects.

No country in the world is ſo well provided with magiſtrates for the diſcharge of juſtice, both in civil and criminal matters, as China; but, as in other countries, they are frequently rendered ineffectual through want of public virtue in the execution.

The emperor is ſtyled, "Holy Son of Heaven, Sole Governor of the Earth, Great Father of his People," &c. He has an abſolute power over the lives and fortunes of all his ſubjects, not even excepting the princes of the blood. His will is law, and his commands admit of no delay or neglect, under the ſevereſt penalties. But notwithſtanding this arbitrary power of the emperor, his government is conducted in a very regular manner; tribunals and magiſtrates are eſtabliſhed in the moſt exact and uniform method, for the adminiſtration of juſtice, and the due perform-

ance

A West VIEW of the ENTRANCE into the CITY of PEKIN the METROPOLIS of CHINA



ance of all the offices of a well-regulated government. The emperor is aſſiſted, in the management of the great affairs of the kingdom, by two ſovereign councils, which aſſemble at Peking. Beſides theſe, ſix ſuperior tribunals are held in the ſame city for civil and military affairs; and their authority extends to every part of the empire.

Every mandarin or governor is obliged to tranſmit to court annually a particular account of his government, and is ſeverely puniſhed if he endeavours to palliate any miſcarriage; but as corruption prevails to a ſhameful degree in China, he that offers the higheſt bribe is ſure of gaining his cauſe. Except the princes of the blood, and tributary kings, there are at preſent no hereditary nobility among the Chineſe, nor is there any diſtinction but what flows from their offices, or their ſuperior wealth or learning.

As to religion, the Chineſe are, in fact, idolaters, but they are ſaid to worſhip one ſupreme God, and ſeveral inferior deities, who appear to have been men eminent in their ſeveral ages, particularly the inventors of arts and ſciences. They alſo worſhip things inanimate, as mountains, woods, and rivers; but never ſacrifice to vice, as is cuſtomary with moſt Pagans. There are, at preſent, three ſects in China: firſt, the followers of Li-Laokun, who, according to their account, lived above five hundred years before Chriſt, and taught that God was corporeal. They profeſs the ſtudy of magic, and pretend to make a drink which gives immortality. Secondly, the diſciples of the celebrated Confucius, who taught that God was a moſt pure and perfect principle, and the fountain and eſſence of all beings. Thirdly, the worſhippers of the idol Fo, or Fohi, the founder of the Chineſe nation; and this ſect is much more numerous than the other two. The emperor, being of the Tartar race, follows the idolatry of that nation, and worſhips the Dalay Lama.

In the accounts of China, tranſmitted to us by the Jeſuits, we are told, that the doctrine of Confucius approximates nearly to Chriſtianity, but very little dependence can be placed on their relations. About 100 years ago great numbers of theſe fathers reſorted to China, and, being men of great abilities, ſoon made a prodigious number of converts, for, if they may be depended on, they had no leſs than two hundred churches and chapels; but the emperor finding that theſe reſtleſs eccleſiaſtics, under pretence of religion, were aſpiring to the civil direction of the government, immediately baniſhed them, levelled their churches with the ground, and forbad the exerciſe of the Chriſtian religion, which ſince that time has made no figure in China. Hiſtory informs us, that Chriſtianity was planted in China by St. Thomas, or one of his diſciples, and many of the Chineſe records tend to confirm this opinion; but the Jeſuits affirm that they did not perceive the leaſt remains of it on their arrival in the country.

The revenues of this extenſive empire are ſaid by ſome to amount to twenty millions ſterling a year; but this cannot be meant in money, which does not at all abound in China. The taxes collected for the uſe of government in rice, and other commodities, may very poſſibly amount to that ſum: theſe are certainly very great, and may be eaſily impoſed, as an account of every man's family and ſubſtance is annually enrolled.

With regard to their military and marine ſtrength, China is at this time a far more powerful empire than it was before its conqueſt by the Eaſtern Tartars in 1644. This is owing to the conſummate policy of Chun-tchi, the firſt Tartarian emperor of China, who obliged his hereditary ſubjects to conform themſelves to the Chineſe manners and policy, and the Chineſe to wear the Tartar dreſs and arms. The two nations were thereby incorporated. The Chineſe were appointed to all the civil offices of the empire. The emperor made Peking the ſeat of his government, and the Tartars quietly ſubmitted to a change of their country and condition which was ſo much in their favour. But this ſecurity of the Chineſe from the Tartars, takes from them all military objects; the Tartar power alone being formidable to that empire. The only danger that threatens it at preſent, is the diſuſe of arms.

The Chineſe land army is ſaid to conſiſt of five millions of men; but in theſe are comprehended all who are employed in collecting the revenue, preſerving the canals, the great roads, and the public peace. The imperial guards amount to about 30,000. The marine force is compoſed chiefly of junks (veſſels much in uſe here) and other ſmall ſhips, that trade coaſt-ways, or to the neighbouring countries, or to prevent ſudden deſcents. In 1772, there was publiſhed at Paris a treatiſe on the military art, tranſlated from the Chineſe into the French language, from which it appears that the Chineſe are well verſed in the theory of the art of war; but caution, care, and circumſpection, are much recommended to their generals: and one of their maxims is, never to fight with enemies either more numerous or better armed than themſelves.

For the better conducting all matters relative to the war department, the Chineſe have placed the military government of the country under the direction of an order of mandarins, called the mandarins of war, of whom there are five claſſes, viz. the mandarins of the rear-guard, the mandarins of the left wing, thoſe of the right wing, thoſe of the main body, and thoſe of the van-guard. Theſe five claſſes are under the juriſdiction of ſo many courts or tribunals, which are all ſubject to a ſixth, viz. the fourth ſovereign court of Peking, which is intruſted with the care of the military of the empire. The preſident of the ſixth tribunal of war is always a grandee of the realm; his authority extends to all military perſons; to him belongs the ſupreme command of the army: but ſhould there be a war, the Chineſe law preſcribes, there ſhall in ſuch caſe be joined with him in commiſſion a mandarin of letters, bearing the title of ſuperintendent of arms; and there muſt be likewiſe appointed out of the ſame order two inſpectors of his conduct. The generaliſſimo undertakes no enterprize without the conſent of theſe three officers, who ſend a particular account of his operations to the fourth ſupreme court at Peking, that awful tribunal, to which even the general himſelf is accountable. Theſe mandarins, or officers at war, are computed at no leſs than eighteen thouſand.

Provinces and Chief Cities in China.

The ſixteen provinces, into which China is divided, are as follow: viz. Pe-ke-li, Kyang-man, Kiang-ſi, Fokyen, Che-ky-ang, Hu-quang, Ho-nan, Shang-tong, Shan-ſi, Shen-ſi, Se-chuen, Quan-tong, Quang-ſi, Yun-nan, Quew-chew, Ly-au-tong (without the great wall.)

The empire is ſaid to contain 4400 walled cities; the chief of which are Peking, Nanking, and Canton.

Peking, the capital of the Chineſe empire, and the ordinary reſidence of the emperors, is ſituated in a very fertile plain, twenty leagues diſtant from the great wall; this name, which ſignifies the Northern Court, is given it to diſtinguiſh it from Nan-king, or the Southern Court. The emperor formerly reſided in the latter; but the Tartars, a reſtleſs and warlike people, obliged the prince to remove his court to the northern provinces, that he might more effectually repel the incurſions of thoſe barbarians, by oppoſing to them the numerous militia that he generally keeps around his perſon. This capital forms an exact ſquare, and is divided into two cities; the firſt is inhabited by Chineſe; the ſecond by Tartars. Theſe two cities, without including the ſuburbs, are ſix leagues in circumference, according to the moſt accurate

curate meaſurement made by the expreſs order of the emperor. The walls of the Tartar city are very lofty, and ſo thick, that twelve horſemen might eaſily ride abreaſt upon them; with ſpacious towers at intervals, a bow ſhot diſtant from one another, and large enough to contain bodies of reſerve in caſe of neceſſity. The city has nine gates, which are lofty, and well arched; over them are large pavilion-roofed towers, divided into nine ſtories, each having ſeveral apertures or port holes; the lower ſtory forms a large hall, for the uſe of the ſoldiers and officers who quit guard, and thoſe appointed to relieve them. Before each gate a ſpace is left of more than 360 feet; this is a kind of place of arms, incloſed by a ſemicircular wall, equal in height and thickneſs to that ſurrounding the city. The great road, which ends here, is commanded by a pavilion-roofed tower, like the firſt, in ſuch manner that, as the cannon of the former can batter the houſes of the city, thoſe of the latter can ſweep the adjacent country. The ſtreets of Peking are ſtraight, about 120 feet wide, a full league in length, and bordered with ſhops. It is aſtoniſhing to ſee the immenſe concourſe of people that continually fills them, and the confuſion cauſed by the prodigious number of horſes, camels, mules, and carriages, which croſs or meet each other. Beſides this inconvenience, one is every now and then ſtopped by crowds, who ſtand liſtening to fortune-tellers, jugglers, ballad-ſingers, and a thouſand other mountebanks and buffoons, who read and relate ſtories calculated to promote mirth and laughter, or diſtribute medicine, the wonderful effects of which they explain with all the eloquence peculiar to them. People of diſtinction oblige all their dependants to follow them. A mandarin of the firſt rank is always accompanied in his walks by his whole tribunal, and to augment his equipage, each of the inferior mandarins in his ſuit is generally attended by ſeveral domeſtics. The nobility of the court, and princes of the blood, never appear in public without being ſurrounded by a large body of cavalry; and, as their preſence is required at the palace every day, their train alone would be ſufficient to create confuſion in the city. It is very ſingular, that in all this prodigious concourſe, no women are ever ſeen; hence we may judge how great the population of China muſt be, ſince the number of females in this country, as well as every where elſe, is ſuperior to that of the other ſex As there is a continual influx of the riches and merchandize of the whole empire into this city, the number of ſtrangers that reſort hither is immenſe; they are carried in chairs or ride on horſeback; the latter is more common; but they are always attended by a guide, acquainted with the ſtreets, and who knows the houſes of the nobility and principal people of the city. They are alſo provided with a book, containing an account of the different quarters, ſquares, remarkable places, and of the reſidence of thoſe in public offices. In ſummer, there are to be ſeen ſmall temporary ſhops, where people are ſerved with water, cooled by means of ice; and one finds every where eating-houſes, with refreſhments of tea and fruits. Each kind of proviſion has a certain day and place appointed for its being expoſed to ſale. The governor of Peking, who is a Mantchew Tartar, is ſtyled governor of the nine gates; his juriſdiction extends not only over the ſoldiers, but alſo over the people in every thing that concerns the police. No police can be more active. It is rare, in a number of years, to hear of houſes being robbed, or people aſſaſſinated; all the principal ſtreets have guard-rooms, and ſoldiers patrol night and day, each having a ſabre hanging from his girdle, and a whip in his hand, to correct, without diſtinction, thoſe who excite quarrels or cauſe diſorder. The lanes are guarded in the ſame manner, and have latticed gates, which do not prevent thoſe from being ſeen who walk in them; they are always kept ſhut during the night, and ſeldom opened even to thoſe who are known: if they are, the perſon to whom this indulgence is granted muſt carry a lanthorn, and give ſufficient reaſon for his going out.

The ſhops where they ſell ſilks and china-ware generally take up the whole ſtreet, and afford a very agreeable proſpect. Each ſhop-keeper places before his ſhop, on a ſmall kind of pedeſtal, a board about twenty feet high, painted, varniſhed, and often gilt, on which are written, in large characters, the names of the ſeveral commodities he ſells. Theſe being placed on each ſide of the ſtreet, at nearly an equal diſtance from each other, have a very pretty appearance.

Of all the buildings in this great city, the moſt remarkable is the imperial palace, the grandeur of which does not conſiſt ſo much in the nobleneſs and elegance of the architecture, as in the multitude of its buildings, courts, and gardens, all regularly diſpoſed: for within the walls are not only the emperor's houſe, but a little town, inhabited by the officers of the court, and a multitude of artificers employed and kept by the emperor; but the houſes of the courtiers and artificers are low and ill-contrived. F. Altiret, a French Jeſuit, who was indulged with a ſight of the palace and gardens, ſays, that the palace is more than three miles in circumference, and that the front of the buildings ſhines with gilding, paint, and varniſh, while the inſide is ſet off and furniſhed with every thing that is moſt beautiful and precious in China, the Indies, and Europe.

The gardens of this palace are large tracts of ground, in which are raiſed, at proper diſtances, artificial mountains, from twenty to ſixty feet high, which form a number of ſmall vallies, plentifully watered by canals, which, uniting, form lakes and meers. Beautiful and magnificent barks ſail on theſe pieces of water; and the banks are ornamented with ranges of buildings, not any two of which are ſaid to have any reſemblance to each other, which diverſity produces a very pleaſing effect.

Every valley has its houſe of pleaſure, large enough to lodge one of our greateſt lords in Europe with all his retinue: many of theſe houſes are built with cedar, brought at a vaſt expence the diſtance of 500 leagues. Of theſe palaces, or villa's, there are more than 200 in this vaſt encloſure.

In the middle of a lake, which is near half a league in diameter every way, is a rocky iſland, on which is built a palace, containing more than a hundred apartments. It has four fronts, and is a very elegant and magnificent ſtructure. The mountains and hills are covered with trees, particularly ſuch as produce beautiful and aromatic flowers; and the canals are edged with ruſtic pieces of rock, diſpoſed with ſuch art, as exactly to reſemble the wildneſs of nature, which gives them a very pleaſing appearance. The city of Peking is computed to contain two millions of inhabitants.

Canton, the capital of the province of Quang-tong, is about as large as Paris: it is the greateſt port in China, and the only one that has been much frequented by the Europeans. The city wall is about five miles in circumference, with very pleaſant walks around it. From the top of ſome adjacent hills, on which forts are built, you have a fine proſpect of the country. It is beautifully interſperſed with mountains, little hills, and vallies, all green; and theſe again pleaſantly diverſified with ſmall towns, villages, high towers, temples, the ſeats of mandarins, and other great men, which are watered with delightful lakes, canals, and ſmall branches from the river Ta; on which are numberleſs boats and junks, ſailing different ways through the moſt fertile parts of the country: the city is entered by ſeven iron gates, and within ſide of each there is a guard-houſe. There are many pretty buildings in this city, great numbers of triumphal arches, and temples well ſtocked with images.

The ſtreets of Canton are very ſtraight, but generally narrow, and paved with flag-ſtones: they are ſo crowded, that it is difficult to walk in them: yet a woman of any faſhion is ſeldom to be ſeen, unleſs by chance when coming out of their chairs. There are great numbers of market-places for fiſh, fleſh, poultry, vegetables, and all kinds of proviſions, which are ſold very cheap. There are many private walks about the ſkirts of the town, where thoſe of the better ſort have their houſes, which are little frequented by Europeans, whoſe buſineſs lies chiefly in the trading parts of the city, where there are only ſhops and warehouſes. The ſhops of thoſe who deal in ſilk are very neat, make a fine ſhew, and are all in one place; for tradeſmen, or dealers in one kind of goods, herd together in the ſame ſtreet. Few of the Chineſe traders of any ſubſtance keep their families in the houſe where they do buſineſs, nor do any of their windows look towards thoſe of their neighbours. It is computed that there are in this city, and its ſuburbs, 1,200,000 people; and there are often 5000 junks or trading veſſels lying before it.

Nanking (a name ſignifying the court of the ſouth, as Peking does the court of the north) is the capital of the province of Kiang-nan. This once ſplendid and extenſive city was for many ages the metropolis of the Chineſe empire, as well as the reſidence of the emperors; whence it took its name. It is the largeſt city in China, and was originally ſurrounded with a triple wall, meaſuring about ſixteen leagues in circumference: but the palace, once famous for its ſplendor and magnificence, hath been deſtroyed, as well as many grand monuments. The ſtreets of this city are narrow, but well paved; the houſes low, but handſome; the ſhops ſpacious, and moſt richly furniſhed with goods.

Nanking is celebrated for its great number of libraries: it excels likewiſe in printing, and in artificers of moſt kinds: here too reſide the moſt eminent doctors of the empire, as well as the greater part of ſuch mandarins as have been diſcharged from their governments. The number of people reſident in this ancient city is eſtimated at about four millions, including thoſe who live in barks upon the water; and indeed whenever a city is ſituated on the banks of a canal or river, there is ſeen another large floating city of barks. If we except a few temples, the city gates, and a tower about 200 feet high, the preſent public buildings of Nanking have rather a mean appearance.

Sou-tcheou, the ſecond city of the province of Kiangnan, is celebrated for its commerce and beautiful appearance. In point of ſituation, it may be compared to Venice, though far ſuperior in extent and populouſneſs. It is four leagues in circumference, excluſive of the ſuburbs, which are very extenſive: it abounds with canals of pure water, capable of bearing ſhips of heavy burden; and here people are conveyed to almoſt any part of the city in gondolas elegantly painted. The trade and riches of this city, the beauty of its ſituation, the fruitfulneſs of the circumjacent country, the continued appearance of the gondolas, the concourſe of viſitants, and the natural politeneſs of the inhabitants, render it the paradiſe of China, in the fulleſt ſenſe of the term.

HISTORY OF THE EMPIRE OF CHINA.

The antiquity of the Chineſe is univerſally admitted; but it is difficult to aſcertain the firſt period of their true chronology. A French writer allows the Chineſe nation to be near as old as the deluge; nor does Maigret, in his remarks on the obſcurity of the reign of Fo-hi, deny the reality of it; others of the learned give it as their opinion, that the Chineſe have been a nation near 4000 years. Even ſuch as have treated with ridicule the pretenſions of theſe people to antiquity, allow their monarchy to be at leaſt as ancient as that of the Egyptians, Aſſyrians, or any other country recorded in hiſtory.

The firſt inhabitants of China ſettled in the province of Chen-ſi, from whence they ſpread themſelves over the adjacent countries, Honan, Pe-tche-li, and Chan-tong, which four provinces together formed a conſiderable kingdom, containing that large tract of country lying north of the river Yang-tſe-kiang. The fame of the firſt princes of this infant monarchy brought together great numbers of foreigners; wherefore, to extend the bounds of their kingdom, they drained a large tract of low country that lay under water, fencing the land againſt the encroachments of the ſea with high banks, and by the ſame means confining the courſe of the rivers within deep and narrow channels: thus two fine provinces, Tche-kiang and Kiang-nan, were added to the kingdom.

We are told, "that under the reign of the emperor Yu, which they place above two thouſand years before Chriſt, they diſcovered a large tract of territory to the ſouth, partly deſtitute of inhabitants: this large extent of country, Yu and his ſucceſſors peopled with colonies, at different periods, under the control of princes of the blood, to whom they portioned out this new country, reſerving to themſelves only ſome acknowledgment. Thus were formed ſeveral little tributary kingdoms, which being afterwards united to the empire, rendered it very conſiderable. During the reign of Yu, the monarchy was divided into nine provinces, a particular delineation of which this emperor cauſed to be engraved on nine brazen veſſels. In the year 2037 before Chriſt, ſeveral nations ſent ambaſſadors to China, and ſubmitted voluntarily to a yearly tribute. Towards the end of the ſecond dynaſty, about 1200 years before Chriſt, certain Chineſe colonies extended themſelves to the eaſtern coaſt, and alſo took poſſeſſion of ſeveral iſlands.

"Under the fifth race, or dynaſty, which commenced about the year 200 before Chriſt, the Chineſe not only enlarged their borders to the north, after many ſignal victories obtained over the Tartars, but puſhed their conqueſts even to the confines of India, viz. to Pegu, Siam, Camboya, and Bengal.

"About 600 years after Chriſt, Kao-tſou-venti, founder of the twelfth race, added to the empire ſeveral of the northern provinces, ſituated beyond the river Yang-tſe-kiang, and which at that time compoſed a particular kingdom ſubject to the Tartars: this went by the name of the northern empire for ſeveral ages.

"The revolution which happened in 1644, when China was conquered by the Tartars, only ſerved to increaſe the power and extent of this great empire, by joining to its former poſſeſſions a conſiderable part of Great Tartary. Thus this vaſt monarchy attained to the ſummit of its greatneſs, by a gradual progreſs, not ſo much in the way of conqueſt like other empires, as by the wiſdom of its laws, the reputation of its government, and at laſt by its diſgrace."

The family of Yu ended with the reign of Kié, a wretch of infamous memory, who is ſaid to have drowned, in the ſpace of one day, three thouſand of his ſubjects, in a pit which he cauſed to be filled with wine. This and other enormities occaſioned a revolt of his ſubjects, who placed upon the throne Tchintang, a tributary prince of China.

Tcheou rendered himſelf abhorred by his ſubjects on account of his wicked and debauched life: his people therefore applied to Vou-vang, a prince of a ſmall neighbouring ſtate, and placed him on the throne. Vou-vang, however, in the beginning of his reign, committed a very capital fault, which in time was productive of great revolutions. In order to gratify certain families, and the princes of the blood royal in particular, he erected for them ſeveral

petty kingdoms, which were at firſt feudatory to the empire, but ſoon after declared for independence.

Under the thirteenth emperor of this family, all theſe petty princes were engaged in inteſtine wars, and diſtracted the whole empire. China became a ſcene of rapine for many ages; its authority was held in contempt, and the tributary princes controlled the emperors, enthroning and depoſing them, as their inclination or caprice dictated.

Tcheou-kiun, the thirty-fifth and laſt emperor of this race, found a very powerful rival in Tchao-ſiang, his vaſſal, the King of Tſin, to whom he was forced to give up his crown; this rebel, however, happened to die ſuddenly, and his ſon, who ſucceeded him, alſo died ſoon after; ſo that his grandſon was the firſt who enjoyed the advantages of this uſurpation.—This grandſon was named Tchuang-ſiang-vang, and was the founder of the fourth ſucceſſion, which gave four emperors to China, and laſted forty-three years only.

The fifth dynaſty began with the reign of Lieou-pau, who was firſt a common ſoldier, and at the head of a gang of robbers: he obtained the imperial throne by dint of violence, and yet proved himſelf capable of governing with a becoming dignity, judgment, penetration, and juſtice. This race laſted 426 years, and produced a great many very reſpectable characters; but the laſt monarchs of this race ſuffered themſelves to be ruled by the court eunuchs, fell into diſgrace, and became as odious as the eunuchs themſelves. The people took up arms, and wars enſued, which terminated in a diviſion of the empire into four parts, under four diſtinct ſovereigns; theſe however were re-united by Tchao-lie-vang, founder of the ſixth dynaſty. This monarch, after the ſhort reign of three years, died, and left Heou-ti, his ſon, who filled the throne forty-one years, and then moſt ſhamefully abdicated it in favour of the uſurper, Chi-tſou-vouti, founder of the ſeventh dynaſty.

The ſeventh race ſubſiſted 155 years, giving fifteen emperors to China, moſt of whom, through their want of capacity to govern, diſcredited the elevated ſtation of life in which fate had placed them. The laſt of theſe monarchs was put to death in the ſecond year of his reign, by one Lieo-you, who, quitting the trade of a ſhoe-maker, commenced ſoldier, roſe to the rank of general, and afterwards aſcended the throne of the empire.

This eighth race, with the ninth, tenth, and two following, only comprehend 198 years; in which ſpace of time there were no leſs than twenty-four reigns. The Chineſe annals of this period preſent us with ſcarce any thing but revolution, rapine, and deſtruction; weak, ſpiritleſs, and ſuperſtitious princes, controlled by their miniſters, and ſome of them betrayed, and even murdered by the very men in whom they had confided.

Under the firſt emperor of the thirteenth family, the people enjoyed the bleſſings of peace, the happy effects of the prudent and conſtitutional adminiſtration of thoſe emperors. The tranquillity which was in a more particular manner enjoyed during the reign of Tai-tſong, the ſecond emperor of this race, is recorded to the immortal honour of that ſovereign.—Under Hiven, the ſixth emperor, the tranquil ſtate of the nation was diſturbed with new commotions and ſeditions, which laſted in continual ſucceſſion from his reign down to that of Tchao-ſuen, the twentieth and laſt emperor of this race. Theſe diſturbances were occaſioned by the arbitrary and oppreſſive conduct of the eunuchs, to whom the monarchs of this dynaſty committed an unlimited exerciſe of regal juriſdiction. Tchou-ven, the captain of a gang of banditti, taking advantage of their unhappy broils, depoſed Tchao-ſuen, murdered him, and founded himſelf the fourteenth family, which, with the four following, ſubſiſted about fifty years; in which ſhort interval, no leſs than thirteen monarchs ſwayed the imperial ſceptre, moſt of whom ſuffered a violent death.

During theſe laſt reigns, the Tartars, who inhabited Leao-tong, one of the moſt northern provinces of China, began to render themſelves powerful. This province was ceded to them by the laſt emperors of the thirteenth race; and Kao-tſou, head of the ſixteenth, who was indebted to them for his advancement to the throne, gave up to them ſixteen more towns in the province of Pe-tche-li, excluſive of a tribute of 300,000 pieces of ſilk. Theſe ſhameful compliances increaſed their power and pride, and were productive of wars for 400 years, which nearly deſolated the empire.

The Chineſe, at length, called to their aſſiſtance the Niu-tche, or Eaſtern Tartars, in conjunction with whom they drove the Northern Tartars from a country which they had poſſeſſed upwards of two centuries; the Chineſe, however, were obliged to pay dearly for the aid of their allies, who not only conſtrained them to cede Leao-tong by way of compenſation, but alſo took poſſeſſion of Pe-tche-li, Chen-ſi, and Ho-nan; and they ſome years afterwards invaded the very heart of the empire, took Nanking, the capital, burned the royal palace to the ground, and forced the Chineſe to accept of the moſt diſhonourable terms of pacification.

Under this family, another race of Tartars, called the Tan-yu Tartars, ſettled weſtward of China, entered into an alliance with the Chineſe againſt their conquerors, the Niu-tche Tartars, and after ſeveral engagements, the Niu tche victory were themſelves conquered and driven from their poſſeſſions in Leao-tong and the other provinces, after an uſurpation of 117 years. The Tan-yu-heroes, however, in requital of their ſervices, demanded a ſettlement in thoſe provinces from whence they had exterminated the Niu-tche barbarians; theſe were accordingly ceded to them; but not contented with ſuch ceſſion, they took poſſeſſion of Yun-nan, Setchuen, and Houguang; and in leſs than half a century were maſters of the whole empire.

The twentieth race took the name of Yven, and had for its founder Chi-tſou, fourth ſon of Tai-tſou, in whom commenced the third Tartarian uſurpation. The Yven family gave to China nine emperors, the former of whom, by their prudential adminiſtration, won the hearts of their ſubjects; but the ſucceeding monarchs, indulging in a life of indolence, luxury, and diſſipation, perceived themſelves excelled in the uſe of arms and natural courage by the very people whom they had conquered, who, poſſeſſing the livelieſt ſentiments of freedom, and deſpiſing their diſſipated victors, wreſted conqueſt from their hands, and drove them back to their native country. This family, which laſted only eighty-nine years, became extinct in the perſon of Chun-ti, a very worthleſs monarch, who was addicted to a variety of vices; which made way for the twenty-firſt race, of which Tai-tſou was founder, and ſubſiſted 276 years. The commotions that happened under this family, produced gradually that grand revolution, which a ſecond time placed a Tartarian family on the throne of China. The progreſs of which was as follows:

The Niu-tche or Eaſtern Tartars, being expelled from Leao-tong and the empire, retreated into the ancient country bordering upon Leau-tong, ſeparating themſelves into ſeven diſtinct cantons, and fighting againſt each other, till at length they were united in ſubjection to one ſovereign. It happened that their merchants, trading in Leao-tong, having received ſome indignity from the merchants of China, exhibited a complaint to the mandarins, who, inſtead of attending to their complaint, augmented conſiderably the grievance, by craftily drawing their prince into an ambuſcade, and ſevering his head from his ſhoulders.

The

The Tartars, enraged at this cruel and iniquitous act, marched a numerous army into the very heart of Leao-tong, commanded by Tien-ming, ſon of their murdered prince, who ſubdued Leao-tong and Petche-li, but was ſoon obliged to abandon thoſe provinces, which were, however, with the reſt of the Chineſe empire, reſerved for his grandſon Tſong-te, but who was cut off by ſudden death, in the moment of his great view of ſovereignty. He had been brought up and educated in China, was maſter of the Chineſe tongue, and perfectly acquainted with the diſpoſition and genius of the people.

At this period the empire was very critically ſituated: the war with the Niu-tche Tartars continued, and as an addition to this national calamity, there was a great famine in the land. The then reigning monarch, too, Hoai-tſong, was a man of mean abilities, ſuffering himſelf to be directed in every thing by his miniſters and eunuchs, who greatly oppreſſed the people. A revolt was the conſequence, and in a ſhort ſpace of time there were eight different factions under the ſame number of chiefs; theſe were, however, reduced afterwards to two, and at length to one, headed by a commander named Li, who invading and poſſeſſing himſelf of the provinces of Ho-nan and Chenſi, ſtyled himſelf emperor of China. In Ho-nan he committed the moſt dreadful ravages; in his attack of Cuif-ong, its capital, that town was laid under water by a ſudden breaking down of the dykes of the Yellow-River, and 300,000 perſons periſhed in the inundation. He afterwards marched to Peking, at the head of 300,000 troops, and entered the city without the leaſt oppoſition; for he had privately conveyed into the city a number of his people in diſguiſe, who threw open the gates to him: and ſuch was the ſupineneſs of Hoai-tſong, the emperor, that he knew nothing of this circumſtance, till the uſurper had laid the whole city under his ſubjection.

As ſoon as the emperor heard the news, he marched from his palace at the head of 600 of his guards, who treacherouſly abandoned him. Thus ſituated, he flew into the gardens of his palace with his daughter, whoſe head he cut off, and then hung himſelf upon a tree: his wives, his prime-miniſter, and ſome of his eunuchs, alſo deſtroyed themſelves. The news of this melancholy event ſoon reached the army, then making war in Tartary, under the command of a general named Ou-ſang-guey, who refuſed to acknowledge Li, as his ſovereign; whereupon the latter put himſelf at the head of his numerous army, for the purpoſe of giving him battle.

Ou-ſang-guey ſhut himſelf up in a ſtrong fortified town; thither Li marched his troops, and having taken captive the father of Ou-ſang-guey, ordered him to be loaded with irons, and placed at the foot of the town wall, ſending word to his ſon at the ſame time, that if he did not immediately ſurrender, his father's throat ſhould be cut from ear to ear. The father found means to ſend a meſſage to the ſon, begging him not to ſurrender; the ſon ſacrificed his filial eſteem to the intereſts of his country, and the old man was moſt cruelly put to death. The patriotic ſoul of Ou-ſang-guey, now inflamed with rage, concluded a peace with the Niu-tche Tartars, and engaged them to enter into an alliance with him againſt Li, whoſe ſuperior force it was impoſſible for him to reſiſt.

Tſong-te, the Tartarian king, came to his aſſiſtance at the head of 80,000 warriors, forced the tyrant to raiſe the ſiege, purſued him even to Peking, and ſo totally routed his army, that he was forced to fly into the province of Chen-ſi, where he ſpent the remainder of his days in obſcurity. Tſong-te being thus ſucceſsful, the people idolized him as their deliverer, and he beſtowed ſeveral diſtinguiſhed honours upon the faithful Ou-ſang-guey: the latter however, ſoon had cauſe to repent his having leagued himſelf with ſo great and powerful a prince, for Tſong-te was no ſooner arrived at Peking, than he began to think of improving the ſucceſs of his arms, and the favourable diſpoſition of the people (with whom, hiſtory informs us, he had been brought up and educated) into the means of his advancement to the throne of China; but being ſeized with an illneſs that ſpeedily brought on his diſſolution, all that he could do was to declare his ſon emperor, who was only ſix years of age. This election was confirmed by the grandees and people, who in conſideration of the ſignal ſervices done by the father, connived at the tender age of the child, who took the name of Chun-ſi, and is conſidered as the founder of the twenty-ſecond dynaſty, which now fills the imperial throne of China.

By this revolution, which happened in the year 1644, a conſiderable part of Great Tartary was united to the Chineſe empire; and ſince the union, the Tartars ſeem rather to have ſubmitted to the laws of the Chineſe, than to have impoſed any upon them; in fact, the latter may be ſaid to be as great gainers by it as the Tartars themſelves. China ſtill holds the ſeat of empire, and has the ſupreme courts of juſtice: thither flows all the opulence of the united kingdoms, and all honours are conferred there. Both nations, ſo oppoſite in genius and character, have each been conſiderably advantaged by the incorporation: the fierce ſpirit of the Tartar has given a ſpark of martial fire to the peaceful temper of the Chineſe, while the arts and commerce of the latter have humanized and ſoftened the ſavage roughneſs of the former.

In the year 1771, all the Tartars which compoſed the nation of the Tourgouths, left the ſettlements which they had under the Ruſſian government on the banks of the Wolga, and the Iaick, at a ſmall diſtance from the Caſpian ſea, and in a vaſt body of fifty thouſand families, they paſſed through the country of the Haſacks; after a march of eight months, in which they ſurmounted innumerable difficulties and dangers, they arrived in the plains that lie on the frontier of Carapen, not far from the banks of the river Ily, and offered themſelves as ſubjects to Chen-Lung, emperor of China, who was then in the thirty-ſixth year of his reign. He received them graciouſly, furniſhed them with proviſions, clothes, and money, and allotted to each family a portion of land for agriculture and paſturage. The year following there was a ſecond emigration of about thirty thouſand other Tartar families, who alſo quitted the ſettlements which they enjoyed under the Ruſſian government, and ſubmitted to the Chineſe ſceptre. The emperor cauſed the hiſtory of theſe emigrations to be engraven upon ſtone in four different languages.

The hopes which were lately indulged of the great and manifold advantages to be derived from the embaſſy of lord Macartney to the court of Peking have ended in diſappointment. Never, perhaps, was there a character better qualified for the management of an embaſſy of ſuch delicacy and importance than lord Macartney: but, notwithſtanding his lordſhip's adroitneſs, he found it utterly impoſſible to obtain permiſſion for the reſidence of an Engliſhman at the capital of China, as ambaſſador, conſul, or in any other character, or any excluſive ſettlement for the Engliſh within the Chineſe dominions, even on a temporary grant, and ſolely for the purpoſes of trade. According to a fundamental principle in Chineſe politics, innovation, of whatever kind, is held to be inevitably pregnant with ruin; and on this principle the emperor declined to admit a foreign reſident at the court of Peking, or to expand the principles on which our commercial intercourſe with this country are at preſent regulated and confined.

The embaſſy arrived in the river Pei-ho, in the gulf of Peking, the beginning of Auguſt 1793, and on the 21ſt of the ſame month reached the city of Peking. They remained here till the beginning of September, when they were conducted to Zhe-hol, or Jehol,

one

one of the emperor's country reſidences in Tartary, diſtant about forty or fifty leagues from Peking.

The emperor was accompanied by moſt of his family on the day of the embaſſador's preſentation, the ſcene of which was in the garden of the palace of Zhe-hol. The emperor's magnificent tent was placed in the middle of the garden, and within it was a throne. Immediately behind this tent was another, of an oblong form, having a ſopha in it at one extremity, for the emperor to retire to occaſionally. In the front were ſeveral ſmall round tents; one for the accommodation of the embaſſy, till his imperial majeſty ſhould arrive; the others for that of the tributary princes of Tartary, and delegates from other tributary ſtates, who came to Zhe-hol to be preſent at the celebration of the birth-day, but who attended now to dignify the embaſſador's reception. The repreſentative of the king of Great Britain was to be received by his imperial majeſty, in his large ſtate tent, ſeated upon his throne.

As a compliment to the Britiſh embaſſy, the emperor permitted his courtiers to appear dreſſed in Engliſh cloth, in lieu of ſilk and furs. The princes wore the tranſparent red button, marking the higheſt of the nine orders, as fixed by the preſent emperor. In compliance with the etiquette of the court, which is to be a long time in waiting, the embaſſy aſſembled before peep of day; but many of the courtiers had remained all night in the garden.

The emperor's approach was notified, ſoon after day-light, by inſtruments of muſic. His imperial majeſty was preceded by perſons loudly proclaiming his virtues and his power. He was born by ſixteen men in a triumphal car, followed by guards, officers of the houſehold, ſtandard and umbrella bearers, and a band of muſic. He wore a plain, dark ſilk, with a velvet bonnet, having a large pearl in the front, the only jewel he had about him.

His imperial majeſty entered the tent, and aſcending a few ſteps, conſecrated only to his uſe, ſeated himſelf upon the throne. The Colao, and two officers of his houſehold, were next him, and knelt whenever they addreſſed him. The princes of the family, the tributary princes, and officers of ſtate, having gained their reſpective ſtations in the tent, the preſident of the tribunal of rites conducted the embaſſador, attended by his page and interpreter, the miniſter plenipotentiary being alſo preſent, near the foot of the throne, on the left hand ſide, the place of honour. The other gentlemen of the embaſſy, many mandarines and officers of various ranks, were at the great opening of the tent, whence every thing that paſſed could be obſerved.

His excellency appeared in a ſuit of velvet richly embroidered, decorated with a diamond badge and ſtar, the Order of Bath, and over this a long mantle of the ſame order. The miniſter plenipotentiary, being an honorary doctor of laws, of the univerſity of Oxford, was habited in the ſcarlet gown of that degree. The Embaſſador, purſuant to inſtructions received from the preſident of the ceremonies, held the large, magnificent, ſquare gold box, embelliſhed with jewels, containing his Majeſty's letter to the Emperor, between both hands raiſed above his head, and mounting the ſteps which led to the throne, and bending upon one knee, preſented the box with a ſuitable laconic addreſs to his Imperial Majeſty, who receiving it graciouſly with his own hands, put it by his ſide, and repreſented "the ſatisfaction he felt at the teſtimony which his Britannic Majeſty gave to him of his eſteem and good-will, in ſending him an Embaſſy, with a letter, and rare preſents; that he, on his part, entertained ſentiments of the ſame kind towards the ſovereign of Great-Britain, and hoped that harmony would always be maintained among their reſpective ſubjects."

The dignified and ſplended manner in which the Embaſſy was received, influenced the minds of the Chineſe, and induced them to believe that the government was about to make a change of meaſures favourable to the Engliſh. Embaſſadors were not uſually received by the Emperor upon his throne; nor were their credentials delivered into his hands, but ordinarily into thoſe of his miniſters.

The firſt preſent which the Emperor made to his Majeſty was a jewel or precious ſtone, more than twelve inches long, highly valued by the Chineſe: it was carved into the ſimilitude of a Chineſe ſceptre, in the form of that which is always placed upon the Imperial throne, alluſive of peace and plenty. The Embaſſador, in compliance with the Chineſe etiquette, and alſo the miniſter plenipotentiary, reſpectfully offered preſents, in their turn, on their own behalf, which his Imperial majeſty vouchſafed to receive, and gave others in return.

Adverting to the inconveniency of having recourſe to an interpreter to explain whatever paſſed during the interview, his Imperial majeſty aſked the Colao, if there were any perſons in the embaſſy acquainted with the Chineſe language; and being told that the ambaſſador's page, Maſter George Staunton, a youth then in his thirteenth year, was the only one who had made any proficiency in it, the emperor deſired he might be brought up to him; and he aſked him to ſpeak Chineſe. His Imperial majeſty was ſo charmed with the converſe and elegant manners of this accompliſhed young gentleman, that he took from his girdle his areca-nut purſe, which hung to it, and preſented it to him with his own hand. It was of plain yellow ſilk, and had the figure of the five-clawed dragon and ſome Tartar characters wrought upon it. Purſes, it ſeems, are the ribbands of the Chineſe monarch, which he beſtows as rewards of merit; but the emperor's own purſe was a token of perſonal favour, valued by the Chineſe above all other gifts.

At the concluſion of theſe ceremonies were brought up to the emperor, at the right hand of the throne, ſeveral Hindoo ambaſſadors from Pegu, and Mahometans from the vicinity of the Caſpian, who, when they had repeated nine ſolemn proteſtations, were ſpeedily diſmiſſed. After this the Engliſh ambaſſador, and the three perſons accompanying him, were conducted to the left hand of his Imperial majeſty, and ſeated upon cuſhions. The princes of the Imperial family, the chief Tartar tributaries, and the higheſt officers of court, were ſeated according to rank, nearer to or more remote from the throne, before which was placed a table for his Imperial majeſty; and one table was likewiſe laid for every two gueſts. When all were ſeated, the tables were uncovered, and diſplayed a ſplendid banquet. Various kinds of viands and different ſorts of fruit were ſerved up in bowls, piled piramidically one above another; tea was alſo introduced. During the repaſt, every bowl or cup handed to the emperor was taken with hands raiſed above the head, as had been done by the ambaſſador when he preſented the gold box. Much ſilence and great ſolemnity, verging on religious awe, were obſerved during the whole of this buſineſs.

His Imperial majeſty's attention to his European gueſts was remarkably conſpicuous: by his order, ſeveral diſhes were handed to them from his own table; and when the repaſt was finiſhed, he ſent for them, and gave them, with his own hand, a goblet of warm Chineſe wine. Enquiring of the ambaſſador how old his own ſovereign was, he cordially wiſhed, in anſwer, that he might attain his years, which then amounted to eighty-three, in a perfect enjoyment of health. The feſtival concluded, he deſcended the throne, and walked firm and erect to the open chair which was in waiting.

The emperor appeared, at the time he gave audience to the embaſſy, to be perfectly unreſerved, chearful, and unaffected; his eyes were full and clear, and his countenance open. He aſcended the throne

of China in the year 1736. He is only the fourth ſovereign of the Tartar dynaſty, which took poſſeſſion of the throne of China about the year 1644.

CHAP. X.

INDIA, OR INDOSTAN.

General Deſcription, with a particular Account of its Boundaries, Situation, Extent, Diviſions, Inhabitants, Government, Religion, Produce, &c.

INDIA is bounded by Uſbeck-Tartary and Thibet on the north; by Acham, Ava, and the Bay of Bengal, on the eaſt; by the Indian-Ocean, on the ſouth; and by the the ſame ſea, and Perſia, on the weſt. It is ſituated between the equator and the parallel of 40 deg. north latitude, and between the 66th and 109th deg. of eaſt longitude; being 2042 miles long, from north to ſouth, and upwards of 1400 broad from eaſt to weſt.

This vaſt country at large may be divided into three great parts: firſt, the peninſula of India beyond the Ganges, called the Further Peninſula; ſecondly, the main land, or the Mogul's empire; thirdly, the peninſula within, or on this ſide the Ganges; all of them vaſt, populous, and extenſive empires. But before they are conſidered ſeparately, it will be neceſſary to premiſe ſome particulars which are common to them all, as this method will at once ſave many repetitions, and convey a more adequate idea to the reader of every material circumſtance relative to this large country.

We ſhall begin with an account of their population, inhabitants, religion, and government.

The two latter diviſions are comprehended by an excellent and authentic hiſtorian, under the title of Indoſtan. This writer ſays, the Mahometans (who are called Moors) of Indoſtan, are computed to be about ten millions. Above half of the empire is ſubject to rajahs, or kings, who derive their deſcent from the old princes of India, and exerciſe all right of ſovereignty, only paying a tribute to the great mogul, and obſerving the treaties by which their anceſtors recogniſed his ſuperiority. In other reſpects, the government of Indoſtan is full of wiſe checks upon the overgrowing greatneſs of any ſubject; but as precautions of that kind depend upon the adminiſtration, the indolence and barbarity of the moguls and emperors, and their great viceroys, have rendered them fruitleſs.

The Indians, or original inhabitants of the country, are called Gentoos; or, as others ſtyle them, Hindoos, and the country Hindooſtan, or Hindoſtan. They pretend that Bramma, their legiſlator both in politics and religion, was inferior only to God, and that he exiſted many thouſand years before our account of the creation. This Bramma probably was ſome great genius, whoſe beneficence, like that of the pagan legiſlators, led his people and their poſterity to pay him divine honours. The Bramins (for ſo the Gentoo prieſts are called) pretend that he bequeathed to them a book called the Vidam, containing his doctrines and inſtitutions; and that though the original is loſt, they are ſtill poſſeſſed of a ſacred commentary upon it, called the Shahſtah, which is written in the Shanſcrita, now a dead language, underſtood only by the Bramins, who ſtudy it, even as our ſacred ſcriptures, written in the Greek and Hebrew, are. But it is not well known, whether that language was originally different from that of the country, or whether it has only now become unintelligible to the people, through that change to which all living languages are incident.

The foundation of Bramma's doctrine, uncorrupted by the arts and gloſſes of the Bramins, conſiſted in the belief of a Supreme Being, who originally created a regular gradation of beings, ſome ſuperior, and ſome inferior to man; in the immortality of the ſoul, and a future ſtate of rewards and puniſhments, which is to conſiſt of a tranſmigration into different bodies, according to the lives they have led in their pre-exiſtent ſtate. From this it appears more than probable, that the Pythagorean metempſychoſis took its riſe in India. But in order to accommodate this ſublime, but otherwiſe complicated doctrine, to the capacities of the lower ranks of people, the Bramins have had recourſe to ſenſible repreſentations of the Deity and his attributes; by which means, the original doctrines of Bramma have degenerated into rank, ridiculous idolatry, in the worſhip of the moſt hideous figures, either delineated or carved; and the belief of an Omnipotent Being is now almoſt confined to the Gentoos. Wooden images are placed in all their temples, and on certain feſtivals are exhibited in the high roads, and in the ſtreets of towns. The human figures with elephants' heads, which are the objects of their devotion, have many hands, and are enormouſly corpulent. Yet amidſt all their errors, they agree in thoſe truths which form the harmony of the univerſe, that "there is one ſupreme God, and that he is beſt pleaſed by charity and good works."

From time immemorial, the Hindoos have been divided into four great tribes.

1. The firſt and moſt noble are the Bramins, who alone can officiate in the prieſthood, like the Jewiſh tribe of Levi. They are not, however, excluded from government, trade, or agriculture, though they are ſtrictly prohibited from all menial offices by their laws.

2. The ſecond in order is the Sittri tribe, who, according to their original inſtitution, ought to be all military men; but they frequently follow other profeſſions.

3. The third is the tribe of Beiſe, who are chiefly merchants, bankers, and banias, or ſhopkeepers.

4. The fourth tribe is that of Sudder, who ought to be menial ſervants, and they are incapable of raiſing themſelves to any ſuperior rank.

If any one of them ſhould be excommunicated from any of the four tribes, he and his poſterity are for ever ſhut out from the ſociety of every body in the nation, excepting that of the Harri caſt, who are held in utter deteſtation by all the other tribes, and are employed only in the meaneſt and vileſt offices. This circumſtance renders excommunication ſo dreadful, that an Hindoo, rather than deviate from one article of his faith, will ſuffer the torture, and even death itſelf.

The Gentoos are alſo ſubdivided into caſts, or ſmaller claſſes and tribes; and it has been computed, that there are eighty-four of theſe caſts, though ſome have ſuppoſed there was a greater number. The order of pre-eminence of all the caſts, in a particular city or province, is generally indiſputably decided. The Indian of an inferior would think himſelf honoured by adopting the cuſtoms of a ſuperior caſt; but this laſt would give battle, ſooner than not vindicate its prerogatives: the inferior receives with reſpect the victuals prepared by a ſuperior caſt, but the ſuperior will not partake of a meal which has been prepared by the hands of an inferior caſt.

There are ſome caſts remarkable for their beauty, and others as remarkable for their uglineſs. The moſt ſtriking features in the character of the Hindoos, are their ſuperſtition, and veneration for the inſtitutions and tenets of their forefathers. Their marriages are circumſcribed by the ſame barriers as the reſt of their intercourſes; and hence, beſides the national phyſiognomy, the members of each caſt preſerve an air of ſtill greater reſemblance to one another.

The diviſion of the Gentoos into tribes or claſſes, diſcovers a ſtriking peculiarity in their government and religion. The tribes are headed by a chief, who is in ſome degree reſponſible for the conduct of thoſe under him; and individuals, on proper occaſions, are ſometimes ſummoned to aſſemble together, in conformity to the requiſitions of government.

Among the Gentoos, the principal deity or divinity itſelf is repreſented as having an infinite number of heads, hands, and eyes, which are emblematical of his knowledge, power, and penetration; and the inferior attributes are figured by almoſt every animal or viſible object in the creation: in particular, wiſdom is repreſented by a ſnake. But the ignorant, not content with one deity, have ſplit their principal divinity into many thouſand parts, and changed each attribute into a ſeparate god.

There are upwards of eighty ſects who ſupport the religions tenets of Bramma; in ſome fundamental points they concur, and never diſpute upon any. They live in friendſhip with perſons of all perſuaſions, and admit of no proſelytes; they ſay heaven has many gates, and every one may enter at which he pleaſes.

In this country, the dominion of religion extends to a thouſand particulars, which in others are governed either by the civil laws, or by taſte, cuſtom, or faſhion. Dreſs, food, the common intercourſes of life, marriages, profeſſions, are all under the jurdiſdiction of religion. There is ſcarcely any thing which is not regulated by ſuperſtition. It preſcribes rules of conduct in all circumſtances and ſituations; nor is there any thing almoſt ſo trifling or minute, as to be conſidered a matter of indifference.

As to the religion of the Mahometants here, it is the ſame as in Perſia, and is the religion of the court; the Mahometan fanatiſciſm, however, having ſubſided to a degree of rationality and candour, all profeſſions or religions here, through this means, are practiſed with freedom and tranquility.

The original government of the Hindoos was in reality an hierachy; for among that religious people. the higheſt authority was poſſeſſed by the prieſthood, or the Bramin caſt.

The governments of both nations were not only hierarchical, but there was in both a vaſt variety of religious obſervances and ceremonies, extending to many particulars, which in order countries are matters of choice or indifference; and both entertained the moſt profound reſpect and veneration for their anceſtors. All the caſts acknowledge the Bramins for their prieſts, and from them derive their belief of the tranſmigration, which leads many of them to afflict themſelves even at the death of a fly, although occaſioned by inadvertence. But the greater number of caſts are leſs ſcrupulous, and eat, though very ſparingly, both of fiſh and fleſh; but, like the Jews, not of all kinds indifferently. To beef they have a particular objection.

The food of the Hindoos is ſimple, conſiſting chiefly of rice, ghee, which is a kind of imperfect butter, milk, vegetables, and oriental ſpices of different kinds, but chiefly what is called in the eaſt, chilly; and in the weſt, green or Cayen pepper. The warrior caſt may eat of the fleſh of goats, mutton, and poultry. Other ſuperior caſts may eat poultry and fiſh; but the inferior caſts are prohibited from eating fleſh or fiſh of any kind. Their greateſt luxury conſiſts in the uſe of the richeſt ſpiceries and perfumes, of which the great people are very laviſh, and which grow almoſt ſpontaneouſly in their gardens. They eſteem milk the pureſt of foods, becauſe they think it partakes of ſome of the properties of the nectar of their gods, and becauſe they almoſt aſcribe divinity to the cow itſelf.

Penal laws are ſcarce known among the Gentoos, as their motives to bad actions are few. Temperate in their living, and delicate in the conſtitutions, their paſſions are calm, and their manners gentle: they have no object but that of living with comfort and eaſe, their happineſs principally conſiſting in the ſolaces of a domeſtic life; and they are taught by their religion, that marriage is an indiſpenſable duty in every man, who does not entirely ſeparate himſelf from the world through a principle of devotion. Their religion alſo permits them to have ſeveral wives; but they ſeldom have more than one: and it has been obſerved, that their wives are diſtinguiſhed by a decency of demeanour, a ſolicitude in their families, and a fidelity to their vows, which might do honour to human nature in the moſt civilized countries.

The amuſements of the Hindoos conſiſt in going to their pagodas, in aſſiſting at religious ſhows, and in fulfilling a variety of ceremonies preſcribed to them by the Bramins. Their religion ſeems to forbid them to quit their own ſhores, nor do they want any thing from abroad. If others therefore had looked on them with the ſame indifference with which they regard the reſt of the world, they might have continued to live in much tranquility and happineſs.

The Gentoo ſoldiers are called rajah-poots, or perſons deſcended from the rajahs. They reſide chiefly in the northern provinces, and are generally more fair-complexioned than the people of the ſouthern provinces, who are quite black. Theſe rajah-poots are a robuſt, brave, faithful people, and enter into the ſervice of thoſe who will pay them; but when their leader falls in battle, they think that their engagements to him are finiſhed, and they run off the field without incurring the charge of cowardice.

The abominable cuſtom of the women burning themſelves upon the death of their huſbands, ſtill continues to be practiſed in India among ſome of high caſt and condition; though ſince the Moguls have become maſters of Indoſtan, theſe ſhocking ſpectacles have been much leſs frequent than formerly, nor do the Bramins encourage them.

The following recent inſtance we have been lately favoured with, will ſufficiently prove, that the cuſtom above alluded to is ſtill obſerved; and may ſerve to invalidate the modern opinion, that the Bramin women have diſcontinued it: "Signor Nicola Fontana de Cremona, a doctor of phyſic, at Calcutta, was witneſs, on Nov. 24, 1784, to the ſhocking ſight of a woman, the wife of a Bramin, burning herſelf on the ſame pile with her huſband. The ſight was more affecting, as the wife was both young and handſome. The ceremony commenced about ſun-ſet. During the preparation of the funeral pile, the females were employed in preparing the widow for the voluntary ſacrifice: they adminiſtered opium to her with a view to annihilate thoſe feelings which ſo painful a death muſt naturally excite. After taking the opium, ſhe was ſtripped and plunged into the river, in order to purify her for that ſtate which they were taught to believe ſhe muſt enjoy, viz. that ſhe would live happy with her huſband 3500 years in the Elyſian-Fields. Having been waſhed, and ſome clothes thrown about her, ſhe reſolutely walked towards the wood, and boldly placed herſelf at the feet of her deceaſed huſband: there ſhe undreſſed herſelf, and diſtributed her clothes to thoſe around her: ſhe ſaid a few words, was tied faſt to the dead body, and the pile was inſtantly ſet on fire. As the flames reached her, ſhe began to ſcream; the whole company inſtantly ſtruck up a doleful kind of hymn; and the more her ſcreams increaſed, the louder they raiſed their voices. When the wood and bodies were reduced to aſhes, each departed home; and thus ended the proceſs of this horrid, ſuperſtitious, and moſt unnatural ceremony."

It may not be amiſs to remark, that the inſtitution of the above horrible ſacrifice is not to be aſcribed to Bramma, but ſeems rather to be the invention of ſome Bramin, who carried his jealouſy beyond the grave. It is a piece of refinement dictated by a barbarous and over-ſtrained affection, and ſuitable to the character

†

ter of thoſe ſuperſtitious beings who think there is a particular merit in rigid morality, or what they ſtyle a tranſcendent purity of manners, how incompatible ſoever their general conduct is to the principles of right reaſon and true religion.

The famous dancing-girls are a particular claſs of women, who are allowed to be openly proſtituted. By the continuation of wanton attitudes, they acquire, as they grow warm in the dance, a frantic laſciviouſneſs themſelves, and communicate, by a natural contagion, the moſt voluptuous deſires to the beholders. Their attitudes and movements are very eaſy, and not ungraceful. Their perſons are delicately formed, gaudily decorated, and highly perfumed.

The Gentoos apply themſelves to the cultivation of their lands, and to public and neceſſary works, with the ſame aſſiduity as the Chineſe; and are alſo remarkably honeſt and humane. There is ſcarcely an inſtance of a robbery in all Indoſtan, though the diamond-merchants travel without defenſive weapons. A late writer obſerves, that the Hindoos, as well as the Perſians, Tartars, and adjoining nations, who have inhabited Indoſtan ſince it was invaded by Tamerlane, though of different nations, religions, laws, and cuſtoms, poſſeſs, nevertheleſs, in equal degrees, hoſpitality, politeneſs, and addreſs. In refinement and eaſe, they are ſuperior to any people to the weſtward of them. In politeneſs and addreſs, in gracefulneſs of deportment, and ſpeech, an Indian is as much ſuperior to a Frenchman of faſhion, as a French courtier is to a Dutch burgomaſter of Dort. The Hindoos, eſpecially thoſe of the higher caſts, are in their demeanor eaſy and unconſtrained, ſtill more than even a French courtier, and their eaſe and freedom is reſerved, modeſt, and reſpectful.

The Indians are of a middle ſtature, their perſons ſtraight and elegant, their limbs finely proportioned, their fingers long and tapering, their countenances open and pleaſant, and their features exhibit the moſt delicate lines of beauty in the females, and in the males a kind of manly ſoftneſs. Their walk and gait, as well as their whole deportment, is in the higheſt degree graceful. The inhabitants of the northern part are of a deep olive colour; and thoſe of the ſouth, black. The natives, who dwell on the mountains in the centre of the peninſula, are exceeding black: all have black eyes, and long black hair.

The dreſs of the men is a kind of cloſe-bodied gowns, and wide trowſers, reſembling petticoats, reaching down to their ſlippers. Such of the women as appear in public, have ſhawls over their heads and ſhoulders, ſhort cloſe jackets, and tight drawers, which come down to their ancles. Hence the dreſs of the men gives them, in the eyes of Europeans, the appearance of effeminacy; whereas that of the women will appear rather maſculine: but theſe ideas are chiefly owing to the influence of habit and cuſtom on human ſentiments. The men tie their hair up in a roll, over which they have a ſmall turban. The women's hair is alſo tied up in a roll, like the men's, and is adorned with jewels, or toys in imitation of them; they have pendants in their ears and noſes, and ſeveral ſtrings of beads round their necks; they wear bracelets on their wriſts and ancles, and rings on their fingers and toes: they put their bare feet into ſlippers, as the men do; though indeed, in the ſouthern parts, ſome of the women wear no ſlippers or ſhoes at all.

The Moors, or Mahometans, appear in a very handſome and becoming dreſs: they have grand turbans of rich muſlin, and their garments reach down to their feet. Their ſaſhes are embroidered in great taſte, the ends being decorated with gold and ſilver tiſſue, and in their ſaſhes they ſtick their daggers; they wear embroidered ſlippers, which they take off, and leave at the foot of a ſopha when on a viſit.—They are remarkably fond of ſmoking tobacco, and uſe the callaan.

In manners, the inhabitants of Indoſtan reſemble the other natives of ſouthern Aſia: they are effeminate and luxurious, and are by education taught to affect a grave deportment, which initiates them early in the arts of diſſimulation, and they are very apt to gratify a private revenge without having had any public quarrel.

Their houſes are of two kinds, thoſe built by the Moguls, and thoſe by the original Indians. The houſes of the Moguls are all in the Perſian taſte; in ſhort, they ſeem to imitate the Perſians in every thing. The Indian houſes cover much ground, and have ſpacious galleries and accommodations of various kinds. The apartments are ſmall, and the furniture not very elegant, if we except the rich Perſian carpets. The grandeur of their palaces conſiſts in baths, perfumes, temples, gods, and harams. The harams, or zenanas, that is, the reſidences of the women, are removed from the front of the houſe, and lighted only from a ſquare ſpace in the centre of the whole building. The apartments in the houſes of the wealthy are ornamented chiefly with looking-glaſſes, which are purchaſed of the Europeans, and many of their ceilings are inlaid with mother-of-pearl and ivory.

The Bramins ſuperintend and have the immediate direction of all the temples and pagodas erected in every capital, which are ſtupendous, but diſguſtful ſtone buildings. If theſe Indian prieſts are maſters of any uncommon art or ſcience, they frequently turn it to the purpoſes of profit from their ignorant votaries. They know how to calculate eclipſes; and judicial aſtrology is ſo prevalent among them, that half the year is taken up with unlucky days; the head aſtrologer being always conſulted in their councils. The Mahometans likewiſe encourage thoſe ſuperſtitions, and appropriate to themſelves the fruits of the Gentoo induſtry.

Though the Gentoos are entirely paſſive under all their oppreſſions, and, by their ſtate of exiſtence, the practice of their religion, and the ſcantineſs of their food, have nothing of thoſe diſagreeable qualities in their nature that animates the generality of mankind; yet they are ſuſceptible of avarice, and ſometimes bury their money; many of them, rather than diſcover it, having put themſelves to death by poiſon, or otherwiſe. The vaſt ſcarcity of ſilver, that till of late prevailed in Indoſtan, has been aſcribed to this practice.

The Indians are ſuppoſed, for the reaſons abovementioned, to be leſs under the influence of their paſſions than the inhabitants of other countries. The perpetual uſe of rice, their chief food, gives them but little nouriſhment; and their marrying early, the male before fourteen, and their women at ten or eleven years of age, keeps them low and feeble in their perſons. A man is in the decline of life at thirty, the women begin to bear children at about twelve, and their beauty is on the decay at eighteen: at twenty-five, they have all the marks of old age. We are not therefore to wonder at their being ſoon ſtrangers to all perſonal exertion and vigour of mind; and whatever may be the cauſe, a perſon who has lately travelled into this country obſerves, that death is regarded with leſs horror in India than in any other country in the world. "The origin and the end of all things, ſays the Indian philoſopher of the preſent times, is a vacuum. A ſtate of repoſe is the ſtate of greateſt perfection; and this is the ſtate after which a wiſe man aſpires." "It is better, ſay the Hindoos, to ſit than to walk, and to ſleep than to wake; but death is the beſt of all."

At certain times, a court of juſtice is held for determining diſputes relative to property, and other controverſies among the people. Law-ſuits are here very quickly adjuſted, as the whole power of deciding is

veſted

veſted in the judge, whoſe principle is avarice, and whoſe ſoul is conſequently a ſtranger to tender or equitable ſentiments.

In every town and village, courts are likewiſe held for the adminiſtration of juſtice: the principal perſon of the place acts as judge, and determines all diſputes within his diſtrict; the determination, however, is generally made in favour of him who diſplays the greateſt liberality, and can give the higheſt bribe.

The emperor himſelf decides in all capital caſes, as his viceroys do in their different governments.—Though there are no written laws, particular puniſhments are inflicted for particular offences. Murder and robbery are puniſhed with death; but the mode of executing is entirely in the will of the mogul or his viceroy. Some offenders are beheaded, ſome hanged, ſome impaled upon ſharp-pointed ſtakes, and others trampled to death by elephants. The poor criminal who is doomed to ſuffer exceſſive torture, has the bones of his legs and arms broken by the elephant, who kicks him in thoſe parts with his heavy foot, and then leaves the victim to expire. There have been inſtances of delinquents being torn to pieces by dogs, in the empire of Indoſtan. According to the Gentoo laws, criminals ſentenced to death are not to be ſtrangled, ſuffocated, or poiſoned, but to be cut off by the ſword; becauſe without an effuſion of blood, malefactors are ſuppoſed to die with all their ſins upon them; but by the ſhedding of blood, it is thought their crimes againſt the Deity are expiated.

In India, the Mahometans are called Moors, and are of Perſian, Turkiſh, Arabic, and other extractions. They invaded Indoſtan ſoon after the caliphs of Bagdad began to reign. Afterwards penetrating to Delhi, they made that city their capital. They ſettled colonies in ſeveral places, whoſe deſcendents are called Pytans; but their empire was overthrown by Tamerlane, who founded the Mogul government, which ſtill ſubſiſts. Thoſe princes, being ſtrict Mahometans, received under their protection all that profeſſed the ſame religion, and who, being a brave, enterpriſing people, counterbalanced the numbers of the natives. The vaſt reſort of Perſian and Tartar tribes has likewiſe ſtrengthened the Mahometan government; but it is obſervable, that in two or three generations the progeny of all thoſe adventurers, who brought nothing with them but their horſes and ſwords, degenerated into all the indolence and ſenſuality of the eaſt.

The Moors are ſaid to have introduced the diviſion of provinces, over which they appointed ſoubahs; and thoſe provinces, each of which might be ſtyled an empire, were ſubdivided into nabobſhips; each nabob being immediately accountable to his ſoubah, who in proceſs of time became almoſt independent on the emperor, or, as he is called, the Great Mogul, upon their paying him an annual tribute.

The Marattas at preſent make the greateſt figure of all the Tartar tribes: Malwa, Berar, Oriſſa, Candeiſh, and Viſipour, the principal part of Amednagur or Dowlatabad, half of Guzarat, and a ſmall part of Agimere, Agra, and Allahabad, are compriſed within their extenſive empire, which reaches from ſea to ſea acroſs the wideſt part of the peninſula, and from the confines of Agra northward to the Kiſtna ſouthward, forming a tract of about 1000 miles long, and 700 wide. This extenſive country is divided among a number of chiefs, whoſe obedience to the Paiſhwah, or head, is merely nominal, and they are often at war among themſelves, and with their head. For the laſt twenty years, their power has been on the decline. They are now a kind of mercenaries, who live on the mountains between Indoſtan and Perſia. They commonly ſerve on horſeback, and, when well commanded, have been known to give law even to the court of Delhi. Though they are originally Gentoos, yet they are of bold active ſpirits, and pay no great reſpect to the principles of their religion.

A modern writer ſays, that the Mahometans or Moors are of ſo deteſtable a character, that he never knew above two or three exceptions, and thoſe were among the Tartar and Perſian officers of the army. We are indeed told, that they are void of every principle even of their own religion; and if they have any virtue, it is an appearance of hoſpitality, but it is an appearance only; for while they are drinking with, and embracing a friend, they will ſtab him to the heart. But, according to others, the Marattas, who have been unjuſtly repreſented as barbarians, are a great and riſing people, ſubject to a regular government, the principles of which are founded in virtue. Theſe people are at this time in friendſhip with the Engliſh; but a rupture taking place between them and Tippoo Saib, a formidable neighbouring potentate, the country of the latter was conquered by the Engliſh, their allies, in 1792.

The Gentoos have a remarkable manner of drinking. They religiouſly avoid touching with their lips the veſſel that contains the liquor, and pour it into their mouths, holding the bottle, or other veſſel, at leaſt at a foot diſtance. They will drink from a pump, or any running ſtream, but not out of a ſtanding pool; for their idea is, that ſtagnated water has a polluting quality.

The empire is hereditary, and the emperor is heir only to his only officers. The imperial demeſne lands are thoſe of the great rajah families, which fell to Tamerlane and his ſucceſſors. Certain portions of them are called jaghire lands, and are beſtowed by the crown on the great lords or omrahs, and upon their death revert to the emperor; but the rights of the ſub-tenants, even of thoſe lands, are indefeaſible. All other lands go in the hereditary line, and continue in that ſtate even down to the ſub-tenants, while the lord can pay his taxes, and the latter their rent, both which are immutably fixed in the public books of each diſtrict. The Mahometan inſtitutes prevail only in their great towns and their neighbourhood.

According to the Gentoo conſtitution, land is not private property, but belongs to the community in the ſeveral villages, but this does not extend to houſes and gardens: theſe villages are ſupplied with their reſpective public officers, as the head-man, to execute juſtice; the conicopoly, to keep the accounts of the village; the corn-meter, ſmith, barber, doctor, aſtrologer, &c. The grounds are cultivated by the community, and the produce ſhared out in certain proportions to all. One is alotted to the Pagodas and Bramins, one to the government, another to the public officers, one to the repair of tanks or reſervoirs of water, and the reſt is diſtributed among the community: but the Mahometan government, and the intruſion of Europeans, have introduced ſome innovations in this ancient conſtitution, among which the farming the circar, or government ſhares, are particularly inſtanced.

The government of this great empire, the outlines of which we have now given, long ſubſiſted without almoſt the ſemblance of virtue or probity among its great officers, either civil or military; till it was ſhaken after the overthrow of Mahomet Shah, by Kouli Khan, which was attended by ſo great a diminution of the imperial authority, that the ſoubahs and nabobs became abſolute in their own governments. Though they could not alter the fundamental laws of property, yet they framed new taxes, which beggared the people, to pay their armies and ſupport their power: ſo that many of the people, within theſe few years paſt, after being unmercifully plundered by collectors and tax-maſters, were left to periſh through want. To ſum up the miſery of the inhabitants, thoſe ſoubahs and nabobs, and other Mahometan governors, employ the Gentoos themſelves, and ſome even of

of the Bramins, as the miniſters of their rapaciouſneſs and cruelties.

Upon the whole, ever ſince the invaſion of Kouli Khan, Indoſtan, from being a well regulated government, is become a ſcene of mere anarchy or ariſtocracy; every great man protects himſelf in his tyranny by his ſoldiers, whoſe pay far exceeds the natural riches of his government. As private aſſaſſinations and other murders are now committed here with impunity, the people, who know they can be in no worſe ſtate, concern themſelves very little in the revolutions of government. To the above cauſes are owing the late ſucceſſes of the Engliſh in Indoſtan. The reader, from this repreſentation, may perceive, that all the Engliſh have acquired in point of territory, has been gained from uſurpers and robbers; and their poſſeſſion of it being guaranteed by the preſent lawful emperor, is ſaid to be founded upon the laws and conſtitutions of that country. But notwithſtanding this, we are ſorry to be obliged to remark, that the conduct of many of the ſervants of the Eaſt India company towards the natives, not being properly checked or puniſhed, either by the directors, or the Britiſh legiſlature, has in too many inſtances been highly diſhonourable to the Engliſh name, and totally inconſiſtent with that humanity which was formerly our national characteriſtic. But we hope the wiſdom and juſtice of the Britiſh parliament will prompt them to puniſh the delinquents for paſt offences, find expedients for removing the preſent evils, and for preventing the like in future.

CHAP. XI.

INDIA BEYOND THE GANGES,

CALLED THE FURTHER PENINSULA.

Situation, Extent, Mountains, Rivers, Soil, Produce, Trade, &c.

THIS peninſula is ſituated between the 92d and 109th deg. of eaſt longitude, and between the 1ſt and 30th of north latitude; being about 2000 miles in length, and 1000 in breadth. It is bounded by Thibet and China, on the north; by China and the Chineſe ſea, on the eaſt; by the ſame ſea and the Straights of Malacca, on the ſouth; and by the bay of Bengal, and the Hither India, on the weſt. The province of Mecklus, and other diſtricts, are ſubject to the king of Ava or Burmah, and lie between Bengal and China.

On the north weſt, are the kingdoms of Acham, Ava, and Arracan, whoſe chief towns are Camdara, Ava, Arracan; containing 180,000 ſquare miles.

On the ſouth-weſt, are the kingdoms of Pegu, Martaban, Siam, Malacca. Their chief towns are, Pegu, eaſt long. 97 deg. north lat. 17 deg. 30 min. containing 50,000 ſquare miles. Mataban; Siam, eaſt long. 100 deg. 55 min. north lat. 14 deg. 18 min. containing 170,000 ſquare miles. Malacca, eaſt long. 101 deg. north lat. 2 deg. 12 min. containing 48,000 ſquare miles.

On the north-eaſt are the kingdoms of Tonquin and Laos. Their chief towns are, Cachao, or Keccio, caſt long. 105 deg. north lat. 21 deg. 30 min. containing 122,000 ſquare miles; Lanchang, containing 59,400 ſquare miles.

On the ſouth-eaſt, lie Cochin-China, Cambodia, and Chiampa; whoſe chief towns are Thoanoa, containing 61,900 ſquare miles; Cambodia and Padram, containing 60,200 ſquare miles.

The whole of this peninſula was unknown to the ancients, and is partly ſo to the moderns. The name of India is taken from the river Indus, which of all others was beſt known to the Perſians.

The air of this peninſula is very dry and healthy in the northern parts, but the ſouthern provinces are very hot and moiſt, eſpecially in the vallies, and low lands near the ſea and rivers, and therefore not ſo healthy; notwithſtanding which, the natives build moſt of their towns in theſe parts. They are obliged to erect their houſes upon high pillars to ſecure them from the floods during the rainy ſeaſon, at which time they have no communication with each other but by boats; and ſuch ſtorms of wind, thunder, and lightning happen, about the equinoxes on the ſhifting of the monſoons, as are ſeldom ſeen in Europe. The year is not divided into winter and ſummer, as with us, but into the dry and wet ſeaſons, or into the eaſterly and weſterly monſoons; a term ſometimes applied to thoſe periodical winds, and ſometimes to the wet and dry weather. When the ſtorms ceaſe, there are ſea and land breezes near the coaſt, which ſhift every twelve hours.

The mountains of this part of India run from north to ſouth almoſt the whole length of the country. The mines of it yield gold, diamonds, rubies, topazes, amethyſts, beryls, aſterias or cat's-eyes, and other precious ſtones, in which the natives drive a great trade.

The principal rivers are, 1. The Domea, in Tonquin, which runs from north to ſouth, and, paſſing by Cachao the capital, falls into the Chineſian ſea. 2 The Mecon, which running from north to ſouth, through Laos and Cambodia, falls by two channels into the ſame ſea. 3. The Menan, which runs from north to ſouth through Siam, and falls into the bay of Siam. 4. The Ava, or the great river Nou Kian, which joining the leſſer river Pegu, they both fall through one mouth into the bay of Bengal. 5. The Sanpoo, or Burrumpooter.

Adjoining to this country are the promontaries of Siam, Romana, and Branſac; the bays of Bengal, Siam, and Cochin-China; and the Streights of Malacca and Sincapore.

The ſoil is in general fertile, but more ſo in ſome places than others. Thoſe are remarkably ſo which are overflowed by the torrents from the mountains, and the mud and ſlime left on the ſurface when the floods retire. Here are produced all the delicious fruits found in other countries contiguous to the Ganges, as well as roots and vegetables. Areca and betle claim particular mention, from the unbounded uſe made of them by the Indians. The areca-tree nearly reſembles the cocoa in height and ſhape; but the trunk is ſmaller, and the leaves ſhorter. Under the leaves grows a long maſs, which forms a bunch or cluſter of fruit, reſembling nuts or apricots, intermixed with flowers. About two months after the flowers are gone, the huſk which covers the fruit begins to open and fall off, when an oblong fruit appears of the ſize of a middling plum, and of a whitiſh and ſhining colour; its ſhell becomes firm, compact, and reddiſh; the pulp contained in it is of a brown caſt, bordering on red, and ſoft and aſtringent to the taſte.

The betle is a plant which creeps along the ground like peas or hops, ſo that its ſtalk muſt be ſupported by a prop, or planted near the areca-tree, to which it fixes itſelf like ivy. Its leaf reſembles that of the citron-tree, and becomes reddiſh when dried. When it is planted in watery places it produces a fruit ſhaped like a rat's tail, but bears none in climates which are too hot or too cold; in which places the inhabitants make uſe of the leaves prepared with lime of oyſter-ſhells, inſtead of it.

An Indian is ſeldom ſeen without betle in his mouth, which they ſay ſtrengthens the gums, preſerve the teeth, makes the breath ſweet, is good for the ſtomach, promotes digeſtion, prevents wind and vomiting, to which they are very ſubject, and is an antidote againſt the ſcurvey. When they chew the

areca, they mix the kernel with the leaves of the betle, dividing a nut into eight or ten parts.

Their other productions are corn, rice, pepper, and a variety of garden-ſtuff and drugs. The principal fruit-trees are the palm, cocoa-nut, tamarind, quava, mango, plantains, orange, lemon, and pomegranate. Pine-apples and melons are likewiſe found here in the greateſt plenty and perfection.

The trade and manufactures of this peninſula vary in the different kingdoms of it; but they principally conſiſt in muſlins, chints, calicoes, and ſilks. The natives are very ingenious in weaving, embroidering, and darning, eſpecially the laſt; ſo that if a piece of muſlin is torn, they join it with ſuch neatneſs, as not to be diſcovered by the moſt curious inſpection. Their painting, though they are ignorant of drawing, is amazingly vivid in its colours. No nation exceeds them for inlaying in ivory; nor can they be equalled for cabinets, eſcrutoires, and other curious works in wood, very finely lacquered. The fineneſs of their linen, and their fillagree work in gold and ſilver, far exceed thoſe in any other part of the world. They have a method of covering canes with caſes of beautiful tortoiſeſhell; and of making beads, little idols, bracelets, necklaces, and various toys, of a very tranſparent cryſtal, found in the mountains. In ſhort, the commerce of India is courted by all trading nations in the world, and probably has been ſo from the earlieſt ages: it was not unknown even in Solomon's time; and the Greeks and Romans drew from thence their higheſt materials of luxury. The Engliſh, Dutch, French, Daniſh, and Sweediſh veſſels reſort thither annually. The greateſt part of it, however, now centres in England, though that of the Dutch is very conſiderable. The French trade thither has been long on the decline, and that of the Swedes and Danes is very inconſiderable. The natives have ſome merchant ſhips of their own, in which they traffic with the countries bordering upon India; but their principal trade is with the Europeans.

Of the different Kingdoms on this Peninſula, and the Religion, Cuſtoms, Government, Conſtitution, &c, of their reſpective Inhabitants.

The kingdom of Acham, or Azem, has China to the eaſt, Indoſtan to the weſt, Tipra to the ſouth, and Boutan, with part of Independant Tartary, to the north. It is one of the moſt fertile kingdoms in Aſia, producing every thing neceſſary for the ſupport of human life. It contains mines of gold, ſilver, ſteel, iron, and lead, the property of which the king has reſerved to himſelf, on condition of not levying any taxes on the people. Great quantities of coarſe ſilk are alſo produced here, eſpecially a particular ſort ſpun by a little inſect reſembling a ſilk-worm, which, when manufactured, bears a prodigious fine gloſs, but it is not laſting. Two ſorts of gum-lack are found in this kingdom, the beſt is of a red colour, and uſed by the natives in painting their linen; the other is made uſe of to varniſh cabinets and make ſealing-wax. Their gold is current in ingots, but they have pieces of ſilver coin of two ſhillings each in value.

The inhabitants towards the north have good complexions and indifferent features, but are ſubject to prodigious wens or ſwellings in their throats, owing to the bad quality of the water. Thoſe in the ſouthern extremity are ſwarthy and flat-noſed, but have no diſagreeable ſwellings in their throats. The only covering they wear is a piece of cloth girt round their middle, and on their heads a cap or bonnet, hung round with boars' teeth. They bore very large holes in their ears, in which they hang pieces of gold and ſilver. The legs and arms of the moſt affluent among them are adorned with bracelets of coral and amber, while the poorer ſort make uſe of tortoiſe and other large ſhells, formed into rings for this purpoſe. There is ſcarce a man in Azem but has a horſe for himſelf, and an elephant to carry his wives, which are uſually four; to every one of whom he aſſigns her particular domeſtic offices. They pay no taxes, they do not even work in the mines, ſlaves being purchaſed for that purpoſe. The favourite food of this people is dog's fleſh, though all kinds of game, and other proviſions, abound here. They have prodigious quantities of fine large grapes, from which they extract brandy inſtead of wine. The Azemites diſpute the invention of gunpowder with the Chineſe; and many circumſtances conſpire to decide this conteſted point in their favour.

Theſe Indians, as well as the Chineſe, had unqueſtionably the uſe of gunpowder before it was known in Europe; and the invention is generally aſcribed to the Azemites.

The metropolis of this kingdom, and the reſidence of the king, which lies in 25 deg. 33 min. north latitude, is named Camdaras, Kemmeroofe, or Guergen; and the city of Azoo is the royal burial place. When any king is buried in the grand temple, his favourite idol is buried; this always being either of gold or ſilver, the vaults are filled with immenſe treaſures. The people imagine that the righteous have, in the other world, plenty of what they deſire, but that the wicked ſuffer all the miſeries of hunger and thirſt. Full of this notion, and not entertaining any very high idea of the morality or piety of their monarchs, they bury with them all kinds of edibles, great riches, ſeveral of their wives, officers, elephants, ſlaves, &c. leſt they ſhould fare worſe in the other world than they did in this.

Ava, according to ſome accounts, is about 765 Engliſh miles in length, and 575 in breadth; but, according to others, it is about 800 miles long, and 250 broad. It is ſituated between 15 and 28 deg. north latitude; and is bounded on the eaſt, by Laos and Siam; on the weſt, by Bengal; on the ſouth, by the Indian ſea; and on the north by Thibet. It is ſaid to be larger than the whole empire of Germany. It is in general a flat country and very fertile, yielding rice, fruits, garden-ſtuff, and a variety of wild and tame animals. It alſo contains mines of ſilver, lead, and copper.

The king aſſumes next to divine honours; his ſubjects approach him with the moſt abject reverence; and the higheſt title they aſpire to, is that of his firſt ſlave. When they ſpeak or write to him, they term him their kiak, or God; and in his letters to foreign princes, he arrogates to himſelf the title of King of kings, to whom all other kings ought to be ſubject. He is accounted near kinſman to all the gods in heaven and on earth; allied to all the planets; having the ſun for his brother, and the moon and ſtars for his couſins.

Ava, the capital, carries on a great trade in muſk and jewels, the latter are principally rubies and ſapphires. Every town in the dominions of the king of Ava hath a kind of ariſtocratical government. The ſubjects trade chiefly in muſk and jewels; and in moſt particulars reſemble thoſe of Pegu.

Arracan, which is called by ſome the empire of Mogo, is bounded, on the eaſt, by Ava; on the weſt, by the bay and country of Bengal; and, on the north, by Tipra: it extends about 400 miles in length; and contains a great number of places, many of which are uninhabited, from the numerous wild beaſts that infeſt the whole country.

This kingdom enjoys a very ſalutary air, and is prodigiouſly fertile and pleaſant; but, though ſituated in ſo warm a latitude, it freezes very intenſely when the wind blows from the north-eaſt.

The inhabitants are in general very robuſt, and have broad flat foreheads, which is eſteemed a beauty among them, large open noſtrils, ſmall quick eyes, and ears which hang down to their ſhoulders; the women

women are tolerably fair. Men of rank wear a veſt, or ſhirt, of fine white calico, which ſits cloſe to the body and arms. Over it they have a long gown of the ſame ſpecies of linen, which buttons round the arms, and is tied cloſe upon the breaſt with ribbons. They wear an apron which covers the belly and thighs before, with another piece of white calico, reſembling a bag, which, being gathered in ſeveral folds, is faſtened round the middle, and falls down behind, ſo that they look as if they carried a large bundle of cloth about them. Their hair, which they ſuffer to grow to a prodigious length, is tied in treſſes behind the head.

The women wear a kind of tranſparent flowered gauze, which, covering the boſom, paſſes over the ſhoulders. About their waiſts they faſten a quantity of very fine calico, which goes three or four times round them, and reaches down to their feet. Thoſe who can afford it wear a ſilk ſcarf over one of their arms, and their hair is curled in a very becoming manner. They put rings of glaſs, ſilver, &c. in their ears; and ſometimes they wear bracelets all the way up their arms to the elbows, and from the ancles to the calves of their legs; but the genteeler ſort content themſelves with a few, curiouſly japanned. They are, however, in general very oſtentatious, and uſually make an appearance beyond their abilities.

A man may marry ſeveral wives, beſides which, he is allowed as many concubines as he can maintain; but they are very indelicate in their amours, always preferring ſuch women as have been openly connected with the Dutch and other foreigners; and, it is ſaid, that thoſe who marry a virgin even hire theſe people to conſummate the nuptials.

Their conduct towards their ſick is equally ridiculous, being always attended by a number of ſuperſtitious ceremonies, performed by the prieſts and the relations of the patient: but when a perſon is ſeized with a diſeaſe, judged to be incurable, he is expoſed on the banks of a river, where he is either drowned or devoured by birds or beaſts of prey.

Theſe idolatrous people make their images of clay, which they bake in the ſun, and then worſhip them; and, it is ſaid, that ſome of their temples, which are built in form of a pyramid, contain no leſs than twenty thouſand of theſe idols. Beſides the temple idols, they have their domeſtic, or houſehold gods, the marks of which they wear branded on their arms, ſides, and ſhoulders. The prieſts are clothed in yellow, have their heads ſhaved, and all go uncovered, except thoſe called Pungrini, who, being ſuperior to the reſt, wear a yellow mitre. They are all obliged to live ſingle, and have very little communication with the reſt of the world. There are a number of hermits among them, called Talapoins, who inflict very rigorous penances on themſelves, and are for that reaſon held in very high eſteem by the people.

The navigation of Arracan extends no further than Bengal and Pegu, ſo that the inhabitants trade very little by ſea. Few of the natives attend at all to the foreign commerce which is carried on, it being chiefly conducted by the Mahometans, who are ſettled there in great numbers. Of theſe ſome trade in elephants, which they ſend to Orixa, the coaſt of Coromandal, Golconda, and Perſia, which they barter for calicoes, ſilks, and ſpices. They likewiſe carry on a traffic with the dominions of the Great Mogul, in timber for building, lead, tin, ſtick-lack, elephants teeth, diamonds, rubies, and other precious ſtones.

Arracan, the capital of this kingdom, is large and well fortified; it is ſituated in a valley, and is fifteen miles in circumference. It is encloſed by very high ſtone walls, and ſurrounded by a ridge of ſteep craggy mountains, ſo artificially formed as to render a penetration almoſt impracticable; beſides which, there is a caſtle within ſtrongly fortified. The city is well watered by a fine river that paſſes through it in different ſtreams, and at length forms two channels, which empty themſelves into the bay of Bengal. The number of inhabitants in this city are eſtimated at 160,000, excluſive of foreigners. The houſes in general are ſmall, and built of bamboos; but thoſe of the better ſort are ſpacious and handſome: in it are upwards of 600 idol temples, moſt of which are ſpacious buildings, elegantly ornamented. The palace is exceeding magnificent, being decorated with the moſt coſtly ornaments. The apartments are lined with various kinds of wood that diſcharge the moſt agreeable fragrance; and the roofs of thoſe belonging to the king are covered with plates of gold. In the centre of the palace is the grand hall, which contains a canopy ornamented with wedges of ſolid gold, reſembling ſugar-loaves.

The province of Pegu is ſituated between the 110th and 116th degrees of longitude, and between the 17th and 30th degrees of north latitude, being about 350 Engliſh miles in length, and almoſt the ſame in breadth. This kingdom is very ſalutary and fertile, the ſoil being enriched by the inundations of the river Ava; and it alſo abounds in elephants, buffaloes, goats, hogs, all ſorts of game, particularly ſtags, and exceeding fine poultry.

The inhabitants are of a tawny complexion; and the women, according to the character given of them by all travellers, ſtrangers to modeſty. This, however, renders them the more agreeable to their own countrymen, for, it is aſſerted, that no Peguan, from the king to the peaſant, will marry a woman who has not previouſly lived with an European. Fathers offer their daughters to ſtrangers for a certain term, and moſt of the foreigners who trade with them, marry a wife for the time of their ſtay. Their common drink is water, or a liquor diſtilled from the milk of the cocoa-nut; and rice, made into cakes, ſerves them inſtead of bread.

The prieſts of this country are called talapoins, who recommend charity and humanity as the greateſt of all virtues; and indeed theſe men do honour to human nature, if the accounts given of them be literally authentic. When the maſter of a veſſel happens to be ſhipwrecked on the coaſt, and he, by this calamity, becomes the ſlave of the ſovereign, the talapoins humanely intercede for him, and get him into their pious care and protection. In their temples theſe good men ſupply a diſtreſſed ſtranger with every thing he wants; and as they are phyſicians as well as prieſts, they tenderly take care of ſick perſons; and, after their recovery, give them letters of recommendation to ſome other convent on the road they travel.

The riches of the king, when an independent ſtate, were almoſt incredible; ſome of his idols, as big as life, being of maſſy gold and ſilver. His revenues aroſe from the rents of lands, of which he was ſole proprietor, and from duties on merchandize; ſo that ſome thought him to be the richeſt monarch in the world, except the Chineſe emperor. He was ſaid to be able to bring a million, and, on occaſion, a million and a half of ſoldiers, to the field, well clothed and armed; and to be maſter of eight hundred trained elephants, each with a caſtle on his back holding four ſoldiers.

The conſtitution of this empire is of the feudal kind, for the king aſſigns lands and towns to his nobles upon military tenures. In the year 1754, Pegu was reduced to the ſtate of a dependent province by the king of Ava. Macao is the great mart of trade here.

Martaban, or Martavan, in the bay of Bengal, was once a kingdom, but is now only a Siameſe province. It is 300 miles long, 115 broad; and is ſo fertile as to have annually three harveſts, and is bleſſed with ſuch a pure air, that the inhabitants never are afflicted with the head-ach. It produces, beſides corn, oranges, lemons, figs, pears, cheſnuts, medicinal plants, oil of jeſſamy, gold, ſilver, ſteel, iron, lead, copper,

copper, rubies, laque, benzoin, &c. The people make a kind of black porcelain, with which they trade to Malacca.

The kingdom of Siam is about 834 Engliſh miles in length, and 400 in breadth where wideſt, but in ſome places it is not above half ſo much. It is ſurrounded by high mountains, which on the eaſt ſide ſeparate it from the kingdoms of Camboja and Laos; on the weſt, from Pegu; and on the north from Ava, or, more properly, from Jangoma; on the ſouth it is waſhed by the river Siam, and has the peninſula of Malacca, the north-weſt part whereof is under its dominion.

By the overflowing of the river Menan, in the month of March, annually, the country is entirely under water for 120 miles round. Theſe inundations leave a mud and ſlime behind them, which, together with the earth waſhed down from the mountains, render the land very fertile. The vegetable and animal productions, together with the minerals in this kingdom, are the ſame with thoſe already mentioned in Azem or Pegu, &c.

The inhabitants of both ſexes are more modeſt than any found in the reſt of this peninſula. They are of a good ſtature, ſeldom corpulent, and have tawny complexions. The faces of both men and women are broad, with high cheek bones, but their fore-heads and chins ſuddenly contract and terminate in a point. They have dark ſmall eyes, hollow jaws, large mouths, thick pale lips, ſhort noſes, large ears, and thick lank hair, which both men and women cut ſo ſhort, that it reaches no lower than their ears — The dreſs of the better ſort is much the ſame as that of the other kingdoms in this peninſula; but as to the common people, they go almoſt naked. The king wears a cap in the form of a ſugar-loaf, ending in a circle of precious ſtones; and thoſe of his officers have circles of gold, ſilver, or vermillion gilt, to diſtinguiſh their quality, which entirely depends upon the poſſeſſion of places, for there is no ſuch thing as nobility among them. The Siameſe, in their manners, are civil, courteous, and timorous; they have a ready and clear conception, and ſoon attain any art that is taught them; their rural ſports are fiſhing and hunting; they alſo act comedies by torch light, from evening till morning, and obſerve a great number of feſtivals.

As to religion, every Siameſe temple has its convent of friars annexed to it, and they are ſaid to have a proportionable number of nunneries. Beſides the images in their temples, whereof the elephant and the horſe are the chief, they worſhip almoſt every thing animate and inanimate; beaſts, birds, fiſhes, woods, mountains, rivers, &c. and like all the inhabitants of this peninſula, and many other parts of Aſia, &c. believe in the doctrine of tranſmigration. They have two languages, one termed Balli, which is the learned or ſacred language; the other which is ſpoke in common, is, in ſome reſpects, ſimilar to the Chineſe, but in others very different.

The king is the moſt haughty and deſpotic monarch upon earth, and the reſpect he demands from his ſubjects borders upon adoration. Even in council, which laſts ſometimes four hours, the miniſters of ſtate, and the mandarins, are continually proſtrated before him; they never ſpeak to him but on their knees, with their hands raiſed to their heads, making every moment profound reverences, and accompanying their diſcourſe with pompous phraſes, celebrating his power and his goodneſs. When he goes abroad, all are obliged to keep within doors: in ſhort, all his ſubjects are his ſlaves, who poſſeſs nothing but what belongs to him, and he commands their ſervice both in peace and war. His revenues ariſe from the lands of the crown, and a rent paid him in kind out of all the lands in his dominions, alſo by monopolies of almoſt every branch of trade; but he does not receive above ſix hundred thouſand pounds per annum in money.

They have a ſilver coin in Siam called a tycal, worth about three ſhillings and three halfpence, but they have neither gold nor copper money. Thoſe ſhells, called cowries, ſerve to buy trifles: they are current in all thoſe countries; and differ in value according to the plenty or ſcarcity of them: in Siam, 800 of them are equal to one penny.

The city of Siam is ten miles in circumference; and many navigable canals, whoſe ſources are in the river Menan, paſs through it. The walls are thick and high; built of ſtone and bricks, of both which materials ſome of the bridges are erected, though moſt are built of wood. The only public ſtructures worth notice are the palaces; and the temples, which are ſo gilded on the outſide that the effulgence of the ſunbeams reflect from them, and dazzle the eyes of the beholders. One of the latter, which is a ſquare building, contains 100 idols, placed in niches four feet from the ground: they are as big as life, ſit croſs-legged, and are all gilt.

The ſtreets are narrow, but regular; the houſes are built on raiſed ground, by reaſon of the frequent inundations; and the inhabitants in the rainy ſeaſons go about their buſineſs in boats. All the houſes are built of timber or cane, except one ſtreet, which contains 200 brick dwellings of only one ſtory.

The river will contain veſſels of 400 tons burthen, and divides the city into eight parts. The markets here are well ſtocked with cattle, wild and tame; rice, fruits, pulſe, roots, &c. and the trade conſiſts of the admirable gems of Pegu, ſilver bullion, manufactured iron, broad ſtammel cloth, looking-glaſſes, &c. China-wares are cheaper than at Bantam.

Bankok, which ſtands about eighteen leagues to the ſouth of Siam, is the only place towards the coaſt that is fortified with walls, batteries, and braſs cannon.

Malacca is a large country, and contains ſeveral kingdoms or provinces: but the Dutch are ſaid to be real maſters and ſovereigns of the whole peninſula, being in poſſeſſion of the capital city. The inhabitants differ but little from brutes in their manner of living; and yet the Malayan language is reckoned the pureſt of any ſpoken in all the Indies. We are told by the lateſt travellers, that its chief produce is tin, pepper, elephants teeth, canes, and gums.— Some miſſionaries pretend it is the Golden Cherſoneſus, or peninſula of the ancients, and that the inhabitants uſed to meaſure their riches by bars of gold. The truth is, that the excellent ſituation of this country admits of a trade with China; ſo that when it was firſt diſcovered by the Portugueſe, who were afterwards expelled by the Dutch, Malacca was the richeſt city in the eaſt, next to Goa and Ormus, being the key of the China, Japan, Moluccas, and Sunda trade.

The city of Malacca is an extenſive and populous place, ſurrounded with a ſtone wall and baſtions: many of the ſtreets are ſpacious and handſome, and are ſhaded with trees on both ſides: the houſes ſtand pretty cloſe to each other, and are built chiefly of bamboos, though ſome of them are of ſtone. The governor's houſe is handſome and commodious, and is ſituated in the fort, garriſoned by 200 Europeans. The harbour is one of the beſt and ſafeſt in that part of the globe, and receives veſſels from moſt parts of the Indies. When poſſeſſed by the Portugueſe, the city was remarkably opulent, being a grand mart for precious ſtones and gold; and before the Dutch made Batavia the chief place of their commerce, it had all the rich commodities of Pegu, Coromandel, Siam, Banda, and other countries: but at preſent its commerce is not very conſiderable, which, as well as the degeneracy of the Malayans, who were formerly an induſtrious people, is eaſily accounted for by the tyranny of the Dutch, whoſe intereſt it is that they

ſhould

ſhould never recover from their preſent ſtate of ſlavery and ignorance.

Here is a kind of ſmuggling trade carried on by the Engliſh in their country ſhips, from the coaſt of Coromandel, and the bay of Bengal, to Malacca. This commerce is connived at by the Dutch governor and council, who little regard the orders of their ſuperiors, provided they can enrich themſelves from the profits ariſing by it.

The Malays are in general ſavages, and live after the manner of beaſts. They are extremely ſwarthy, and ſo deſirous of having children as white as the Europeans, that, as ſoon as they arrive on their coaſt, they offer them their wives and daughters, thinking by that means they ſhall obtain their wiſhes. It is however aſſerted, that there are another ſort of people in this country, who in ſhape, as well as complexion, reſemble the Europeans, having grey eyes, and yelloviſh hair, which reach to the women's hips; their feet turn inwards, and they can ſee only in the night, and therefore always ſleep till ſun-ſet.

The inland people, called Morakabos, delight ſo much in miſchief, that if the Malayans ſow grain in any ground but what is well fenced, they come down and burn it. Rice, or any other kind of grain, is very little cultivated; and in ſome of theſe parts the people ſubſiſt chiefly on ſago.

The articles for trade are gold, tin, pepper, elephants-teeth, roſe-wood, cinnamon, eagle and kalambak-woods, ſapan-wood, diamonds, gum-benjamin, rattans, and canes.

TONQUIN.

THE kingdom of Tonquin is bounded on the eaſt and north by the empire of China; on the weſt, by the two ſmall kingdoms of Laos and Bowes, bordering on Siam; and on the ſouth and ſouth-eaſt by Cochin-China. It is about 400 miles in length, and 300 in the broadeſt part.

As to the climate of Tonquin, this country being ſituated under the tropic, the weather is extremely variable; however, their two chief diſtinctions with reſpect to this, are thoſe of the dry and rainy ſeaſons; the former of which is the more agreeable, and continues from September to March; during which time, the north-wind blows without intermiſſion, and the air is healthful, except in January and February, when the weather is frequently very ſevere. The rainy ſeaſon begins in April, and ends in Auguſt, the ſouth-wind blowing all the time; the three firſt months of this ſeaſon are very unhealthy. During the months of June, July, and Auguſt, the heat is very intenſe; nevertheleſs, the country, at this time, has a moſt pleaſing and beautiful appearance; the trees are loaded with fruit, and the plains covered with a rich harveſt. However, as the land moſtly lies low, particularly near the ſea, it is ſubject to frequent inundations; and when theſe are greater than uſual, the natives are conſiderable ſufferers.

The inhabitants are of a tawny colour, though not ſo deep as moſt other Indians. Their faces are oval, and generally flattiſh, notwithſtanding which they have a graceful appearance. Their hair is black, long, and lank, and both ſexes affect to have their teeth as black as ebony, white ones being eſteemed a great defect. The men are of a ſtrong, hardy conſtitution; and the higher claſs of women very modeſt and reſerved. They are dreſſed much in the ſame manner, wearing a ſtraight, long robe, cloſe at the neck, and reaching down to the heels, which is kept cloſe to the waiſt by a girdle of ſilk, or gold and ſilver tiſſue. The ladies cover their heads with a ſort of very broad hat, made of the leaves of a tree, and adorned with a net-work of thread curiouſly wrought: it is the cuſtom of the country to go barefooted all the year.

The Tonquineſe are indefatigable in whatever buſineſs they apply themſelves to: their judgment is juſt, their memory retentive, and they are capable of long application; but on the other hand, they are ſaid to poſſeſs a moſt unbounded love for gaming, and that the lower claſs are inſufferably indolent. They are, however, excellent mechanics, and fair traders; but greatly oppreſſed by their king and great lords. His majeſty engroſſes the trade, and his factors ſell by retail to the Dutch and other nations. The Tonquineſe are fond of lacker-houſes, which are unwholeſome and poiſonous. The people in the ſouth are a ſavage race, and go almoſt naked, with large ſilver and gold ear-rings, and coral, amber, or ſhell bracelets.

Silks, cottons, and lackered ware, are the principal manufactures of Tonquin The trade of it is carried on almoſt entirely in foreign bottoms, and the articles exported from thence are aloes, turpentine, muſk, rhubarb, and ſeveral other drugs, ſaltpetre, ſulphur, ſpices, &c.

In Cachao, the capital of this kingdom, the Engliſh have a very flouriſhing houſe, conveniently fitted up, with ſtorehouſes, offices, and noble apartments for the merchants, factors, and other officers belonging to the company. The chouah, or chief governor, generally reſides in this city, which is ſituated in the centre of the country. The bua's palace is a vaſt ſtructure, and has a fine arſenal.

The natives are all Pagans, and, among other animals, worſhip the elephant and horſe. They are exceedingly ſuperſtitious, great pretenders to aſtrology and the black-art, and ſtrict obſervers of times and ſeaſons.

Tonquin was originally under the Chineſe government; but having revolted, a civil war enſued, which continued ſome centuries: at laſt a compromiſe was effected between the contending parties, wherein it was agreed, that the repreſentative of Din, the firſt revolter, ſhould enjoy all the executive powers of the government, under the appellation of Chouah; and that the heir of the ancient kings ſhould retain the royal titles, with ſome other inconſiderable prerogatives, exerciſed within the limits of his own palace, from whence neither he, nor any of his family, ſtir but four times in a year, when they are allowed to ſtay out ſix days each time, being always attended by officers, or ſpies, appointed by the chouah. In the mean time, this bua, or real monarch, reigns with the utmoſt deſpotiſm: every ſubject is obliged to pay him a land-tax, according to his circumſtances, and the fertility of his lands; beſides which, they are bound to pay him a perſonal ſervice of ſix months in every year, for which he only allows them a bare ſubſiſtence, and even that is in his power to refuſe.

THE KINGDOM OF LAOS.

Boundaries, Produce, Inhabitants, &c.

THIS is a rich plentiful country, but is little viſited by Europeans. It is bounded on the eaſt by Cochin China and Tonquin; on the weſt, by Brama; on the north, by the lake Chamay; and on the ſouth, by Cambodia and Siam. Its extent cannot with certainty be aſcertained; but the general opinion is, that it reaches from the 15th to the 25th degree of north latitude.

The moſt valuable article produced in this country is gum benjamin, which is eſteemed the beſt in quality of any throughout the Indies; it grows in great abundance, and brings ſo conſiderable a revenue to the king, that the exportation of it is ſeverely prohibited. The gardens abound with a great variety of fruit, and they have rice in abundance, which, though different in taſte from that of any other country, is eſteemed the beſt in the eaſt. They have

a great plenty of honey, wax, cotton, amber, and muſk; and ivory is ſo little valued, from the great number of elephants with which the country abounds, that the teeth are uſed for fences to their fields and gardens. They have prodigious herds of beeves and buffaloes, and the rivers abound with all kinds of fiſh, ſome of which are of an immenſe ſize. In theſe rivers are found gold and ſilver duſt; and in ſeveral parts of the country are mines of iron, lead, and tin. Salt is alſo produced here in great abundance, and prodigious quantities of it are exported to foreign parts. It is formed by a white froth left on the rice-fields after harveſt, which afterwards becomes condenſed by the heat of the ſun.

The inhabitants of Laos called Langians, are naturally very affable in their diſpoſition; and though they envy ſuch as are in a more eligible ſituation than themſelves, yet they are ſtrictly honeſt, and appear to be utter ſtrangers to avaricious ſentiments. They are in general well-ſhaped, and though their complexion is of an olive caſt, yet they are much fairer than their neighbours; the women are very modeſt in their carriage, and in other reſpects little inferior to the women of Portugal.

Their food principally conſiſts of rice, the fleſh of the buffalo, and ſeveral kinds of pulſe: they eat four meals a day, and have very great appetites, notwithſtanding which, they are ſeldom afflicted with any diſeaſes. They ſometimes eat fowls, which they dreſs without plucking off the feathers; and they kill them by ſtriking them on the head with a ſtick, the ſhedding of blood being conſidered as one of the greateſt crimes.

Their employment principally conſiſts in huſbandry and fiſhing; but they are naturally of an indolent diſpoſition, nor will they attend buſineſs till they are reduced to it from abſolute neceſſity.

A robbery is here ſeldom heard of, but when ſuch circumſtances do happen, if the criminal cannot be found, the neighbours muſt make reſtitution to the parties injured.

Their marriage ceremonies conſiſt only in the parties promiſing before two who have been ſome years joined in wedlock, that they will be true to each other ſo long as they ſhall live; but they often part from the moſt trifling circumſtances, and this may be attributed to the inſignificancy of the mode by which they are joined together.

If a woman is found guilty of adultery, ſhe is deprived of her liberty, and for the reſt of her life is conſidered as an abſolute ſlave, and muſt be ſubject to ſuch ſevere treatment as her huſband ſhall think proper to inflict.

Fornication is permitted among the laity, but the talapoins, or prieſts, are prohibited from it under ſevere puniſhments. Polygamy is alſo allowed.

The talapoins, or prieſts, are under tuition from their childhood till they are twenty-three years of age, when they undergo an examination, and, if approved of, are immediately appointed to the order of prieſthood. In the exerciſe of their office, they are in general very indolent; and though they originate from the moſt humble ſtations, they afterwards aſſume an inſufferable arrogance.

The Langians profeſs the pagan religion. Thoſe who deny the tranſmigration of ſouls, affirm, that the wicked, after death, are irredeemably loſt; but that the good aſſume a body of air as light and pure as the ſun, and that after inſenſibly paſſing through ſixteen heavens, where they enjoy the moſt perfect felicity, they return to their natural ſhape, and enjoy a ſtate of conſummate felicity.

The king preſerves an unlimited power in all caſes, whether civil or eccleſiaſtical; and all honours and employments are ſolely at his diſpoſal; the private property of individuals is liable to be converted to ſuch purpoſes as he ſhall think proper; ſo that no family can be ſaid to enjoy their own poſſeſſions. The greateſt homage is paid by all ranks of people to the ſovereign, who conſiders himſelf as ſuperior to all other monarchs. The characteriſtic by which he denotes his ſuperiority over them, is from the length of his ears, which are ſo diſtended by weights as to hang upon his ſhoulders.

In order to impreſs his people with a due ſenſe of reſpect for him, he appears in public twice every year; and his ſubjects are ſo elated on this occaſion, that they teſtify their gladneſs by the moſt diſtinguiſhed rejoicings. Several tributary kings come to court, in order to pay their homage to the king of Laos, and they acknowledge their ſubmiſſion to him by magnificent preſents.

The metropolis of this kingdom is by ſome called Lanchang, and by others Lanjeng. It is ſituated in the interior part of the kingdom, in 18 deg. north lat. it is defended on one ſide by the great river Lao, and on the other by high walls, and broad ditches. The palace is very lofty and magnificent, and, with the offices and other buildings, extend more than two miles in circumference. The architecture is exceeding grand, and the apartments within are furniſhed in the moſt ſumptuous manner; the baſſo-relievo's in particular are ſo richly gilt, that they appear as if covered with panes inſtead of leaves of gold.

The houſes of the better ſort are built of wood, are very lofty and handſome, and elegantly furniſhed; but thoſe of the common ſort are very low and mean. The talapoins or prieſts only have liberty to build their houſes of brick or ſtone.

COCHIN, OR WESTERN CHINA.

Extent, Boundaries, Inhabitants, &c.

THIS country is about 500 miles in length, but much leſs extenſive in its breadth from eaſt to weſt. It is ſituated under the torrid zone, and extends, according to ſome, from the 8th to the 17th, and, according to others, from the 12th to the 18th deg. of north lat. being bounded on the eaſt by the Chineſe Sea; on the weſt, by Laos and Cambodia; and on the north, by Tonquin. It was originally a province of Tonquin, but has for upwards of 300 years formed a diſtinct kingdom, and is, like Tonquin, tributary to the Chineſe emperor.

The houſes are built of canes entwined together, ſo that the walls reſemble the ſides of a wicker baſket, and theſe they plaſter over with a kind of mortar made of dirt or lime.

The inhabitants of this kingdom reſemble the Siameſe in their ſtature and complexion, and the ſexes are ſcarce diſtinguiſhable by their dreſs, which conſiſts of a long gown, bound round them with a ſaſh: people of diſtinction uſually wear ſilk, but they prefer Engliſh broad-cloth, when it is to be purchaſed; the inferior ſort wear cotton cloth, dyed of a dark colour. They are excellent mechanics, and very fair dealers. Their chief food is rice, pulſe, and fiſh variouſly dreſſed and ſeaſoned. Their common drink is tea, and they have alſo ſome ſtrong liquors, brewed or diſtilled from rice. Their government is nearly the ſame as that of China.

The king has an abſolute power over the lives and fortunes of his ſubjects, and conducts all the affairs of his dominions in the moſt deſpotic manner, without conſulting his miniſters. His revenues, which are immenſe, ariſe from the ſale of odoriferous woods, gold duſt, and elephants teeth. One third of all the rice produced in the kingdom is his, and he receives yearly tributes of conſiderable value from all the provinces ſubject to him, beſides other prodigious taxes and advantages.

The religion, marriages, funeral ceremonies, &c. of the Cochin-Chineſe, are the ſame as thoſe of the Tonquineſe.

Cambodia, or Camboya, is ſituated on the eaſt ſide of the Gulf of Siam. Its greateſt length, from north to ſouth, is about 520 Engliſh miles; and its greateſt breadth, from weſt to eaſt, about 398 miles; being bounded, on the weſt, by Cochin-China; by the Indian-Ocean, on the ſouth; and by the kingdom of the Laos, and the Kemois mountains, on the north. The river Mecon, which is very ſpacious, runs through it, the banks of which are the only habitable parts of the nation, on account of its ſultry air, and the peſtiferous goats, ſerpents, and other noxious animals bred in the woods.

The ſoil, commodities, trade, animals, and products by ſea and land, are much the ſame with thoſe of the other kingdoms of this vaſt peninſula.

The betle (already noticed in the general account of this peninſula) is a plant of a particular flavour, and, as they ſay, an excellent remedy for all thoſe diſeaſes that are common to the inhabitants of the Eaſt-Indies, is the higheſt luxury of the Cambodians, from the king to the peaſant; but it is very unpalatable and diſagreeable to the Europeans.

The ſame barbarous magnificence, deſpotiſm, ignorance, and idolatry, prevail here as throughout the reſt of the peninſula.

Their capital, Cambodia, which is the only city here worth notice, is ſituated on the river Mecon, about 100 miles from the bar. It is built on a riſing ground, in order to avoid the annual overflowings of the river, and principally conſiſts of one large ſtreet. About the centre of it is a palace for the reſidence of the prince; it is a very inſignificant edifice, ſurrounded by a kind of wall, with ramparts, on which are ſeveral pieces of artillery.

Between Cambodia and Cochin-China lies the little kingdom of Chiampa, the inhabitants of which trade with the Chineſe, and ſeem therefore to be ſomewhat more civilized than their neighbours.

We ſhall cloſe our deſcription of this peninſula, with ſome account of the kingdom of Tipra, or Tipoura, which is bounded by the empire of Ava, and part of China, to the ſouth and eaſt; by Independent Tartary, to the north; by Arracan, to the ſouth-weſt; and by Indoſtan, to the weſt. Lying under the tropic of Cancer, it is exceedingly hot, the air is nevertheleſs pure and ſalubrious; but the water is ſo bad, that it occaſions the throats of the inhabitants to ſwell to a prodigious ſize.

The ſovereign of this country is tributary to the king of Arracan: he exports gold and ſilver to China in ingots, and in return receives ſilver, which is coined into two ſpecies of currency, at 20d. and 22d. value each: gold is coined into aſpers, which are worth about 5s. apiece.

CHAP. XII.

INDIA WITHIN THE GANGES.

Extent, Boundaries, Climate, Seas, Bays, Inhabitants, Produce, &c.

THIS extenſive empire (including the peninſula weſt of the Ganges) is 2000 miles in length, and 1500 in breadth; ſituated between 7 and 40 deg. north lat. and 66 and 92 deg. eaſt long. and occupies a ſpace of 870,910 ſquare miles. Its boundaries are Uſbeck Tartary, and Thibet, on the north; Thibet and the Bay of Bengal on the eaſt; the Indian Ocean, on the ſouth; and the ſame ſea, with Perſia, on the weſt: the Mogul empire, or Indoſtan, properly ſo called, being the main land.

The north-eaſt diviſion of India contains the provinces of Bengal Proper, Naugracut, Jeſuar, Patna, Necbal, Gore, Rotas; whoſe chief towns and places are Calcutta, Fort William, Hugly, Decca, belonging to the Engliſh; Malda, Engliſh and Dutch; Chatigan, Caſſumbazar, Naugracut, Rajapour, Patna, Necbal, Gore, Rotas.

The north-weſt diviſion on the frontiers of Perſia, and on the river Indus, contains the provinces of Soret, Jeſſelmere, Tata, or Sinda, Bucknor, Moultan, Haican, Cabul; the chief towns of which are, Jaganal, Jeſſelmere, Tata, Bucknor, Moultan, Haican, Cabul.

The middle diviſion contains the provinces of Candiſh, Berar, Chitor, Ratipor, Navar, Gualeor, Agra, Delhi, Lahor, or Pencah, Hendowns, Caſſimere, Jengapour, Aſmer, or Bando; their chief towns are Medipour, Berar, Chitor, Ratipor, Navar, Gualeor, Agra, Delhi, Lahor, Hendowns, Caſſimere, Jengapour, Aſmer.

In this climate, the winds generally blow for ſix months from the ſouth, and ſix from the north. In April, May, and the beginning of June, the weather is exceſſively hot, but there are refreſhing ſea-breezes; and in ſome dry ſeaſons, the hurricanes, which tear up the ſands, and let them fall in dry ſhowers, are exceſſively diſagreeable. The Engliſh, and the Europeans in general, who arrive at Indoſtan, are commonly ſeized with ſome illneſs, ſuch as flux or fever, in their different appearances; but when properly treated, they recover, and afterwards prove healthy, eſpecially if the patients are abſtemious.

Indoſtan is ſurrounded on three ſides by mountains. The moſt remarkable are thoſe of Caucaſus and Naugracut, which divide India from Perſia, Uſbeck Tartary, and Thibet, and are inhabited by Marattas, Afghans, or Patans, and other people more warlike than the Gentoos. The mountains of Balegaut, which run almoſt the whole length of India from north to ſouth, and cut the peninſula of India in two, are ſo high, that they ſtop the weſtern monſoon, the rains beginning ſooner on the Malabar coaſt, than on the coaſt of Coromandel. Theſe mountains are only paſſable in certain places, through which roads have been made for the ſake of commerce.

The moſt remarkable rivers are the Indus and the Ganges. The Indus is by the natives called Sinde, or Sindeh, and is formed of about ten principal ſtreams, which deſcend from the Perſian and Tartarian mountains on the north-eaſt and north-weſt.

From the city of Attock down to Moultan, it is commonly ſtyled the River Attock; below Moultan, it is often named the Soor, until it divides itſelf into many channels near Tatta, where the principal branch takes the name of Mehran. Beſides thoſe famous rivers, many others water this country, as the Behat, or Chelum, the Hydaſpes of Alexander, the Jenau, or the ancient Aceſines, or Beah, Setlege, Jumna, and the Rauvee, formerly the Hydraotes, on the ſouth bank of which ſtands the city of Laher.

The Gentoos are perſuaded, that the waters of the three great rivers, Ganges, Kiſtna, and Indus, have the ſacred virtue of purifying from all pollutions and ſins, thoſe who bathe in them. This religious idea ſeems to be founded on a principle of policy, and intended to reſtrain the natives from emigrating into diſtant countries; for it is remarkable, that the ſacred rivers are ſo ſituated, that there is not any part of India where the inhabitants may not have an opportunity of waſhing away their ſins, as they ſuppoſe.

The Ganges, which riſes in the mountains of Thibet with its different branches, runs through the kingdoms of Bengal, Bahar, and Orixa, and the upper provinces of Oude, Rohilcund, Agra, Delhi, and Lahoſe, being a courſe of about 3000 miles.—The Kiſtna divides the Carnatic from Golconda, and runs through the Viſiapore into the interior parts of the Decan. And the Indus, bounding the Guzarat

zarat provinces, ſeparates Indoſtan from the Perſian dominions.

The ſeas, bays, and capes, are as follow: the Indian Ocean, the Bay of Bengal, Capes Comorin and Diu, the Gulf of Cambaya, the Streights of Ramanakael.

With reſpect to the inhabitants, as we have already made a general review of this great empire, it is therefore neceſſary only to add, to what was ſaid of their religion and ſects, that the fakirs are a kind of Mahometan mendicants or beggars, who travel about, practiſing the greateſt auſterities; but many of them are impoſtors. Their number is ſaid to be 800,000. Another ſet of mendicants are the joghis, who are idolaters, and are ſuppoſed to be twelve millions in number, but all of them vagabonds, and have been impoſtors, who live by amuſing the credulous Gentoos with fooliſh fictions. The Banians profeſs the Gentoo religion, or ſomewhat like it: they ſerve as brokers, and take their name from their affected innocence of life.

There are likewiſe the Perſees, or Parſes, of Indoſtan, who are originally the Gaurs: they are a moſt induſtrious people, particularly in weaving, and architecture of every kind. They pretend to be poſſeſſed of the works of Zoroaſter, whom they call by various names, and which ſome of the Europeans ſuppoſe contain many particulars that would throw ſome light upon ancient hiſtory, both ſacred and profane. Though this opinion may be countenanced by the few parcels of thoſe books that have appeared in the world; nevertheleſs, ſome think that the whole is an impoſture, founded upon ſacred, traditional, and profane hiſtories, aided by religion. They are ſtyled worſhippers of fire, and are known as paying divine adoration to it; but, we are told, only as an emblem of the Divinity, and as his chief agent in the ſyſtem of the univerſe. They never, indeed, extinguiſh fire, but will ſtand for hours by their lamps, putting up their prayers to God, with folded hands, and their eyes turned towards heaven with great marks of devotion. They utter ejaculatory prayers all day long, and conſtantly mix buſineſs, and even common converſation, with devotion.

The Perſees have a ſuperſtitious veneration for cocks and dogs. They breed great numbers of dogs at their own houſes, and feed them regularly twice every day with rice and ghee. To all dogs, whether their own, or not, they are very hoſpitable. Whenever they ſee a dog, they preſently call him, and offer him food. If you walk abroad with a dog in any of their villages, you preſently hear the cry of Jo! Jo! at every turn, each ſtriving to be the firſt to entertain your dogs. Theſe animals are alſo ſacred in all the Turkiſh dominions.

The dogs on the iſland of Bombay, a few years ago, were many of them mad; whereupon an order was given by the governor, for killing all dogs without exception. When this order was known, the Perſees were greatly alarmed, met together, and entered into a ſolemn league and covenant in defence of their dogs, threatening to protect their lives at the riſque of their own. It was therefore thought prudent not to inſiſt on the execution of the decree that had been iſſued againſt thoſe faithful and affectionate domeſtics, but to ſuffer them to live.

Hunting with the bow, as well as the gun, is a common diverſion among the nobility and people of rank, who often train up leopards to the ſports of the field. Like other people in hot countries, they affect ſhady walks and cool fountains. They are fond of tumblers, mountebanks, and jugglers; of barbarous muſic, both from wind and ſtringed inſtruments, and play at cards in their private parties.

Their houſes make no appearance, and thoſe of the commonalty are poor and mean, and generally thatched, which renders them ſubject to fire; but the manufacturers chuſe to work in the open air; and the inſides of houſes belonging to principal perſons are many of them magnificent, and in general neat, commodious, and pleaſant.

With reſpect to trade and manufactures, it appears, from the moſt authentic accounts, that the empire of Indoſtan, particularly the kingdom or province of Bengal, from the mildneſs of its climate, the fertility of its ſoil, and the natural induſtry of the Hindoos, has been always remarkable for its commerce. Every village has its canal, every town its river, and the whole kingdom of the Ganges, which falling by various mouths into the Bay of Bengal, opens a noble communication with the ocean, for exporting the produce and manufactures of this famous country.

While the houſe of Tamerlane filled the throne of Indoſtan, the balance of trade was greatly in favour of Bengal. Senſible of the advantages they themſelves derived from a free commercial intercourſe between their ſubjects, they were invariably the protectors of merchants. The military ideas which they brought from Tartary, prevented the military ſervants of the crown from engaging in trade; and therefore monopolies of every kind were diſcouraged, and almoſt unknown. No government in Europe was ever more ſevere againſt foreſtalling and regrating, than that of the moguls in India.—A ſmall duty was paid to the crown, but this was amply repaid by the noble ſecurity given to the merchant.

The commerce of the Engliſh, Dutch, French, Danes, and Portugueſe, was principally carried on with bullion: and it appears from a very moderate computation, that no leſs than 917,500l. ſterling, in bullion, were thrown annually into that kingdom by the Europeans only. The exports of Bengal to the gulphs of Perſia and Arabia were very great, and brought home annually in gold into her coffers 375,000l. Her trade in opium and piece-goods to the peninſula beyond the Ganges, to the Malayan and Phillippine-Iſlands, brought yearly a ballance in her favour of 150,000l. The inland trade of Bengal, with the upper provinces of Indoſtan and Aſſam 250,000l. And the coaſting trade with the coaſts of Coromandel and Malabar, 160,000l. So that the annual balance of trade in favour of Bengal, was 1,852,500l. ſterling. Out of which take 1,250,000l. remitted annually to Delhi, and there remains 602,500l. yearly acquiſition. Bengal was at that period one of the richeſt, moſt populous, and beſt cultivated kingdoms in the world; but the troubles and civil wars which ſucceeded, have been attended with the moſt tragical events. The country has been depopulated, diſtreſs of every kind has ſucceeded to plenty and eaſe. Many of the principal cities have been rendered deſolate, the moſt fertile fields laid waſte, and near five millions of harmleſs and induſtrious people either expelled or deſtroyed. Theſe dreadful diſaſters have greatly impoveriſhed this once flouriſhing country, now become ſo highly intereſting to the ſubjects of Great Britain.

The Mahometan merchants in India carry on a great trade with Mecca, in Arabia, from the weſtern parts of this empire, up the Red Sea. This trade is carried on in a particular ſpecies of veſſels, called junks, the largeſt of which, we are told, beſides the cargoes, will carry 1700 Mahometan pilgrims to viſit the tomb of their prophet. At Mecca, they meet with Abyſſian, Egyptian, and other traders, to whom they diſpoſe of their cargoes for gold and ſilver: ſo that a Mahometan junk is often worth 200,000l. on his return from his voyage.

Before we enter upon a deſcription of the provinces and cities of Indoſtan, it may be proper to obſerve, that the Britiſh nation poſſeſſes in full ſovereignty, the whole ſoubah of Bengal, and the greateſt part of Bahar. In Oriſſa, or Orixa, only the diſtricts of Midnapour. The whole poſſeſſions contain about

150,000 ſquare miles, and ten millions of inhabitants. With their allies and tributaries, they now occupy the whole navigable courſe of the Ganges, from its entry on the plains to the ſea, which is more than 1350 miles.

The only places worth mentioning, in the midland provinces of Indoſtan, are Agra and Delhi.

Agra is the capital of the province of that name; it was founded in the year 1566, by Eckbar, who called it Eckbarabat, and made it the metropolis of his empire. It is ſituated in 26 degrees north latitude, and in 79 degrees eaſt longitude from London: it lies on the river Gemma, about 700 miles north-eaſt of Surat, a journey which the caravans generally perform in nine weeks, and about 500 leagues north of Pondicherry, on the Coromandel coaſt. This is the greateſt city in all the Indies, containing forty large towns, and 340 villages. It ſtands in the middle of a ſandy plain, which greatly adds to the heat of the climate; it is about eight miles long, but not near ſo broad; and no part is fortified but the palace; there are, however, generally a great number of ſoldiers here.

The houſes are ſo ſituated, as to command an agreeable proſpect of the river, and, according to Tavernier, are at ſome diſtance from each other encompaſſed by lofty walls. The buildings of the omrahs and other great men are of ſtone, and elegantly conſtructed. The great numbers of moſques, caravanſeras, ſquares, baths, and reſervoirs, intermixed with gardens, trees, and flowers, render this place extremely pleaſant; and the royal palace is a magnificent ſtructure, ſituated in the form of a creſcent on the banks of the river, defended by a lofty ſtone wall mounted with cannon, and encompaſſed by a broad moat, acroſs which are draw-bridges; and there is a terrace garden cut through, with canals of running water, mixed with verdant plats and ſummer-houſes, forming a moſt pleaſing ſcene. The palace is divided from the city by a large noble ſquare, where the rajahs alternately mount guard at the two outer gates, facing the principal ſtreets of the city. On entering the firſt gate of the palace, a fine ſtone walk preſents itſelf, with canals on each ſide of it; and further on is ſeen a ſpacious ſquare, in which the omrahs aſſemble, and the Mahometan guards are muſtered. Still further on, the eye is preſented with another grand ſquare or court, which leads to the Durbar (another ſpacious court) originally the place of reſort for perſons who had audience of the emperor; during which interval a band of muſic always played, while the imperial monarch ſat on a throne of jewels.

In 1638, this city had no leſs than 70 moſques.—There are 800 purifying baths in it; and near it ſtands that grand piece of architecture the mauſoleum, which 20,000 men were twenty-two years in building. The Dutch have a factory here, but not the Engliſh.

Dehli, or Delhi, capital of the province of Dehli, ſituated in the heart of the empire, is in 78 degrees eaſt longitude from London, and in 26 degrees north latitude: it ſtands in the form of a creſcent on the river Gemma, which divides it; and it is diſtinguiſhed into three towns, lying within about 120 miles north of Agra, in a fine plentiful country, where the air is more cool and ſalubrious than at Agra.—The firſt town that was built, is ſaid to have had nine caſtles and fifty-two gates. At ſome diſtance is a ſtone bridge, and a delightful plantation of trees, leading to the ſecond town, which was taken from the Indians by the firſt Mogul conqueror, who afterwards demoliſhed it.

The city of Dehli is entered by a long ſtreet, with arches on each ſide of it, under which are the ſhops of the tradeſmen. This ſtreet leads directly to the palace. at the entrance of which are a couple of elephantic figures, on whoſe backs ride two famous rajahs, repreſentatives of two brothers, who loſt their lives in bravely defending certain towns laid ſiege to by Eckbar. The palace wall, which is of hewn ſtone, with battlements, and every tenth battlement having a tower, is not much leſs than two miles in circumference. The ditches encompaſſing the wall are full of water, and are likewiſe faced with hewn ſtone.

The houſes of the great, which are on the banks of the river, or in the ſuburbs, are ſpacious and airy, having large courts, cellars, gardens, groves, ponds, fountains, and enormous fans on each ſide, for cooling the air. The poorer ſort live in houſes built with clay, and thatched, which have convenient courts and gardens.

Here is a market for all ſorts of green and dry fruits, which are brought from Perſia and other countries; but they are in general exceeding dear; melons, in particular, have been ſold from 6s. to 8s. each.

In this city there are ſcarce any mechanics, not from want of ſkill in the people, but from the ill treatment of the omrahs, who, if they can meet with them, oblige them to work, and reward them according to their own diſcretion.

Tatta, the capital of the province of Sinda, is ſituated in a fine plain: it is about three miles in length, and about one and a half in breadth. Here is a palace for the nabob, and alſo a citadel. This city is famous for the manufacture of palanquins, which are a kind of canopied couches, on which the great men all over India, Europeans as well as natives, repoſe when they appear abroad. They are carried by four men, who will trot along, morning and evening, 40 miles a day; ten being generally hired, who uſually carry the palanquin by turns, four at a time. Though a palanquin is dear at firſt coſt, yet the porters may be hired for nine or ten ſhillings a month each, out of which they maintain themſelves.

The citadel in Tatta, which ſtands at the weſt end of the town, has barracks and ſtables, capable of accommodating between 20 and 30,000 men and horſe. The Indus at Tatta is about a mile broad, and famous for its fine carp.

Moultan is not a very fruitful province, yet it yields excellent iron and canes. Its capital is not very large, nor does it carry on any conſiderable trade, but is famous for the excellent bows made there, and its nimble dancers. It is, by the courſe of the river, about 800 miles from the ſea. The inhabitants, by their ſituation, are enabled to deal with the Perſians and Tartars yearly for above 60,000 horſes.

The province of Caſſimere is entirely ſurrounded by mountains, excepting two or three narrow paſſages, which conduct the traveller into its delightful plains. It is ſaid to contain an hundred thouſand villages ſtored with cattle and game, without any beaſts of prey; and the capital, which is called by ſome Caſſimere, and by others Sirenaker, is a very large city. It is ſituated near a fine lake, and ſo delightfully diverſified with canals and gardens, that the moguls give it the appellation of the Paradiſe of the Indies. The inhabitants, particularly the women, are as fair as the Europeans. They are celebrated for their wit and dexterity, and are exceeding ingenious in making curious toys, which they ſell in every part of the Indies. They likewiſe carry on a curious manufacture of ſhawls, which are made either of the wool of the country, being finer than that of Spain, or of hair, finer than beaver, taken from a wild goat, in Great Thibet. They are very light and warm, for which reaſon the Indians wear them round their heads in the winter.

Lahor is one of the largeſt and moſt fruitful provinces in the Indies, being well watered, and abounding in rice, corn, fruits, good wine, and the beſt ſugars in all Indoſtan. The capital alſo, called Lahor, was once no leſs than three leagues in length, but is now greatly decayed. The inhabitants carry on ſeveral manufactures, and all thoſe of India flouriſh in the different towns of this province.

The province of Aſmer, which lies ſouth-weſt of Dehli, and weſt of Agra, is divided into three leſſer provinces or diſtricts, called Bando, Jeſſelmere, and Soret. The capital city is Aſmer, which is tolerably large, and carries on a great trade in ſalt-petre. Pilgrims from all parts of India reſort to this city, in order to pay their devotions at the tomb of Khoja Mondi, a Mahometan ſaint.

The province of Kabul, or Kabuleſtan, is remarkable only for its productions of drugs, canes, and iron. In the two laſt articles a conſiderable trade is carried on with the Perſians and Tartars, who barter their horſes for them. This province, beſides Kabul, its capital, which is very large, contains a number of ſmall cities, towns, and villages.

Patna, ſituated in the Upper Ganges, is thought the moſt famous province in the univerſe for the cultivation of opium, but it is far inferior in ſtrength to that made in Syria and Perſia. The capital, of the ſame name, is one of the largeſt cities in India. The Engliſh and Dutch have factories here.

The province or ſoubahſhip of Malva, lying to the weſt of Bengal, we know little of; Sindia and Halkar divide the largeſt part of it. The capital of the former is Ougein; and of Halkar, the city of Indoor. It is as fertile as the other provinces.

Candiſh includes the province of Berar and part of Orixa: its capital is Brampur, or Burhanpoor, a flouriſhing city, and it carries on a vaſt trade in chintzes, calicoes, and embroidered ſtuffs. Cattack is the capital of Orixa, and lies in the only road between Bengal and the northern circars, and belongs to the Berar, Rajah, Moodajee Booſla, whoſe dominions are very extenſive. Of the five northern circars, Cicacole, Rajamundry, Ellore, Condapilly, and Gunton, the latter is in the hands of the Nizam, the reſt are in poſſeſſion of the Engliſh.

The province of Bengal gives name to the moſt conſiderable gulf in Aſia, divides the two peninſulas of the Indies, and is perhaps, of all the Indian provinces, the moſt intereſting to an Engliſh reader. It is upwards of 240 leagues from eaſt to weſt: and its natural ſituation (as deſcribed by Major Rennels, late ſurveyor-general in Bengal) is ſingularly happy with reſpect to ſecurity from the attack of foreign enemies. On the north and eaſt, it hath no warlike neighbours, and hath moreover a formidable barrier of mountains, rivers, or extenſive waſtes, towards thoſe quarters, ſhould an enemy ſtart up. On the ſouth is a ſea-coaſt guarded by ſhallows and impenetrable woods, and with only one port, which is difficult of acceſs in an extent of 300 miles. An enemy can only be apprehended on the weſt; but there the natural barrier is ſtrong, and with its population and reſources, and the uſual proportion of Britiſh troops, Bengal might bid defiance to any part of Indoſtan which was inclined to become its enemy. It is eſtimated to be the ſtore-houſe of the Eaſt Indies. Its fertility exceeds that of Egypt after being overflowed by the Nile; and the produce of its ſoil conſiſts of rice, ſugar-canes, corn, ſeſamum, ſmall mulberry, and other trees: here is likewiſe an herb, from which very beautiful ſtuffs and tapeſtry are made. Its calicoes, ſilks, ſalt-petre, lakka, opium, wax, and civet, go all over the world; and proviſions here are in vaſt plenty, and incredibly cheap, eſpecially pullets, ducks, and geeſe. The country is interſected by canals cut out of the Ganges for the benefit of commerce, and extends near one hundred leagues on both ſides the river, being full of cities, towns, villages, and caſtles. The Engliſh company's forces eſtabliſhed in Bengal are very conſiderable. The power is inveſted in Europeans, though the bulk of the army conſiſts of natives.

The worſhip of the Gentoos, in its greateſt purity, is practiſed in Bengal; and their ſacred river (Ganges) is in a manner lined with their magnificent pagodas or temples. The women are ſaid to be laſcivious and enticing, notwithſtanding their religion.

Calcutta is the principal Engliſh factory in Bengal: it is called Fort-William, and ſituated on the river Hugly, the moſt weſterly branch of the Ganges. The fort itſelf is ſaid to be irregular, and untenable againſt diſciplined troops; but the ſervants of the company have provided themſelves with an excellent houſe, and moſt convenient apartments for their accommodation. As the town itſelf has been in fact for ſome time in poſſeſſion of the company, an Engliſh civil government, by a mayor and aldermen, was introduced into it. This was immediately under the authority of the company.

Afterwards, in 1773, an act of parliament was paſſed, to regulate the affairs of the Eaſt India Company, as well in India as in Europe. By this act, the governor-general and four counſellors were appointed, and choſen by the parliament, with whom was veſted the whole military and civil government of the preſidency of Fort-William; and the ordering, management, and government of all the terreſtrial acquiſitions and revenues in the kingdom of Bengal, Bahar, and Oriſſa, ſo long as the company ſhould be in poſſeſſion of them.

The governor-general and council, ſo appointed, are inveſted with the power of ſuperintending and controlling the government and management of the preſidencies of Madras, Bombay, and Bencoolen: they are likewiſe to pay obedience to the orders of the court of directors, and to correſpond with them: and are empowered to eſtabliſh a court of judicature at Fort-William, to conſiſt of a chief juſtice, and three other judges, to be named from time to time by his majeſty: theſe are to exerciſe all criminal, admiralty, and eccleſiaſtical juriſdiction; to be a court of record, and a court of oyer and terminer for the town of Calcutta, and factory of Fort-William, and its limits; and the factories ſubordinate thereto.

But the eſtabliſhment of this ſupreme court does not appear to have promoted either the intereſts of the Eaſt-India Company, or the felicity of the people of country. No proper attention has been paid to the manners and cuſtoms of the people; acts of great oppreſſion and injuſtice have been committed, and the ſupreme court has been a ſource of great diſſatisfaction, diſorder, and confuſion.

In 1757, the ſoubah of Bengal, whoſe indignation had been raiſed by ſome procedures of the company, inveſted Calcutta, which was then in a defenceleſs ſtate. The governor, and ſome of the principal perſons of the places, alarmed at the appearance of a very numerous army, threw themſelves, with their chief effects, on board the ſhips in the river; they who remained, for ſome hours, defended the fort; but their ammunition being expended, they ſurrendered upon terms. The ſoubah, a capricious unfeeling tyrant, inſtead of obſerving the capitulation, forced Mr. Holwell, the governor's chief ſervant, and 145 Britiſh ſubjects, into a little but ſecure priſon, called the Black-hole, a place about eighteen feet ſquare, and ſhut up from all communication of free air. Their miſeries, during the night, were inexpreſſible, and before morning no more than twenty-three were found alive, the reſt dying of ſuffocation, which was generally attended with a horrible frenzy, in conſequence of fevers, and an exceſſive thirſt occaſioned by the violent heat of the place. Among thoſe who ſurvived was Mr. Holwell himſelf, who tranſmitted to the company a moſt affecting account of the cataſtrophe.

The inſenſible Nabob returned to his capital, after plundering the place, imagining he had rooted the Engliſh out of his dominions; but the ſeaſonable arrival of admiral Watſon, and colonel (afterwards lord) Clive, put them once more, with ſome difficulty, in poſſeſſion of the place; and the war was ſoon concluded by the battle of Plaſſy, gained by the colonel, and

*

and the death of the Nabob Sura, Dowlaja, in whoſe place Mhir Jeffeir, one of his generals, and who had previouſly ſigned a ſecret treaty with Clive to deſert his maſter and amply reward the Engliſh, was advanced to the ſoubahſhip. After the unfortunate Mr. Holwell and his friends had obtained their diſcharge, they took boat, and arrived at Corcemadad, a Dutch ſettlement, whence they embarked and ſailed for England.

The Nabob of Bengal keeps his court at Muxadabad, or Moorſhedabad: Benares lying in the ſame province, is the Gentoo univerſity, and celebrated for its ſanctity. This zemindary, which includes alſo the circars of Gazypeur and Chunar, conſtituted a part of the dominions of Oude till 1744, when its tribute or quit-rent of twenty-four lacks, was transferred to the Engliſh.

The principal place poſſeſſed by the French in Bengal is Chandernagore, which lies higher up the river than Calcutta: but though ſtrongly fortified, furniſhed with a garriſon of 500 Europeans, and 1200 Indians, and defended by 123 pieces of cannon and three mortars, it was taken by the Engliſh admirals Watſon and Pococke, and colonel Clive; and the ſame place was alſo obliged to ſurrender in the laſt war, but reſtored by the peace.

Hugly, which is fifty miles to the north of Calcutta, upon the Ganges, is a place of prodigious trade for the richeſt of all Indian commodities. The Dutch have here a well-fortified factory, erected in an open place, at a ſmall diſtance from the river.—The ſearch for diamonds is carried on by about 10,000 people from Saumelpour, which lies thirty leagues to the north of Hugly, for about fifty miles further.

Dacca is ſaid to be the largeſt city of Bengal, and the tide comes up to its walls. It contains an Engliſh and a Dutch factory. The town is ſituated in 24 deg. north lat. the ſoil is fertile, the ſituation fine, and the richeſt commodities of India and Europe are brought to its market. It receives conſiderable advantages from its cottons, from which are produced ſtriped and worked muſlins, more valuable in their texture than thoſe made in any other parts of India. The beſt and fineſt embroideries in gold, ſilver, or ſilk, are manufactured here.

The other chief towns are Caſſumbazar, Chinchura, Barnagua, and Maldo; beſides a number of other places of leſs note, but all of them abounding in the manufactures of India.

The provinces deſcribed above, are thoſe which belong to the mogul's empire to the north of the peninſula within the Ganges. In our account of the peninſula itſelf, we ſhall take notice of the provinces that lie to the ſouthward.

HISTORY OF INDIA.

The famous Alexander of Macedon was the firſt invader, worthy to be noticed, of this extenſive and fruitful country. Where the fortreſs of Rotus now ſtands, on the banks of the Behat, he is ſuppoſed to have put in execution his ſtratagem for croſſing the river, whilſt the oppoſite ſhore was poſſeſſed by Porus, whom Alexander defeated, but afterwards reſtored to him his dominions, as a reward for his bravery in defending them. Zinghis Khan alſo directed his force there in 1221, and obliged the emperor to forſake his capital. The ſeat of government was indeed often changed, either by neceſſity or choice, as from Gaza to Delhi, to Lahor, Agra, and Canaſe. This laſt place was in the reign of Porus, and for ages, the capital of Indoſtan, but is now reduced to a middling town, though the ruins are of great extent: it is ſuppoſed to be the Palibrotha of the ancients. In the ſixth century it contained 30,000 ſhops, in which betle-nut was ſold, and there were alſo 60,000 bands of muſicians and ſingers, who paid a tax to government.

Tamerlane the Great was the next conqueror of India: he croſſed the Indus nearly at the ſame place with Alexander. But Mahometan princes had entered, made conqueſts, and eſtabliſhed themſelves in this country, long before Tamerlane. Valid the ſixth of the Caliphs, named Ommiades, who aſcended the throne in the 708th year of the Chriſtian æra, and in the 90th of the Hegira, made conqueſts in India; by which means the Koran was introduced here very early. Mahmoud, ſon of Sebegtechin, prince of Gazra, the capital of a province ſeparated by mountains from the north-weſt parts of India, and ſituated near Kandahar, carried the Koran with the ſword into Indoſtan in the year 1000 or 1002 of the Chriſtian æra. He treated the Indians with all the rigour of a conqueror, and all the fury of a zealot, plundering treaſures, demoliſhing temples, and murdering idolaters throughout his route. The wealth found by him in Indoſtan is repreſented to be immenſe.

The ſucceſſors of Mahmoud are called the dynaſty of the Gaznavides, and maintained themſelves in a great part of the countries which he had conquered in India, till the year 1155, or 1157, when Coſron Schah, the thirteenth and laſt prince of the Garnavide race, was depoſed by Kuſſain Gauri, who founded the dynaſty of the Gaurides, which furniſhed five princes, who poſſeſſed nearly the ſame countries as the Gaznavides, their predeceſſors.

Scheabbedin, the fourth of the Gauride emperors, during the life of his brother and predeceſſor Gaiatheddin, conquered the kingdoms of Moultan and Delhi, and drew from thence prodigious treaſures. But an Indian, who had been rendered deſperate by the pollutions and inſults to which he ſaw his gods and temples expoſed, made a vow to aſſaſſinate Scheabbedin, and executed it. The race of Gaurides finiſhed in the year 1212, in the perſon of Mahmoud, ſucceſſor and nephew to Scheabbedin, who was alſo cut off by the ſwords of aſſaſſins.

Several revolutions followed till the time of Tamerlane, who made his appearance in India at the end of the year 1398, deſcending more terrible than all its former inundations, from the centre of the northern part of the Indian Caucaſus. This invincible barbarian, ſecuring the northern provinces to himſelf, met with no reſiſtance ſufficient to juſtify, even by the military maxims of Tartars, the cruelties with which he marked his way. But after an immenſe ſlaughter of human victims, he at length rendered himſelf maſter, on uniting his conqueſts of the vaſt tract of territory from the coaſt of Smyrna to the borders of the Ganges. The hiſtory of Tamerlane's ſucceſſors, who reigned over Indoſtan, with little interruption, more than 350 years, has been variouſly repreſented; but all agree in the main, that they were powerful and deſpotic princes, reigned very magnificently, and committed their provinces to rapacious governors, or to their own ſons, whereby their empire was often miſerably torn in pieces.

It is highly worthy of remark, that the provinces of Indoſtan have ſeldom continued under one head during a period of twenty years, from the earlieſt hiſtory down to the reign of Akbar, who died in the year 1605, amidſt the tears of his ſubjects, who loved him as their father, admired him as their leader, and reverenced him as their prince. Bold, manly, and enterpriſing, he was an enemy to oppreſſion; and he hated cruelty, as he was a ſtranger to fear. This great prince took from his officers the power of oppreſſing the people. Severe in his juſtice, he never forgave extortion. He encouraged trade by the invariable protection given to merchants of all nations; regarding neither the religious opinions, nor the countries of men; all who entered his dominions

nions were his ſubjects, and they had a right to his juſtice.

In proceſs of time, Bengal, Guzarat, and other provinces, became independent, and ſometimes the empire of Indoſtan was confined within the proper limits of the province itſelf: ſo that the hiſtory of it furniſhes an excellent leſſon to princes, not to graſp at too much dominion; and to mankind, to circumſcribe the ambitious deſigns and undertakings of their rulers. Theſe obſervations will appear the more juſt, if we conſider, that ſome parts of the empire were 1000 miles diſtant from the ſeat of government: the Engliſh conqueſts in India met thoſe of Tamerlane in a point equidiſtant from the mouths of the Ganges and Indus, in the year 1744, for they cloſed their campaign that year at Saldong, 1100 miles from Calcutta.

The famous Aurengzebe, in the year 1667, though the youngeſt among many ſons of the reigning emperor, after defeating or murdering his father, brothers, and nephews, mounted the throne of Indoſtan, and may be conſidered as the real founder and legiſlator of the Mogul empire. He was a great and politic prince, and the firſt who extended his dominion, though it was little better than nominal, over the Peninſula within the Ganges, at preſent ſo well known to the Engliſh. He lived ſo late as the year 1707, and died in the 49th year of his reign, and 90th of his age. It is ſaid that ſome of his great officers of ſtate were alive in the year 1750.

From what has been already ſaid of this empire, Aurengzebe ſeems to have left too much power to the governors of his diſtant provinces, and to have been at no pains in preventing the effects of that dreadful deſpotiſm, which, while in his hands, preſerved the tranquillity of his empire; but when it devolved to his weak, indolent ſucceſſors, occaſioned its overthrow. Four of his grandſons, in 1713, diſputed the empire, which, after a bloody ſtruggle, fell to the eldeſt,

Mauzoldin, who took the name of Jehander Shah. This prince was a ſlave to his pleaſures, and was governed by his miſtreſs ſo abſolutely, that his great omrahs conſpired againſt him, and raiſed to the throne one of his nephews, who ſtruck off his uncle's head.

Furrukhſir, the new emperor, was governed and at laſt enſlaved by two brothers of the name of Leyd, who abuſed his power ſo groſsly, that being afraid to puniſh them publicly, he ordered them both to be privately aſſaſſinated. They diſcovered his intention, and dethroned the emperor, whom they alſo impriſoned, and afterwards ſtrangled.

The two brothers, after the death of Ferrukhſir, raiſed to the throne a grandſon of Aurengzebe, by his daughter. The young emperor, who was only ſeventeen years of age, proving diſagreeable to them, they inveſted with the ſovereignty his elder brother, who took the title of

Shah Jehan. On his acceſſion, the rajahs of Indoſtan, whoſe anceſtors had entered into ſtipulations, or what may be called "pacta conventa," when they admitted the Mogul family, took the field againſt the two brothers; but the latter were victorious, and Shah Jehan was put in peaceable poſſeſſion of the empire, but died in 1719. He was ſucceeded by another prince of the Mogul race, who took the name of

Mahommed Shah. This monarch entered into private meaſures with his great rajahs for deſtroying the Seyds, who were declared enemies to Nizamal Muluck, one of Aurengzebe's favourite generals.—Nizam, it is ſaid, was privately encouraged by the emperor to declare himſelf, againſt the brothers, and to proclaim himſelf ſoubah of Decan, which belonged to one of the Seyds, who was aſſaſſinated by the emperor's order, and who immediately advanced to Delhi, to deſtroy the other brother; but he no ſooner underſtood what had happened, than he proclaimed the Sultan Ibrahim, another of the Mogul princes, emperor. A battle enſued in 1720, in which the emperor was victorious, and is ſaid to have uſed his conqueſt with great moderation, for he committed Ibrahim to the priſon from whence he had been taken; and Seyd, being likewiſe a priſoner, was condemned to perpetual confinement, but the emperor took poſſeſſion of his vaſt riches. Seyd did not long ſurvive his confinement; and, upon his death, the emperor abandoned himſelf to the ſame courſe of pleaſures that had been ſo fatal to his predeceſſors.

As to Nizam, he became now the great imperial general, and was often employed againſt the Marattas, whom he defeated, when they had almoſt made themſelves maſters of Agra and Delhi. He was confirmed in his ſoubahſhip, and was conſidered as the firſt ſubject in the empire. Authors, however, are not agreed as to his motives for inviting Nadir Shah, otherwiſe Kouli Khan, the Perſian monarch, to invade Indoſtan. It is thought that he had intelligence of a ſtrong party formed againſt him at court; but the truth perhaps is, that Nizam did not think that Nadir Shah could have ſucceſs, and at firſt wanted to make himſelf uſeful by oppoſing him. The ſucceſs of Nadir Shah is well known, and the immenſe treaſure which he carried from Indoſtan in 1739. Beſides theſe treaſures, he obliged the mogul to ſurrender to him all the lands to the weſt of the rivers Attoch and Synd, comprehending the provinces of Peyſhor, Cabul, and Gagna, with many other rich and populous principalities, the whole of them almoſt equal in value to the crown of Perſia itſelf. This invaſion coſt the Gentoos 200,000 lives.

The plunder made by Nadir Shah is by ſome accounts, and thoſe ſtrongly authenticated, made to amount to the incredible ſum of two hundred and thirty-one millions ſterling, as mentioned by the London Gazette of thoſe times. The moſt moderate ſay, that Nadir's own ſhare amounted to conſiderably above ſeventy millions. Be that as it will, the invaſion of Nadir Shah may be conſidered as putting a period to the greatneſs of the Mogul empire in the houſe of Tamerlane.

When Nadir Shah had raiſed all the money he could in Delhi, he reinſtated the mogul, Mohammed Shah, in the ſovereignty, and returned into his own country. A general defection of the provinces ſoon after enſued; none being willing to yield obedience to a prince deprived of the power to enforce it. The provinces to the north-weſt of the Indus had been ceded to Nadir Shah, who being aſſaſſinated in 1747, Achmet Abdalla, his treaſurer, an unprincipled man, but poſſeſſed of great intrepidity, found means, in the general confuſion occaſioned by the tyrant's death, to carry off three hundred camels loaded with wealth, whereby he was enabled to put himſelf at the head of an army, and march againſt Delhi with 50,000 horſe. Thus was the wealth drawn from Delhi made the means of continuing thoſe miſeries of war which it had at firſt ſubjected them to. In this extremity, Prince Ahmed Shah, the mogul's eldeſt ſon, and the vizier, with other leading men, took the field, with 80,000 horſe, to oppoſe the invader. The war was carried on with various ſucceſs, and Mohammed Shah died before its termination. His ſon, Ahmed Shah then mounted the imperial throne at Delhi; but the empire fell every day more into decay. Abdallah erected an independent kingdom, of which Kandahar is the capital, and the Indus is the general boundary to the eaſt.

Before the invaſion of Nadir Shah, the Marattas, a warlike nation, poſſeſſing the ſouth-weſtern peninſula of India, had exacted a chart or tribute from the empire, ariſing out of the revenues of the province of Bengal, which being with-held, in conſequence of the enfeebled ſtate of the empire, the Marattas became clamorous.

†

clamorous. The kingdom began to totter to its foundation; every petty chief, by counterfeiting grants from Delhi, laying claim to jaghires and to diſtricts. The country was diſtracted by civil wars, and groaned under every ſpecies of domeſtic confuſion.

Ahmed Shah reigned only ſeven years, after which much greater diſſenſions and diſturbances prevailed in this country; whereby the people were involved in great calamities. After this, the imperial dignity of Indoſtan was veſted in Shah Allum, or Zadah, who is univerſally acknowledged to be a real deſcendant from the Tamerlane race. A perpetual commiſſion for the office of receiver-general of the revenues of Bengal, Bahar, and Orixa, was obtained from him for the company. In conſideration of this imperial mandate, which conferred the government of Bengal for ever on the company, Shah Allum was to receive an annual penſion of 325,000l. The annuity was moderate to the lineal ſucceſſor of Tamerlane. He was at the ſame time guaranteed in the poſſeſſion of the province of Allahabad; and thus a kind of proviſion was made for a prince who retained nothing of what belonged to his illuſtrious anceſtors, but the empty title of emperor of Indoſtan, ſince he depends upon the protection of the Engliſh, whoſe intereſt it is to ſupport him.

We ſhall now conclude the hiſtory of Indoſtan with ſome account of the Britiſh tranſactions in that part of the world, ſince 1765, when they were quietly ſettled in the poſſeſſion of the provinces of Bengal, Bahar, and Orixa, not indeed as abſolute ſovereigns, but as tributaries to the emperor. This ſtate of tranquillity, however, did not long continue, for in 1767, they found themſelves engaged in a very dangerous war with Hyder Ally, the ſovereign of Myſore.—This man had originally been a military adventurer, who learned the rudiments of the art of war in the French camp; and in the year 1753, had diſtinguiſhed himſelf in their ſervice. In 1763, having been advanced to the command of the army of Myſore, he depoſed his ſovereign, and uſurped the ſupreme authority, under the title of regent. In a ſhort time he extended his dominions on all ſides, except the Carnatic, until at laſt his dominions equalled the iſland of Great Britain in extent, with a revenue of not leſs than four millions ſterling annually. The diſcords which took place in various parts of Indoſtan, particularly among the Marattas, enabled him to aggrandiſe himſelf in ſuch a manner, that his power ſoon became formidable to his neighbours; and in 1767, he found himſelf in danger of being attacked on one ſide by the Marattas, and on the other by the Britiſh. The former were bought off with a ſum of money, and the latter were in conſequence obliged to retire. Having ſoon, however, aſſembled all their forces, ſeveral obſtinate engagements took place; and the Britiſh now, for the firſt time, found a ſteady oppoſition from an Indian prince. The war continued with various ſucceſs during the years 1767, 1768, and part of 1769, when Hyder, with a ſtrong detachment of his army, paſſing by that of the Britiſh, advanced within a little diſtance of Madras, where he intimidated the government into a peace upon his own terms. The advantages gained by this peace, however, were quickly loſt by an unfortunate war with the Marattas, from whom, in the year 1771, he received a moſt dreadful defeat, almoſt his whole army being killed or taken. Hyder was now reduced to the neceſſity of allowing his enemies to deſolate the country, till they retired of their own accord; after which he retrieved his affairs with incredible perſeverance and diligence, ſo that in a few years he became more formidable than ever. In 1772, the Marattas made ſome attempts to get poſſeſſion of the provinces of Corah, and ſome others, but were oppoſed by the Britiſh; who, next year, defeated and drove them acroſs the river Ganges, when they had invaded the country of the Rohillas. On this occaſion the latter had acted only as the allies of Sujah Dowla, to whom the Rohilla chiefs had promiſed to pay forty lacks of rupees for the protection afforded them; but when the money came to be paid, it was, under various pretences, refuſed; the conſequence of which was, that the Rohilla country was next year (1774) invaded and conquered by the Britiſh, as well as ſeveral other large tracts of territory; by which means the boundary of Oude was advanced, to the weſtward, within twenty-five miles of Agra; north-weſtward to the upper part of the navigable courſe of the Ganges; and ſouth-weſtward to the Jumna river.

In 1778, a new war commenced with the Marattas; on which occaſion a brigade, conſiſting of 7000 Indian troops, commanded by Britiſh officers, traverſed the whole empire of the Marattas, from the river Jumna to the weſtern ocean. About this time the war with France broke out, and Hyder Ally, probably expecting aſſiſtance from the French, made a dreadful irruption into the Carnatic, at the head of 100,000 men. For ſome time he carried every thing before him; and having the good fortune to defeat, or rather deſtroy, a detachment of the Britiſh army, under colonel Baillie, it was generally imagined that the power of Britain in that part of the world would have ſoon been annihilated. By the happy exertions of ſir Eyre Coote, however, to whom the management of affairs was now committed, the progreſs of this formidable adverſary was ſtopped, and he ſoon became weary of a war, which was attended with incredible expence to himſelf, without any reaſonable proſpect of ſucceſs. By the year 1782, therefore, Hyder Ally was ſincerely deſirous of peace, but died before it could be brought to a concluſion; and his rival, ſir Eyre Coote, did not ſurvive him above five months: a very remarkable circumſtance, that the commanders in chief of two armies, oppoſed to each other, ſhould both die natural deaths within ſo ſhort a ſpace of time.

To Hyder Ally ſucceeded his ſon, Tippoo Sultan, whoſe military proweſs is well known. Of all the native princes of India, Tippoo was the moſt formidable to the Britiſh government, and the moſt hoſtile to its authority. The peace of Mangalore, in 1784, had, it was ſuppoſed, ſecured his fidelity by very feeble ties; and the ſplendid embaſſy which, not long after that event, he diſpatched to France, afforded much reaſon to apprehend that ſome plan was concerted between the old government of that country and the tyrant of Myſore, for the annoyance of Great Britain in its Indian poſſeſſions; but this plan was happily defeated by the French revolution.

The increaſing power of Tippoo was not leſs formidable to the Dutch than to the Engliſh; and the vicinity of Cochin, their moſt flouriſhing ſettlement on the continent of India, to the territories of that aſpiring monarch, made them tremble for its ſafety. That ſagacious people, however, have ſeldom been without their reſources. Beſides Cochin, the Dutch were poſſeſſed of two other forts, which were ſituated between Myſore and their favourite ſettlement; and one of them, Cranganore, had been taken by Hyder Ally in 1779, or 1780. When the war broke out in 1780 between Hyder and the Engliſh, he was obliged to evacuate his garriſons on the Malabar coaſt, to employ his force in the Carnatic; and Holland and France being ſoon after united with Hyder againſt the Engliſh, the Dutch embraced the opportunity of clandeſtinely taking poſſeſſion, and re-garriſoning the fort: a meaſure which greatly offended Hyder, and of which he loudly complained. By the mediation, however, of France, a compromiſe took place, but upon what terms is uncertain.

From the vicinity of Cranganore and Acottah to his boundary, and their ſituation within the territory of an acknowledged tributary to Myſore (the rajah of Cochin), the poſſeſſion of them was a moſt deſirable object with Tippoo. In the month of June, 1789, he

he marched a formidable force towards Cranganore, with a profeſſed intention of making himſelf maſter of it, upon a claim chiefly founded upon the tranſactions we have juſt related. Unable therefore to retain the poſſeſſion of the fort themſelves, and fearing for a ſettlement of much ſuperior value, the Dutch readily entered into a negotiation with the rajah of Travancore for the purchaſe of them. That politic people eaſily ſaw, that by placing them in his hands, they erected a moſt powerful barrier, no leſs than the whole force of Great Britain (who was bound by treaty to aſſiſt him), againſt the encroachments of their ambitious neighbour upon their ſettlement at Cochin. The imprudence of the rajah, in entering upon ſuch a purchaſe while the title was diſputed, drew down upon him the heavieſt cenſures from the government of Madras; and he was repeatedly cautioned both by ſir Archibald Campbell, and Mr. Holland, his ſucceſſor in the government, not to proceed in the negotiation. Such, however, was the ardour and temerity of the rajah in making this acquiſition, that he not only concluded the purchaſe with the Dutch, but even treated with the rajah of Cochin, without the privity of Tippoo, though he was the acknowledged tributary of that prince, for ſome adjacent territory. The bargain was concluded in July 1789, though it was not till the 4th of Auguſt that the rajah informed the Madras government, through their reſident Mr. Powney, that he was on the point of making the purchaſe.

It was not probable that Tippoo would remain an indifferent ſpectator of theſe tranſactions. He inſiſted on the claim which he retained over theſe forts, in conſequence of their being conquered by his father, and in conſequence of the ſubſequent compromiſe. He aſſerted, that, according to the feudal laws, no transfer of them could take place without his conſent, as ſovereign of Myſore; and on the 29th of December, he made with a conſiderable force a direct attack upon the lines of Travancore. On receiving a remonſtrance from the Britiſh government of Fort St. George, he deſiſted, and even apologiſed. From the 29th of December to the 1ſt of March, Tippoo Sultan remained perfectly quiet, ſtill aſſerting his claims to the feudal ſovereignty of the forts; but, it is confidently affirmed, offering to ſubmit the diſpute to an impartial arbitration.

On the 1ſt of March, 1790, the rajah's troops made an offenſive attack upon Tippoo, who had continued quiet within his lines from the 29th of December. An engagement took place; and the Britiſh government conceived themſelves bound to take an active part. No period appeared more favourable to humble Tippoo, if that was the object of the Britiſh adminiſtration. With all the other powers of India we were not only at peace, but treaties of alliance exiſted between Great Britain and the two moſt powerful ſtates of India, the Nizam and the Marattas; and both declared themſelves in perfect readineſs to exert their utmoſt force to cruſh the riſing power of Myſore.

We ſhall here preſent the reader with a brief account of the progreſs and termination of this war, by which the Britiſh power was more than ever eſtabliſhed on the continent of Aſia, from a narrative drawn up by major Dirom, from journals and authentic documents.

It ſhould be remembered, that the campaign here recorded was the third of our war with Tippoo Sultan. The firſt commenced in June, 1790, and concluded with that year. It was confined below the Ghauts. The ſecond campaign contained the capture of Bangalore, which fixed the ſeat of war in the enemy's country, and concluded with the retreat of lord Cornwallis from Seringapatam, towards the end of May 1791. The third commences almoſt from that point, and terminates in March 1792. Obſerving, however, as the author very properly ſtates, that, in the fine climate of Myſore, campaigns are regulated rather by plans of operations, than by ſeaſons.

The narrative commences with unfavourable circumſtances; the retreat of the two armies under general Abercromby and lord Cornwallis; the loſs of cannon in both; an epidemic diſtemper among the cattle; and a dreadful ſcarcity of grain. Theſe evils, however, vaniſhed by degrees; the junction of the Marattas afforded a ſupply of neceſſaries, and arrangements were made for obtaining in future the moſt ample and regular proviſion of bullocks and grain, and for replacing the battering guns. On the return of the army to the vicinity of Bangalore, the operations began, which were to ſecure the communication with the Carnatic, and reduce the power of the enemy in thoſe parts. The Britiſh force was immediately and ſucceſsfully employed to reduce Ouſſoor, Rayacotta, and the other hill forts commanding the Policode paſs. The next object was the forts to the north-eaſt of Bangalore, which interrupted the communication with the Nizam's army, and with the Carnatic, by that route. Theſe being ſoon reduced, Nundydroog, built on the ſummit of a mountain, about one thouſand ſeven hundred feet in height, a place of greater magnitude and ſtrength, was attacked, and after being beſieged from September 22, was carried by aſſault, on the 18th of October, in ſpite of obſtacles which might reaſonably have been deemed inſurmountable.

By means of diſpoſitions made for that purpoſe, ſupplies of all kinds now came in from the Carnatic. Penagra was taken at the end of October; and Kiſtdagheri attacked on the 7th of November; this was almoſt the only enterpriſe that was not completely ſucceſsful; the lower fort and pettah were taken; but the upper fort maintained its defence, and the attack was relinquiſhed. It ſeems that it could only have been carried by a *coup de main*, which unluckily failed. On the 2d of the ſame month, another inſtance of ill ſucceſs happened to us; the relief of Coimbetore having been prevented, that garriſon was obliged to capitulate to Cummer-ud-Deen Cawn, on terms which Tippoo did not afterwards fulfil.

Savendroog, or the Rock of Death, bore witneſs, in the month of December, to the ardour and perſeverance of the Britiſh troops. This fortreſs, ſtanding in the way between Bangalore and Seringapatam, is thus deſcribed: It is "a vaſt mountain of rock, and is reckoned to riſe above half a mile in perpendicular height, from a baſe of eight or ten miles in circumference. Embraced by walls on every ſide, and defended by croſs walls and barriers, wherever it was deemed acceſſible: this huge mountain had the farther advantage of being divided above by a chaſm which ſeparates the upper part into two hills, which, having each their defences, form two citadels capable of being maintained, independent of the lower works; and, affording a ſecure retreat, ſhould encourage the garriſon to hold out to the laſt extremity." It is no leſs famed for its noxious atmoſphere, occaſioned by the ſurrounding hills and woods, than for its wonderful ſize and ſtrength. Hence it derives its formidable name.

The ſultan is ſaid to have flattered himſelf, that before this place "half the Europeans would die of ſickneſs, the other half be killed in the attack;" he was, however, miſtaken. The garriſon, fortunately for us, truſted more to the ſtrength of the place than to their own exertions, and, on the 21ſt of December, only the eleventh day of the ſiege, this fortreſs, hitherto deemed impregnable, was taken by aſſault in leſs than an hour, in open day, without the loſs of a man, only one private ſoldier having been wounded.

Outredroog, and other forts, fell ſucceſſively after this brilliant ſucceſs. The forces of the allies were not equally fortunate during the ſame interval. The army of the Nizam, after a long ſiege of Gurramcondah,

condah, drew off to join our forces, and only left the place blockaded. To make amends for this failure, the Maratta army, under Purſeram Bhow, aſſiſted by our engineers, took Hooly Onore, Bankapoor, Simoga, and other places. By the latter end of January, 1792, the whole allied force, excepting the Bombay army, was aſſembled in the vicinity of Hooleadroog.

We come now to the operations againſt Seringapatam. On the 1ſt of February, 1792, the allies began their march, and by two o'clock on the 5th, were encamped acroſs the valley of Milgotah, only ſix miles from the poſition of Tippoo before Seringapatam. It could not well be expected by the ſultan that he ſhould receive ſo early an attack as lord Cornwallis deſtined for him. His camp was ſtrongly ſituated and fortified by a bound hedge, and ſeveral redoubts. Nevertheleſs, after cauſing his poſition to be reconnoitred in the morning of the 6th, the commander in chief iſſued orders for the attack that very evening. The army was to march at night in three diviſions, and without cannon. "The plan of attack," ſays major Dirom, "was indeed bold beyond the expectation of our army; but, like a diſcovery in ſcience, which excites admiration when diſcloſed, it had only to be known, to meet with general applauſe." The outlines of this great enterpriſe are generally known; the particulars cannot be detailed in this place, but are related with great clearneſs by the hiſtorian, and ſo illuſtrated by the attendant plans, that the circumſtances cannot be miſtaken.

The reſult of this operation was, that Tippoo was driven from his camp into Seringapatam, all his redoubts taken, and a lodgement eſtabliſhed on the iſland, in a ſtrong poſition, where lieutenant Stuart remained poſted. All poſſible preparations were made, from this time, for taking the capital by aſſault: and they were ſuch as probably would have been crowned with full ſucceſs. On the 16th of February, the Bombay army, under general Abercromby, after overcoming various obſtacles, joined the main army, and remained poſted to the northweſt of the city. On the 19th it was ſtationed on the ſouth ſide of the Cavery, in a ſituation that ſeemed to give the ſultan much uneaſineſs. However, after attacking the advanced poſt of this army on the night of the 21ſt, Tippoo made no farther effort; and on the 24th, when the preparations for the general aſſault were in great forwardneſs, it was announced that preliminaries of peace were ſettled. The conferences for this purpoſe had begun on the 15th; but the operations on both ſides continued till the 24th. After the ceſſation of arms, which then took place, the conduct of Tippoo Sultan was ſo equivocal and ſuſpicious, as to make it neceſſary on our part to renew the preparations for the ſiege. Overawed, at length, by the firmneſs and deciſion of lord Cornwallis, and probably alarmed by the diſcontent of his own people, the reluctant ſultan ſubmitted to all the terms propoſed; and on the 19th of March, the copies of the definitive treaty were delivered in form, by his ſons, to lord Cornwallis, and the agents of the allied princes. The Nizam's ſon, prince Secunder Jah, and the Maratta plenipotentiary, Hurry Punt, thought it beneath their dignity to be preſent on this occaſion in perſon, and were repreſented by their vakeels.

The ſubſtance of the treaty was: 1ſt. That Tippoo was to cede one half of his dominions to the allied powers. 2d. That he was to pay three crores and thirty lacks of rupees. 3d. That all priſoners were to be reſtored. 4th. That two of the ſultan's three eldeſt ſons were to become hoſtages for the due performance of the treaty.

Tippoo is ſaid to have been prevailed upon with infinite difficulty to ſubſcribe to the terms of peace: and now that all was ſettled, the uneaſineſs in the ſeraglio became extreme in parting with the boys, who were to be ſent out as hoſtages. The ſultan was again intreated to requeſt they might be allowed to ſtay another day, in order to make ſuitable preparations for their departure; and lord Cornwallis, who had diſpenſed with their coming at the time the treaty was ſent, had again the goodneſs to grant his requeſt.

When the princes left the fort, which appeared to be manned as they went out, and every where crowded with people, who, from curioſity or affection, had come to ſee them depart, the ſultan himſelf was on the rampart above the gateway. They were ſaluted by the fort on leaving it, and with twenty-one guns from the park as they approached our camp, where the part of the line they paſſed was turned out to meet them. The vakeels conducted them to the tents, which had been ſent from the fort for their accommodation, where they were met by ſir John Kennaway, the Maratta and Nizam's vakeels, and from thence accompanied by them to head quarters.

The princes were each mounted on an elephant richly capriſoned, and ſeated in a ſilver howder (a canopied ſeat), and were attended by their father's vakeels, and the perſons already mentioned, alſo on elephants. The proceſſion was led by ſeveral camel harcarras (meſſengers) and ſeven ſtandard-bearers, carrying ſmall green flags ſuſpended from rockets, i. e. rocket is a miſſile weapon, conſiſting of an iron tube of about a foot long, and an inch in diameter, fixed to a bamboo rod of ten or twelve feet long, followed by one hundred pikemen, with ſpears inlaid with ſilver. Their guard of two hundred ſepoys, and a party of horſe, brought up the rear. In this order they approached head quarters, where the battalion of Bengal ſepoys, commanded by captain Welch, appointed for their guard, formed a ſtreet to receive them.

Lord Cornwallis, attended by his ſtaff, and ſome of the principal officers of the army, met the princes at the door of his large tent, as they diſmounted from the elephants; and, after embracing them, led them in, one in each hand, to the tent; the eldeſt, Abdul Kalick, was about ten, the youngeſt, Mooza-ud-Deen, about eight years of age. When they were ſeated on each ſide of lord Cornwallis, Gullam Ally, the head vakeel, addreſſed his lordſhip as follows: "Theſe children were this morning the ſons of the ſultan, my maſter; their ſituation is now changed, and they muſt look up to your lordſhip as their father."

Lord Cornwallis, who had received the boys as if they had been his own ſons, anxiouſly aſſured the vakeel and the young princes themſelves, that every attention poſſible would be ſhewn to them, and the greateſt care taken of their perſons. Their little faces brightened up; the ſcene became highly intereſting; and not only their attendants, but all the ſpectators, were delighted to ſee that any fears they might have harboured were removed, and that they would ſoon be reconciled to their change of ſituation, and to their new friends.

The princes were dreſſed in long white muſlin gowns and red turbans. They had ſeveral rows of large pearls round their necks, from which was ſuſpended an ornament conſiſting of a ruby and an emerald of conſiderable ſize, ſurrounded by large brilliants; and in their turbans, each had a ſprig of rich pearls.—Bred up from their infancy with infinite care, and inſtructed in their manners to imitate the reſerve and politeneſs of age, it aſtoniſhed all preſent to ſee the correctneſs and propriety of their conduct.

Thus ended a war in which the advantages gained by us may be briefly ſtated thus:—1. Our moſt formidable enemy is ſo reduced by it, as to render our poſſeſſions in India both profitable and ſecure. 2. Madras is ſecured from invaſion by poſſeſſion of the paſſes, and covered by a territory defended by ſtrong forts. 3. The value of Bombay is greatly enhanced by poſ-

ſeſſions

ſeſſions gained on the Malabar coaſt, protected by Poligautcherry and the frontier of the Coorga Rajah. Theſe advantages, it may be preſumed, will far overbalance the expences of the war. By a ſtatement of major Dirom, it appears that Tippoo loſt in this war 67 forts, 801 cannons, and 49,340 men.

It would be unjuſt to with-hold our approbation from lord Cornwallis in every thing that reſpects the conduct of the concluding campaign. Nothing that ſound judgment could deviſe, or activity effect, appears to have been omitted. The humanity and goodneſs of his lordſhip were conſpicuous during the whole of the enterpriſe; and his moderation and ſound policy in the concluding ſcenes cannot be too highly extolled.

CHAP. XIII.

THE PENINSULA WITHIN THE GANGES.

European Settlements, Rivers, Mountains, &c.

THE ſouth-eaſt coaſt of India, ſituate on the bay of Bengal, uſually called the coaſt of Coromandel, compriſes the provinces of Madura, Tanjore, eaſt-ſide of Biſnagar, or Carnatic, Golconda, and Orixa. The chief towns in theſe provinces are, Madura, containing 16,400 ſquare miles; Tanjore, Tranquebar (Danes), Negapatam (Engliſh), Biſnagar, Porta Nova (Dutch), Fort St. David (Engliſh), Pondicherry, Conymere (French), Coblon, Sadraſpatan (Dutch), St. Thomas (Portugueſe), Fort St. George, or Madras (Engliſh), Pullicate (Dutch), containing 35,550 ſquare miles; Golconda, containing 62,100 ſquare miles; Gani, or Coulor, diamond mines; Maſſulipatam (Engliſh and Dutch), Viſagapatam (Engliſh), Bimlipatan (Dutch), Orixa, Ballaſore (Engliſh).

The ſouth-weſt coaſt of India, uſually called the coaſt of Malabar, compriſes the weſt ſide of Biſnager, or Carnatic; the provinces of Deccan, or Viſiapour; Cambaya, or Guzarat. The chief towns are, Tegapatam (Dutch), Anjengo (Engliſh), Cochin (Dutch), Callicut, Tellicherry (Engliſh), Canannore (Dutch), Mangalore, Barcelore (Dutch and Portugueſe), Radconda (diamond mines), Cawar (Engliſh), Goa (Portugueſe), Rajapore (French), Dabul (Engliſh), Dundee, Shoula (Portugueſe), Bombay (iſle and town, Engliſh), Baſſeen (Portugueſe), Salſette (Engliſh), Damon (Portugueſe), Surat, Swalley, Barak (Engliſh and Dutch), Amedabad, Cambaya, Dieu (Portugueſe).

The rivers in this peninſula are, the famous Kiſtna, a principal branch of which paſſes within 30 miles eaſt of Poonah, where it is named Beurah, and is eſteemed a ſacred river; the Puddar and Godaven, which laſt is alſo eſteemed as a ſacred river; the Cattack, or Mahanada, the mouths of which have never been traced; the Soane and Nerbudda.

A chain of mountains, which we have already taken notice of, run from north to ſouth of this part of India, and render it winter on one ſide of the Peninſula, while it is ſummer on the other. Towards the latter end of June, a ſouth-weſt wind begins to blow from the ſea, on the coaſt of Malabar, attended by prodigious and conſtant rains, which continue four months; during which time the weather is ſerene on the eaſtern ſide, known by the appellation of the coaſt of Coromandel. About the end of October, the rainy ſeaſon, and the change of the monſoon, begin on the Coromandel coaſt, which being entirely unprovided with good harbours, renders it extremely dangerous for ſhips to remain there, during that time; and to this are owing the periodical returns of the Engliſh ſhipping to Bombay, upon the Malabar coaſt.

The air of this peninſula is naturally hot, but is refreſhed by breezes, the wind altering every twelve hours; that is, from midnight to noon it blows off the land, when it is intolerably hot, and during the other twelve hours from the ſea, which laſt proves a great refreſhment to the inhabitants of the coaſt.

The ſoil is in general fruitful, and its productions are the ſame with thoſe already mentioned in the other parts of the Eaſt Indies. The like may be ſaid of their quadrupeds, fiſh, fowl, noxious creatures, and inſects.

There is great reaſon to ſuppoſe that the inhabitants of this part are the deſcendants of a colony which have migrated hither from Ethiopia, as their complexions are blacker than thoſe of the other peninſula of India. The greater part of them have but a faint notion of any allegiance they owe to the emperor of Indoſtan, whoſe tribute from hence has been, ever ſince the invaſion of Nadir Shah, intercepted by their ſoubahs and nabobs, who now exerciſe an independent power in the government; but beſides theſe ſoubahs, and other imperial viceroys, many eſtates in this peninſula belong to rajahs or lords, who are the deſcendants of their old princes, and look upon themſelves as independent on the mogul and his authority.

As one ſoubah often engroſſes ſeveral provinces, and fixes the ſeat of his government according to his own conveniency; it would on theſe accounts be more conformable to the preſent ſtate of this peninſula to divide it into ſoubahſhips than into provinces; but the ancient diviſion into provinces is ſtill continued, and the whole country conſidered as compoſed of two principal parts, called the coaſt of Coromandel, and the coaſt of Malabar. Theſe are ſubdivided into provinces, and in theſe the greater part of the European factories in India are eſtabliſhed.

The province of Madura, which begins at Cape Comorin, the ſouthernmoſt part of the peninſula, is about as extenſive as the kingdom of Portugal, and is ſaid to be governed by a monarch, who has ſeventy tributary princes under him, each being independent in his own principality, only paying him a tax.—This province produces nothing valuable, except a pearl fiſhery, which is on its coaſt. The capital is alſo called Madura, and the other principal towns in it are Triſhirapalli, Manapar, where the Dutch have a factory, and Tutukurin, a large ſea-port, which, together with ſeveral ſmaller, belong to the Dutch.

To the eaſt of Madura lies the ſmall kingdom of Tanjore, the ſoil of which is exceedingly fertile, and its prince rich, till plundered by the nabob of Arcot, and ſome Britiſh ſubjects connected with him; the chief places in it are Tanjore, the capital, which is governed by a rajah under the Engliſh protection.

Negapatan, a Dutch colony and fortreſs, was taken from them during the laſt war, and confirmed to the Engliſh by the laſt treaty of peace; and Tranquebar, belonging to the Danes. The king's revenues are ſaid to be very conſiderable.

North of Tanjore lies the kingdom of Karnata, better known to us by the appellation of the Carnatic. It is bounded on the eaſt by the bay of Bengal, on the north by the river Kiſtna, which divides it from Golconda, on the weſt by Viſipour, and, on the ſouth, by the kingdoms of Meſſaur and Tanjore. It is about 345 miles in length, from ſouth to north, and 276 in breadth, from eaſt to weſt. This country is in general fertile, and contains a conſiderable number of cities and towns. The whole kingdom is divided into ſmall principalities, whoſe princes are all independent in their reſpective territories, but at the ſame time ſubordinate to the Great Mogul.

The

The moſt remarkable places on the ſea-coaſt, commonly called the Coromandel coaſt, are the following, viz. Porto Nova, where the Portugueſe are very numerous, and the Engliſh and Dutch have alſo ſome houſes.

Fort St. David's, which, with the diſtrict round it, belongs to the Engliſh, who purchaſed it in 1686, from a Maratta prince, for ninety thouſand pagodas. The fort is tolerably ſtrong, and the country, which extends eight miles every way, fertile and pleaſant.

Pondicherry, which lies about five leagues to the north of Fort St. David's, and was formerly the principal place belonging to the French in the Eaſt Indies. It has been repeatedly taken by the Engliſh, and as often reſtored by treaties of peace.

Madras, or Fort St. George, the capital of the Engliſh Eaſt India ſettlements, is divided into two parts, called the White and Black Towns. It ſtands fronting the ſea, and has a ſalt-water river on the land ſide, which prevents all freſh ſprings from being brought within a mile of the town, and, in the rainy ſeaſon, cauſes inundations on one ſide, while the ſea often threatens deſtruction on the other: ſo that its ſituation is far from being either ſafe or commodious, though it is both healthy and delightful.

The White Town, which is inhabited by Europeans, is walled quite round, and has ſeveral baſtions and bulwarks to defend it; beſides which it is ſecured by the ſea on one ſide, and a ſalt river on the other. It is about 400 paces long, and 150 broad. The ſtreets are in general regular, and in the centre of the town ſtands Fort St. George. The houſes are of brick, well built, with flat roofs, and ſpacious rooms. Here are two elegant churches, one for the Proteſtants, the other for the Roman Catholics, a good hoſpital, a mint for coining rupees and pagodas, and a town-hall, underneath which is a priſon for debtors. The town is a corporation, conſiſting of a mayor and aldermen, formerly choſen by the burghers, but at preſent by the governor and his council; in conſequence of which every thing is carried on as the governor's will directs, who can annul all deciſions in caſe of debt, or otherwiſe, made by the court, which is properly a court of conſcience. Nothing has been omitted to mend the natural badneſs of the ſituation of this town, which ſeems originally owing to the neighbourhood of the diamond mines, that are but a week's journey diſtant. Theſe mines are under the direction of a Mogul officer, who lets them out by admeaſurement, incloſing the contents by paliſadoes; all diamonds above a certain weight originally belonged to the emperor. Religions of every kind are tolerated at Madras, every ſect having its reſpective place of worſhip.

Eighty thouſand inhabitants of various nations are ſaid to be dependent upon Madras; but its ſafety conſiſts in the ſuperiority of the Engliſh by ſea. It carries on a conſiderable trade with China, Perſia, and Mocha. The diſtrict belonging to Madras does not extend much more than forty miles round, and is of little value for its product.

Immenſe fortunes have been acquired by the Engliſh upon this coaſt within theſe forty years, but ſome of theſe fortunes appear to have been obtained by the moſt illicit practices. Some fundamental errors muſt therefore have crept into the conſtitution of the Eaſt India Company. The directors conſidered the riches acquired by their governors and other ſervants, as being plundered from the company, and accordingly ſent out ſuperintendants to control their governors and overgrown ſervants, and have from time to time changed their governors and members of the council there.

Through the diſtractions of the Mogul empire, the ſupport of our government, and the undaunted but fortunate efforts of their military officers, the Engliſh East India Company have acquired ſo amazing a property in this peninſula, and in Indoſtan, that it is ſuperior to the revenues of many crowned heads; and ſome of their own ſervants affirm, that, when all their expences are paid, their clear revenue amounts to near two millions ſterling; out of which they were to pay 400,000l. annually to the government, while ſuffered to enjoy their revenues. How that revenue is collected, or from whence it ariſes, is beſt known to the company: part of it, however, has been granted in property, and part of it is ſecured on mortgages, for diſcharging their expences in ſupporting the intereſts of their friends, the emperor, and the reſpective ſoubahs and nabobs, to whom they have afforded their aſſiſtance.

Many rights peculiar to ſovereignty, have been exerciſed by this company; ſuch as thoſe of holding forts, coining money, &c. Thoſe powers were thought incompatible with the principles of a commercial limited company, and therefore the Engliſh miniſtry and parliament have repeatedly interfered: in order to regulate the affairs of the company, a board of control at home being at length eſtabliſhed.

The Gentoos are for the moſt part entirely paſſive in all the revolutions of their government. The Moors, or Mahometans, ignorant and treacherous as they are, appear to have no violent attachment to any religious principles, and are abject enough to live under any form of government. Theſe conſiderations manifeſt the wiſdom of not driving them into deſperate meaſures, and thereby affecting an union of their forces, which muſt prove fatal to the Britiſh intereſt there.

It is indeed much to be regretted, that as the government has thought proper to interfere in the affairs of the Eaſt India Company, it has not alſo taken ſome meaſures to puniſh thoſe many and infamous inſtances of oppreſſion, injuſtice, and cruelty, of which the ſervants of the company have been guilty, and which have been ſo loudly complained of both at home and in the Indies. The ſupreme court lately eſtabliſhed at Calcutta, has not anſwered the purpoſes for which it was appointed; it has been equally complained of by the ſervants of the company, and by the natives: many of the latter have been grievouſly haraſſed by it, who were not amenable to its juriſdiction; nor has that regard been paid to their manners and cuſtoms, which both juſtice and policy required. Theſe reflections, founded on indubitable facts, we hope will have their due weight with thoſe who have ability and inclination to rectify theſe enormous abuſes of delegated authority.

The Black Town is inhabited by Gentoos, Mahometans, Armenians, Portugueſe, and by the merchants of every nation in Aſia, together with negroes. It is about a mile and a half in circuit, almoſt encompaſſed by a river and the ſea; and has of late years been ſurrounded by a ſtone wall, with baſtions cannon proof. Here is an Armenian church, and ſeveral pagods, or Indian temples; but the houſes in general are nothing more than thatched cottages.—To the north of Madras lies Pullicate, belonging to the Dutch, who have a ſmall fort there, in which they keep a garriſon.

The kingdom of Golconda extends 260 miles along the bay of Bengal, in form of a creſcent, and is 200 in breadth from eaſt to weſt. The ſoil, which is very fertile, yields annually two crops of rice, and ſeveral other kinds of grain. Of the grapes, which are remarkably fine, and ripe in January, the inhabitants make a very good white-wine. The country alſo yields indigo, bezoar, mines of iron, ſteel, and ſalt, and ſeveral of diamonds (of which Raolconda is a very famous one) with other precious ſtones. Proviſions of all kinds are extraordinary cheap; a ſheep being bought for a ſhilling, a fowl for two-pence, and ſo in proportion. Golconda is ſubject to a prince called the Nizam, or ſoubah of the Deccan, who is tributary

tary to the Great Mogul, has vaſt revenues ariſing from lands, cuſtoms of merchandize, and proviſions, but principally from the diamond-mines and ſalt.—His army is ſaid to be very numerous, conſiſting generally of 100,000 horſe and foot, beſides 200 elephants. The inhabitants are many of them extremely rich, and the artificers are very ſkilful in the cotton manufactures, which they make ſo fine, and of ſuch lively colours, that many prefer them to ſilk. This kingdom contains ſeveral large cities, among which are Bagnagar, or Hyderabad, the capital; but the kingdom takes its name from the city of Golconda, and compriſes the eaſtern part of Dowletabad.

Eaſt-ſouth-eaſt of Golconda lies Maſulipatam, where the Engliſh and Dutch have factories. The Engliſh have alſo factories at Ganjam and Viſagapatam, on this coaſt; and the Dutch at Narſipore.

The province of Orixa, from whence the Engliſh company draw ſome part of their revenues, lies to the north of Golconda, extending in length from eaſt to weſt about 550 miles, and in breadth about 240. It is governed chiefly by Moodajee Booſlah, and his brother Bembajee, allies to the Marattas. In this province ſtands the idolatrous temple of Jagaryunt, which they ſay is attended by 500 prieſts. The idol is an irregular pyramidal black ſtone, of about 4 or 500 pounds weight, with two rich diamonds near the top, to repreſent eyes, and the noſe and mouth painted with vermillion.

The Deccan is a very extenſive country, comprehending ſeveral large provinces. and ſome kingdoms; particularly thoſe of Barſana, Balagate, Telenga, and the kingdom of Viſiapour. The names, dependencies, and governments of thoſe provinces are extremely unſettled, and have been ſubject to almoſt annual revolutions and alterations ſince their reduction by Aurengzebe, or his father; ſo that modern geographers are not agreed upon their exact ſituation and extent. The principal towns are Aurungabad, and Doltabad, or Dowlatabad; the latter is the ſtrongeſt place in all Indoſtan. In a plain of about two leagues ſquare, ſtand the famous pagods of Elora. The tombs, chapels, temples, pillars, and many thouſand figures that ſurround it, are ſaid to be cut out of the natural rock, and to ſurpaſs all the other efforts of human art.

Telenga is ſituated on the eaſt of Golconda.—Beder, its capital, is a very large city, ſurrounded by brick walls, and garriſoned with 3000 horſe and foot. The inhabitants ſpeak a language peculiar to themſelves.

Guzerat is a maritime province on the gulf of Cambaya, and one of the fineſt in India, but inhabited by a fierce, rapacious people. It is ſaid to contain thirty-five cities. Amedabad is the capital of the province, where there is an Engliſh factory, and is ſaid to vie in wealth with the richeſt towns in Europe.

Surat, where the Engliſh have a factory, lies at the diſtance of about forty-three French leagues from Guzerat.

The kingdom of Viſiapour is very extenſive: the weſtern part of it is called Konkan, and is intermingled with the Portugueſe poſſeſſions. The rajah of Viſiapour is ſaid to have had a yearly revenue of ſix millions ſterling, and to bring into the field 150,000 horſe and foot. The capital is of the ſame name, and the country very fruitful. The principal places on this coaſt are Daman, Baſſaim-Trapor, or Tarapor, Chawl, Dandi-Rajah-pur, Dabul-Rajah-pur, Gheriah, and Vingorla. The Portugueſe have loſt ſeveral valuable poſſeſſions on this coaſt, and thoſe which remain are on the decline.

There are alſo many iſlands on this coaſt, among which is that of Bombay, belonging to the Engliſh Eaſt India Company. It is about ſeven miles in length, and twenty in circumference. It originally belonged to the Portugueſe, and was given to Charles II. as part of the portion he received with the infanta of Portugal, who gave it to the Eaſt India Company; and the iſland is ſtill divided into three Roman Catholic pariſhes, inhabited by Portugueſe, and what are called Popiſh-meſtizo, and Canarins; the former being a mixed breed of the natives and Portugueſe, and the other the aborigines of the country. The Portugueſe gave it the appellation of Boonbay, from the excellency of its harbour, which, it is ſaid, will conveniently hold a thouſand ſail of ſhips. The chief town is near a mile long, but filled with very mean houſes, except a few belonging to the Portugueſe.—At a ſmall diſtance from it ſtands the fort, but not in the moſt advantageous ſituation. The ſoil of the iſland is in general ſterile, the principal produce of it being fine groves of cocoa-nut trees; and in the gardens are found ſeveral ſorts of Indian fruits. The air and climate are rather unhealthy, particularly to ſtrangers; and the beſt water to be had, is what the people catch in ciſterns during the great rains, for that contained in the wells has a brackiſh diſagreeable taſte. The inhabitants, who are a mixture of ſeveral nations, amount in all to near 60,000, and every one enjoys the practice of his religion unmoleſted. The poſts of the governor and council of Bombay, as well as thoſe of the officers under them, are lucrative; and the troops on the iſland are commanded by Engliſh officers. The natives, when formed into companies, and diſciplined, are here, and in every part of India, diſtinguiſhed by the appellation of Sepoys.

The Turks that reſort to this place on account of trade, are, like the reſt of their countrymen, ſtately, grave, and reſerved, and honeſt in their dealings, though merchants. The Perſians are more gay, lively, and converſible, but leſs honeſt in matters of trade than the ſaturnine Turks. The Arabians are all life and fire, and when they treat with you on any ſubject, will make you a fine oration in flowing numbers, and a muſical cadence, but they are the moſt diſhoneſt of all. The Armenians are generally handſome in their features, mild in their tempers, and in their nature kind and beneficent: they are a kind of Chriſtians, and an honour to that religion, beyond numbers that go from England.

Contiguous to Bombay are ſeveral other iſlands, one of which called Elephanta, contains one of the greateſt and moſt inexplicable antiquities in the world. A figure of an elephant, about ſeven feet high, rudely carved out of a black ſtone, is placed on the landing-place, near the bottom of a mountain, from whence an eaſy aſcent leads to a ſtupendous temple, hewn out of the ſolid rock eighty or ninety feet long, and forty broad. The roof, which is flat, is ſupported by regular rows of pillars, about ten feet high, with capitals, reſembling round cuſhions, as if preſſed by the weight of the incumbent mountain. At the further end of the temple are three gigantic figures, and round it are various others, and groups cut in ſtone, one of which bears a rude reſemblance to the judgment of Solomon. There is alſo a colonade, and a door of regular architecture: but when, or by whom this prodigious edifice was erected, ſtill is, and in all probability ever will remain a ſecret. It is certain that it was not built by the Hindoos, the aborigines of this country, as it has not the leaſt appearance of their manner.

South of Bombay lies the iſland and city of Goa, the chief ſettlements of the Portugueſe in the Eaſt Indies. The iſland is about twenty-ſeven miles in compaſs, and has one of the fineſt and ſtrongeſt ports of this part of the world. Formerly it was a moſt ſuperb ſettlement, but is now greatly gone to decay. The Jeſuits, before they were ſuppreſſed, had five houſes here, and it is ſaid their revenues were equal to thoſe of the crown of Portugal. The number of inhabitants are ſuppoſed to be about 20,000, of which the native Portugueſe form a very ſmall proportion. The natives are as black as jet, having long black hair,

hair, and many of them very fine features. The men are, in general, proud, jealous, revengeful, indolent, and indigent; and the women lazy and laſcivious. Goa, and all the Portugueſe ſettlements on this coaſt, are under a viceroy, who ſtill keeps up the remains of the ancient grandeur of the government, though the power and credit of it are in a manner loſt. The Peninſula of Salzete, with ſome other places, are dependent on Goa, but they are of very little conſequence, otherwiſe than as they ſupply that city with proviſions.

South of the Portugueſe territories lies Sunda, which is governed by a rajah, ſubject to the Great Mogul. The mountains in this country are ſaid to yield the fineſt pepper in the world. The only place worthy notice in it is Corwar, where the Engliſh have a factory, and it is the moſt pleaſant and healthy ſettlement belonging to the company on the Malabar coaſt. Their government here is under the direction of a chief and council, and the garriſon conſiſts of thirty Sepoys, beſides Engliſh.

About forty miles to the ſouth of Goa lies Canoree, which reaches as far as Calicut. It is a pleaſant country, and prodigiouſly fertile in rice, large quantities of which are imported into Europe, beſides ſupplying ſeveral parts of India. The Canorines are generally excellent ſoldiers and miners, and very attentive to commerce. Their language, which is termed Kanareyn, is ſpoken, with ſome variation of dialect, from the borders of Malabar to Surat. The principal places in it are Bedmur, Onar, Batakolo, Barſeloar, Bakkanor, Molkey, and Mangalore, which is the greateſt mart of trade in all the Canoree dominions.

The celebrated Hyder Ally, with whom the company formerly made a peace, but with whom their ſervants ſoon after embroiled them, and who in the late war made a violent irruption into the Carnatic, took many of its chief places, obtained great advantages over the company's troops, and brought his forces to the gates of Madras, but died before the concluſion of the war. He is ſaid to be a native of Myſore, which lies to the ſouth-weſt of the Carnatic. The Chriſtians of the apoſtle St. Thomas live at the foot of the Gatti mountains.

The dominions of Tippoo Saib, ſon of Hyder Ally, comprehended generally the provinces of Myſore, Bednore, Zaimbalore, Zanaree, and Dindigal, beſides his acquiſitions to the northward from the Marattas: they are at leaſt 400 miles in length, and in breadth from 290 to 130, ſo that he had the largeſt ſhare in the peninſula.

Malabar, which gives its name to the whole ſouth-weſt coaſt of the peninſula, taken in its moſt extenſive ſenſe, contains not only the country under that name to the weſt of Cape Comorin, but alſo thoſe to the eaſt, as far as Negapatan. But in the more contracted and modern ſenſe of the word, Malabar is now confined only to the country ſo called, lying on the weſt of Cape Comorin, and known by the appellation of the dominion of the Samorin. This country is about 350 miles in length, and from eighty to twenty in breadth. The air is exceeding good, and the ſoil as fertile as any in Aſia; uſually yielding two crops annually. Formerly Malabar was united under one emperor, called the Samorin; but it is now divided into a number of ſmall principalities, moſt of which are independent.

The moſt remarkable places in this country, are Cannanore, which contains a Dutch factory and fort: Tillicherry, where the Engliſh have a ſmall ſettlement, and keep a conſtant garriſon of thirty or forty ſoldiers. The chief trade conſiſts in pepper and cardamums: Burgara, Kota, Tikorey, Calicut, where the French and Portugueſe have ſmall factories; Tanmore, Pennancy, Chitiva, where the Dutch have a factory; Kranganor, where there is alſo a factory belonging to the Dutch; and Cochin. Among the inhabitants of the laſt, are ſeveral thouſand Jews, who have a ſynagogue about two miles from the city, in which are preſerved their records engraven on copper-plates, in Hebrew characters. They call themſelves a remnant of the tribe of Manaſſeh, a part whereof was, by order of Nebuchadnezzar, carried to the moſt eaſtern province of his extenſive empire, which it ſeems reached as far as Cape Comorin. The Dutch have a ſettlement, and a garriſon of 300 men at Cochin, the king being in fact only their vaſſal. In Porkey, Hoilkoiloan, and Koyloan, the Dutch have alſo factories; to which we may add Erwa, where the Danes have a ſmall factory; Anjengo, where the Engliſh have a ſmall fort and ſettlement, being the moſt ſoutherly poſſeſſion they have on the Malabar coaſt; Tegapatan, where the Dutch have a factory, and Holicha. All theſe towns are ſituated along the coaſt, but there are ſeveral within land, ſome of which are very conſiderable.

Cape Comorin, which is about three leagues in extent, forms the moſt ſouthern part of this peninſula. In this ſmall ſpace one has often the pleaſure of ſeeing ſummer and winter united; for the trees will be loaded with bloſſoms and fruit on one ſide of a garden, while on the other they are ſtripped of all their leaves. This phænomenon is owing to the mountains of Gatti, mentioned before, which traverſe the whole peninſula from ſouth to north. On the oppoſite ſides of the Cape, the winds are continually at variance; blowing from the weſt on the weſtern ſide, and from the eaſt on the eaſtern ſide.

CHAP. XIV.

PERSIA.

Extent, Boundaries, Diviſions, Name, Climate, Soil, Rivers, Chief Cities, Iſlands, &c.

MODERN Perſia is ſituated between the 44th and 70th deg. of eaſt longitude, and between the 25th and 44th deg. of north latitude. It is about 1300 miles in length, and 1100 in breadth; and contains 800,000 ſquare miles. It is bounded by the mountains of Ararat, or Daghiſtan, which ſeparate it from Circaſſian Tartary, on the north-weſt; by the Caſpian Sea, which divides it from Ruſſia, on the north; by the river Oxus, which divides it from Uſbeck Tartary, on the north-eaſt; by India, on the eaſt; by Arabia and Turkey, on the weſt; and by the Indian Ocean, and the gulfs of Perſia and Ormus, on the ſouth.

Geographers in general divide this extenſive empire into the following provinces, viz. On the frontiers of India are Choraſan, part of the ancient Hyrcania, including Herat and Eſterabad; Sableuſtan, including the ancient Bactriana and Candahor; and Sigiſtan, the ancient Drangiana. The ſouthern diviſion contains Makeran, Kerman, the ancient Gedroſſia, and Farſiſtan, the ancient Perſia. The ſouth-weſt diviſion, on the frontiers of Perſia, contains the provinces of Churiſtan, the ancient Suſiana, and Irac-Agem, the ancient Parthia. The north-weſt diviſion, lying between the Caſpian Sea and the frontiers of Turkey in Aſia, contains the provinces of Aderbeitzen, the ancient Media; Gangea, Daghiſtan, part of the ancient Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan, and Mazanderan.

With reſpect to its name, it is probable that the word Perſia is only a corruption of the word Parthia, and that the modern Perſians derive their name from their progenitors the Parthians, the ancient inhabitants of the country. The word itſelf implies a horſeman; the Perſians and Parthians having always been famed for their ſkill in horſemanſhip. The ancient poets

derived its name from Perſius, the ſon of Jupiter and Danae, which appears too fabulous to deſerve a preference.

The air of this vaſt kingdom varies prodigiouſly, according to the different ſituation of places. In the midland provinces of Perſia, it is ſerene, pure, and and exhilirating, but in the ſouthern provinces it is hot, and ſometimes communicates to the midland parts noxious blaſts, which are often ſo fatal, that the inhabitants fortify their heads with very thick turbans. Thoſe provinces which are in the neighbourhood of Caucaſus and Daghiſtan, and the mountains near the Caſpian Sea, are piercing cold, which may be attributed to the ſnow with which the ſummits of theſe mountains are perpetually covered.

The ſoil and productions vary like the air. Towards Tartary and the Caſpian Sea, the ſoil is far from being luxuriant, but with cultivation it might produce abundance of corn and fruits. South of Mount Taurus, the fertility of the country in corn, fruits, wine, and other luxuries of life, is equalled by few others. It produces wine and oil in plenty, ſenna, rhubarb, and the fineſt of drugs. The fruits are delicious, eſpecially their dates, oranges, piſtachio-nuts, melons, cucumbers, and garden ſtuff; not to mention vaſt quantities of excellent ſilk; and the gulf of Baſſora formerly furniſhed great part of Europe and Aſia with very fine pearls. Some parts near Iſpahan eſpecially, produce almoſt all the flowers that are valued in Europe; and from ſome of them, the roſes eſpecially, they extract waters of a ſalubrious and odorific quality, which form a gainful commodity in trade. In ſhort, the fruits, vegetables, and flowers of Perſia, are of a moſt exalted flavour; and had the natives the art of horticulture to as great perfection as ſome nations in Europe, by tranſplanting, engrafting, and other meliorations, they would add greatly to the natural riches of the country. The Perſian aſſafœtida flows from a plant called hiltot, and turns into a gum: ſome of it is white, and ſome black; but the former is ſo much valued, that the natives make very rich ſauces of it, and ſometimes eat it as a rarity. Tobacco grows all over Perſia, and ſaffron is cultivated in many parts of it.

There is no country in the world which contains more mountains than India, ſome of the chief of which form natural bulwarks to this extenſive empire. Among theſe are Caucaſus and Ararat, ſometimes called the mountains of Daghiſtan, which fill all the iſthmus between the Euxine and Caſpian Seas. This enormous ridge, together with its branches, run through the country from Natolia to India.

Moſt of theſe mountains yield iron, copper, braſs, and lead; as alſo ſulphur, ſalt-petre, and antimony. Turquoiſe-ſtones are found in Choraſſan; and quarries of red, white, and black marble, have been diſcovered near Taurus. Natural ſalt is produced in the province of Caramania.

There are few navigable rivers in Perſia. The moſt conſiderable are thoſe of Kur, anciently Cyrus; and Aras, anciently Araxes, which riſes in or near the mountains of Araxes, and, joining their ſtreams, fall into the Caſpian Sea. Some ſmall rivulets falling from the mountains water the country; but their ſtreams are ſo inconſiderable, that few or none of them can be navigated, even with boats. The Oxus can ſcarcely be called a Perſian river, though it divides Perſia from Uſbeck-Tartary. Perſia has the river Indus on the eaſt, and on the weſt, the Tigris and Euphrates.

The ſcarcity of rivers in Perſia is conſequently attended by a ſcarcity of water, which defect, however, is ſupplied in many places by aqueducts, canals, and reſervoirs. In the province of Tabriſton, or Maſanderan, the waters are ſo fetid, that by often overflowing part of the country, they change even the complexions of the inhabitants.

With reſpect to the Gaures, or ancient Perſians, they were homely, ill-ſhaped, and clumſy, with a rough ſkin, and olive complexion; but the modern Perſians, by the intermarriages of their anceſtors, for a ſeries of years, with the Georgian, Circaſſian, and other beautiful women, are of a good ſtature, ſhape, and complexion: the latter indeed differ according to the ſituation of provinces. The women are in general handſome and well-ſhaped.

The men ſhave their heads; thoſe only that are young indeed ſuffer a lock of hair to grow on each ſide, and the beard of their chins to reach up to their temples. The religious have long beards, and on their heads a ſquare cap, ten or twelve inches high. All wear turbans; and thoſe belonging to people of diſtinction are exceeding magnificent, being often interwoven with gold and ſilver. The reſt of their dreſs conſiſts of a calico ſhirt, the collar of which is open; then a veſt, which, reaching below the knee, is girt round the middle with a ſaſh, in which they place a dagger, and over that a looſe garment, ſomewhat ſhorter, and linen trowſers. Their clothes are uſually made of the richeſt furs, ſilks, muſlins, cottons, or ſome other fine and valuable ſtuffs, richly embroidered with gold and ſilver. They wear ſlippers on their feet, and pliant boots of yellow leather on their legs. The dreſs of the women does not differ materially from that of the men, only their veſts are longer, and they wear a ſtiffened cap on their heads, with their hair flowing looſe. Pearls and jewels of all kinds are diſpoſed about their heads and perſons with great taſte, and they omit no pains to heighten their natural beauty by waſhes and paints.

The Perſians, in their manners, are brave, ſenſible, lively, humane, and hoſpitable. Their only foibles ſeem to be profuſeneſs and vanity; for the richneſs of their cloths, their ſuperb equipages, and the amazing number of their ſervants, too often exceed their finances, and bring them into difficulties. They uſually breakfaſt on coffee, very early in the morning, and dine upon fruits, ſweetmeats, and milk, at eleven. Supper is their chief meal, which uſually conſiſts of a diſh of pilau. They never uſe either knives, forks, or ſpoons; neither do they eat pork, or any other animal prohibited to the Jews. All their meat is ſeaſoned very high with ſalt and ſpices, and they always dreſs it the ſame day it is killed: their bread, which is excellent, is baked into thin cakes, which ſaves them the trouble of cutting it. At their meals, the cloth is ſpread upon a carpet, and they all ſit croſs-legged upon the floor; but when Europeans viſit them, they are generally accommodated with ſtools. Their uſual drink is water and ſherbet, wine being prohibited: great quantities of it are, however, drank, particularly by the officers and ſoldiers, and none make any ſcruple of intoxicating themſelves with opium. They are immoderately fond of tobacco, which they ſmoke through a tube fixed in water, ſo as to be cool in the mouth; and they are ſo attached to this amuſement, that whenever it has been prohibited by their princes, many have been known to quit their country. The Perſians are not leſs jealous of their women than the Turks, and there is no country where they are more ſtrictly watched and confined, particularly in the harams of their princes, and great men. When the king's women remove, they are ſent away in covered litters, with a ſtrong guard; and on theſe occaſions, all men who reſide in the places through which they are to paſs, receive orders to quit their habitations, on pain of death; by which it appears, that they are not leſs jealous of their women than the Turks and other eaſtern nations.

The Perſians are fond of muſic, and take a pleaſure in converſing in large companies; but their chief diverſions are thoſe of the field, ſuch as hunting, hawking, horſemanſhip, and the exerciſe of arms, in all which they are very dexterous. They are fond of rope-dancers, jugglers, and fighting of wild beaſts; and

and privately playing at games of chance, as theſe are prohibited by law, under ſevere penalties. They excel in archery, as their anceſtors, the ancient Parthians, did.

They write, like the Hebrews, from the right to the left; are neat in their ſeals and materials for writing, and amazingly expeditious in the art. As no printing is allowed in Perſia, the number of people employed in their manuſcripts is incredible: their writing is beyond deſcription beautiful and correct: they write eight different hands, but eſteem that moſt in which the Koran is written: this hand is called the Neſky.

The Perſian marriages are uſually founded upon mercenary motives, the legal wife being conſidered as a ſuperintendant of the other women. They are indeed allowed by law to have four wives, and as many concubines as they pleaſe; but they ſeldom marry any more than one. If a man wants to part from his wife through mere whim, and wants to be divorced from her, though ſhe hath not committed any fault, he is obliged to pay the dowry contracted for at the marriage. We are told, that men may marry for life, or for any determined time, in Perſia, as well as through all Tartary; and that travellers or merchants, who intend to ſtay ſome time in any city, commonly apply to the cadee, or judge, for a wife during the time he propoſes to ſtay. The cadee, for a ſtated gratuity, produces a number of girls whom he declares to be honeſt, and free from diſeaſes; and becomes ſurety for them. A gentleman who lately attended the Ruſſian embaſſy to Perſia, declares, that, amongſt thouſands, there has not been one inſtance of their diſhoneſty during the time agreed upon.

The Perſians in general bury their dead; but the Gaurs expoſe them to be devoured by beaſts of prey, or other voracious creatures.

When a perſon is on the point of expiring, the Perſians kindle fires at the tops of their houſes, which ſerve as ſignals to their neighbours and travelling ſtrangers to offer up their prayers for the patient. The mollah or prieſt being ſent for, he exhorts the ſick perſon to repentance, who uſually ſays, *taube*, or, I do repent. The breath is no ſooner out of the body, than the ſurviving relations and friends ſet up a terrible ſcreaming, and make uſe of many affectionate expreſſions to the dead corpſe, bewailing his fate, and declaring their affliction to be paſt remedy. The coffin is wrapped in a kind of winding-ſheet, on which many paſſages of the Koran are ſtamped or written. The face of the dead perſon is laid towards Mecca, and an arch is built on that ſide near the grave.

The religion at preſent eſtabliſhed in Perſia, is that of Mahomet, but they differ from the Turks by following the ſect of Ali; for which reaſon, the Turks, who adhere to the ſucceſſion of Omar and Abu Bekr, call them heretics. Their religious notions are, if poſſible, in ſome reſpects, more fantaſtical and ſenſual than thoſe of the Turks; but in many points it is mingled with Bramin ſuperſtitions. When they are taxed by the Chriſtians with drinking ſtrong liquors, as many of them do, they retort upon them, very juſtly, "You Chriſtians whore and get drunk, though you know you are committing ſins, which is the very caſe with us." Reſpecting the Bramins, the compariſon between them and the Perſian Guebres, or Gaurs, who pretend to be the diſciples and ſucceſſors of the ancient Magi, the followers of Zoroaſter, may well deſerve a learned diſquiſition: it may be eaſily proved, that both of them held originally pure and ſimple ideas of a Supreme Being; but the Indian Bramins and Parſees accuſe the Gaurs, who ſtill worſhip the fire, of having ſenſualized thoſe ideas, and introducing an evil principle into the government of the world. A combuſtible ground, about ten miles diſtant from Baku, is the ſcene of the Guebres devotions. It muſt be admitted, that the ground is impregnated with very ſurpriſing inflammatory qualities, and contains ſeveral old little temples, in one of which the Guebres pretend to preſerve the ſacred flame of the univerſal fire which riſes from the end, and a large hollow cane ſtuck in the ground, reſembling a lamp burning with very pure ſpirits. Their ſect is ſaid to be numerous, though tolerated in very few places. The Mahometans are the declared enemies of the Gaurs, who were baniſhed out of Perſia by Shah Abbas. The preſent race of Perſians are ſaid to be very cool in the doctrines of Mahomet, owing chiefly to their late wars with the Turks.

The ancient Chriſtians ſeem to have been early driven into Perſia and the neighbouring countries, by the long wars between the Romans and Perſians: even to this day, many ſects are found that evidently have Chriſtianity for the ground-work of their religion. Some of them, called Souffees, who are a kind of quietiſts, ſacrifice their paſſions to God, and profeſs the moral duties. The Sabean Chriſtians have, in their religion, a mixture of Judaiſm and Mahometaniſm: they are numerous towards the Perſian Gulf. The Armenian and Georgian Chriſtians are alſo very numerous in Perſia.

The Perſian language is ſpoken in common throughout the whole empire, but more correctly in ſome provinces than others. The Turkiſh, however, is the polite, or court language. Many of the learned Perſians have written in the Arabic, and the higher claſs have adopted it as the modiſh language, as we do the French. The common people towards the ſouthern coaſts of the Caſpian Sea, ſpeak Turkiſh; and the Arabic probably was introduced into Perſia under the caliphates, when learning flouriſhed in thoſe countries. The pure Perſic is ſaid to be ſpoken in the ſouthern parts, on the coaſt of the Perſian Gulf, and in Iſpahan; but in many of the provinces they ſpeak a barbarous mixture of the Turkiſh, Ruſſian, and other languages.

The Perſian alphabet conſiſts of twenty-eight letters, none of which are vowels; their accent ſerves in lieu thereof, and points out how the voice is to be modulated, and the conſonants pronounced; they have no ſtops, but begin every ſentence with a capital letter; but in whatever language they write, always make uſe of Arabic characters; and, inſtead of quills, uſe reeds to make pens of.

In ancient times, the Perſians were famed for learning and learned men; and their poets were renowned all over the eaſt. A manuſcript at Oxford contains the lives of 135 of the fineſt Perſian poets: Ferduſi and Sadi were among the moſt celebrated. The former compriſed the hiſtory of Perſia in a ſeries of epic poems, which employed him for near thirty years, and which are ſaid to be a glorious monument of eaſtern genius and learning. Sadi was a native of Schiras, flouriſhed in the thirteenth century, and wrote many fine pieces both in proſe and verſe. Shemſeddin was one of the moſt eminent Lyric poets that Aſia has produced; and Nakhſheb wrote in Perſian a book, called "The Tales of a Parrot," not unlike the Decameron of Boccace. Jami, who flouriſhed in the middle of the fifteenth century, was a moſt animated and elegant poet: his beautiful compoſitions, on a great variety of ſubjects, are preſerved at Oxford, in twenty-two volumes. Hariri compoſed in a rich, elegant, and flowery ſtyle, a moral work, in fifty diſſertations, on the changes of fortune, and the various conditions of human life, interſperſed with a number of agreeable adventures, and ſeveral fine pieces of poetry.

Learning is now at a very low ebb among the Perſians. Their boaſted ſkill in aſtronomy is reduced to a mere ſmattering in that ſcience, and terminates in judicial aſtrology; ſo that no people in the world are more ſuperſtitious than the Perſians: they place an implicit confidence in their aſtrologers, who are all

all natives of Choraſſan, and pretend to be deſcended from the ancient Magi. Their almanacks are an abſurd mixture of aſtronomy and judicial aſtrology, morality and predictions; and they underſtand nothing more of arithmetic than the four fundamental rules. In ſhort, their genius is but little cultivated by education, and leſs by experience, as they never travel into foreign countries; and the ſameneſs of cuſtoms and manners in their own, does not afford a ſufficient variety for obſervation and improvement.

The learned profeſſion in greateſt eſteem among them, is that of medicine; which is at perpetual variance with aſtrology, becauſe every doſe muſt be in the lucky hour fixed by the aſtrologer, which often defeats the ends of the preſcription. It is ſaid, however, that the Perſian phyſicians are acute and ſagacious. Their drugs are excellent, and they are no ſtrangers to the practices of Galen and Avicenna.—Add to this, that the plague is but little known in this country; many diſeaſes alſo are equally rare here, that are fatal in other places; ſuch as the gout, the ſtone, the ſmall-pox, conſumptions, and apoplexies. The Perſian practice of phyſic is therefore pretty much circumſcribed; and they are very ignorant in ſurgery, which is exerciſed by barbers, whoſe chief knowledge of it is in letting blood; for they truſt the healing of green wounds to the excellency of the air, and the good habit of the patient's body. They are alſo totally unacquainted with anatomy.

The Perſians ſalute by an inclination of the head, and putting the right hand to the breaſt upon the heart. Before the ſovereign and great men, they bow with their faces three times towards the ground; but near relations and familiar companions ſalute thus: he who pays the compliment, preſſes one of the other perſons hands between both his own, and then gently raiſes it up to his forehead, which is expreſſive of the higheſt and moſt cordial eſteem.

The moſt magnificent remains of antiquity in Perſia are the ruins of Perſepolis, the ancient metropolis of that kingdom, conſiſting of ſuperb columns, ſpacious ſtair-caſes, grand portals, and beautiful pilaſters, adorned with figures in baſſo relievo. Accurate deſcriptions of theſe ſuperb remains of antiquity may be found in ſir John Chardin's and M. Le Brun's Travels, and in the fifth volume of the ancient part of the Univerſal Hiſtory. About a league diſtance from theſe ruins is a famous mountain, ſituated between two fine plains, to which the natives give the ſeveral appellations of Kabraſton Gauron, Nachs-Ruſtan, and Takt-Ruſtan. It is an entire rock, harder and capable of a better poliſh than marble. Having been levelled by art, its ſides are quite perpendicular, ſo that it has the appearance of a large wall; and upon it are a variety of figures, repreſented in baſs relief with great ſkill and beauty. At a ſmall diſtance from theſe figures are ſeveral tombs cut out of the rock, with two ſmall edifices, and ſeveral inſcriptions. Theſe are ſuppoſed to have been the burial-places of the ancient kings of Perſia, and many of the inſcriptions and figures are yet perfect; but others, through the brutal zeal of the Mahometans, who think it meritorious to deſtroy all kinds of images, and the injuries of time, are almoſt defaced. At Iſpahan is a pillar, erected by Shah Abbas, ſixty feet high, conſiſting of the ſkulls of beaſts. It is ſaid that ſome of his ſubjects having rebelled againſt him, he made a vow, that, on ſubduing them, he would erect ſuch a pillar of their ſkulls; but, upon their ſubmiſſion, he relented, and ſubſtituted thoſe of brutes, obliging each of the rebels to find one.

The river Mahmoudker, or the deafening river, is a very ſurpriſing natural curioſity. At ſome diſtance from Iſpahan there is a range of rocks, plain and even for a conſiderable ſpace, except that here and there they have openings, like the embraſures of baſtions; through theſe the winds paſs with amazing velocity. The river falls from theſe rocks into a noble baſon, partly wrought by the water itſelf, and partly by art. In aſcending the mountain the water is ſeen at the bottom of it like a ſleeping lake, interſperſed with rocks. It is ſuppoſed to be unfathomable, and, when ſtones are thrown into it, they cauſe a moſt amazing noiſe, which almoſt deafens the hearer, from which circumſtance it, in all probability, derives its name. Many are of opinion that this river does not derive its water from ſprings, but from the ſnow on the tops of the mountains, which, melting gradually, diſtills through the chinks of the rocks into this vaſt lake.

Near Gombroon are ſome baths, which, for the famous cures performed by them, juſtly merit a place among the natural curioſities of Perſia. The everlaſting fire at Baku has been already mentioned under the article religion.

The Perſian moſques are buildings ſet apart for public worſhip: they are of a ſquare form, and generally of ſtone; before the chief gate there is a ſquare court, paved with white marble, and low galleries round it, whoſe roof is ſupported by marble pillars. Thoſe galleries ſerve for places of ablution, before the Mahometans go into the moſque. About every moſque there are ſix towers, called minarets, each of which has three little open galleries, one above another. Theſe towers, as well as the moſques, are covered with lead, and adorned with gilding and other embelliſhments; and from thence, inſtead of a bell, the people are called to pray by certain officers appointed for that purpoſe. At Sultania, once a noble city, but now greatly decayed, there is a prodigious large moſque, that contains the ſepulchre of Sultan Mahomet Chadabende, the founder of the city. This moſque hath three gates of fine poliſhed ſteel, which equal in bigneſs the gates of any church in Europe; the roof is of blue and white ſtones. At the entrance of it there is a beautiful fountain; the tower, which is of an octagonal form, is ſurrounded by eight other towers. Upon the whole, it is a ſtructure which aſtoniſhes the imagination, and gratifies the curioſity.

No woman is allowed to enter the moſque; nor can a man with his ſhoes or ſtockings on. Near moſt moſques is a place of entertainment for ſtrangers during three days; and the tomb of the founder, with conveniences for reading the Koran, and praying. Near the moſque founded by Sha Iſmael, are the ruins of a triumphal arch built of free-ſtone.

The Perſian bagnios are uſually round, though ſome are ſquare. The roofs are covered with painted tiles, the walls are of a beautiful kind of white ſtone; each is covered with a dome. In the centre of the building is a large hall, floored with marble, and a capacious baſon to bathe, round which are the apartments to dreſs and undreſs in. Each bagnio contains three rooms; the firſt for dreſſing and undreſſing; the ſecond contains the water, and the third the bath.

When the baths are ready in the morning, a ſervant goes to the terrace on the top of the building, and blows a horn, to give public notice of the ſame. The men bathe in the morning, and the women in the afternoon about four o'clock. When the men have done bathing, the male attendants all withdraw, and are ſucceeded by the females, who are appointed to attend the women. No people of any very great conſideration, however, go to the public baths, as they generally have baths in their own houſes.

Bathing is not only enjoined to the Perſians by their religion, but it is particularly conducive to their health, on account of their never entirely undreſſing themſelves when they go to reſt. Add to this, they reckon it among their principal pleaſures.

Beſides being well rubbed by the attendants at the bagnios, the barbers ſhave them with incredible diſpatch

patch and eaſe, and there cut the nails both of their hands and feet, chafe the fleſh, and give them a very rough pull of both the arms, in order to ſtretch the nerves.

The Perſian harams, or ſeraglio's, which are appropriated for the women, are, from the moſt credible accounts of them, contrived according to the taſte and conveniency of the owner, and divided into a certain number of apartments; and as there is no country in the world where women are ſo ſtrictly guarded and confined as among the great men in Perſia, theſe rooms therefore are ſeldom or never entered by ſtrangers.

With reſpect to manufactures and commerce, it has been juſtly remarked, the Perſians equal, if not exceed all the manufacturers in the world in ſilk, woollen, mohair, carpets, and leather. Their works in theſe join fancy, taſte, and elegance, to richneſs, neatneſs, and ſhew; and yet they are ignorant of painting, and their drawings are very rude. Their dyeing excels that of Europe. Their ſilver and gold laces, and threads, are admirable for preſerving their luſtre. Their embroideries and horſe-furniture are unequalled; nor are they ignorant of the pottery and window-glaſs manufactures. On the other hand, their carpenters are very indifferent artiſts, which is ſaid to be owing to the ſcarcity of timber all over Perſia. Their jewellers and goldſmiths are clumſy workmen, and they are ignorant of lock-making and the manufacture of looking-glaſſes. Upon the whole, they lie under inexpreſſible hardſhips from the form of their government, which renders them ſlaves to their kings, who often engroſs either their labour or profits, as the exigencies of the ſtate, or other lucrative motives, may prompt them.

As the Perſians have little or no ſhipping, their trade is chiefly carried on in foreign bottoms. That between the Engliſh and other nations, by the gulph of Ormus, at Gombroon, was the moſt gainful they had; but the perpetual wars they have been engaged in have ruined their commerce. The great ſcheme of the Engliſh, in trading with the Perſians through Ruſſia, promiſed vaſt advantages to both nations, but it has hitherto anſwered the expectations of neither. Perhaps the court of Peterſburgh is not fond of ſuffering the Engliſh to eſtabliſh themſelves upon the Caſpian Sea, the navigation of which is now poſſeſſed by the Ruſſians; but till the government of Perſia is in a more ſettled ſtate than at preſent, we can ſay nothing with certainty on that head.

The conſtitution and government of Perſia are extremely precarious, as reſting in the breaſt of a deſpotic and often capricious monarch. The Perſians, however, had ſome fundamental rules of government. They excluded from their throne females, but not their male progeny. Blindneſs likewiſe was a diſqualification for the royal ſucceſſion. In other reſpects, the king's will was a law for the people. The favourites of the prince, female as well as male, are his only counſellors, and the ſmalleſt diſobedience to their will is attended with immediate death. The Perſians have no degrees of nobility, ſo that the reſpect due to every man, on account of his high ſtation, expires with himſelf. The king has been known to prefer a younger ſon to his throne, by putting out the eyes of the elder brother. The inſtances that have been given of the cruelties and inhumanities practiſed by the Mahometan kings of Perſia, are almoſt incredible, eſpecially during the two laſt centuries. The reaſon given to the chriſtian ambaſſadors, by Shah Abbas, one of their moſt celebrated princes, was, that the Perſians were ſuch brutes, and ſo inſenſible by nature, that they could not be governed without the exerciſe of exemplary cruelties. But this was only a wretched and ill-grounded apology for his own barbarity.

No rank or condition of Perſians is exempted from ſevere taxations and ſervices. The crown claims one-third of the cattle, corn, and fruits of his ſubjects, and likewiſe a third of ſilk and cotton. Even the water, that is let into fields and gardens, is ſubject to a tax; and foreigners, who are not Mahometans, pay each a ducat per head. The governors of the provinces have particular lands aſſigned to them for maintaining their retinues and troops, and the crown lands defray the expences of the court, king's houſehold, and great officers of ſtate. From the above ſtatement, the reader cannot doubt that the revenues of the Perſian kings were prodigious; but, in the preſent diſtracted ſtate of that country, nothing can be ſaid with any certainty.

The military ſtrength of Perſia conſiſted formerly of cavalry, and it is now thought to exceed that of the Turks. Since the beginning of this century, however, their kings have raiſed bodies of infantry. The troops are diſtinguiſhed into two bodies, called Kortſkies and Goulans: theſe are cavalry, and upon a peace-eſtabliſhment, the former amount to about 22,000, and the latter to about 8,000 men; they are generally well kept, and regularly paid. The kortſkies are the deſcendants of foreigners, and the goulans are made up of Georgian renegadoes, and ſlaves of all nations. The tangtchies or infantry are compoſed of the moſt hardy peaſants, and amount to about 50,000 men. The regular troops of horſe and foot brought to the field, even under Kouli Khan, did not exceed 60,000; and according to the modern hiſtories of Perſia, they are eaſily recruited in caſe of a defeat.

The fortified towns and places in Perſia, are in general deſpicable, and they had no great naval power till the time of Kouli Khan, who built a royal fleet, in which was a man of war of eighty guns: but it is imagined that they are laid up in the ports, and rotten, as nothing hath been heard of them ſince the death of that uſurper. The arms of Perſia are a lion couchant looking at the ſun as he riſes over his back. The emperor's title of Shah, ſignifies diſpoſer of kingdoms. The Perſian monarch does not ſubſcribe his name to public inſtruments, but the deed runs in this ſtyle, viz. "This edict or act is given by him whom the univerſe obeys."

From the diſtracted ſtate of Perſia for many ſucceſſive years, the political diviſion of the provinces cannot be aſcertained; but the moſt remarkable places in the empire have been viſited of late years by ſeveral merchants and others, who went upon embaſſies; the moſt authentic and intereſting of whoſe accounts we ſhall blend for the information of our readers, by deſcribing ſome of their cities and principal towns.

Iſpahan, the capital of Perſia, is ſituated in a delightful and extenſive plain, ſurrounded by mountains, on the banks of the river Zenderoud, over which there are three fine bridges. The fertility of the ſoil, the mildneſs of the ſeaſons, and the fine temperature of the air, all conſpire to render this city one of the moſt inviting and deſirable in the world. The mountains with which it is ſurrounded, defend it equally from the ſultry heats of the ſummer, and the piercing winds of the winter ſeaſons; and the plain on which it ſtands, is watered by ſeveral rivers, which contribute both to its ornament and uſe; the water of theſe ſtreams being ſweet, pleaſant, and wholeſome, almoſt beyond compariſon.

The extent of Iſpahan is very great, not leſs, perhaps, than twenty miles within the walls, which are of earth, poorly built, and ſo covered with houſes and ſhaded with gardens, that in many places it is dfficult to diſcover them. The number of inhabitants were formerly computed at 650,000; but ſince the reign of Kouli Khan, who almoſt depopulated the city, the number is vaſtly decreaſed, not one third of the houſes being inhabited, and many of them levelled with the ground.

The ſtreets are in general long, narrow, crooked, and unpaved; but ſome of them are broad and handſome,

ſome, adorned with canals and fountains, and, on each ſide a row of lofty trees planted. As it ſeldom rains here, the city is rendered extremely diſagreeable in ſummer by the duſt; though the citizens, to remove this inconvenience as much as poſſible, frequently cauſe the ſtreets to be watered, during the intenſe heat.

Moſt of the public buildings are rather neat than magnificent, though here are ſome ſumptuous palaces, and handſome houſes. The royal palace is very ſpacious, being near a league and a half in compaſs, and contains ſome very grand apartments. The royal moſque, the Kayſerich, where all ſorts of foreign commodities are expoſed to ſale, and the mint, called Serraah Khoneh, where the current money of the kingdom is coined, are all noble ſtructures; and the royal ſquare, or Meidan Shah, is one of the fineſt in the world. There are in Iſpahan 160 moſques, 1800 caravanſeras, 260 public baths, and a prodigious number of fine ſquares.

This city has eight, or, as ſome ſay, ten gates, beſides poſterns; the ſuburbs are very large, and, beſides natives, Iſpahan formerly contained above 10,000 Indians, all ſupported by trade, 20,000 Georgians, Circaſſians, and Tartars: with a conſiderable number of Engliſh, Dutch, and Portugueſe, and a few French.

The bridge at Zulpha, one of the ſuburbs of Iſpahan, is eſteemed the fineſt ſtructure in Perſia. It is built of brick, with edgings of free-ſtone, and is almoſt level, the middle of it being not much higher than the ends. It is above 300 paces in length, and twenty in breadth, and ſupported by a great number of low ſtone arches. On each ſide is a gallery eight or nine feet broad, extending from one end to the other, raiſed ſeveral ſteps above the level of the bridge, with a number of apertures to let in the air and light, and give a proſpect of the river. Theſe galleries or covered walks are not entirely appropriated to foot paſſengers; they are frequently uſed by horſemen in winter, when the river overflows, and fills the middle paſſage of the bridge, which is properly deſigned for horſes. Over the galleries is a platform, but ſo much expoſed to the ſun that it is ſeldom frequented. The moſt remarkable part of this bridge is a paſſage along the bed of the river, when the water is low in ſummer, for the convenience of foot paſſengers in that hot ſeaſon; for the ſtones are ſo placed, that a perſon may ſtep from one to the other without wetting his ſhoes; and proper openings are made through the piers, from one end of the bridge to the other.

Gombroon, or, as the natives call it, Bander-Abaſſi, owes its preſent wealth and grandeur to the demolition of Ormus, and the deſtruction of the Portugueſe empire in the Eaſt Indies. It was built by the great Shah Abbas, and is now very juſtly eſteemed one of the chief marts in the Eaſt.

This city is large, and, from the extenſive commerce carried on in it, by the Engliſh and Dutch factories, as well as the natives, is extremely populous; but its ſituation is remarkably bad. It is defended on the land-ſide by a ſingle wall only; but towards the ſea are erected ſeveral ſmall forts, with a platform, two caſtles, and two ſtone baſtions, mounted with cannon, to ſecure it and the road from the attempts of an enemy.

The ſtreets are narrow, and the houſes in moſt of them ſo out of repair, ſome half ruined, and others entirely ſo, that a ſtranger would ſuppoſe the town had been ſacked and ravaged by an enemy, not a veſtige of the wealth really contained in the place appearing in view. The Banians, or ſhop-keepers, have moſt of them tolerable houſes; they are in general built of earth and lime, but the better ſort are of ſtone; moſt of them have ventilators on the top, which contributes greatly to the health of the inhabitants.

§

Gombroon is an unhealthy place; the moſt ſickly months are from April to October, during which time the genteel part of the inhabitants retire into the country, winter being the only time for commerce.

There are great plenty of ſheep, goats, hairs, pigeons, partridges, &c. and wheat in ſuch abundance, that the poor ſubſiſt chiefly on bread and dates. Rice is imported from India; and the adjacent country affords apricots, peaches, pomegranates, and other delicious fruits, in great abundance. But amidſt all theſe advantages there is the greateſt ſcarcity of freſh water; not a ſpring or well is found in the town, or nearer to it than Aſhen, from which place all the inhabitants of this city are ſupplied with water, though at the diſtance of ſeven miles; and perſons of condition keep a camel conſtantly employed in fetching freſh and wholeſome water.

About the year 1631, the Engliſh began to ſettle here, when, in conſideration of their ſervices againſt the Portugueſe, Shah Abbas granted them half the cuſtoms of that port. They enjoyed this lucrative donation, till they began to neglect the ſervices they had ſtipulated, when it was taken from them. They have ſtill a factory here, and at Aſhen they have a country-houſe with noble gardens, to which the factors repair for their amuſement. As the natives have no ſhips of their own, and are entirely ignorant of navigation, they ſend their goods to Surat, and other Indian marts, in Engliſh and Dutch bottoms, at an exorbitant price, ſo that great part of the company's profit ariſes from freights.

The commodities of the Gombroon market are, fine wines of different kinds, raiſins, almonds, prunellas, dates, piſtachio nuts, ginger, ſilks, carpets, leather, galbanum, ammoniac, aſſafœtida, tragacanth, with other gums, and a variety of drugs.

In 33 deg. 51 min. of north lat. lies the city of Katſchan, in the midſt of a fine fertile plain; this is one of the fineſt cities in Perſia, the houſes in general being handſome, and the public ſtructures ſuperior to thoſe of any other city; the country about it is ſo fruitful, that the very pooreſt inhabitants live luxuriouſly. The city is exceeding populous, not only from the great number of natives, but from the vaſt influx of foreigners, who flock thither from all parts, particularly from India, to carry on trade; the walls and fortifications are made of a kind of potter's clay. The Sophi hath a grand garden here, in the midſt of which is a ſummer palace, reputed to have a thouſand doors and windows. The greateſt inconvenience in Katſchan is the want of water, as they have not any but what is ill-taſted, thick, and muddy.

Reſched, which is in 31 deg. north lat. and in 50 deg. long. from London, is the capital of the province of Ghilan, which is one of the moſt fertile, rich, and pleaſant provinces in all Perſia. It is large and populous, but hath not the leaſt fortification. The ſtreets are agreeable and planted with trees; but the houſes in general are meaner than thoſe of any other city in the empire; they are all covered with tiles, or ſlates. The market-place is capacious, and contains many good ſhops; and all the neceſſaries of life are exceedingly cheap.

Derbent is ſituated in 41 deg. 15 min. north lat. and in 51 deg. eaſt long. it is about three miles in length, and near five hundred paces in breadth; the caſtle and wall are five feet thick, and it is ſuppoſed they were built by Alexander the Great. They appear to be built with free-ſtone, but in reality are a compoſition of pounded muſcle-ſhells, and pieces of free-ſtone beaten to powder, which being moulded into the form of bricks, are ſo excellently cemented together, that the whole compoſition becomes harder than any marble; a garriſon of five hundred ſoldiers is kept here.

Schiras,

Schiras, which lies about two hundred miles to the ſouthward of Iſpahan, is a place of conſiderable trade. The wines made here are the beſt in Perſia; the fruits and flowers are incomparable, and the ſurrounding country is a perfect paradiſe; but only about four thouſand of the houſes are at preſent inhabited: it is the capital of Pars, the ancient Perſia; and its college for the ſtudy of oriental literature, is one of the beſt in Perſia. Though the ſtreets are narrow, the buildings in general are ſuperb and elegant, and the moſques are innumerable.

HISTORY OF PERSIA.

Perſia has been inhabited from the moſt early times: it was peopled by Elam the ſon of Shem, ſoon after the confuſion at Babel. It conſtituted part of the firſt monarchy called the Aſſyrian empire, founded by Nimrod, Belus, or Baal, about 200 years after the flood. But the foundation of the empire of Perſia, ſingly conſidered, was laid by Cyrus about the year before Chriſt 556. This prince, in the firſt year of his reign, publiſhed the famous edict, by which the Jews were permitted to return to Jeruſalem; reſtoring at the ſame time all the veſſels of the temple, which Nebuchadnezzar had brought from Judea, and placed in the temple of Belus, his god. The empire continued in its luſtre about 227 years, when it terminated in the perſon of Darius, who was conquered by Alexander the Great.

On the death of that monarch, whoſe dominions were divided among his principal officers, Perſia, together with Babylonia and Syria, fell to the ſhare of Seleucus, the ſon of Antiochus. The Romans afterwards ſubdued all the territories poſſeſſed by the ſucceſſors of Alexander's generals, except Perſia, which ſtill continued to have princes of its own, who more than once defeated the Roman legions.

The Saracens, about the year 630, made a conqueſt of Perſia, and kept poſſeſſion of the throne during an interval of 70 years, when they were driven out by the Turks. About the year 1260, the Tartars and Scythians, under the conduct of two of the ſons of Zingis Khan, defeated the Turks, and took poſſeſſion of the empire. Tamerlane, after defeating Bajazet, reduced both Perſia and Turkey in Aſia. On his return to Samarcand, the capital of his dominions, with a great number of Perſian captives, Cheik Aider, a doctor of the Mahommedan law, highly eſteemed in that country, obtained the releaſe of moſt of theſe priſoners. This act of kindneſs greatly increaſed his reputation with his countrymen; and Tamerlane having appointed no governor of the weſtern provinces, the Cheik uſurped the office; and, pretending that he was lineally deſcended from Ali, the ſon-in-law and genuine ſucceſſor of Mahomet, took upon himſelf the title of Caliph, which includes both the ſpiritual and civil juriſdiction. This event happened in the year 1400. Iſmael Sophi ſucceeded his father, and being a brave ſucceſsful prince, was confirmed in his poſſeſſion of the throne by the unanimous voice of the people. At his death Shah Tahmas obtained the ſceptre of Perſia: but being a very cruel prince, he was depoſed by his ſubjects, and his brother Codabundi placed on the throne.

Codabundi deceaſed in 1585, and was ſucceeded by his ſon Shah Abbas, a virtuous and warlike prince. He recovered the province of Candahor from the emperor of Indoſtan, reduced the kingdoms of Lar and Ormus, and expelled the Turks from great part of Armenia and Georgia. He reigned forty years, and was by far the greateſt prince of the Sophi dynaſty. He was ſucceeded by his grandſon Shah Sophi, a cruel and tyrannical prince, an enemy to virtue, and a ſcandal to humanity. His ſucceſſors followed his ſteps, till the people, rouſed at laſt by their ſufferings, exerted the rights of human nature; and in the year 1701 depoſed Huſſein, a prince of the Sophi race, and put him to death; together with all his family, except Shah Tahmas, who eſcaped from the rebels, and took refuge in the northern parts of Perſia.—Mahmud, who headed the rebels, took poſſeſſion of the throne. He did not, however, long enjoy the imperial ſceptre, which he had purchaſed by the blood of his maſter; he was ſoon after murdered by Eſref, one of his general officers, who uſurped the throne. In the mean time prince Tahmas raiſed a powerful army, and was joined by a great number of royaliſts, and amongſt the reſt, by Kouli Khan, a famous partizan on the frontiers of Uſbec Tartary. Eſref, whoſe cruelty and injuſtice had rendered him obnoxious to the people, was defeated, taken priſoner, and put to death. Tahmas aſcended the throne of his anceſtors, and ſent Kouli Khan, at the head of a numerous army, againſt the Turks. The Perſians were victorious, and Kouli Khan recovered all the places the Othmans had taken on the frontiers of Perſia during the late troubles. Haughty by nature, and inſolent from ſucceſs, Kouli Khan beheld the honours conferred on him by the ſophi with contempt. He complained that his ſervices were neglected; but nurſed in ſilence the bloody deſign he had formed againſt his maſter. He courted popularity, and when his ſcheme was ripe for execution, he dropped the maſk that had hitherto concealed his intentions. He aſſumed the names of Tahmas Kouli Khan and Nadir Shah, rebelled againſt his ſovereign, took him priſoner, and put him ſecretly to death.

All oppoſition being thus removed, Shah Nadir mounted the Perſian throne. Cruel and fierce by nature, and happy only in the midſt of war and tumult, the uſurper turned his arms againſt the neighbouring princes. His expedition into Indoſtan, and the amazing treaſure he collected in that famous empire, have been already mentioned in the hiſtory of the Indies. Uſbeck Tartary next excited the ambition of Kouli Khan; he conquered that country, and thinking his arms invincible, attempted to reduce the Dagheſtan Tartars; but fortune, that had hitherto attended his ſtandards, now forſook him. He found difficulties which all his ferocious abilities could not remove. The precipices of Dagheſtan oppoſed his march, and his victorious army was cut off by Tartar detachments in the defiles of the mountains, without his being able to force the enemy to an engagement. The misfortunes of one campaign were not however ſufficient to intimidate Nadir; he led his forces againſt the Turks, and defeated them in ſeveral battles. He laid ſiege to Bagdat, but could not ſucceed, and was obliged, after many efforts, to abandon the enterprize. His next attempt (for his reſtleſs ſoul could never be idle) was againſt the religion of his country; he was determined to introduce the tenets of Omar, inſtead of thoſe of Ali, embraced by the Perſians; but ſoon found that it is much eaſier to conquer force than bigotry; the great principle of his government was terror, which was here exerted in vain. Exaſperated at an oppoſition he could not ſubdue, he became one of the moſt cruel tyrants that ever diſgraced mankind. He put his own ſon to death, and formed the deteſtable deſign of exterminating all his family and relations. Self-preſervation now oppoſed the diabolical purpoſe; his actions were thoſe of a madman, and his relations and chief officers aſſaſſinated him in his tent. This event happened in the year 1747. The cruelty of Nadir had deſtroyed all the immediate branches of the royal family, and the throne became the ſport of fortune. One pretender after another ſtarted up and fell, either by open force, or the ſecret machinations of treachery. Anarchy and deſtruction overſpread the whole empire; the fields were laid waſte, the cities were plundered, the inhabitants murdered, and every diſtrict exhibited a ſcene of horror and blood. Famine at laſt ſheathed

the ſword of deſtruction, and Kerim Khan was crowned at Tauris in the year 1763. Since that period the Perſians have enjoyed the happineſs of peace; but it is very probable that the miſeries and diſtreſs which have been introduced by rebellion, will not for a long time be removed: trade is ſtill in a languiſhing condition, great part of the country remains uncultivated, and poverty and toil have uſurped the place of affluence and eaſe.

CHAP. XV.

ARABIA.

Situation, Boundaries, Diviſions, Climate, Soil, Produce, Inhabitants, Language, Religon, &c.

ARABIA is ſituated between the 35th and 60th deg. of eaſt longitude, and between the 12th and 30th of north latitude; extending about 3000 miles in length, and 1200 in breadth, and contains 700,000 ſquare miles. It is bounded by Turkey on the north; by Perſia and the gulphs of Baſſora and Ormus, on the eaſt; by the Red Sea, which divides it from Africa, on the weſt; and by the Indian Ocean, on the ſouth.

This country is divided into, 1. Arabia Petræa, N. W. 2. Arabia Deſerta, in the middle. 3. Arabia Felix, S. E.

Arabia Petræa has for its chief town, Suez, eaſt long. 33 deg. 27 min. north lat. 29 deg. 50 min.

Arabia Deſerta is ſubdivided into Haggiaz or Mecca, and Tehama; whoſe chief towns are, Mecca, eaſt long. 43 deg. 30 min. lat. 21 deg. 20 min. Siden, Medina, and Dhafar.

Arabia Felix is ſubdivided into Mocha, Hadramut, Caſſeen, Segur, Oman or Muſcat, Jamama, and Bahara. The town of Sibet belongs to Mocha, and that of Elcalf to Bahara; the reſt are the ſame as the provinces.

This country has always preſerved its ancient name. The word *Arab*, it is generally ſaid, ſignifies a robber or free-booter. The word *Saracen*, by which one tribe is called, is ſaid to ſignify both a thief, and an inhabitant of the deſert. Theſe names juſtly belong to the Arabians, for they ſeldom let any merchandize paſs through the country without extorting ſomething from, if not robbing, the owners. Thus concerning the Arabians, who are the poſterity of Iſhmael, is the prediction in ſcripture, Gen. xvi. 12. fulfilled, where it is ſaid, "He will be a wild man; his hand will be againſt every man, and every man's hand againſt him: and he ſhall dwell in the preſence of all his brethren."

The principal mountains in Arabia are thoſe called Gabel el Ared, in Arabia Felix, and the mountains of Sinai and Horeb, in Arabia Petræa, eaſt of the Red Sea. The latter are ſituated on the north ſide of the deſert of Sinai, and very ſteep and high, but not proportionably broad; and though a road is cut all the way up to their ſummits, the aſcent is very difficult and fatiguing.

The principal rivers are the Euphrates, which waſhes the north-eaſt limits, and the Tigris; both which have been already mentioned in the deſcription of Turkey in Aſia. Beſides theſe, there are few rivers, fountains, or ſprings in this country, which is almoſt ſurrounded with ſeas; namely, the Indian Ocean, the Red Sea, the gulfs of Perſia and Ormus. Roſalgate and Muſſedon are the chief capes or promontories.

Arabia being ſituated between the 2d, 3d, 4th, and 5th climates, the longeſt day in the ſouth is about fourteen hours and an half, and in the north eighteen hours and a half. A conſiderable part of this country lies under the torrid zone, and the tropic of Cancer paſſes over Arabia Felix; ſo that the air is exceſſively dry and hot, and, in many places, very unſalutary, particularly near the coaſt.

The air is ſaid to be the moſt ſultry and dry in the northern parts, and the hot poiſonous winds, which blow there as well as in Perſia, often prove fatal to thoſe who breathe them. Towards the ſouth, the heat is ſomewhat alleviated by the prodigious dews which generally fall in the night, and refreſh the earth.

The heat of the climate is greatly increaſed by the nature of the ſoil, which, in a great meaſure, conſiſts of barren rocky mountains, or ſandy deſerts of prodigious extent, over which there is no beaten paths; ſo that the caravans, obliged by the exceſſive heat to travel in the night, and having no tracks, are guided, as at ſea, by a compaſs, or by the ſtars. "Here," ſays Dr. Shaw, "are no paſtures ſtored with flocks, nor vallies ſtanding thick with corn; here are no vineyards or olive-yards; but the whole is a loneſome deſolate wilderneſs, no otherwiſe diverſified than by plains covered with ſands, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unleſs ſometimes at the equinoxes, refreſhed with rain; and the intenſeneſs of the cold in the night is almoſt equal to that of the heat in the day." This, however, is not to be underſtood of the ſouthern parts of Arabia, where the ſoil, refreſhed by the dews already mentioned, is in general exceeding fertile.

The cultivated lands in the ſouthern parts of Arabia Felix, which are chiefly about the towns near the ſea-coaſt, yield exceeding fine coffee, manna, myrrh, caſſia, aloes, balm of Gilead, frankincenſe, ſpikenard, and other valuable gums; cinnamon, pepper, and cardamoms; oranges, lemons, pomegranates, figs, dates, and other fruits, with a ſmall quantity of corn and wine. At Betelfagui the coffee-tree is cultivated.

The Arabian horſes are held in the higheſt eſteem all over Europe for their ſwiftneſs and beauty, and preferred to thoſe of any other country for ſtallions; the breed of Engliſh horſes, particularly, have been much improved by them. The fineſt ſort is in the kingdom of Sunnaa, where Mocha is ſituated. But the moſt uſeful animals to the Arabs are their camels and dromedaries, which are fitted by nature for travelling in parched and ſandy deſerts, their ſtomachs being formed in ſuch a manner, that they can from thence throw the water up into their throats. This peculiarity enables them to travel ſeven or eight days without drinking. It is ſaid, that theſe animals can diſtinguiſh the ſcent of water at a conſiderable diſtance, and the inſtant they ſmell it ſet out on a ſwift trot, and never ſtop till they reach the ſpot where it is found. They uſually carry eight hundred weight upon their backs, which is never taken off during the longeſt journeys, for they naturally kneel down to reſt, and riſe again with their load.

Though the Arabs in general are a wandering people, and conſequently very little acquainted with commerce; there is, however, a conſiderable trade carried on from Mocha by the Engliſh and Dutch companies ſettled there, in coffee, olibanum, myrrh, aloes, liquid ſtorax, white and yellow arſenic, gum Arabic, balm of Gilead, and other drugs.

As to the inhabitants, they are, in common with moſt of the Aſiatics, of a ſwarthy complexion, middle ſtature, and thin, with black hair and eyes. They are ſaid to be a brave people, excellent horſemen, very ſwift of foot, expert at the bow and lance, and, ſince they became acquainted with fire-arms, good markſmen. Some of them reſide in cities and towns upon the ſea-coaſts, and apply themſelves to trade, and cultivate the ſciences; but the far greater part have no ſettled habitation, roving, with their flocks and herds, from place to place, for the conveniency of

of water and paſture; and, during their abode in any particular ſpot, they live in tents. Among themſelves, and towards ſuch ſtrangers as they receive as friends, they are honeſt, civil, and humane; but their general character is that of free-booters or robbers, which the word Arab is ſaid to imply. Their food is chiefly rice, fiſh, herbs, veniſon, fowl, and moſt kinds of fleſh; but they prefer that of camels. Like the Jews, they always drain the blood from every thing they eat, and abſtain from ſuch fiſh as have no ſcales. Their drink is chiefly water and ſherbet, for they have no ſtrong liquors.

The habit of the roving Arabs is a kind of blue ſhirt, girt about them with a white ſaſh or girdle; and ſome of them have a veſt of fur or ſheep ſkins over it. They likewiſe wear drawers, and ſometimes ſlippers, but no ſtockings; and they have a cap or turban on their head. Many of them, however, go naked; but the women are ſo wrapped up, that no part of them can be ſeen but their eyes.

We ſhall now give ſome account of the caravans, and manner of travelling through the deſerts:—A caravan implies a company of merchants, travellers, or pilgrims, who, for their greater ſecurity, form a troop, in order to aſſiſt each other in travelling through the deſerts, which are infeſted by wild Arabs and other banditti. But no caravan can be formed without procuring the permiſſion in writing of the prince in whoſe dominions the caravan is formed, as well as that of thoſe through whoſe territories it is to paſs.—Theſe permiſſions always expreſs the number of perſons and carriages, and the quantity of merchandize, which are to compoſe the caravan, as well as the merchants to whom the goods belong. They alſo regulate every thing relating to its police and government, during the whole journey.

Caravans are generally diſtinguiſhed into four kinds; the heavy caravans, which are compoſed of elephants, camels, dromedaries, and horſes; the light caravans, in which there are but few elephants; the common caravans, in which there are none of thoſe unwieldy animals; and the horſe caravans, in which horſes only are uſed.

The heavy caravans are regulated by the following portions: when there are five hundred elephants, they add a thouſand camels, a thouſand dromedaries, and two thouſand horſes. The eſcort conſiſts of four thouſand cavalry. Two men are neceſſary for leading one elephant, ſeven men for eleven camels, and five men for three dromedaries. This multitude of ſervants, together with the officers and paſſengers, whoſe number is not limited, ſerve to ſupport the eſcort, in caſe of an attack; and therefore render the caravan at once more formidable and more ſecure.

The Arabian princes ſubſiſt principally in robbing; they traverſe the deſerts in troops, ſo that the caravans always travel with the greateſt precaution, being drawn up in a very regular manner. None ſtray from the caravan, nor deviate from the poſition aſſigned them at their firſt ſetting out. The wandering Arabs, as ſoon as they have intelligence of a caravan having entered the deſerts, ſend out ſpies to make the neceſſary obſervations on the number and force of the eſcort. If they find they are not able to attack the caravan in form, they hover round it, in order to pilfer from the merchants during the night; but, if they think themſelves able to defeat the eſcort, they approach boldly, and, begin the attack with the utmoſt fury. If the eſcort ſtand firm, the Arabs generally fly with the greateſt precipitation; for, being ſtrangers to military diſcipline, they hardly ever rally after being once repulſed; but, if the eſcort give way, the whole is thrown into confuſion, the caravan is plundered, and the whole convoy, except the foreign merchants, ſold for ſlaves. It is therefore no wonder if travellers of all kinds, and even pilgrims themſelves, who croſs theſe barren tracks from motives of devotion, are ſtruck with terror on entering the deſerts. Nor is even the moſt powerful caravan always ſecure, for they have more than once been attacked and plundered. In the year 1750, a body of 50,000 Arabians, under the command of one of their princes, attacked a caravan of merchants and pilgrims returning from Mecca, killed about 16,000 perſons, and plundered it of every thing valuable, though eſcorted by a Turkiſh army. On the ſea-coaſt they are mere pirates, and make prizes of every veſſel they can maſter, without diſtinction.

The whole commerce of the Indies was formerly carried on by caravans; but, ſince the diſcovery of a paſſage by the Cape of Good Hope, the caravan trade has been upon the decline. The dreadful wars carried on in the Leſſer Aſia and Egypt, whereby theſe rich countries were ſtripped of their wealth and inhabitants, increaſed the evil; and the exactions of the Turks, added to the late dreadful troubles in Perſia, have almoſt annihilated the whole. Few caravans now croſs the deſerts, except thoſe that paſs annually to Mecca on account of religion; and even theſe begin to decline, becauſe the merchants are no longer able to carry on their former trade with India. The roving Arabs raiſe a contribution on the caravans; thoſe which travel from Damas to Mecca procure an uninterrupted journey for the conſideration of 150,000 livres, to which the grand ſeignior is ſubjected.

Many of the wild Arabs are ſtill Pagans, but the people in general profeſs Mahometaniſm. Of this religion we ſhall give an account in the Hiſtory of Mahomet, their countryman.

Arabia was, in former ages, famous for learning and learned men, who were ſkilled in all the liberal arts; and many of the Arabian performances in phyſic, aſtronomy, and mathematics, ſhew the authors have been perſons of great genius and application; but there is ſcarcely a country at preſent where the people are ſo univerſally ignorant. The vulgar language uſed in the three Arabias is the Arabeſk, or corrupt Arabian, which is likewiſe ſpoken, with ſome variation of dialect, over great part of the Eaſt, from Egypt to the court of the great mogul.

The pure old grammatical Arabic, which is ſaid to be a dialect of the Hebrew, and, by the people of the eaſt, accounted the richeſt, moſt energetic, and copious language in the world, is taught in their ſchools, as Greek and Latin is among Europeans, and uſed by Mahometans in their worſhip. The books which treat of it, ſay, they have no leſs than a thouſand terms to expreſs the word *camel*, and five hundred for that of a *lion*. In this language the Koran was written, and they will not ſuffer it to be read in any other: they look upon it to have been the language of Paradiſe, and think no man can be maſter of it without a miracle, as conſiſting of ſeveral millions of words.

Sir William Jones has lately tranſlated into Engliſh ſeven Arabian poems, called the Moalakat, which are preſerved in the temple of Mecca, or ſuſpended on its walls or gates, and afford a fine ſpecimen of oriental poetry, as to the dramatic paſtoral. As a ſpecimen of theſe poems may ſerve to gratify the curioſity of our readers, and alſo diſplay a lively and entertaining view of the Arabian cuſtoms and modes of living, we have therefore tranſcribed from one of them the following ſtanzas:

1. "Deſolate are the manſions of the fair, the ſtations in Minia, where they reſted, and thoſe where they fixed their abodes! Wild are the hills of Goul; and deſerted is the ſummit of Rijaam."

2. "The canabs of Rayaan are deſtroyed: the remains of them are laid bare, and ſmoothed by the floods, like characters engraved on the ſolid rocks."

3. "Dear ruins! many a year has been cloſed, many a month, holy and unhallowed, has elapſed, ſince

ſince I exchanged tender vows with the fair inhabitants."

4. "The rainy conſtellations of ſpring have made their hills green and luxuriant: the drops from the thunder clouds have drenched them with profuſe as well as with gentle ſhowers."

5. "Showers from every nightly cloud, from every cloud veſting the horizon at day-break, and from every evening-cloud, reſponſive with hoarſe murmurs." (&c.)

6. "Here the wild eringo-plants raiſe their heads; here the antelopes bring forth their young by the ſides of the valley, and here the oſtriches drop their eggs."

7. "The large eyed wild cows lie ſuckling their young a few days old: their young, who will ſoon become a herd on the plain."

8. "The torrents have cleared the rubbiſh, and diſcloſed the traces of habitations, as the reeds of a writer reſtore efaced letters in a book;"

9. "Or as the black duſt, ſprinkled over the varied marks on a fair hand, brings to view, with a brighter tint, the blue ſtains of woad."

10. "I ſtood aſking news of the ruins concerning their lovely habitants; but what avail my queſtions to dreary rocks, who anſwer them only by their echo?"

11. "In the plains, which now are naked, a populous city once dwelled: but they decamped at early dawn, and nothing now remains but the canals, which encircled their tents; and the Thumaam plants, with which they were repaired."

12. "How were thy tender affections raiſed, when the damſels of the tribe departed; when they hid themſelves in carriages of cotton, like antelopes in their lair; and the tents, as they are ſtruck, gave a piercing ſound!"

13. "They were concealed in vehicles, whoſe ſides were well covered with awnings and carpets, with fine ſpun curtains and pictured veſts."

14. "A company of maidens were ſeated in them, with black eyes and graceful motions, like the wild heifers of Tudah, or the roes of Wegera, tenderly gazing on their young."

15. "They haſtened their camels till the ſultry vapour gradually ſtole them from thy ſight, and they ſeemed to paſs through a vale, wild with tamariſks, and rough with large ſtones, like the valley of Beiſha."

In theſe countries, time is meaſured by hour glaſſes; and, in ſome parts of Arabia Petræa, they have calendars that were left them by their anceſtors, which are rather curious, and in which the ſun's place, the ſemidiurnal and nocturnal arch, the length of the twilight, and the hours of prayer, are inſerted in their proper columns, and calculated to a moment.

They know nothing of algebra, or numerical arithmetic, though their anceſtors furniſhed us with the characters of the one, and with the name at leaſt of the other; yet they have a way of reckoning by putting their hands into each other's ſleeves, and touching one another with a certain joint or finger ſo expreſſively that, without even moving their lips, they can conclude bargains or agreements. They have, however, if you believe them, ſome wiſe men among them, who are ſo ſkilled in figures as to be able, by certain combinations of numbers, to form the moſt wonderful calculations. But Arabia is the boaſted ſeat of wonders!

The principal places and cities in Arabia come next under our conſideration.

The deſert of Sinai is a beautiful plain, near nine miles long, and above three in breadth; it lies open to the north-eaſt, but, to the ſouthward, is cloſed by ſome of the lower eminences of Mount Sinai; and other parts of that mountain make ſuch encroachments upon the plain as to divide it into two, each ſo capacious as to be ſufficient to receive the whole Iſraelitiſh camp.

Mount Horeb, where Moſes kept the flocks of Jethro, his father-in-law, when he ſaw the burning buſh, may be ſeen from Mount Sinai. On theſe mountains are many chapels and cells, poſſeſſed by the Greek and Latin monks, who, like the religious at Jeruſalem, pretend to ſhew the very ſpot where every miracle or remarkable tranſaction recorded in Scripture, was performed.

There are few places worthy notice in Arabia. The principal cities are Mecca, Medina, Mocha, Aden, Muſchat, and Suez; and thoſe only will be deſcribed. The two former are the centre of the devotion of all Mahometans; and the four latter the principal places of trade.

Mecca, the capital of all Arabia, and celebrated for being the birth-place of Mahomet, is ſituated forty-two miles to the eaſt of the Red Sea, in ſo barren a ſpot, that the country round it affords no ſuſtenance either for man or beaſt; ſo that the city is ſupplied with corn, &c. by two caravans, which arrive there, one in the ſummer, and the other in the winter, annually. All the water from the ſprings in the town is bitter and unfit to drink, which obliges the inhabitants to preſerve the rain water in ciſterns. There is indeed a well in the neighbourhood, called by the Arabs Zemzem, which they hold in the higheſt veneration, believing it to be the ſame which the angel pointed out to Hagar when her ſon Iſhmael was periſhing with thirſt. The pilgrims, who reſort to this city, always drink of the water of this well, to which they aſcribe a number of fabulous virtues. It is of a brackiſh taſte, and cauſes eruptions on the bodies of thoſe who drink it in any great quantity.

Hammam Faraun is the name of a hot ſpring, which riſes by two apertures out of a rock, at the foot of a high mountain. It is uſed in baths by the neighbouring ſick, who commonly ſtay forty days for cure, during which their only food is a fruit called Laſſaf, which grows here. The tradition that the Jews paſſed this way, and that Pharaoh's army was drowned here, has occaſioned this place to receive the name of Birket-el-Faraun. The Arabs imagine that Pharaoh is doing penance at the bottom of this well, and vomits up the ſulphurous vapour with which the water is impregnated.

The moſque in this city is eſteemed the moſt magnificent of any temple in the world. Its lofty roof, raiſed in form of a dome, and covered with gold, and the two beautiful towers, of extraordinary height and architecture, make a moſt ſuperb appearance, and are conſpicuous at a very great diſtance. This temple has an hundred gates, with a window over each; is three hundred and ſeventy cubits long, three hundred and fifteen broad, and ſupported by four hundred and thirty-four pillars. The Mahometans pretend that this moſque is erected on the very ſpot where Abraham built his dwelling-houſe, which has been preſerved ever ſince, and ſtands in the centre of the temple. They call it Al-Caabah, the Holy-Houſe, or chapel, and ſay, that it was firſt erected by Adam; but, being deſtroyed by the deluge, was, by the command of God, rebuilt by Abraham and Iſhmael. It is about fifteen feet long, twelve broad, and thirty high. The door is of ſilver; the walls are conſtantly covered with hangings of fine ſilk, beautifully wrought, and girt round with two belts of gold, one near the bottom, and the other near the top. In this houſe the Mahometans alſo affirm that their great prophet was born, and every Muſſulman is obliged, by his religion, to viſit it once in his life, or to ſend a deputy; ſo that the number of pilgrims who annually reſort thither is incredible.

Medina is ſituated about 250 miles north of Mecca, and fifty from the Red Sea. It is famous for being the place which Mahomet choſe for his reſidence when he was driven out of Mecca, and likewiſe that of his interment. The moſque, which contains his ſepulchre, is a ſtructure of vaſt magnificence, and

ſtyled the Moſt Holy. It is ſupported by 400 ſtately columns, and embelliſhed with 300 ſilver lamps, continually burning. The cupola, which is but ſmall, is covered with plates of ſilver, and under it is raiſed the prophet's tomb of white marble, encloſed in ſuch a manner that it can only be viewed through windows, made for that purpoſe, and latticed with ſilver. The inſide is enrched with ſtones of immenſe value, particularly that part which is over the head of the prophet. At the foot of the coffin is a golden creſcent, the workmanſhip of which is greatly admired, being curiouſly wrought, and adorned with precious ſtones. The coffin is covered with cloth of gold, and over it is a rich canopy of ſilver tiſſue, both which are renewed annually by the baſhaw of Egypt, according to the orders he receives, for this purpoſe, from the grand ſeignior. The camel which carries it derives a ſort of ſanctity from it, and is never to be uſed in any drudgery afterwards. The old pall and canopy are always cut to pieces, and ſold to the ſuperſtitious Mahometans as ſacred relics. The place where the coffin lies, is ſupported by black marble pillars, and encompaſſed by a baluſtrade of ſilver, hung with a number of lamps of the ſame metal, kept continually burning. Vaſt numbers of pilgrims reſort to this city, but not in ſuch multitudes as to Mecca; for this journey is not enjoined expreſsly by their religion, though ſuch as perform it are entitled to great privileges, and eſteemed ſaints ever after. Chriſtians are forbid approaching either Mecca or Medina within a limited diſtance, on pain of being burnt alive.

Mocha is a port town, ſituated on the Red Sea, and gives name to a kingdom of conſiderable extent along the ſouthern coaſt of Arabia. It has four gates and as many towers; the buildings are lofty, and tolerably regular: they are covered with a chinam or ſtucco, that gives a dazzling whiteneſs to them. The harbour is ſemicircular, the circumference of the wall is two miles, and there are ſeveral handſome moſques here. This city is now the emporium for the trade of all India to the Red Sea, and the coffee exported from thence is eſteemed ſuperior to that of any other place. It has already been obſerved, that the Engliſh and Dutch companies have houſes there, and carry on a conſiderable commerce. The only inconvenience they ſuſtain is from the violence and exactions of the Arabian princes; for the king's cuſtoms are eaſy, being fixed at three per cent. to all Europeans.

Aden is likewiſe a conſiderable place for trade, on the Indian Ocean, being ſituated in the kingdom, about 120 miles ſouth-eaſt of that city, and not far from the Streights of Babelmandel. It ſtands at the foot of ſeveral high mountains, on the ſummits of which the Arabians have erected five or ſix forts, with ſeveral fortifications, to guard the paſſes. This town is well ſupplied with good water, and contains about 6000 inhabitants.

Muſchat, or Moſcat, and Suez, were formerly places of conſiderable ſtrength; but they are now only remarkable for the trade carried on with the latter by the Turks, and with the former by the Portugueſe.

The city of Suez ſtands upon the weſtern ſide, but not juſt upon the weſtern extremity of the Arabian gulf. It is not ſurrounded with walls; but the houſes are built ſo cloſely together that there are only two paſſages into the city, of which that neareſt the ſea is open, the other ſhut by a very inſufficient gate. The houſes are very ſorry ſtructures; the kans being the only ſolid buildings in the city. Hardly any part now remains of the caſtle which the Turks built upon the ruins of the ancient Kolſum. Suez is very thinly inhabited: among its inhabitants are ſome Greeks, and a few families of Copts; but, about the time of the departure of the fleet, it is crowded with ſtrangers.

The ground lying round it is all one bed of rock, ſlightly covered with ſand; ſcarce a plant is to be ſeen any where in the neighbourhood; trees, gardens, meadows, and fields, are entirely unknown at Suez. Fiſh is the only article of proviſions plentiful here. All other neceſſaries of life, for both men and the domeſtic animals, are brought from afar, from Cairo, which is three days journey from Suez; Mount Sinai, at the diſtance of ſix days journey; or Ghaſſo, at the diſtance of ſeven. There is not a ſingle ſpring of water.

Ship-building is the chief employment of the inhabitants; although wood and iron, and all the other materials, are to be brought from Cairo upon camels, and are conſequently very dear. The ſhips built at Suez have a very awkward rudder, made of a large beam, the uſe of which is dangerous and inconvenient. The governor of Suez was a bey from Cairo; and he kept a very numerous houſehold. He was a Mahometan by birth, and the ſon of a ſugar-merchant.

Mr. Niebuhr, in his travels through Arabia, has given the following deſcription of the city of Loheia in that country. He tells us it has ſtood only for three centuries: that its founder and patron was a Mahometan ſaint, called Schiech Saled, who built a hut on the ſhore where Loheia now ſtands, and ſpent there the reſt of his days as a hermit. After his death, a kabbet, or houſe of prayer, was raiſed over his tomb; and it was afterwards, by degrees, embelliſhed and endowed. Some devout perſons, imagining that it would be a great happineſs to them to live near the remains of ſo holy a perſon, built huts for themſelves about his tomb. Nearly at the ſame time, the harbour of Marabea, a neighbouring city, in which a governor reſided, was filled up. The inhabitants, upon this, deſerted their city, and ſettled at Loheia, whither the ſeat of government was tranſferred.

The territory of Loheia is arid and barren. The harbour is ſo indifferent, that even the ſmalleſt veſſels are obliged to anchor at a great diſtance from the city; and when the tide is at ebb, laden boats cannot approach near it. Notwithſtanding this diſadvantage, a conſiderable trade in coffee is carried on from Loheia; the coffee is brought from the neighbouring hills, and expoſed in one large heap for ſale. This coffee is not reputed to be ſo good as that which comes from Beit el Fakih, and is ſhipped at Mocha and Hodeida: but coffee is to be purchaſed here upon more reaſonable terms, and the carriage to Jidda coſts leſs.

Loheia, although without walls, is not entirely defenceleſs. Twelve towers, guarded by ſoldiers, ſtand at equal diſtances round it. Theſe towers reſemble thoſe in ſome of the imperial cities of Germany: the height of its gates renders it neceſſary to climb up to them upon ladders. Only one of thoſe towers, and that newly built by Emir Farhan, is ſuch as to admit of being defended by cannons: the reſt are ſo ill built, that the Arabs of Haſchid, ſome time ſince, made their way through them, and ſet fire to the city.

Several of the houſes in Loheia are built of ſtone; but the greater part are huts conſtructed in that faſhion which is common among the Arabs. The walls are of mud, mixed with dung, and the roof is thatched with a ſort of graſs, which is very common there. Around the walls within, are a range of beds made of ſtraw, on which, notwithſtanding their ſimplicity, a perſon may either ſit or lie commodiouſly enough. Such a houſe is not large enough to be divided into ſeparate apartments; it has ſeldom windows, and its door is only a ſtraw mat. When an Arab has a family and cattle, he builds for their accommodation ſeveral ſuch huts, and encloſes the whole with a ſtrong wooden fence. The population of the cities of Arabia, therefore, cannot be proportionate to their extent. The water of Loheia is very

bad, and is brought from a diſtance: the beſt comes two leagues and a half from the city. The common people drink from a well, which is a league from the city. Within two leagues of Loheia, is a ſmall hill, which affords conſiderable quantities of mineral ſalt.

The city of Mocha, built about four centuries ſince, ſtands in a very dry and barren ſituation. Its fortifications are the walls that ſurround it, ſome towers on the way to Muſa, which are dignified with the name of caſtles, and two other caſtles of the ſame ſort upon the two arms of the harbour. The greateſt of theſe two caſtles is called Kalla Tojar, and the ſmalleſt Kalla Abdurrah, from the names of two ſaints, buried in theſe two places. They are provided with ſome few pieces of cannon.

The houſes in the city are built of ſtone, and ſome are handſome: however, there are others, both within and without the walls, no better than the huts common through all the Tehama. In the environs of this city are abundance of date trees, and many agreeable gardens.

The northern parts of Arabia being ſubject to the Turks, are governed by baſhas of their appointing. The inland country is under the juriſdiction of ſeveral petty princes, denominated Xeriſs and Imans, who, in ſpiritual as well as temporal affairs, ſeem to be abſolute, guiding themſelves by no other laws than thoſe found in the Koran, and the comments upon it. The wandering Arabs are governed by ſheikhs and emirs. A ſheikh ſuperintends a particular collection of tents, which are called dow-wars; but an emir rules over a whole tribe, and, conſequently, their authority extends to many of theſe dow-wars. There is one diſtinguiſhed by the title of grand-emir, who is in ſome reſpect ſuperior to the reſt, though his authority is often diſputed.

The Arabs have no ſtanding regular militia, but their chief commands both the perſons and purſes of the ſubjects, as the neceſſity of affairs requires. The people are diſtributed into ſeveral clans; and the whole number of inhabitants are ſuppoſed to amount to about 2,000000.

THE HISTORY OF THE ARABS, AND OF MAHOMET, THEIR PROPHET.

THE Arabs, even from the earlieſt times, have been a free and independent people. It was foretold of their great anceſtor Iſhmael, that his hand ſhould be againſt every man, and every man's hand againſt him. This prediction has been remarkably fulfilled. The Arabs are ſtill wanderers in their native country. They owe no ſubjection to any but their emirs, the princes or chiefs of each itinerant tribe. Robbers by profeſſion, they conſider the property of every ſtranger as their own; and their ferocity, added to the inhoſpitable nature of their extenſive deſerts, has much tended to leſſen the trade carried on by caravans to India. In the remote ages of antiquity, the Arabs were indeed a great and warlike people; they had kings of their own, and to their aſſiſtance Ninus chiefly owed the conqueſt of Babylon: but inteſtine commotions, and civil wars, ſoon commenced among themſelves, and their different tribes have ever ſince continued under a kind of patriarchal government. Neither the Perſians under Cyrus, the Greeks under Alexander, the Romans under their moſt fortunate generals, the Tartars under Tamerlane, nor the Turks in their greateſt height of power, could make an entire conqueſt of Arabia. Part of that country was indeed ſubdued; but the greater number of theſe wandering tribes ſtill preſerved their independency, and bid defiance to all the force that could be ſent againſt them.

In the ſixth century, about the year 596, the great impoſtor Mahomet appeared, and changed, for a time, the greater part of the Arabian ſyſtem of government. He was born at Mecca, and deſcended from the tribe of the Coreiſchites, eſteemed the moſt ancient and illuſtrious in Arabia; but his parents were very poor. In the early part of his life, he was employed as a factor by his uncle, Abuteleb, and in that capacity travelled into Syria, Paleſtine, and Egypt. Subtle by nature, though deſtitute of learning, he made many obſervations on the different religions profeſſed in thoſe countries, and the various ſects into which they were divided. He perceived that moſt of the fundamental principles of theſe different ſects were the ſame, and that the conteſted tenets which had given riſe to ſuch dreadful animoſities, were trifling in themſelves, and thence imagined that it would be eaſy to form a religion which would unite them all, and remove thoſe heats and animoſities which had produced ſo many diſorders among mankind. But his poverty and want of learning were obſtacles which he was at firſt in no capacity to ſurmount.

In the mean time his uncle died, and Mahomet became a ſervant to a rich Syrian merchant, and for ſome time travelled with his caravans into different parts of Aſia-Minor. Cadija, the wife of Mahomet's maſter, often received her ſervant with pleaſure, and at his death, took him to her bed. This fortunate incident removed one of the obſtacles to Mahomet's ſcheme; he was now poſſeſſed of wealth ſufficient for his purpoſes, but learning was not to be purchaſed with money: time and aſſiduity alone could procure that valuable acquiſition; and thoſe were incompatible with the nature of his deſign. Enterpriſing by nature, and poſſeſſed of a ſpecies of ambition peculiar to himſelf, he conſidered every moment he delayed the execution of his ſcheme, as a loſs to the world as well as to himſelf. In this ſtate of perturbation he diſcovered, that a perſon among his own ſervants was poſſeſſed of the learning he ſo greatly wanted, and which had hitherto prevented him from attempting the work he was ſo deſirous to perform. This perſon was Sergius, a Neſtorian monk, a perſon of great parts and learning, but ſuch a libertine in his conduct, that he had been expelled the convent, and taken ſhelter among the Arabs. The monk cordially embraced the offers of Mahomet; but, at the ſame time, rightly obſerved, that it would be very difficult, perhaps impoſſible, to eſtabliſh a new religion, without pretending to a divine ſanction. Mahomet perceived the juſtneſs of the remark, and, ever fruitful in reſources, determined to turn a natural calamity to his own advantage. He had long been afflicted with epileptic fits, and pretended that theſe were only trances, into which he was thrown at the ſight of the angel Gabriel, who was often ſent from heaven to reveal the will of the Almighty, and which he was commanded to publiſh to the world. But leſt the truth of this ſtory ſhould be ſuſpected, he lived a very auſtere and abſtemious life, which ſoon procured him a character for ſanctity, far ſuperior to that of any of his neighbours. This gave a ſanction to his pretenſions; his followers increaſed daily both in number and enthuſiaſm, and Mahomet now thought proper to make an open declaration of his miſſion. He aſſerted, that he was a prophet ſent from God into the world to teach his law, and compel mankind to obſerve it. Alarmed at the pretenſions of this enthuſiaſtical impoſtor, and dreading the fatal conſequences generally attending popular inſurrections, the magiſtrates of Mecca determined to put a final period to the growing evil, by taking off the bigotted leader. But the requiſite ſecrecy was not obſerved: Mahomet was apprized of their intentions, and fled, with a few of his faithful followers, to Medina. This flight, which happened in the tenth year of his miniſtry, the Mahometans uſe as an epocha in the computation of time, calling it by the Arabic word Hegira, i. e. the flight.

The fame of Mahomet had reached Medina ſome years

years before he was obliged to take refuge in that city; ſo that the inhabitants received him with open arms. Aſſiſted by his faithful companion the monk, Mahomet now applied himſelf to form a ſyſtem of religion that ſhould extend to all the neighbouring nations, and be conformable to their different profeſſions. At the ſame time, he was very careful to render it agreeable to the prejudices of mankind. He knew that ſenſual enjoyments were much better adapted to the generality of the people, than ſpiritual; and therefore promiſed them every delight that human nature is capable of enjoying.

The fundamental principle on which Mahomet erected the ſuperſtructure of his religion was, that there has been from the beginning of the world but one true orthodox belief, which conſiſts in acknowledging one true God only, and obeying the precepts of ſuch miniſters and prophets as he ſhall, from time to time, ſend into the world, to reveal his will to mankind. Upon this foundation, *he* pretended to be a prophet ſent into the world to reform the abuſes crept into religion, and to reduce it to its original ſimplicity. He added, that as the endeavours of Moſes and Chriſt were rendered abortive, God had ſent him, as his laſt and greateſt prophet, with a more ample commiſſion than either Moſes or Chriſt were intruſted with. Their's were confined to perſuaſion only, but his extended to force. The ſword was to effect what preaching and miracles had endeavoured in vain: the divine law was to be propagated by force, and the throne of the faithful founded on the blood of unbelievers. The bounds of this kingdom were to be the ſame with thoſe of the world, and all the nations of the world were to be governed by the ſceptre of Mahomet. But as theſe conqueſts could not be made without danger, Mahomet promiſed, that thoſe who ventured their lives in eſtabliſhing his kingdom, ſhould enjoy the ſpoils and poſſeſſions of their enemies, as a reward in this life, and, after death, a paradiſe of all ſenſual enjoyments, eſpecially thoſe of love. He added, that thoſe who died in propagating the faith, would enjoy a diſtinguiſhed place in paradiſe, experience pleaſures peculiarly intenſe, and vaſtly ſuperior to the reſt of mankind. Theſe particulars, together with the doctrine of predeſtination, and a prohibition of drinking ſpirituous liquors, formed the principal articles of Mahomet's creed; and were written by the monk already mentioned, in a book called the Koran, or Alkoran, by way of eminence above all other writings.

The Koran was no ſooner publiſhed, than Mahomet's followers increaſed in a very aſtoniſhing manner. His doctrine was ſoon propagated in diſtant countries. Arians, Jews, and Pagans abandoned their former religion, and became Mahometans. The contagion ſpread in a very rapid manner over Arabia, Syria, Egypt, and Perſia; and Mahomet, from a deceitful, impotent impoſtor, became one of the moſt powerful monarchs of his age. He died three years after his conqueſt of Mecca, in the ſixty-third year of his age, and in the year 629. His ſucceſſors purſued the plan of their prophet, and exerted themſelves in propagating his religion by the ſword.

The caliphs of Egypt and Arabia, under the names of Saracens and Moors, extended their conqueſts into various parts of Europe. They reduced great part of Spain, France, Italy, and the iſlands in the Mediterranean. The caliphs of Perſia turned their arms to the eaſt, and conquered ſeveral countries; the Tartars, under Tamerlane, carried their conqueſts into China and the Indies; and the Turks reduced the Greek empire, and made Conſtantinople the ſeat of their government.

In this rapid manner was the Mahometan religion propagated in various parts of the world; it is ſtill profeſſed by a conſiderable part of mankind, and eſtabliſhed in various countries.

CHAP. XVI.

THE ASIATIC, OR INDIAN AND ORIENTAL ISLANDS.

THE EMPIRE OF JAPAN.

THE iſlands of which this extenſive and opulent empire is compoſed, are called Japan, or Niphon, Bongo, Tonſa, and Dezima. They are ſituated about 150 miles eaſt of China, and extend from the 30th to the 41ſt deg. of north lat. and from the 130th to the 147th deg. of eaſt long.

The inhabitants call this empire Niphon, the name of the chief iſland; the Chineſe term it Siphon; and the Europeans give it the general appellation of Japan. It was firſt diſcovered between the years 1535 and 1548, by the Portugueſe, who were afterwards expelled from this gainful trade by the Dutch.

Japan being ſituated between the fourth and ſeventh climates, the ſun riſes with them about eight hours before it does with us. The ſea breezes greatly mitigate the heat in ſummer, but they add to the exceſſive coldneſs in winter, and render the ſeaſons in general exceedingly unſettled. The rains in ſummer are very violent, and ſtorms of thunder and lightning, and dreadful hurricanes, frequently happen, to the great detriment of the country; earthquakes are alſo very common here.

The ſoil, and likewiſe the animal and vegetable productions of Japan, are much the ſame with thoſe in China. The earth yields Indian and other corn, fine rice, millet, and various other grain, beſides ſeveral kinds of fruits: likewiſe flowers and herbs, particularly excellent tea. The mountains, woods, and foreſts are well ſtocked with horſes, ſheep, oxen, hogs, elephants, wild beaſts, buffaloes, deer, &c.

The rivers, which afford plenty of fiſh, are generally exceeding rapid, and many dreadful cataracts fall from the mountains. The principal rivers are the Ujingava, whoſe waters are ſo furious, that no bridge can be built over it; the Corric, that takes its name from the province in which it riſes; and the Aſkagava, remarkable for its depth and perpetual fluctuation.

The chief lake, called Citz, is 100 miles in length, and twenty in breadth. It is formed by the conflux of ſeveral rivers, and diſembogues itſelf into the ſea on the ſouth-weſt ſide of the iſland.

The mountains in this empire are very numerous, moſt of the iſlands of which it is compoſed being ſurrounded by them; one in particular, in Niphon, is of ſuch a prodigious height, that though its diſtance from the ſhore is fifty-four miles, it may be diſcerned twice that diſtance by veſſels at ſea; and ſome authors are of opinion, that it is higher than the famous peak at Teneriffe. Indeed, this may with more propriety be called a cluſter of mountains, and among them are eight dreadful volcanoes, which burn with ſuch prodigious fury, that the country is often deſtroyed for ſeveral miles round. Some of the mountains yield mines of gold, ſilver, copper, tin, lead, iron, and various other metals; while others abound with ſeveral ſorts of marble and precious ſtones. The mountains in the iſland of Niphon alſo afford great variety of medicinal waters of different degrees of heat; one of which is ſaid to be as hot as burning-oil. Several rivers and brooks have their ſources among them, ſome of which fall in gentle caſcades, whilſt others form dreadful cataracts. The ſeas ſurrounding theſe iſlands produce great quantities of red and white coral,

and

and pearls of great value, with a profuſion of ſea-plants and beautiful ſhells. Many dangerous whirlpools are formed in theſe ſeas, which make a terrible noiſe, and, at low water, ſwallow up the largeſt veſſels, if they attempt to croſs them.

The complexions of the Japaneſe are in general yellowiſh, although ſome few, chiefly women, are almoſt white. Their narrow eyes, and high eyebrows, are like thoſe of the Chineſe and Tartars, and their noſes are ſhort and thick. Their hair is univerſally black.

They are very ingenious mechanics, and greatly excel the Chineſe in ſuch works as are common in both empires; particularly in the beauty, goodneſs, and variety of their ſilks, cottons, and other ſtuffs, and in the porcelain and lacquered wares. Both the temper and workmanſhip of their ſcimitars, ſwords, muſkets, &c. are ſuperior to any other made in theſe eaſtern parts. Their architecture is in the ſame ſtyle as that of China; but they affect rather uſefulneſs than grandeur in their houſes, which are built with upright poſts, croſſed and wattled with bamboo, plaſtered both without and within, and whitewaſhed: they generally have two ſtories; but the uppermoſt is low, and ſeldom inhabited. The roofs are covered with pantiles, large and heavy, but neatly made.—The floors are elevated two feet from the ground, and covered with planks, on which mats are laid. They have no furniture in their rooms, not even beds.—They ſit down on their heels upon mats. Their victuals are ſerved up on a low board, near the floor, one diſh at a time. Their mirrors are not fixed up as ornamental furniture.

Their dreſs is ſimilar to that of the Chineſe, but more neat and elegant, and generally of ſilk or cotton. The women of faſhion, eſpecially the young ones, adorn themſelves with flowers, feathers, pearls, &c. but are ſeldom ſeen abroad, or even at home, by any except their own people, without a veil. Fans are uſed by both ſexes equally.

They are naturally cleanly; in their manners, civil and polite; obedient to parents, reſpectful to ſuperiors, and honeſt in their dealings; ſo that, though their penal laws are ſevere, puniſhments are ſeldom inflicted. Commerce, manufactures, and agriculture flouriſh here.

The forces of Japan, in time of war, amount to 400,000 foot, and 40,000 horſe; and the annual revenues have been computed at thirty-ſix millions ſterling. The government, like that of all the eaſtern nations, is deſpotic; but the power of the emperor is generally exerciſed with clemency.

The principal commodities exported from Japan, are rice, ſilk, and cotton; fine porcelain and lacquered wares, gold, ſilver, copper wrought and in bars, iron, ſteel, and other metals; rich furs, tea of all ſorts, much finer and better cured than that of China; a great variety of drugs, which as well as their tea are ſold genuine, well dried, and carefully preſerved: diamonds and other precious ſtones, pearls of exquiſite beauty, coral, ambergris, &c.

All trade with the Europeans, except the Dutch, is prohibited, and even the Hollanders are allowed to have only one factory, which is at Nagaſacci, in the iſland of Dezima, where there is an excellent harbour. Nor are they permitted to converſe with any of the inhabitants, but ſuch as are appointed by the governor, except the ſix weeks of open trade, when the Japaneſe reſort from all parts of the empire to Dezima, where they open booths furniſhed with the fineſt merchandize of their country.

In the city of Meaco, in 45 deg. 38 min. north lat. and 138 deg. 15 min. eaſt long. which was formerly the capital of Japan, is a Coloſſus of gilt copper, of prodigious dimenſions. It is ſeated in a chair eighty feet in breadth, and ſeventy in height. The thumb of this enormous ſtatue is fourteen inches in circumference, and the other parts in proportion; fifteen men can ſtand on its head. It is one of the principal idols of this empire.

Jeddo, Jedo, or Yeddo, is now the metropolis of the empire, and the moſt conſiderable city in Japan. It is large and populous, and contains the palace of the emperor, ten or twelve miles in circumference. This city is in 35 deg. 48 min. north lat. and 144 deg. 10 min. eaſt long.

Next to the above two, the moſt conſiderable city in Japan is Oſacco, which is ſituated at the mouth of the river Jedogawa, about fifteen leagues from Meaco, and in 35 deg. 15 min. north lat. and 137 deg. 20 min. eaſt long. It is deemed the principal ſea-port in the empire, and is filled with an incredible number of merchants, tradeſmen, mechanics, eccleſiaſtics, &c. It is near fifteen miles in circuit, contains many elegant houſes, ſome palaces belonging to the nobility, and is ſtrongly fortified.

The principal commodities of Japan have been already mentioned: and it may not be improper to add, that no people in the world equal the Japaneſe in the fairneſs of their dealings; no fraud of any kind is practiſed; their commodities are genuine, not the leaſt adulteration is uſed. Cautious and faithful themſelves, they expect the ſame treatment from others. All commodities are exported and imported duty free. But if contraband goods are found on board any trading veſſel, if the wares are either adulterated or damaged, and the injury concealed, or any fraud be diſcovered in the invoice, the offenders are always puniſhed in the ſevereſt manner.

At the ſeaſon when the Dutch fleet is expected, centinels are placed on the hills to give timely notice of the approach of any ſhips; and boats are immediately ſent off with proper officers, who take care that no trade of any kind be carried on with the natives, till the permiſſion to trade arrives from the emperor: even then the greateſt regularity is obſerved, ſix only of the ſeamen are permitted to go on ſhore at one time; and in this manner they ſucceed each other during the time the mart is open. By this wiſe conduct, all diſorders are unknown; trade is carried on in a fair and open manner; all frauds and deceptions, which generally reſult from hurry and confuſion, are prevented; and the whole is conducted in a manner that gives entire ſatisfaction to both parties.

Beſides the ſugars, ſpices, and manufactured goods which the Dutch ſend to Japan, they carry thither annually upwards of 200,000 doe-ſkins, and more than 100,000 hides, the greateſt part of which they get from Siam, where they pay for them in money. The merchandize they export from theſe iſlands, both for Bengal and Europe, conſiſts in 900 cheſts of copper, each weighing 120 pounds, and from 25 to 30,000 pounds weight of camphire. Their profits on imports and exports are valued at forty or forty-five per cent. As the Dutch company do not pay duty in Japan, either on their exports or imports, they ſend an annual preſent to the emperor, conſiſting of cloths, chintz, ſuccoats, cottons, ſtuffs, and trinkets.

The Japaneſe are the groſſeſt of all idolaters; nor does it appear that they ever had any notion of a Supreme Being: they believe the world to have exiſted from all eternity; and that the gods they worſhip were once men, who lived upon earth ſeveral thouſand years, and were at laſt, as a reward for their piety, mortification, and voluntary death, raiſed to that height of power and dignity they now poſſeſs.—They are ſo irreconcileable to Chriſtianity, that it is commonly ſaid, the Dutch, who are the only Europeans with whom they now trade, pretend themſelves to be no Chriſtians, and humour the people in the moſt abſurd ſuperſtitions; inaſmuch as it is ſaid, that a ſtranger is not ſuffered to land in any part of the empire, unleſs he firſt publicly renounces the Chriſtian religion. But notwithſtanding this ſhameful compli-

ance

ance of the Dutch, the natives are very ſhy and rigorous in all their dealings with them.

The Japaneſe are not remarkable for uſeful learning, aſtrology being the art in general ſtudied among them. There are, however, a vaſt number of univerſities, in which the prieſts preſide, diſperſed all over the empire: they are finely ſituated, richly endowed, accommodated with all the conveniencies of life, and furniſhed with large libraries. Theſe people are much addicted to poetry, muſic, and painting; and are ſaid to excel in the firſt, both with regard to the ſtyle, imagery, and harmony of the cadence. They are better painters than the Chineſe, but greatly inferior to the European artiſts. Their language has ſome affinity to that of China, but appears, from its various dialects, to have been originally compounded of that and other languages, uſed by the various nations that firſt peopled theſe iſlands.

With reſpect to their hiſtory, the Japaneſe annals of early times are filled with ſuch inconſiſtent abſurdities, and ridiculous fables, that no dependence can be placed on them, till about 660 years before Chriſt, which is their common æra; and, according to which, our preſent year 1800, is with them the year 2460; it is likewiſe to be obſerved, that the Japaneſe year begins the neareſt new moon, which either precedes or follows the 5th day of February.

The hiſtories of Japan, written by the natives, take very little notice of the policy, virtues, vices, or tranſactions of their monarchs, but are filled with an account of their deſcent, names, birth, ſucceſſion, length of reign, &c.

The following chronicle of the more recent princes of Japan, is taken from their own hiſtorians:

1. Taycho. This monarch was of a very mean extraction, but in his youth raiſed himſelf to be butler to a tributary prince, and by dint of valour and merit was at length exalted to the cuboſhip. He was the firſt monarch who obliged the petty kings and great lords to attend upon him perſonally, and ſuffer their wives and kindred to reſide in his palace, as hoſtages for their fidelity; by which prudent policy he ſtruck at the very root of that rebellious ſpirit ſo common in Japan, and put an end to the poſſibility of raiſing inſurrections. He expelled the Portugueſe from Japan, prohibited their ever after trading with his ſubjects, and began the firſt perſecution againſt the Chriſtians. He died on the 6th of December, A. D. 1598. After his deceaſe he was deified, and called the *Second Mars of Japan.*

2. Quanbacundono, the nephew of Taycho, is accounted the thirtieth Cubo, as he reigned for ſome time in conjunction with his uncle; but having diſobliged that monarch, he was ordered to rip up his own bowels, the moſt honourable method of ſuffering death in Japan.

3. Fide-Jori, the ſon of Taycho, began his reign at ſix years of age; during his minority, the affairs of government were conducted by his father-in-law, Ijejas, for Fide-Jori had been contracted in his infancy to a daughter of that nobleman, who traiterouſly deprived him of his crown and life, after a reign of fourteen years.

4. Ijejas-Samma, having uſurped the throne, made the following articles the principal objects of his reign. 1. The total extirpation of the Portugueſe from Japan. 2. The prohibition of any of his ſubjects from leaving the empire, and recalling thoſe who were in foreign parts. 3. The publication of ſevere edicts againſt gaming, luxury, and duelling. 4. The granting a Dutch factory to be eſtabliſhed in Japan.

It may be proper to obſerve here, that the perſecution againſt the Chriſtians in Japan, both natives and foreigners, was carried on with ſuch horrid cruelty, that in the ſpace of the four firſt years of the reign of this monarch, 20,570 perſons were maſſacred. Notwithſtanding which, in the two ſucceeding years, after the churches had been ſhut, and the public profeſſing of Chriſtianity prohibited, the Jeſuits, by their private endeavours, made 12,000 proſelytes; and when any of theſe were detected, they not only abſolutely refuſed to abjure the Chriſtian faith, but readily ſubmitted to death, and ſuffered martyrdom with aſtoniſhing conſtancy. And indeed the perſecution continued forty years, reckoning from its commencement, in the reign of Taycho, with unremitting cruelty, before Chriſtianity could be totally exterminated. Ijejas reigned about five years after the death of Fide-Jori, and died at about ſeventy years of age.

5. Fide-Tada, the grandſon of the above monarch, as we have already inferred, continued the perſecution, till at length the Chriſtians, driven to the utmoſt deſpair, retired to the number of 37,000, to the caſtle of Simabara, in the iſland of Ximo, where they determined to defend themſelves to the laſt extremity. The Japaneſe army laid ſiege to the place, which held out for three months; but at length was compelled to ſurrender on the 12th of April, 1638, when the Chriſtians were all put to the ſword.

This monarch reigned eighteen years, and was ſucceeded by his ſon,

6. Ijemitz. This emperor reigned twenty-one years, and was ſucceeded by,

7. Ijetznako. This monarch, who was the ſon of the former, reigned thirty years, and left the crown to his ſon,

8. Tſinajos. This prince was the laſt Japan monarch that we have any authentic account of, and was upon the throne when the Dutch ambaſſador was at Japan, being then forty-three years of age, and having reigned thirteen years; he was a great philoſopher, a ſtrict obſerver of the laws, exceedingly humane and benevolent, and, in the true ſenſe of the word, the father of his people.

CHAP. XVII.

THE LADRONE ISLANDS.

THESE iſlands, which are about twenty in number, belong to the Spaniards, and were firſt diſcovered in 1521. They obtained the name of Marian-Iſlands, from Mary, Queen of Spain, who reigned at the time of their being firſt inhabited by her ſubjects. They are alſo known by the name of Thieves-Iſlands, which epithet was given to them by Ferdinand Magellan, the firſt perſon who diſcovered them, on account of the continual robberies for ſome time committed by the natives.

The Ladrone Iſlands lie about 600 leagues to the eaſt of Canton in China; 700 leagues eaſt from the Philippines, and 7300 weſt from Cape Corientes in America. The principal part of them have been for many years uninhabited, notwithſtanding they are all pleaſantly ſituated, and the ſoil in general is very fertile. The only one that can properly be ſaid to be now inhabited by the Spaniards is Guam, where a governor reſides, and where there is kept a very ſtrong garriſon. It is at this iſland that the Manilla regiſter-ſhip generally takes in freſh proviſions and waters, in her paſſage from Acapulco to the Philippines.

The iſlands of Tinian and Rota were once very populous; but the former is now quite uninhabited, and the latter contains only a few Indians, who are employed in cultivating rice for the inhabitants of Guam.

Guam is about forty miles in length, and ninety miles in circumference, and the number of inhabitants are eſtimated at 4000; out of which it is ſuppoſed 1000 live in the city of San Ignatio de Agona, where the governor uſually reſides. It is pleaſantly

ſituated, and affords a fine landſcape when viewed from the ſea. The ſoil being rather dry, it produces little rice; but they have ſeveral kinds of excellent fruit, particularly pine-apples, melons, and oranges. They have likewiſe plenty of cocoas, yams, and a fruit about the ſize of an apple, which, when baked, is exceeding good, and is uſed inſtead of bread.

The natives of this iſland are ſtrong and well-ſhaped, but of an olive complexion: they have thick lips, a long viſage, and a ſtern countenance: they wear long black hair, anoint themſelves with the oil of the cocoa-nut, and paint their teeth with red and black colours. Their houſes are chiefly built of ſtone and timber, and the tops of them are covered with tiles. Their food chiefly conſiſts of cocoa-nuts, bananas, fowls, fiſh, and pork; the latter of which is peculiarly ſweet in its taſte, the hogs being principally fed with cocoa-nuts, which grow here in the greateſt abundance.

The other iſlands here, though uninhabited, afford a great plenty of proviſions; but neither of them have any commodious harbour.

THE ISLANDS OF FORMOSA AND HAINAN.

Some parts of theſe iſlands belong to the Chineſe, to whom the natives are ſubject; but in the other parts they live independent, and are only ſubject to their own laws and government.

FORMOSA, which is the moſt fertile of theſe iſlands, is altogether a very fine country; and for that reaſon it obtained its name, the word Formoſa ſignifying *fair* or *beautiful*. It is ſituated nearly oppoſite to the province of Fo-kien in China, and is computed to be 216 miles in length from north to ſouth, and about 70 miles in the broadeſt part. Its longitude from Pekin is from 3 deg. 20 min. to 5 deg. 40 min. eaſt; ſo that when the ſun is almoſt vertical over it, the climate is rather hot; but this is far from being diſagreeable, as the violence of the heat is greatly mitigated by the ſituation of the iſland, which is ſo elevated, as to receive the moſt agreeable advantages from the cooling breezes of the ſea.

That part of the iſland poſſeſſed by the Chineſe is particularly fertile, and produces great quantities of different kinds of grain, eſpecially rice; and its fertility is greatly accelerated by the numerous rivers, whoſe ſtreams glide conveniently through it.

This iſland likewiſe produces as great a variety of fruits as are to be found in any other parts of the Indies; particularly oranges, cocoas, bananas, ananas, guyavas, papayas, &c. alſo ſeveral kinds of thoſe produced in Europe, as peaches, apricots, figs, grapes, and cheſnuts. They have likewiſe a ſort of melon, which is of an oblong form, and much larger than thoſe in Europe: they conſiſt of a white or red pulp, and are full of a fine juice, which is exceeding grateful to the taſte. Sugar and tobacco alſo grow here to the greateſt perfection; and the trees that produce theſe are ſo agreeably arranged, that they appear as if calculated to embelliſh the moſt beautiful garden.

The wild beaſts of this iſland are but few, and thoſe ſeldom ſeen, as they chiefly inhabit the diſtant parts of it, which are exceeding mountainous, and ſeldom reſorted to by the inhabitants. They have ſome horſes, ſheep, oxen, goats, and hogs. They have but few birds, the principal of which is the pheaſant; but the rivers produce great plenty of various kinds of fiſh.

The coaſts about this iſland are very high and rocky, and have neither havens nor ſea-ports, ſo that it is almoſt impoſſible to effect an invaſion. Teovang, or Tyowang, is the only bay in the whole iſland, where ſhips of any bulk can approach; and this is ſituated at the mouth of a river ſo narrow, and defended by ſuch high rocks and forts on each ſide, that no enemy could poſſibly enter it, without being repulſed.

The inhabitants of thoſe parts of the iſland belonging to the Chineſe, have the ſame manners and cuſtoms, and are under the ſame government as thoſe of China; ſo that a repetition of them would be here unneceſſary; we ſhall therefore only deſcribe the perſons, manners, and cuſtoms of the natives.

The natives of this iſland, who are ſubject to the Chineſe, are divided into forty-five boroughs, or towns, thirty-ſix of which are in the northern part, and nine in the ſouthern. They are in general of a low ſtature, have a large mouth, and are very ſwarthy in complexion: they have a very high forehead, and are altogether greatly diſproportioned, for the body is very ſhort. the neck ſmall, and the arms and legs remarkably long.

Their weapons are bows and arrows, which they uſe with ſuch dexterity, that they will kill a pheaſant flying at the diſtance of 400 yards. They have little ceremony in their marriages; nor do they purchaſe their wives as in China.

Some writers have deſcribed the Formoſans as being mere infidels, which we can aſſign no other reaſon for, but from their being conſidered ſo by the Chineſe. This, however, is a falſe aſſertion: they believe in one Supreme Being, and ſeem to entertain wiſer notions than the inhabitants of many eaſtern countries. The Chineſe acknowledge that they are not ſubject to cheat, thieve, or quarrel; but, on the contrary, that they practiſe all the duties of equity and mutual benevolence. They worſhip idols as in China, to whom they offer ſacrifices of hogs, rice, &c.

Their manner of treating the dead before interment is very ſingular. When a perſon dies they lay him on a kind of ſcaffold made of bamboo, which they place over a ſlow fire for nine days; after which they wrap the corpſe in a mat, and lay it on a higher ſcaffold, covered with a pavilion, made of ſhreds of ſilk, cloth, &c. Here it remains for two years, at the expiration of which, they dig a large hole in the ground, and bury it. Each of theſe ceremonies is accompanied with feaſting, muſic, dancing, &c.

One cuſtom is almoſt univerſal among them, namely, if a perſon is exceeding ill, or afflicted with any painful diſorder, which is not likely to be removed, they think it a kindneſs to diſpatch him.

The government of each town or borough is confined to itſelf. Three or four of the moſt ancient, who are known to be men of integrity, are appointed as judges over the reſt, who determine all differences; and he who refuſes to ſubmit to the deciſion, is baniſhed the town, nor can he either return, or be admitted into any of the others, ſo that he is obliged to finiſh his days, without ever again participatiag of the natural enjoyments of ſociety.

An annual tribute is paid by the inhabitants to the Chineſe, which conſiſts of certain quantities of grain, the tails and ſkins of ſtags, and other productions of the country. In order to gather this tribute, a perſon is appointed to each town, who learns the language of the natives, and diſcharges the office of interpreter between them and the mandarins of China. There were formerly twelve boroughs in the ſouthern part of the iſland that paid tribute to the Chineſe; but, from the tyrannic conduct of their interpreter, or gatherer of the tax, they revolted, drove the interpreter out of the town, and no longer continued to pay tribute to China.

The capital city of Formoſa is called Tai-ouan-fou. It is large and populous, and carries on ſo extenſive a trade, that it is little inferior to ſome of the moſt opulent in China. It is plentifully ſupplied with all kinds of proviſions, either of its own product, or commodities brought from other countries, as rice, cotton, ſugar, wine, tobacco, and dried veniſon, the latter of which

which is greatly admired by the Chineſe, and conſidered as the moſt delicious food. They have likewiſe all kinds of fruits, medicinal herbs, roots, gems, &c. with plenty of linen, ſilk, and cotton of various ſorts.

The ſtreets are long and ſpacious, the houſes very ſmall, built of clay, and covered with thatch; the buildings have awnings on each ſide, that join in ſuch a manner as to cover the ſtreet; but theſe are only uſed during the hot months, to keep off the exceſſive heat of the ſun. Some of the ſtreets are near three miles in length, and between thirty and forty feet broad: theſe ſtreets are chiefly occupied by dealers, whoſe ſhops are furniſhed with all kinds of goods, ranged and diſplayed to the greateſt advantage. Theſe ſhops appear very brilliant, and many people walk in the ſtreets merely to gratify themſelves with the ſight of ſo great a variety of the richeſt commodities.

Though this city is not defended either by walls or fortifications, it has a good garriſon of horſe and foot, conſiſting of 10,000 men, who are principally Tartars. Theſe are commanded by a lieutenant-general, two major-generals, and a number of inferior officers, who are at liberty to relinquiſh their ſituation after having ſerved three years, or ſooner, if occaſion ſhould require. The harbour is tolerably good, and ſheltered from the winds; but the entrance to it is dangerous for ſhips of burthen, the bottom of it being rocky, and the water not above ten feet deep at the higheſt tides.

The moſt authentic hiſtorians inform us, that the iſland of Formoſa was firſt inhabited by the Japaneſe about the beginning of the laſt century. Theſe people were ſo pleaſed with the appearance of the country, that they built ſeveral ſmall towns, and ſoon ſettled a colony: however, they were but a ſhort time on the iſland before they were interrupted by the Dutch, a ſhip belonging to whom being accidentally forced into the harbour, the people landed on the iſland, in order to obtain refreſhments, and repair the damage the veſſel had ſuſtained by the ſtorm. Pleaſed with the apparent fertility of the country, and the wholeſomeneſs of the climate, they formed a plan of circumventing the Japaneſe, by taking the iſland into their own poſſeſſion. Fearful, however, of offending them, leſt it might be injurious to their trade, they were very cautious in what manner they proceeded; and though they were the moſt powerful, yet they were rather deſirous of obtaining their wiſhes by artful than violent meaſures. To effect this, they earneſtly intreated the Japaneſe, that they would permit them to build a houſe near the ſea ſide, which, they alleged, would be of the greateſt utility to them in their paſſage to and from Japan. This requeſt was refuſed, which produced a ſecond ſolicitation that met with no better ſucceſs. Unwilling, however, to give up any endeavours they could project, they again renewed their ſolicitations, and preſſed them to give conſent, aſſuring them that they deſired no more ground than what might be encompaſſed by the hide of an ox. The modeſty, as well as oddity, of this requeſt, had the wiſhed-for effect, and the Japaneſe at length gave their conſent.

Having now made an opening into their future intentions, the Dutch immediately diſcovered a piece of cunning, little thought of by the Japaneſe. They got a large hide, which they cut into a number of ſlips, and, faſtening the whole together, covered a very extenſive piece of ground, on which, inſtead of a ſingle building, they erected ſeveral ſpacious habitations. The Japaneſe were at firſt greatly vexed at this ſtratagem, but, from the ſingularity of it, they were at length pacified; and were ſo far from either envying the Dutch, or being any way apprehenſive of danger from them, that they permitted them to do whatever they thought proper; and of this indulgence the Dutch were not deficient in taking the greateſt advantages, for they ſoon erected ſeveral ſtrong buildings, particularly a caſtle, which they called Zealand, ſituated on ſo advantageous a ſpot, that it was impoſſible for any ſhip to enter it, of whatever force, without being repulſed. But in proceſs of time, the Japaneſe, being either offended at the great progreſs the Dutch had made, or not finding the advantages they expected, ſoon quitted the iſland, and left the Dutch in ſole poſſeſſion of it; after which the latter erected other fortifications oppoſite to their new fort, and raiſed ſuch other defences, as made them complete maſters of the iſland, which however continued but a few years in their poſſeſſion. One of the Chineſe generals (a man of an enterpriſing genius) being defeated by the Tartars, who were then at war with the Chineſe, fixed his views on Formoſa, forming a reſolution of ouſting the Dutch, and eſtabliſhing a new kingdom on the iſland. Accordingly he ſailed from China with a very conſiderable fleet, and arriving near the mouth of the harbour, he landed ſome of his men, and began to attack the fort of Zealand. The Dutch, not being apprehenſive of any danger, were ill provided to attack ſo powerful an enemy; they had only four ſhips in the harbour, and not above twenty men in the fort, excluſive of the natives; notwithſtanding which they made ſo forcible an oppoſition, that the ſiege laſted upwards of three months. The Chineſe general was ſo enraged at being thus diſappointed, that he at length had recourſe to a very deſperate effort, which had the deſired effect. He converted ſeveral of his veſſels into fire-ſhips, and the wind happening to be high and favourable, drove them into the harbour, when three of the Dutch ſhips were entirely deſtroyed. Thus ſituated, the Dutch could not make any further reſiſtance, and the Chineſe general offering them liberty to depart with their effects in caſe they would ſurrender, they readily accepted the offer; and putting all their valuables on board the ſhip that was left, they departed, and left the Chineſe general ſole poſſeſſor of the iſland. The general immediately acknowledged ſubmiſſion to the emperor, and ſeveral other towns were ſoon built on different parts of the iſland, the inhabitants of which have ever ſince been ſubject to the government of China, and, as hath been before obſerved, teſtify their ſubmiſſion by an annual tribute.

Hainan, the other iſland, (the principal part of which alſo belongs to the Chineſe) is of conſiderable extent, and ſome of the towns are very populous. It is ſituated between 107 and 110 deg. eaſt long. and between 18 and 20 deg. north lat. It is bounded on the eaſt by the Chineſe ſea; on the weſt by the coaſt of Cochin-China; on the north by part of the province of Quang-tong, to which it belongs; and on the ſouth by the channel of Paracel, which joins the eaſtern coaſt of Cochin-China. It is about 200 miles in length from eaſt to weſt, near 150 in breadth, and about 400 in circumference.

Kian-tcheou is the principal city; and is ſo ſituated, that ſhips lie at anchor cloſe to its walls with the greateſt ſecurity. The ſtreets are very uniform, and ſome of them at leaſt a mile in length, but the houſes in general are low mean buildings. But, beſides the capital, there are ſeveral other conſiderable cities on the iſland, all of which are ſituated near the ſea-ſide, and ſubject to the juriſdiction of Kian-tcheou, which is governed by mandarins of two orders, namely, thoſe of learning, and thoſe of arms.

On the ſouthern part of the iſland there is a fine port, the bay of which is near twenty feet deep. There is alſo another very convenient port on the northern part, the entrance to which is defended by two ſmall forts, though the depth of water does not exceed twelve feet. Here the barks frequently come from Canton with various commodities, in exchange for which they take ſeveral kinds of minerals, the natural produce of the country; for in ſome parts of

of the iſland there are gold and ſilver mines, as alſo mines that produce the lapis-lazuli, which the natives of Canton uſe in painting the blue porcelain. Between the two forts that defend the entrance of the northern port, is a large plain, on which are ſeveral handſome Chineſe ſepulchres.

The climate of this iſland is in general very unhealthy, particularly the northern part, though the ſoil is tolerably fertile. The ſouthern and eaſtern parts are exceeding mountainous; but the vallies beneath are rich, and produce great plenty of rice. Here are likewiſe ſeveral ſorts of very valuable trees, particularly the roſe, or violet-tree, which is ſo fragrant in its ſcent, that it is purchaſed at a very high price for the ſole uſe of the emperor. There is alſo another tree, little inferior to this; it produces a kind of liquid, which by the natives is called dragon's blood, and, if thrown into the fire, diffuſes a ſcent of the moſt agreeable nature. Indigo grows very plentifully on this iſland, as alſo ſugar, tobacco, and cotton; and they have a great variety of the moſt delicious fruits.

Horſes, ſheep, cows, and hogs, are the chief animals here. On the mountains, and in the woods, are prodigious numbers of apes, ſome of which are very large, of a black colour, and the features of their faces ſo diſtinct, as to reſemble the human ſpecies with greater niceneſs than any others to be found in the univerſe; but theſe are very ſeldom ſeen; and though the natives have often endeavoured to catch them, yet they are ſo cunning and alert, that they have baffled every machination they could project. Theſe apes appear to be of the ſame ſpecies with two ſent ſome years ago in a coaſting veſſel, as a preſent from a merchant of the rajah of the Carnatic dominions to the governor of Bombay, a particular deſcription of which is thus given by Mr. Groſe, in his *Voyage to the Eaſt Indies*: "They were," ſays he, "ſcarcely two feet high, walked erect, and had perfectly an human form. They were of a ſallow white, without any hair, except in thoſe parts that is cuſtomary for mankind to have it. By their melancholy, they ſeemed to have a rational ſenſe of their captivity, and had many of the human actions. They made their bed very orderly in the cage in which they were ſent, and, on being viewed, would endeavour to conceal with their hands thoſe parts that modeſty forbids manifeſting. The joints of their knees were not re-entering like thoſe of monkies, but ſaliant like thoſe of men; a circumſtance they have in common with the Oran-outangs in the eaſtern parts of India, particularly in Sumatra, Java, and the Spice Iſlands, of which theſe ſeem to be the diminutives, though with nearer approaches of reſemblance to the human ſpecies. But though the navigation from the Carnatic coaſt to Bombay is of a very ſhort run, of not above ſix or ſeven degrees, whether the ſea air did not agree with them, or that they could not brook their confinement, or that the captain had not properly conſulted their proviſion, the female ſickening firſt, died, and the male giving all the demonſtrations of grief, ſeemed to take it to heart ſo, that he refuſed to eat, and in two days after followed her. The captain, on his return to Bombay, reporting this to the governor, was by him aſked, What he had done with the bodies? He ſaid, he had flung them overboard. Being further aſked, Why he did not keep them in ſpirits? He replied, that he did not think of it. On this the governor wrote afreſh to the merchant, deſiring him to procure another couple, at any rate, as he ſhould grudge no expence to be maſter of ſuch a curioſity. The merchant's anſwer was, He would very willingly oblige him, but that he was afraid it would not be in his power: that theſe creatures came from a foreſt about 70 leagues up the country, where the inhabitants would ſometimes catch them on the ſkirts of it; but that they were ſo exquiſitely cunning and ſhy, that this ſcarcely happened once in a century."

Hainan alſo abounds with various kinds of game, particularly deer and hares; alſo a great plenty of birds, as partridges, woodcocks, ſnipes, turtle-doves, and moſt ſorts of water-fowl, all which are little inferior to thoſe in Europe. They have likewiſe moſt ſorts of fiſh in great abundance; among theſe is a blue fiſh found among the rocks, which is ſo beautiful as to be eſteemed of greater value than the golden fiſh; but they will live only a few days out of their natural element.

The natives of this iſland are ſhort in ſtature, of a reddiſh complexion, and ſome of them greatly deformed. The men wear only a looſe garment, reaching from the waiſt to the knees: it is made of calico, and the colour is either a deep blue, or quite black. The women wear a garment made of the ſame ſtuff, though different in form: it ſomewhat reſembles a waiſtcoat, and reaches from the ſhoulders to the knees: and they are further diſtinguiſhed from the men, by ſtreaks made on their faces with indigo. Both ſexes braid their hair, and ornament their ears with rings; and their hats, which tie under the chin, are made of ſtraw or rattan. Their chief weapons are bows and arrows, in the uſe of which they are not ſo expert as the inhabitants of Formoſa. They have alſo a kind of hanger faſtened with a girdle to their waiſt, which they generally uſe to clear the way in foreſts, or other woody places. They occupy the centre part of the iſland, which is very mountainous; and here they live independent, being ſubject only to their own laws and modes of government.

The natives are ſeldom ſeen by the Chineſe, except when they make an attempt to ſurpriſe any of the neighbouring villages. This, however, ſeldom happens, and when it does, they are naturally ſuch cowards, that half a dozen Chineſe will defeat at leaſt an hundred of them. Many of them are in the ſervice of the Chineſe, who employ them to cultivate their lands, and take care of their cattle. Others of them are allowed to poſſeſs villages on the plain; and the principal part, as in Formoſa, pay an annual tribute to the emperor of China.

THE PHILIPPINE ISLANDS.

Theſe iſlands, which are numerous, were diſcovered by Magellan in 1519. They lie from 5 to 10 deg. north latitude, and from the 114th to the 130th deg. of eaſt longitude, being ſituated in the Pacific Ocean, 300 miles to the ſouth-eaſt of China. In general they abound with every delicacy, and the ſoil is inconceivably fertile; but the exceſſive heat, from their vicinity to the line; the innumerable noxious inſects, and venemous reptiles; the dreadful earthquakes, and the frequent eruptions from many of their mountains, which are volcanos; the great number of poiſonous herbs and flowers, from which the moſt pernicious vapours exhale; and the terrible ſtorms of thunder, lightning, and rain, which ſpread ſhocking devaſtations around, combine to render them neither ſafe or deſirable.

The principal of theſe iſlands are the following:

Luconia, or Manila. This iſland is the largeſt of the Philippines, being near 400 miles in length, and about 180 in breadth, is ſituated in 15 deg. north lat. and deemed more healthy than either of the others. It has many mountains, which contain gold, fertile plains, fine paſtures, and ſprings of the moſt excellent water in the univerſe. It produces buffaloes, ſheep, hogs, goats, horſes, fruit, &c.

The city of Manila lies upon an excellent bay, which is circular, and near 60 miles in circumference; the port is of courſe remarkably good, and well ſituated for the Chineſe and Eaſt India trade. It contains about 3000 inhabitants; and, during the war of 1762, was taken by Admiral Corniſh and Sir William

liam Draper. It was, however, ſtipulated to be ranſomed: but the ranſom money has never yet been entirely diſcharged. It is a handſome city, containing ſeveral ſpacious ſtreets, good houſes, elegant churches, decent convents, and tolerable colleges. The ſeat of the ſpaniſh government is here. The Indians pay a poll-tax; and a conſiderable ſum of money is annually allowed for the ſupport of female orphans, born of Spaniſh and Indian parents. To this iſland the Spaniards bring divers commodities; ſuch as ſilver from New Spain, Mexico, and Peru; diamonds from Golconda; ſilks, teas, Japan, and China ware, and gold-duſt, from China and Japan. The Spaniards ſend two large ſhips every year from hence to Acapulo in Mexico, with merchandize, and return back with ſilver.

St. John lies between 7 and 8 deg. north lat. is above 110 miles in length, and about 70 miles over in the broadeſt part. The ſoil is fertile; but, with the other iſlands, it partakes of the general inconveniences before recited. The inhabitants are good-natured and humane, but exceedingly ignorant. Their marriage ceremony is nothing more than putting earth upon the head of the woman, in token of her ſubordinate ſtate, and the neceſſity of implicit obedience to her huſband. They call themſelves Chriſtians. They wear only a looſe robe of cotton or calico, which hangs to their feet: the men throw it over their ſhoulders, and wrap it round their waiſts; the women cover their heads with it like a hood, and cloſe it at their breaſt; but the men go bareheaded, and the children naked. In this iſland there is only one town, which is erected upon poſts, but it is both inconſiderable and mean, and the furniture of the houſes deſpicable.

Mindanao is 180 miles in length, and about 130 in breadth: the hills are ſtony, but produce many trees; the vallies are fertile, and well watered; and the inhabitants are plentifully ſupplied with all the neceſſaries, and many of the luxuries of life.

This iſland is governed by a ſultan, ſubordinate to whom are ſeveral petty ſovereigns, who rule over various diſtricts. The monarch when he goes abroad, is carried in a palanquin, and has a ſtrong guard to attend him, who are armed with lances, ſwords, and bayonets.

The chief trade of this iſland is to Manila and Borneo; and the Dutch come from the Moluccas to purchaſe of them rice, tobacco, bees-wax, &c. The common people are always boaſting of their honeſty, but practiſe roguery: they ſteal whatever they can lay their hands on; and the magiſtrates, inſtead of puniſhing the delinquents, will protect them, in order to partake of the booty.

The inhabitants of the various diſtricts, or ſubjects of the ſeveral petty kings, ſpeak different languages, but have a general reſemblance in perſons and features. They are ſhort of ſtature, have tawny complexions, ſmall eyes, little noſes, wide mouths, thin lips, black teeth, and lank hair. They are ingenious, yet indolent; active, yet lazy; and good humoured though revengeful. They live on the fleſh of buffaloes, moſt kinds of fowls, all ſorts of fiſh that their ſeas and rivers afford, with rice and ſago. They are, however, but ſlovenly in their cookery, and eat without either knives, forks, or ſpoons.

Some ſettlements in this iſland formerly belonged to the Spaniards, but they were driven from hence by the natives, who have been ever ſince extremely jealous of any foreigners making ſettlements among them.

The inhabitants in general are Mahometans. Thoſe who reſide in the interior parts of the country are called Hilanoons, and poſſeſs ſeveral gold mines. The people of the north-weſt part of the iſland are the moſt ſavage, and in making war, neither give or take quarter. They allow of poligamy. The diſeaſes they are ſubject to are fluxes, agues, cholics, and the ſcurvy.

Mindanao, the capital, is ſituated on the ſouth ſide of the iſland, in 6 deg. 20 min. north lat. and 123 deg. 15 min. eaſt long. It is watered by a ſmall river, that will not admit of ſhips of any conſiderable burthen; and thoſe that do come up to the city, are greatly in danger of having their bottoms deſtroyed by worms, which abound in that river, unleſs they are well ſheathed. The city is ſquare, being about a mile each way: the houſes are built upon poſts near twenty feet high, with ladders to aſcend them, according to the uſual faſhion of building in the Philippine Iſlands: they conſiſt but of one floor, but are divided by partitions into many apartments. The ſultan's palace is ſupported by 150 wooden pillars, or rather poſts, and is much higher than any other houſe in the city, having iron cannon in the hall, and a broad fixed ſtair-caſe to aſcend it. The Malayan, as well as the language proper to the iſland, is ſpoken in this city. All the floors of the houſes are matted, upon which the people ſit croſs-legged. The principal trades are ſhip builders, goldſmiths, and blackſmiths.

Bohol is ſituated to the north of Mindanao, being about 120 miles in circumference: it produces cattle, fiſh, roots, rice, and gold.

Layta is about 270 miles in circumference, and is ſituated about 20 leagues north of Mindanao: a chain of mountains runs through the middle, and occaſions ſuch a ſingular variety in the climate, that while the northern ſide is benumbed with chilling blaſts of winter, the ſouthern parts are cheared with the genial warmth of ſummer. The ſoil is in general fertile, and the people tolerably civilized.

Paragon, by ſome called Little Borneo, lies between 9 and 11 deg. north lat. and 114 and 118 deg. eaſt long. and is the remoteſt of the Philippine Iſlands to the ſouth-weſt: it is 240 miles in length, and 60 in breadth. Different parts of it have different maſters: the interior diſtricts belong to the native Indians, the north-eaſt parts to the Spaniards, and the ſouth-weſt to the ſovereign of Borneo. The Indian inhabitants are Mahometans, and poſſeſs the greateſt military ſpirit of any people who are natives of the Philippines. It produces prodigious large figs, a ſmaller ſort which is ſuperior in quality, and plenty of rice.

Three inconſiderable iſlands, called Calamines, lie to the north and north-eaſt of Paragon, which are not remarkable for any thing but plenty of wild birds.

Mindora is about 60 miles long and 36 broad, and extends from 12 to 13 deg. north lat. and from 119 to 120 eaſt long. It produces gold and pepper, and is divided from Lucconia by the Straits of Mindora.

Tandaya is one of the moſt eaſterly of the Philippines; it is ſeparated from Manila by a narrow ſtrait, and is 125 miles in length, and 100 in breadth. On the northern coaſt there is a volcano, which throws out fire and flames.

Philippina was the firſt that was diſcovered of this cluſter of iſlands, and conſequently gave name to the reſt. It lies between 12 and 14 deg. 30 min. north lat. and is the moſt fertile and pleaſant of all the Philippines, exhibiting a ſcene of perpetual verdure; for here the ſun is powerful without being diſagreeable.

Sebu, ſouth-weſt of Layta, is 60 miles long, and 38 broad. On the eaſt ſide of it is the town of Nombre de Dios. The Spaniſh Standard was firſt ſet up here by Magellan, the primitive circumnavigator of the world, who was afterwards murdered in this iſland by the natives. The town of Nombre de Dios is guarded by a conſiderable garriſon, defended by a ſtrong fort, and has a good haven. The iſland produces cotton, bees-wax, garlick, onions, and the abaca plant, of which cordage and packthread are made.

Panay lies between 10 and 11 deg. north lat. and 120 and 121 deg. eaſt long. and is about 300 miles

in circumference, and has the name of being the moſt populous of all the Philippines. It is watered by many rivers, and is exceeding fruitful, particularly in rice, of which it produces about 100,000 buſhels annually above what the natives conſume. Almoſt adjoining to this is the little iſland of Imavas, which is not remarkable for any thing but producing a conſiderable quantity of ſarſaparilla.

Negroes Iſland lies between 9 and 11 deg. north latitude, and is about 300 miles in circumference. The natives are the moſt black of any of the inhabitants of the Philippines, from which circumſtance the iſland is called Negroes Iſland. Bees-wax and cocoa nuts are the only produce of the place. The bees are remarkably fine and large, and the people uncommonly ſkilful in managing them; but in other reſpects, the natives are rude, brutiſh, and ignorant, which has given riſe to this proverbial expreſſion: *Negroes Iſland is inhabited by blacks and bees; but the winged natives are wiſer and better governed than the walking natives.* Indeed, the prudence, decorum, and various regulations of theſe ſagacious little inſects are truly aſtoniſhing.

Xolo is the moſt ſouth-weſterly of all the Philippines, and is governed by a ſovereign prince of its own. It produces great quantities of rice, and elephants teeth, and, indeed, is the only iſland among the Philippines in which elephants are bred. The air in this iſland is tolerable, being refreſhed by frequent rains. The ſea yields pearls; and great quantities of ambergris are found upon the ſhores. The ſoil is fertile in fruits, rice, and pepper; and numerous herds of cattle graze in the paſtures.

Maſbate, which lies almoſt in the center of the Philippines, is 93 miles in circumference, and abounds in gold, civet, bees-wax, and ſalt.

Theſe iſlands produce great quantities of gold and other metals, pearls, ambergris, loadſtones, ivory, pepper, bees-wax, and an excellent fruit called tanter, of which a moſt delicious pickle is made; mangos, durians, oranges, which are both larger and better than thoſe of Europe; lemons both ſour and ſweet; palm trees, of which there are forty ſpecies, the principal being the ſago; tamarinds, plantains, bananas, the caſſia-tree, and ebony, moſt of the common timber trees, ſugar-canes, tobacco, indigo; odoriferous and medicinal herbs, admirable flowers, and culinary vegetables, particularly potatoes, &c.

There is a ſingular ſpecies of cane-trees about the mountains of theſe iſlands, which being cut, yield water in great plenty. Theſe canes afford great relief and refreſhment to the natives, who would otherwiſe be parched with thirſt, as no running ſtreams or ſprings are found in any of the mountains where they grow.

They have one plant that has all the properties of, and is uſed as a ſubſtitute for, opium; of this the natives are very fond, and frequently intoxicate themſelves with it.

The camondog tree is of ſuch a poiſonous nature, that death inſtantly ſeizes any living creature who taſtes either its fruit or leaves. It ſuffers no verdure to grow beneath its ſhade, and if tranſplanted, poiſons all vegetables that are near it, except a ſhrub, which is an antidote to it. The natives make an inciſſion in this tree, from whence a liquor flows, into which they dip the points of their arrows and darts, in order to poiſon them; after which, a wound received from any of thoſe weapons proves mortal. Beſides this tree, there are many poiſonous herbs and flowers.

The Philippines likewiſe abound in cattle of all kinds; wild beaſts, whoſe fleſh and ſkins are valuable articles; horſes, ſheep, civet-cats, game-fowls, fiſh, &c.

Aligators here are very dangerous; and the ignana, a kind of land aligator, does a great deal of miſchief. Here are an abundance of ſnakes, ſcorpions, centipedes, &c. The peacocks, parrots, cocatoos, and turtle-doves, are very beautiful: the Zolo bird eats like a turkey; the camboxa is a well taſted fowl, peculiar to theſe iſlands; and they have another kind of fowl, whoſe fleſh and bones are quite black, but are, nevertheleſs, delicious food. The herrero, or carpenter, is a fine large green bird. It is called carpenter, becauſe its beak is ſo hard, that it digs a hole in the trunk, or ſome large branch of a tree, in order to build its neſt. The tavan, a ſea-fowl, lays its eggs in the ſand, to be hatched by the heat of the ſun.

Monkies and baboons here are very ſagacious. During the ſeaſon, when there is no fruit to be got, they go down to the ſea-ſide to catch oyſters. That the fiſh may not pinch their paws, they put a ſtone between the ſhells to prevent their ſhutting cloſe.

In general the natives of theſe iſlands are compoſed of native blacks and tawnies; Chineſe or the poſteriry of Chineſe, who have long ſettled among them; Malayans, Portugueſe, Spaniards, other Europeans; and a mongrel breed from the whole: the make, features, complexions and manners of the people, conſequently vary from each other.

Rice, fiſh, and fruit, are the common food of the natives, who eat very little fleſh. They drink water, palm wine, and ſpirits diſtilled from cocoa and palm trees. The Spaniards, however, live luxurioufly, eating fleſh at noon, and fiſh at night, and indulging themſelves with all manner of Aſiatic delicacies. Spaniards, as well as natives, ſmoak tobacco; but the latter chew betel and areka.

Swimming, bathing, dancing, muſic, and dramatic performances, are their amuſements. Their weapons are bows, arrows, lances, daggers, and darts; and they defend themſeves with helmets, ſhields, and breaſt-plates.

Poligamy is permitted among ſome of the Indian nations, but in others it is not allowed, except in caſes of barrenneſs. They admit of divorces, which frequently happen. The huſband buys the wife from her father, or neareſt relation; a beaſt is ſacrificed, an entertainment made of the fleſh, and the bride and bridegroom having eat together out of the ſame trencher, are deemed lawfully married.

Children are either named after herbs or flowers, or from ſome accidental circumſtance that occurs at the time of their birth: but as ſoon as they marry they chuſe new names, and their parents are obliged to make uſe of their old ones.

The bodies of the dead are waſhed and perfumed, wrapped in ſilk, and put in a cloſe coffin, near which a cheſt is placed, that contains the arms of a man, or domeſtic utenſils of a woman. Mourners are hired to aſſiſt in making a diſmal noiſe; but as ſoon as the body is buried an entertainment is made, and all is converted into mirth and feſtivity. In general they mourn in black garments, and ſhave their heads and eye-brows. The real natives are exceedingly ſuperſtitious, profeſs the moſt groſs idolatry, and their religious tenets are a jumble of ideas ridiculous and abſurd.

The only accounts we have of the Caroline or New Philippine Iſlands, are thoſe written by two prieſts, Father Clan and Father Gobien, which were compoſed at Manila, and founded on a deſcription of them given by ſome of the natives, who were driven by ſtreſs of weather upon the iſland of Tandaya.

Theſe accounts place thoſe iſlands between 6 and 12 deg. north lat. and 127 and 138 deg. eaſt long. Thoſe gentlemen inform us, that they are exceeding populous, and governed by a king, who reſides in one of them, named Lamaree; that the natives reſemble the Malayans, go almoſt naked, paint their bodies, ſpeak a language ſomewhat like the Arabic, are without any form of worſhip, make no ſet meals, live temperately, &c. They have a few fowls, plenty of fiſh, and fertile lands; but they are without

out quadrupeds of any kind. The women adorn themſelves with necklaces, bracelets, and rings, all made of tortoiſe-ſhell. They are of ſo placid a diſpoſition, that no quarrel ever happens among them, and war is totally unknown.

We may conclude, from this brief account, that theſe are the moſt happy people that have ever yet fallen under our obſervation. They have no foes to fight, quarrels to decide, beaſts to hunt, or game to kill; but each ſucceeding day enjoy the bounties of Providence without bodily labour, and inſenſible of any anxiety of mind.

The Moluccas, or Spice Islands, are called Moluccas, from the word Moloc, ſignifying *head*, and referring to their ſituation at the head or entrance of the Archipelago of St. Lazarus. They are denominated Spice Iſlands, from their abounding in ſpices, particularly nutmegs and cloves, which grow in no other countries in the known world. They lie between 5 deg. north, and 7 deg. ſouth lat. and from 121 to 130 deg. eaſt long.

The principal of theſe iſlands are the following, viz. Banda, Pulloway, Pulorin, Nera, Gumanpi, and Gulialen, all of which produce nutmegs, and are diſtinguiſhed under the name of the Banda Iſlands; Ternate, Tidore, or Tidor, Motir, Machian, Bachian, Amboyna, Buoro, Celam, Gilolo, and Bouton, moſtly produce cloves, &c.

The ſpices of theſe iſlands were known to the Europeans long before the paſſage to the Eaſt Indies, by the way of the Cape of Good Hope, had been found out, being brought to the Mediterranean by the way of the Red Sea, or ſometimes through Perſia and Turkey. But the Portugueſe diſcovering the beforementioned paſſage, and penetrating, to theſe iſlands, in 1511, the emperor Charles V. claimed them as his own; but the Portugueſe would not give them up: they were, however, driven out by the Dutch, who are at preſent in poſſeſſion of them, and deſtroy great quantities of the ſpices annually, in order to keep up the price, and not glut the markets.

The nutmeg reſembles a peach, and the clove a laurel-tree, only the leaves are ſmaller than either: the fruit of the former is both nutmeg and mace, the nutmeg being the kernel, and the mace a kind of leaf, that incloſes the nutmeg-ſhell, and the whole is contained in a large coat, like that of a walnut: but the cloves appear in cluſters: the bloſſoms change gradually from white to green, red, and brown, which latter is the characteriſtic of its ripeneſs; but, when dried in the ſun, it receives a blackiſh hue. The clove is gathered from September to February, and the nutmeg in April, Auguſt, and December. The April crop is, however, deemed the beſt; and the nutmegs, when gathered, are boiled in lime, to prevent their being worm-eaten.

The Banda Iſlands, or thoſe which produce the nutmegs, lie near each other. Banda, the principal of them, is about 20 miles long, and 10 broad. Beſides the large foreſts of nutmeg and clove-trees, which grow ſpontaneouſly, and require not the leaſt trouble, the ſoil is fertile in a variety of delicious fruits. The iſland is in the ſhape of a creſcent, and the concavity of it forms an excellent bay, near which ſtands the principal town. Several brooks, which flow from a ſmall mountain, water the whole country, and render it exceeding pleaſant.

The natives are ſtrong in their perſons, diſagreeable in their features, malicious in their tempers, and melancholy in their diſpoſitions.

The iſland of Banda is divided into three diſtricts: the religions are Mahometaniſm and Paganiſm. The natives have ſhips of ſome force, containing a few cannon in each, and uſe bucklers, back and breaſt plates, as defenſive, and carbines, darts, lances, ſcymetars, &c. as offenſive weapons. The men are very idle, and oblige the women not only to do all the domeſtic drudgery, but to cultivate the land. They have three harveſts in the year, but make fruit a principal part of their diet.

The Dutch have a fort at the weſtern part of the iſland, erected upon the top of a mountain, and aſcended to by 324 ſtone ſteps. At the foot of the mountain ſtands a negro town, the principal factory of the Dutch being at Nera, which is well fortified, as are all the landing-places in the iſland; and the whole are under the direction and ſuperintendance of a governor and council.

The imports into this and the other Banda iſlands, are gold chains, gold coins, enamelled and damaſked ſword-blades, ſilver cups gilt, guns, China ware, broad cloth, velvets, damaſks, flannels, &c. The exports are ſpices and fruits.

Nothing can be ſaid of the other Little Banda iſlands, but what is included in the above general deſcription of Banda.

Ternate is not above 24 miles in circumference; but, though inferior in ſize to ſome of the other Moluccas, it is deemed the principal, both by the Dutch and natives, as the Dutch make it the head ſeat of their government, and the chief prince of theſe iſlands the place of his reſidence.

This iſland produces cloves in great abundance, admirable almonds, delicious fruits, a few goats, and ſome poultry, but not rice, or any other grain; for the exceſſive heat which is requiſite to ripen ſpices, and meliorate fruit, parches the earth ſo, as to render it incapable of bearing wheat, barley, or rice: for, here the ſun is ſeen in all his ſplendour and power, and his influence is ſo greatly felt, that his rays penetrate through the pores of the earth, and warm the ſoil to a conſiderable depth beneath the ſurface.

The natives have a ſubſtitute for bread, which makes the moſt wholeſome and exquiſite cakes in the univerſe; that is, the pith of a tree called Sago, whoſe ſalubrious qualities are well known in Europe.—This excellent tree is not only of utility with reſpect to its medicinal virtues, and for yielding them bread, but it affords them likewiſe drink, clothing, and ſhelter; for, by inciſion, a liquor is drawn from it that exceeds moſt wines; the leaves being a kind of cotton, the ſmaller are converted into garments, and the latter uſed to thatch their houſes. This bread contributes to the longevity of the natives, moſt of whom live to an hundred years of age.

All the Moluccas are ſubject to a king, who receives tribute from every one of the iſlands. The natives ſtruggled againſt the encroachments of foreigners many years, but were totally ſubdued by the Dutch in 1680, and the latter have, at preſent, ſo many forts, and ſuch ſtrong garriſons, that the former do not entertain the leaſt idea of driving them from their country.

The houſes in general are built of cane; ſome few of the better ſort, indeed, have wooden houſes.—With reſpect to their furniture, a mat ſerves them inſtead of a bed, chair, and table, for they lie on it, eat and drink on it, and ſit on it. This, and a pot to dreſs their victuals, a hatchet to cut their wood, and a calibaſh to hold their water, make the whole catalogue of their houſehold utenſils: their windows are not glazed, nor are their doors ſecured by locks. They wear ſilk or calico, and all perſons make their own garments, the king and grandees excepted.—Their fuel is odoriferous woods, and even their ſmiths uſe nothing in their forges but almond-ſhells. The king reſides at Malaya, a little town, fortified with a mud wall; but the ſuburbs, in which the Dutch factory have a fine garden, are pretty large, and well inhabited by blacks. The palace is but a trivial building, but the gardens belonging to it are very pleaſant, and contain an aviary, filled with a great variety of beautiful birds, whoſe harmonious notes are delightful to the ear.

The waters in this iſland are remarkably clear, and the fiſh very delicious.

Ternate

Ternate produces parrots, which are handſomer, and ſpeak more diſtinctly than thoſe of the Weſt Indies; but the moſt remarkable of the feathered race in this iſland, is the bird of Paradiſe, which is juſtly deemed the moſt beautiful bird in the univerſe. The head is like that of a ſwallow, but the bill conſiderably longer; the body is ſmall, but the plumage diſplays ſuch admirable colours, as are inconceivably pleaſing to behold.

There is a volcano in this iſland, which caſts out a ſulphurous fire three months in the year, and ſometimes does great miſchief. We have the following recent account of its dreadful devaſtations, in a letter from a merchant at Batavia, dated Oct. 18, 1776:

"On the 4th of June, 1775, there were more than one hundred ſhocks of earthquakes felt here, ſome of which were ſo violent, that they ſeemed to threaten the deſtruction of the whole iſland. About the 20th of Auguſt they were felt again, and the burning mountain, after a dreadful exploſion, threw out hot ſtones, cinders, and lava in abundance; and, on the 5th of November, the earth was never ſtill for three hours; the mountain ſeemed all on fire, and the moſt dreadful ſtorm of thunder and lightning fell in every part of the iſland, which threw the inhabitants into ſuch a conſternation, that they ran from one part to another for ſhelter, but none was to be found: the ſea was ſo dreadfully boiſterous, that deſtruction was there inevitable: and, on the land, the earth opened and trembled under them, as if the whole iſland was going to be annihilated; but, by the providence of the Almighty, a calm was reſtored, and the inhabitants had time to ſee what damage had been done, when it appeared that the Dutch ſettlement had ſuffered but little, but it will be ſome years before the iſlanders recover their loſs. The king has made a report, that a large track of land, on the north ſide of the iſland, in the diſtrict of Xulla Tacory, had been ſwallowed up, by which ſixteen plantations have been totally deſtroyed, and 141 perſons either burnt, or drowned in the ſea, where many of them took refuge in their boats. This report has been confirmed by about thirty of the unfortunate inhabitants, who are rendered dreadful objects, by wounds and burns, in this ſhocking event, On the 5th and 6th of November, the earthquakes and effuſions of fire, ſtone, and ſulphurous ſmoke, from the mountain, began as bad as ever, but no lives were loſt. The horrors of this night are not to be deſcribed; for the thunder, lightning, and moſt ſhocking earthquakes continued without interruption for twelve hours, with the moſt terrible violence: from this dreadful night, there were no more earthquakes till July 1, 1776, when they were again felt for two hours, but not violent."

The iſlands of Tidor, Motir, Machian, and Bachian, are remarkable only for producing nutmegs and cloves.

Amboyna, which is better than 70 miles to the northward of Banda, is about 72 miles in circumference, and lies in 3 deg. 8 min. ſouth lat. and 127 deg. 10 min. eaſt long. It contains at preſent above 50 proteſtant churches, and many of the natives, who have been ſent over to Holland for education, officiate as clergymen and miſſionaries, by which means proſelytes are exceeding numerous. The ſoil is very fertile, producing, in abundance, nutmegs, cloves, oranges, lemons, citrons, potatoes, millet, tobacco, ſugar, bamboos, &c. but the air is unwholeſome: there is a good bay, which penetrates very far into the land, and, by that means, forms a commodious harbour. The people extract a ſpirituous liquor, and a kind of oil, from green cloves, which are both good in paralytic caſes. The men wear only a piece of cloth about their waiſts, and are mighty proud of having large whiſkers. They purchaſe their wives, but, in caſe of barrenneſs, divorce them. The women are both of a looſe and malicious diſpoſition. On account of the earthquakes, the houſes are all built very low. The ſtrong and important fortreſs, called Fort Victory, is the ſtaple of the Dutch East India Company in thoſe parts. It is defended by four bulwarks, a broad ditch, and a garriſon of 800 men. The Engliſh had formerly factories here as well as the Dutch; but, in 1623, the latter maſſacred the former, and uſurped the dominion of the Spice Iſlands, which had been ceded to the Engliſh by the natives themſelves. In putting the Engliſh and ſome Japaneſe to death, they uſed the moſt horrid cruelties, in order to extort confeſſions concerning a pretended plot, which they accuſed them of having formed: and to the ſhame of king James I. and king Charles I. no ſatisfaction was obtained for the villainous barbarity. Oliver Cromwell was not, however, ſo eaſy about the matter; for he frightened the Dutch into the payment of 300,000l. as ſome kind of retribution. There are ſeveral populous villages in the iſland, in the churches and chapels of which religious ſervice is performed both in the Dutch and Malayan tongues. It contains likewiſe many mountains, with ſprings of excellent water.

Bouro, in 2 deg. 30 min. ſouth lat. and 125 deg. 30 min. eaſt long. is about 75 miles in length, and 30 in breadth. The Dutch have a ſtrong fort here; though the iſland is perfectly ſecure, from the ſingularity of its coaſt, which riſes in a high ridge, and encompaſſes the whole as with a wall. It contains ſome prodigious high mountains, but is, nevertheleſs, very fertile, producing cloves, nutmegs, cocoa-trees, bananas, piany, green ebony, beans, peas, potatoes, tobacco, Indian wheat, lime-trees, herbs, flowers, &c. Among the beaſts are the civet-cat, and a ſingular kind of roe-buck, whoſe fleſh is very delicate. The natives are black, and go entirely naked till they are twelve years of age, at which period they tie a piece of cloth round their waiſts, and never wear any other garment. They are Mahometans and Pagans, but, upon the whole, have very little ſenſe of religion. When a relation dies, they appear very ſad till the corpſe is in the ground, and then they ſeem merry to an exceſs; but do not forget to make a kind of ſepulchre of ſtone and clay, to cover the grave of the defunct. The next day after the women are delivered of children, in this iſland, they go about their ordinary work, while the men indulge themſelves in bed, and pretend to be vaſtly ill. Inſtead of a cradle, they put their infants in a kind of network hammock, which they hang upon a peg, whenever they are too buſy to dandle it in the arms.

Ceram is in 2 deg. 30 min. ſouth lat. and in 127 deg. eaſt long. and produces cloves and nutmegs, but is woody and mountainous. The Dutch factory, called Ambay, is defended by a ſtrong fort and good garriſon. The inhabitants, who are Pagans and Mahometans, own the king of Ternate as their ſovereign, though they have a prince of their own, who dwells at Cambello.

Gilolo extends from 1 deg. ſouth, to 2 deg. north latitude; and from 125 to 128 deg. eaſt longitude; and is 190 miles long, and 110 broad. The air is unhealthy, and the ſoil produces rice and ſago, but no ſpices. The inhabitants are ſtrong and tall, but barbarous and cruel, and have an independent ſovereign of their own.

Bouton lies between 4 and 5 deg. ſouth lat. and in 121 deg. 30 min. eaſt longitude. It is 75 miles in length, and 30 in breadth. It has a good harbour, and contains a large town with tolerable houſes, built in the manner of thoſe of Mindano. This town is encloſed by a ſtone wall, and ſurrounded by groves of cocoa trees. The natives are governed by a prince of their own, ſpeak the Malayan language, and profeſs the Mahometan religion.

The CELEBES, or Iſland of MACASSAR, lies under the equator, is divided from Borneo by the ſtreights of Macaſſar, as it is by the ocean from the Molucca Iſlands on the eaſt, and the Philippines on the north. Its

Its extent from north to ſouth is upwards of 300 miles, and in the broadeſt part it is near 240. It is divided into ſix petty kingdoms or provinces, the principal of which are, the Celebes on the north-weſt, and Macaſſar, the latter of which takes in all the ſouthern part of the iſland. But as all the other provinces are ſubject to theſe two, the iſland is ſometimes called by the name of one, and ſometimes by the other.

As the climate is both hot and moiſt, it is therefore unhealthy, except at the times of the northern monſoons. The weſtern part lies low and flat but the ſouthern part is very high. In the rivers here is found gold duſt, which is waſhed down in the ſands from the neighbouring hills by the great torrents of water that ſometimes fall after exceſſive rains.

Here is great plenty of various kinds of vegetables, all excellent in their qualities; the rice in particular is ſaid to be much ſuperior to that cultivated in any other part of the Indies. The fruits and flowers are much the ſame as thoſe in the Philippines. They have pepper, ſugar, betel, and areka, with the beſt cotton and opium; and their cattle are much larger and finer than any to be met with in other eaſtern countries. Their oxen and buffaloes are uſed only for draught, and they have very ſmall horſes for riding; but the natives uſe no other ſaddle than a painted cloth, without ſtirrups or bridle, having only a cord faſtened to a bit made of wood. Theſe horſes having very hard hoofs are never ſhod.

There are prodigious numbers of monkies and baboons in the woods and foreſts which are ſo large, and go together in ſuch conſiderable bodies, that they are very dangerous to travellers; but they have one enemy by whom they are ſometimes conquered, namely, ſerpents, which are here of a moſt extraordinary ſize, and have ſuch agility and ſtrength, that they will purſue them to the very tops of trees and frequently deſtroy them.

There is but one large river in the iſland, and that is dangerous, by reaſon of its being greatly infeſted with crocodiles. It runs from north to ſouth into the bay of Macaſſar, where it is about half a league broad, and waſhes the walls of the city of that name: its channel is deep enough in ſome places to admit the largeſt veſſels, but in others it is very ſhallow.

The natives are rather ſhort in ſtature, and of a light olive complexion: they are particularly fond of having flat noſes, inſomuch that they practiſe methods in their infancy to obtain that diſtinguiſhed form, with as much labour and attention as the Chineſe women do to acquire ſmall feet. Neither men or women wear any covering on their heads; but their hair, which is of a fine ſhining black, is ingeniouſly tied up, and from it hangs curls that lay gracefully on the neck and ſhoulders. The men ornament their hair with jewels, but the women do not: the latter only wear a gold chain round their necks. Both ſexes, however, dye their nails red, and their teeth either black or red, both of which they conſider as very material ornaments.

The lower ſort of people wear a looſe garment made of cotton, which reaches below the knees; but none uſe either ſhoes or ſtockings. The women have a garment made of muſlin with ſtraight ſleeves that button at the wriſts; beſides which they wear a kind of drawers made of cotton, that are faſtened round the waiſt, and reach to the ancles. The garments of the better ſort are made of ſcarlet cloth, or brocaded ſilk, with large buttons of ſolid gold. They have likewiſe a very handſome ſaſh made of ſilk, and embroidered, which contains their dagger and purſe.

The diet of the common people conſiſts principally of rice, herbs, roots and fiſh; and their uſual drink is water or tea: the better ſort eat fleſh and poultry, the former being generally beef or kid, which are both exceeding fine; and they drink tea, coffee, and chocolate, the latter of which they get from the Spaniards in the Philippine Iſlands: they alſo uſe palm wine, arrack, and other ſpiritous liquors. They have but two meals a day, one in the morning and the other about ſunſet, the latter of which is the principal: in the intermediate ſpace they refreſh themſelves by chewing betel and areka, or ſmoaking tobacco intermixed with opium. They ſit croſs-legged on the floor at their meals, and have very low tables for their proviſions, which are ſet on them in plates or diſhes made of wood; but they uſe neither kives or ſpoons.

Their houſes, which are ſmall, but very neat, are chiefly built of ebony, and other wood of variegated colours. They have but little furniture, except the neceſſary utenſils for dreſſing their proviſions; but what they have is always kept exceeding clean; and to prevent the houſe being made filthy, they have veſſels to ſpit in when they chew betel or ſmoak tobacco.

In general the men are very robuſt, and naturally ſo courageous, that they are eſteemed the beſt ſoldiers in India; for which reaſon they are frequently hired into the ſervices of other princes. Their arms are ſabres and daggers, the latter of which they often infect with poiſon; and they have trunks from which they blow poiſoned darts; theſe darts are pointed with the tooth of a fiſh dipped in the venomous juice of certain drugs that grow in the country, and it is ſaid they will ſtrike a mark with them at near 100 yards diſtance.

Theſe courageous iſlanders were the laſt enſlaved by the Dutch, who, however, could not effect a conqueſt till after a very long and expenſive war, in which were employed almoſt all the forces they had at that time in India. The Dutch firſt joined the natives to oppoſe the Portugueſe, who made an attempt to ſubdue this iſland; but the latter being ſoon conquered, the Dutch immediately took ſole poſſeſſion of it, and have preſerved an abſolute dominion over it ever ſince.

The Portugueſe, and after them the Dutch, endeavoured to ſubdue this iſland, becauſe it is ſituated near the Molucca and Banda iſlands, which produce ſuch great plenty of cloves and nutmegs, the poſſeſſion of which they could not have ſecured without being maſters of this iſland.

The natives, if well uſed, are loving and faithful in their diſpoſition; but, if ill treated, will not be ſatisfied till they have had revenge on the party by whom they were injured. They are haſty and paſſionate, but have ſuch juſt notions of honour, that when they diſcover themſelves to be wrong, they will condemn their own conduct, and be glad to comply with any ſubmiſſion that may be thought neceſſary, as a recompenſe for the offence committed.

The women of this iſland are obliged to be very circumſpect in their carriage, and very careful not to be ſeen in company with any other man than their huſband. When this happens to be the caſe, the huſband is indemnified if he kills the man he finds with his wife. On the contrary, the huſband is permitted to have as many wives and concubines as he thinks proper; and the more children he has, the greater he is conſidered as being uſeful to ſociety.

Both ſexes are rendered active by a cuſtom practiſed during their infancy. Every day their nurſes rub them with oil, or water juſt warm; and theſe unctions encourage nature to exert herſelf with the moſt extenſive freedom. Male infants are taken from the breaſt when a year old, their parents having an opinion that if they ſuckled longer, it would greatly prejudice their underſtandings. When they are five or ſix years old, children of any diſtinction are entruſted to the care of ſome relation or friend, that their courage may not be weakened by the careſſes of their mothers, and a habit of reciprocal tenderneſs. They do not return to their parents till they arrive at the age of fifteen or ſixteen, when the law allows them to marry: but this is a liberty they ſeldom uſe, till they are

thoroughly verſed in the exerciſe of arms. The boys are ſent to ſchool to the prieſts, who teach them reading, writing, arithmetic, and the precepts of the Koran; for though they retain many Chineſe ceremonies, they are profeſſed Mahometans. The girls are taught to read and write, to ſpin, cook, and make cloaths; for as there are not any taylors here, the women not only make their own cloaths, but alſo thoſe worn by the men: and ſome of them are ſo induſtrious and expert, that they will obtain very handſome fortunes by that profeſſion.

Theſe people are ſo little addicted to infamous practices, or litigious diſputes, that they have neither lawyers, attornies, or bailiffs. If any differences ariſe, the parties apply perſonally to the judge, who determines the matter with expedition and equity. In ſome matters of a criminal nature they are permitted to do juſtice to themſelves. If a man detects another in the commiſſion of adultery, murder, or robbery, he has a right to execute juſtice himſelf, by deſtroying the culprit.

The huſband, on marriage, receives no other portion with his wife than the preſents ſhe received before the ceremony, which, as ſoon as the prieſt has performed, the new married couple are confined in an apartment by themſelves for three ſucceſſive days, having only a ſervant to bring them ſuch neceſſaries as they may have occaſion for; during which time their friends and acquaintances are entertained, and great rejoicings made at the houſe of the bride's father. At the expiration of the three days the parties are ſet at liberty, and receive the congratulations of their friends; after which the bridegroom conducts his wife home, and each apply themſelves to buſineſs; he to his accuſtomed profeſſion, and ſhe to the duties of houſewifery.

Theſe iſlanders are all of the Mahometan religion. Many of them are great pretenders to magic, and carry charms about them, on a ſuppoſition of their ſecuring them from every danger.

Funeral ceremonies are performed here with great decency; to ſecure which, the meaneſt perſons make proviſion while in health, by aſſigning a certain ſum to defray the incidental expences. As ſoon as a perſon is dead the body is waſhed, and being clothed in a white robe, is placed in a room hung with white, which is ſcented with the ſtrongeſt perfumes. Here it continues for three days, and on the fourth it is carried on a palanquin to the grave, preceded by the friends and relations, and followed by the prieſts, who have attendants that carry incenſe and perfumes, which are burnt all the way from the houſe to the grave. The body is interred without a coffin, there being only a plank at the bottom of the grave for it to lie on, and another to cover it; and when this laſt is placed, the earth is thrown in, and the grave filled up. If the perſon is of diſtinguiſhed quality, a handſome tomb is immediately placed over the grave, adorned with flowers; and the relations burn incenſe and other perfumes for forty ſucceſſive days.

This iſland was formerly under monarchial government; and in order to prevent the crown falling on an infant, the eldeſt brother ſucceeded after the death of the king. All places of truſt in the civil government were diſpoſed of by the prime miniſters: but the officers of the revenue, and of the houſhold, were appointed by the ſovereign. The king's forces, when out of actual ſervice, were not allowed any pay, but only their cloaths, arms, and amunition. It is ſaid, that in ſome former wars he has brought into the field 12,000 horſe, and 80,000 foot.

Aſſemblies are held at particular times on affairs that concern the general intereſt, and the reſult of their determinations becomes a law to each ſtate. When any conteſt ariſes, it is decided by the governor of the Dutch colony, who preſides at this diet. He holds a watchful eye over theſe different ſovereigns, and keeps them in perfect equality with each other, to prevent any one from agrandizing himſelf to the prejudice of the company. The Dutch have diſarmed them all, under pretence of hindering them from injuring each other; but, in reality, with a view only to keep them in a ſtate of ſubjection.

The only foreigners permitted to come to this iſland are the Chineſe, who bring hither tobacco, gold-wire, china, and unwrought ſilks; in return for which they take opium; ſpirituous liquors, gum, and linens. They get but little gold from hence, but great quantities of rice, wax, ſlaves, and tripam, a ſpecies of muſhroom, which the rounder and blacker, the more excellent it is eſteemed. The cuſtoms bring in upwards of 80,000 livres to the company: but they obtain a much larger profit from their trade, and the tenth part of the territory, which they hold in full right of ſovereignty.

The chief city, Macaſſar, is ſituated on the banks of a river of the ſame name, near the ſouth-weſt corner of the iſland. Here the Dutch have a very ſtrong fort, mounted with a great number of cannon, and the garriſon conſiſts of 800 men.

In general, the ſtreets of the city are very long and ſpacious, and are planted on each ſide with trees; but there are not any of them paved. The moſques and houſes of the quality are built with ſtone; but thoſe of the common people are of wood, and elevated from the ground with pillars. They are made of wood of various colours, and the tops of them are covered with palm or cocoa leaves. Here are large markets for the ſale of proviſions and other commodities. The markets are opened twice a day, viz. in the morning and evening, before the riſing and ſetting of the ſun. The proviſions are brought to market and ſold by women only; for if a man was to be ſeen in that character, he would be treated with the moſt diſtinguiſhed contempt. The number of inhabitants in this city were formerly eſtimated at 160,000 men able to bear arms; but ſince the Dutch deprived them of their trade, great numbers have forſaken it: and the other towns and villages, which were proportionably populous, have been greatly deſerted for the ſame reaſon.

Jampandam, the only principal place on this iſland, excluſive of the city of Macaſſar, is ſituated about 15 miles to the ſouth of Macaſſar river. This was the firſt place of any importance taken by the Dutch, who have a good fort here; and there is as commodious an harbour as any to be met with in the Indidian Seas.

Of the ſeveral iſlands about the Celebes, that go by the ſame name, the principal is ſituated about five leagues from the ſouth-eaſt corner. This iſland is about 80 miles long, and 30 broad. On the eaſt ſide of it is a large town and harbour called Callacaſſong, the ſtreets of which are ſpacious, and encloſed on each ſide with cocoa-trees. The inhabitants are Mahometans, ſpeak the Malayan tongue, and are governed by an abſolute prince.

To the north-eaſt of this iſland are the Straights of Patience, ſo called from the great difficulty in paſſing them, which ariſes from the violence of the currents, and the contrariety of winds.

The SUNDA ISLANDS. Borneo, the largeſt of the Sunda Iſlands, was diſcovered by the Portugueſe in 1521. It is of great extent, being ſituated between 7 deg. 30 min. north lat. and 4 deg. 10 min. ſouth, under the equinoctial line, which divides it into two unequal parts, 7 deg. 30 min. lying northward of it, and 4 deg. 10 min. ſouthward; ſo that it is 700 miles in length, and 480 in breadth. It is bounded on the eaſt by the Celebes, on the weſt by Sumatra, on the north by the Philippines, and on the ſouth by the iſland of Java.

Conſidering the ſituation of the country, the air is tolerable, particularly in thoſe parts next the coaſt, which are refreſhed every morning by cooling breezes from the ſea, otherwiſe the heat would be inſupport-

able. Theſe parts, however, are very unwholeſome, as they lay on a flat for many hundred miles, and are annually overflowed. When the waters retire, a muddy ſlime is left on the ſurface of the earth, which the ſun ſhining upon with perpendicular rays, occaſions thick fogs, that afterwards turn to rain, with cold chilling winds; ſo that the air at this time is very unwholeſome. Another circumſtance that contributes to this, is the great number of frogs and other vermin left on the mud, which being deſtroyed by the heat of the ſun, produce an intolerable ſtench.

In April the dry ſeaſon begins, and continues till September, during which time the wind is eaſterly between the ſouth coaſts of Borneo and the Iſland of Java; but from September to April the winds are weſterly, attended by violent ſtorms of rain, thunder, and lightning. Theſe ſtorms are ſo continual, eſpecially on the ſouth coaſt, that it is thought very extraordinary to have two hours fair weather in the courſe of twenty-four.

Excluſive of rice, which is very plentiful, the produce of this country conſiſts of frankincenſe, muſk, aloes, pepper, cinnamon, and other ſpices; alſo various kinds of fruits, with excellent maſtic, and other gums, wax, caſſia, honey, cotton, and the beſt camphire.

Borneo produces great quantities of excellent timber, with the cotton ſhrub, canes, and rattans, In the rivers, particularly that of Suocadanea, are found excellent diamonds, and great quantities of gold duſt are gathered from the ſands. The loadſtone is alſo found here; and the wild ape produces the richeſt bezoar ſtones that are any where to be met with. Here are alſo mines of iron and tin, which are ſaid to be excellent in their qualities.

The animals of this country are oxen, buffaloes, horſes, deer, and goats; beſides which there are ſeveral ſorts of wild beaſts, as elephants, bears, tygers, monkies, and baboons.

There are various kinds of parrots and paroquets, one of which is called, by the Banjareens, *luree*, and is admired for its beauty. They have alſo ſeveral other kinds of birds, but not any like thoſe in Europe, except the ſparrow. During the time of the weſtern monſoons, the ſky is frequently darkened with bats, which fly in prodigious numbers. They are called by ſome *flying cats*, and, in colour, ſhape, and ſmell much reſemble a fox, though not ſo large: but their wings, when extended, are not leſs than ſix feet from the tip of the one to that of the other.

The natives of this iſland may be conſidered as of two claſſes, differing as well in their perſons and dreſs, as in their cuſtoms and religion. Thoſe who inhabit the ſea-coaſt are Mahometans, and called Banjareens, from the town of Banjar, to which moſt nations reſort to purchaſe the various commodities of the country. The Banjareens are rather low in ſtature, and of a ſwarthy complexion, but, on the whole, very proportionably made. The common people have no other covering than a ſmall piece of linen faſtened round the waiſt; but the better ſort wear a kind of waiſtcoat made of ſilk, or European cloth, over which they throw a looſe garment of ſilk or betella, that reaches to the knees. They alſo wear a pair of drawers, but have neither ſhirt, ſhoes, or ſtockings. Their hair is tied up in a roll, and covered with a piece of muſlin or calico; and when they go abroad they always carry a dagger with them.

The women are ſmaller than the men, and their features much more delicate: they are alſo much fairer in complexion; and, contrary to the mode of moſt Indian women, walk very upright, and ſtep with a graceful air. They are very conſtant after marriage, but are apt to beſtow favours with great freedom when ſingle: but however indiſcreet, they may have been in this point, they are not conſidered the worſe for it by their huſbands; nor dare any one reproach them for the faults they have committed previous to their marriage.

The chief part of their food is rice, but with it they eat veniſon, fiſh and fowl. The better ſort are ſerved in veſſels made of gold or ſilver, but the poorer ſort uſe diſhes made of earth or braſs. They all ſit croſs-legged at their meals upon mats or carpets. Both ſexes chew betel and areka, and are very fond of ſmoaking tobacco, with which they often mix opium made into pills, after being boiled in water till it comes to a conſiſtency. The whole company uſually ſmoke out of the ſame pipe; the maſter begins, and after having ſmoked two or three whiffs, he gives it to the perſon neareſt him, from whom it paſſes round till it comes to the maſter again.

The principal diverſions are dancing and comedies, which are performed after the manner of the eaſt.—Their rural ſports are ſhooting at a mark and hunting. They travel chiefly in the night, on account of the coolneſs of the air at that time; the common people uſually go in covered boats, but the better ſort travel by land on elephants and horſes.

The ſalaam, or lifting the hands to the head, and bending the body, is their mode of ſalutation. When they appear before their ſuperiors, they raiſe their hands above the forehead; and if before a prince they proſtrate themſelves on the ground, and retire backwards on their knees.

Thoſe who inhabit the inland parts of this iſland are taller, and much more robuſt, than the Banjareens. They are called Byajos, and are Pagans in their religion. Their complexion is more ſwarthy than the inhabitants of the coaſt; and their time is chiefly employed in hunting and attending their cattle. They go almoſt naked, having only a ſmall piece of linen faſtened round the waiſt; they paint their bodies of a bluiſh colour, and beſmear them with ſtinking oil. Some of them are very fond of having large ears, to obtain which they make holes in the ſoft parts of them when young: to theſe holes are faſtened weights about the breadth of a crown piece, which continually preſſing on the ears expand them to an immoderate length. The better ſort pull out their fore teeth, and place artificial ones in their ſtead, made of gold; but their greateſt ornament conſiſts of a number of tygers teeth, which are ſtrung together, and worn about the neck.

The Banjareens, in burying their dead, always place the head to the north, and throw into the grave ſeveral kinds of proviſions, from a ſuperſtitious notion that they may be uſeful to them in the other world. They fix the place of interment out of the reach of the flood; and the mourners, as in Japan and China, are dreſſed in white, and carry lighted torches in their hands.

Pagans as well as Mahometans allow a plurality of wives and concubines. They in general live to an advanced age, which is attributed to their frequent uſe of the water, for both men and women bathe in the rivers once in the day; from which practice they are very expert in ſwimming. The Malayan is the language of thoſe on the coaſt.

They are ſtrangers to the uſe of phyſic, and the letting of blood, however deſperate the caſe of the patient, is to them a circumſtance of the moſt alarming nature. An inſtance of their great timidity on this occaſion is thus given by captain Beckman, who was under the neceſſity of ſubmitting to that operation. "One day (ſays he) being indiſpoſed, I ordered the ſurgeon to bleed me. Cay Deponattee, and ſeveral others of the natives, being in the room, and ſtrangers to the operation, were in great amazement to know what we were about, till at length the vein being opened, they ſaw the blood guſh out; at this they were ſo frightened that they immediately ran out of the room, crying out, in their language, "the man's heart or mind is fooliſh;" after which they told us,

us, we let out our very ſouls and lives willingly, which they ſaid was very ill done. To this I anſwered, that their diet being mean, and their drink only water, they had no occaſion for bleeding; but that we, who drink ſo much wine and punch, and fed upon ſo much fleſh, which rendered the blood hot and rich, had an abſolute neceſſity of doing it, otherwiſe we ſhould be ſick. "Aye (ſays Cay Deponattee) I think that ſhews you to be ſtill greater fools, in putting yourſelves to ſuch expenſive charges, on purpoſe to receive pain for it." This was certainly a very trite obſervation, and fully evinced, that if they wanted faith in the utility of this expedient, they were not defective in natural underſtanding.

As they ſuppoſe moſt of their diſtempers to ariſe from the malice of ſome evil demon, when a perſon is ſick, inſtead of applying to medicine, they make an entertainment of various kinds of proviſions, which they hold under ſome conſpicuous tree in a field; theſe proviſions, which conſiſt of rice, fowls, fiſh, &c. they offer for the relief of the perſons afflicted: and if he recovers, they repeat the offering, by way of returning thanks for the bleſſing received; but if the patient dies, they expreſs their reſentment againſt the ſpirit by whom he is ſuppoſed to have been affected.

They know nothing of aſtronomy; and when an eclipſe happens, they think the world is going to be deſtroyed. They likewiſe know little of arithmetic, and their only method of calculating is by parallel lines and moveable buttons on a board.

Their current money is dollars and half and quarter dollars; and for ſmall change they have a ſort of money made of lead in the form of rings, which are ſtrung on a kind of dry leaf.

The towns and factories to which the Europeans trade are built on floats of timber on the river: each town conſiſts of one long ſtreet; and, to ſecure them from being carried away by the ſtream, poſts are driven into the ground near the ſhore, to which they are faſtened with cables made of rattans. Each houſe conſiſts only of one floor divided into different apartments, according to the number in family: the ſides of the building are made with ſplit bamboo, and the roof is covered with leaves of trees: the walls are made high for the benefit of the air, and from their tops hang coverings that reach within five feet of the logs, and are made in a ſloping form, to keep off the ſcorching heat of the ſun. The floats are made of large logs of wood; and the houſes are ſo light in their conſtruction, that a great part of the float is ſeen above the ſurface of the water.

The houſes of the poorer ſort are built on piles of bamboo, in the mud on each ſide, and are ranged in an uniform manner behind thoſe on the floats. At high water they get to their houſes with boats; and when the water is low, they go from one to the other on logs of timber. It ſometimes happens at ebb tides, when the current is exceſſive ſtrong, that theſe houſes will be removed a conſiderable diſtance, and with great difficulty brought back to their original ſtations. Inſtances have been known of their being driven to ſea, and totally loſt.

The city of Borneo, on the north, Paſſeer on the eaſt, Succadanea on the weſt, and Banjar Maſſeen on the ſouth, are the principal places for trade on this iſland. The laſt of theſe is the moſt conſiderable on account of the river Banjar, which is ſo commodious as to admit ſhips of the greateſt burden.—This river runs from north to ſouth above half through the iſland, and towards its mouth is near two miles broad. Its banks are planted with thick groves of evergreens; and one branch of it is called the China River, from the Chineſe junks conſtantly paſſing it.

The inland part of this country is divided into ſeveral petty kingdoms, each of which is governed by a rajah, or king. Formerly all the rajahs were ſubject to the rajah of Borneo, who was eſteemed the ſupreme king over the whole iſland; but his authority has been of late years greatly diminiſhed; and there are other kings equal, if not more powerful, than himſelf, particularly the king of Caytonge. The town where this prince reſides is ſituated about 80 miles up the Banjar river. His palace is a very elegant building, erected on pillars, and is open on all ſides. Before the palace is a large building, conſiſting of only one room, which is ſet apart for holding of councils, and entertaining foreigners. In the center of the room is the throne, covered with a rich canopy of gold and ſilver brocade. About the palace are planted ſeveral cannon, which are ſo old, and mounted on ſuch wretched carriages, that they are neither ornamental nor uſeful.

The ſuperiority of this prince is derived from the cuſtoms he receives at the port of Banjar Maſſeen, which are eſtimated at 8000 pieces of eight per annum.

Next in rank to the above, is the king or ſultan of Negaree, whoſe palace is ſituated at a place called Metapoora, about ten miles from Caytonge. Before the gates of this palace is an handſome armoury, which contains a great number of fire-arms, and ſeveral cannon. He is always on good terms with his neighbour the prince of Caytonge, and to theſe two princes the reſt are ſubordinate.

The natives pay great homage to theſe princes, and it is difficult for a ſtranger to get acceſs to them. The only means to effect this is by complimenting them with ſome valuable preſent, for avarice is their darling paſſion; and the ſtranger will be treated with reſpect in proportion to the preſent he makes.

The mountaineers live independent of any of theſe kings: they are divided into different clans under their reſpective chiefs, and are ſubject to a government peculiar to themſelves. They are ſeldom ſeen, as they live in the woods and foreſts, where they are ſo ſecure, that it would be difficult to attack them: and they are ſo ſavage, that an attempt would, in all probability, be attended with the moſt fatal conſequences. Their arms are a dagger, and a trunk about ſeven feet long, through which they ſhoot poiſoned darts made of braſs, and barbed on each ſide. Their dreſs conſiſts only of a piece of cloth wrapped round the waiſt, and a rag about their heads. They often come down to Tatas to get commodities from the Banjareens, in exchange for which they give gold, bezoar, rice, wax, &c.

The Dutch poſſeſs the principal parts on the coaſt of this iſland, and are maſters of the beſt ports, and moſt valuable articles in traffic; but there are many creeks about the iſland, where others have free commerce without moleſtation. As this country produces a great variety of articles, whoſe value are more eſtimable to other nations than to the Dutch, numbers of foreigners reſort here for thoſe commodities that are beſt adapted to the trade of their own nation. The Chineſe and Japaneſe come here for ſpices; the Malayans for gold; and thoſe from the Mogul country in ſearch of diamonds. As the Dutch reckon the pepper, cloves, and cinnamon, as inferior to thoſe of the other ſpice iſlands, ſo they ſuffer them to be ſold without interruption. The natives are ſupplied by the Dutch with the manufactures of India; in exchange for which they receive gold, diamonds, and other valuable commodities.

Pepper, gold, precious ſtones, and a gum called dragon's blood, which is ſaid to be finer here than in any other part of the world, are the principal articles purchaſed by the Engliſh merchants.

The European commodities taken here conſiſt of guns, piſtols, gunpowder, ſheet-lead, iron and ſteel bars, nails of different ſizes, hangers, knives, and other cutlery wares, boots made of red leather, ſpectacles, looking-glaſſes, clock-work, callimancos, and various ſorts of linens.

The

The capital city, Borneo, is ſituated on the north-weſt corner of the iſland, and lies in 112 deg. 2 min. eaſt long. and in 4 deg. 55 min. north lat. On the eaſt ſide of it is an excellent harbour, adjoining to which is a large river, capable of accommodating ſhips of the greateſt burthen. The town is very large, the ſtreets ſpacious, and the houſes well built: they are, in general, three ſtories high, covered with flat roofs. The ſultan's palace is an elegant and extenſive building.

This place is the chief ſeat of commerce in the iſland, and the port belonging to it is continually crowded with ſhips from various nations, particularly from China, Cambodia, Siam, and Malacca: and there are prodigious numbers of boats that come from the Philippine and other iſlands. The Dutch import here glaſs, cinnabar, cloths, woollens, and iron, in exchange for which they take camphire, gold and precious ſtones. The Portugueſe and Engliſh have ſome trade here, though no ſettled factory; but there are merchants of both nations who correſpond with the company's factors on the coaſt of Coromandel.

Here it may not be improper to obſerve, that thoſe who barter with the natives of Borneo muſt carefully examine the goods they purchaſe, and ſee that the weight or meaſure is juſt; for they are arrant cheats; and ſuch ſtrangers are they to any remorſe of conſcience, that he thinks himſelf the moſt ingenious who commits the moſt diſtinguiſhed fraud. They make compoſitions to imitate ſome of the moſt valuable articles, particularly bezoar and bars of gold; the latter of which is ſo artfully executed, that, unleſs a penetration is made entirely through them, the deception cannot be diſcovered.

The iſland of Java is ſituated between 102 and 113 deg. eaſt long. and between 5 and 8 deg. of ſouth lat. being about 700 miles in length, and 200 in breadth. It is bounded on the eaſt by the iſland and ſtraits of Bally, on the weſt by the ſtraits of Sunda, (from whence it is called one of the Sunda iſlands,) on the north by the iſland of Borneo, and on the ſouth by the Indian Ocean.

The iſland of Java produces goats, ſheep, hogs, buffaloes, and horſes. The horſe, which is ſaid to have been met with here when the country was firſt diſcovered, is a ſmall, but nimble animal, being ſeldom above thirteen hands high. The horned cattle of this country are different from thoſe of Europe; the fleſh is extremely lean, but of a very fine grain. Both the Chineſe, and the natives of the iſland, feed on the buffalo; but the Dutch will neither taſte the fleſh or the milk, from a ridiculous idea that they are productive of fevers. The ſheep are tough and ill-taſted, and they have long hanging ears. A few ſheep from the Cape of Good Hope being at Batavia, captain Cook bought ſome of them at the rate of 1s. per pound.

Formerly this iſland produced no kind of ſpices but pepper, and the quantity which the Dutch bring annually from thence is very conſiderable; but the quantity uſed in the country is very ſmall, as the people there give the preference to Cayan pepper. The inhabitants are very fond of nutmegs and cloves, but they bear too high a price to be much in uſe, as the trees which produce them are all become Dutch property.

The natives of Java profeſs the religion of Mahomet, and of courſe do not indulge in wine, at leaſt publicly, but, not to be exceeded in the vice of drunkenneſs by their Chriſtian neighbours, they are almoſt conſtantly chewing opium, which is well known to intoxicate in a high degree.

The moſt diſtinguiſhed city in this iſland is Batavia, ſituated in 6 deg. 10 min. ſouth lat. and 106 deg. 50 min. eaſt long. from the meridian of Greenwich. It is built on the bank of a large bay, ſomething more than twenty miles from the ſtreight of Sunda, on the north ſide of the iſland of Java, in low boggy ground. Several ſmall rivers, which riſe forty miles up the country in the mountains of Blaeuwen Berg, diſcharge themſelves into the ſea at this place, having firſt interſected the town in different directions. There are wide canals of nearly ſtagnated water in almoſt every ſtreet, and as the banks of theſe canals are planted with rows of trees, the effect is very agreeable; but theſe trees and canals combine to render the air peſtilential. Some of the rivers are navigable more than thirty miles up the country; and, indeed, the Dutch appear to have choſen this ſpot to build the town on, for the ſake of water-carriage, in which convenience Batavia exceeds every place in the world, except the towns of Holland.

The ſtreets being wide, and the houſes large, it ſtands on more ground than any other place that has only an equal number of houſes.

In dry weather, a moſt horrid ſtench ariſes from the canals, and taints the air to a great degree; and when the rains have ſo ſwelled the canals that they overflow their banks, the ground-floors of the houſes, in the lower parts of the town, are filled with ſtinking water, that leaves behind it dirt and ſlime in amazing quantities. The running ſtreams are ſometimes as offenſive as the ſtagnant canals; for the bodies of dead animals are frequently lodged on the ſhallow parts, where they are left to putrify and corrupt the air, except a flood happens to carry them away. This was the caſe with a dead buffalo, while the crew of the Endeavour were there, which lay ſtinking on the ſhoal of a river, in one of the chief ſtreets, for ſeveral days: indeed, the air of this place is ſo very unwholeſome, that it is repreſented by captain Cook as the grave of European navigators.

Any number of ſhips may anchor in the harbour of Batavia, the ground of which is ſo excellent, that the anchor will never quit its hold. This harbour is ſometimes dangerous for boats, when the ſea-breeze blows freſh; but, upon the whole, it is deemed the beſt and moſt commodious in all India.

The environs of Batavia have a very pleaſing appearance, and would, in almoſt any other country, be an enviable ſituation. Gardens and houſes occupy the country for ſeveral miles; but the gardens are ſo covered with trees, that the advantage of the land having been cleared of the wood, with which it was originally covered, is almoſt wholly loſt; while theſe gardens, and the fields adjacent to them, are ſurrounded by ditches which yield not the moſt fragrant ſcent, and the bogs and moraſſes in the adjacent fields are ſtill more offenſive.

At near forty miles from the town, the land riſes into hills, and the air is purified in a great degree; to this diſtance the invalids are ſent by the phyſicians, when every other proſpect of their recovery has failed, and the experiment ſucceeds in almoſt every inſtance, for the ſick are ſoon reſtored to health; but they no ſooner return to the town than their former diſorders viſit them.

Pine-apples grow here in ſuch abundance, that they may be purchaſed, at firſt hand, for the value of an Engliſh farthing. Our people bought ſome very large ones for a halfpenny a-piece at the fruit-ſhops.

There are plenty of mangos, but their taſte is far inferior to that of the melting peach of England, to which they have been compared.

The tamarinds are equally cheap and plentiful; but as the method of preſerving them, which is in ſalt, renders them a mere black lump, they are equally nauſeating to the ſight and palate.

The Batavians, as well as the natives of other parts of the iſland of Java, ſtrew an immenſe number of flowers about their houſes, and are almoſt always burning aromatic woods and gums, which is done by way of purifying the air; the ſtench that ariſes from the canals and ditches being exceeding nauſeous and diſagreeable.

The hogs here, eſpecially thoſe of the Chineſe breed, are exquiſitely fine food, but ſo very fat, that the lean is always ſold ſeparate.

The Portugueſe make a practice of ſhooting the wild hog, and deer of two kinds, with which the neighbourhood of Batavia abounds. Theſe are all good eating, and are purchaſed at very moderate prices. The goats of this country are as bad food as the ſheep. Dogs and cats abound on the iſlands, and wild horſes, and other cattle are found on the mountains, at a conſiderable diſtance from Batavia.

Few monkies are ſeen near the towns, but there are many on the mountains and deſert places, where are alſo a few rhinoceroſes, and great numbers of tygers.

The quantity of fiſh taken here is aſtoniſhingly great, and all the kinds of them are fine food, except a few, which are very ſcarce; yet, ſuch is the falſe pride of the inhabitants, that theſe few ſorts are ſold at very high rates, while thoſe that are good are ſold for a mere trifle, nor are they eaten but by the ſlaves. A gentleman, with whom captain Cook dined, told him, he could have bought a finer diſh of fiſh for a ſhilling than what he had given ten for; but that he ſhould have been the ridicule of all the politer people, if he had gone to ſo good a market.

Mr. Banks, while here, ſhot a lizard, five feet long, which was exceeding well-taſted; and our adventurers were informed, that ſome of theſe animals had been ſeen, which were full as thick as the thigh of a man.

Captain Cook was informed that, at the time he was there, the whole place could not furniſh fifty women who were natives of Europe, yet the town abounded with white women, who were deſcended from Europeans, who had ſettled there at different times, all the men having paid the debt of nature; for ſo it is, that the climate of Batavia deſtroys the men much faſter than the women.

Mercantile buſineſs is conducted at Batavia with the ſlighteſt trouble imaginable. When a merchant receives an order for goods of any kind, he communicates the contents of it to the Chineſe, who are the univerſal manufacturers. The Chineſe agent delivers the effects on board the ſhip for which they are beſpoke, and taking a receipt for them from the maſter of the veſſel, he delivers it to the merchant, who pays the Chineſe for the goods, and reſerves a conſiderable profit, without the leaſt trouble, riſk, or anxiety.

The Indian inhabitants of Batavia, and the country in its neighbourhood, are not native Javaneſe, but are either born on the ſeveral iſlands from whence the Dutch bring their ſlaves, or the offspring of ſuch as have been born on thoſe iſlands: and theſe having been made free, either in their own perſons, or in the perſons of their anceſtors, enjoy all the privileges of free men. They receive the general appellation of Dranſlam, which implies, "Believers of the true faith."

The hair of the people, which is black, without a ſingle exception, grows in great abundance; yet the women make uſe of oils and other ingredients, to increaſe the quantity of it; they faſten it to the crown of the head with a bodkin, having firſt twiſted it into a circle, round which circle they place an elegant wreath of flowers, ſo that the whole head-dreſs has a moſt beautiful appearance.

It is an univerſal cuſtom, both with the men and women, to bathe in a river once a day, and ſometimes oftener, which not only promotes health, but prevents that contraction of filth, which would be otherwiſe unavoidable in ſo hot a climate.

Almoſt every perſon has heard or read of the Mohawks; and theſe are the people who are ſo denominated, from a corruption of the word Amock, which will be fully explained by the following ſtory and obſervations. To run a muck is to get drunk with opium, and then ſeizing ſome offenſive weapon, to ſally forth from the houſe, kill the perſon or perſons ſuppoſed to have injured the Amock, and any other perſon who attempts to impede his paſſage, till himſelf is taken priſoner, or killed on the ſpot.

While captain Cook was at Batavia, a perſon whoſe circumſtances in life were independent, becoming jealous of his brother, intoxicated himſelf with opium, and then murdered his brother, and two other men, who endeavoured to ſeize him. This man, contrary to the uſual cuſtom, did not leave his own houſe, but made his reſiſtance from within it; yet he had taken ſuch a quantity of the opium, that he was totally delirious; which appeared from his attempting to fire three muſkets, neither of which had been loaded, or even primed.

During captain Cook's ſtay, ſeveral inſtances of the like kind occurred; and he was informed by an officer, whoſe duty it was to take ſuch offenders into cuſtody, that hardly a week paſſed in the year in which he was not obliged to exerciſe his authority: the captain was alſo told, that jealouſy of the women is the uſual reaſon of theſe poor creatures running a muck, and that the firſt object of their vengeance is always the perſon whom they ſuppoſe to have injured them. The officer, whoſe buſineſs it is to apprehend theſe unhappy wretches, is furniſhed with a long pair of tongs, in order to take hold of them at ſuch a diſtance from the point of their weapons, as to inſure his perſonal ſafety. When he takes one of them alive he is amply rewarded; but this is not often the caſe, as they are ſo deſperate as not to be eaſily apprehended: when they are killed in the attempt to take them, the officer has only the cuſtomary gratification. Thoſe who are taken alive are broken on the wheel, as near as poſſible to the place where the firſt murder was perpetrated: and as they are ſeldom apprehended without being previouſly wounded, the time of their execution is ſooner or later, according to the opinion of the phyſicians, whether the wounds are, or are not, mortal.

There are many inſtances of the ſuperſtition of theſe people, that might be thought very extraordinary; but the following will appear much more ſo. They are poſſeſſed with an idea, that when one of their wives is brought to bed, a crocodile is born, as a brother to the infant; and they imagine that the midwife conveys the young crocodile to an adjacent river, into which ſhe puts it with the utmoſt care and tenderneſs. Thoſe who ſuppoſe themſelves honoured by the birth of this new relation, fail not to put food in the river for his ſubſiſtence; but this is the peculiar duty of the twin-brother, who performs this ſervice regularly, at fixed periods, during the whole courſe of his life; firmly believing, at the ſame time, that ſickneſs or death would be the conſequence of an omiſſion on his part.

In the iſlands of Boutou and Celebes, the natives keep crocodiles in their families; and it is conjectured, that the ſtrange idea of the twin-crocodile was firſt conceived in one of thoſe iſlands: it extends, however, to Java and Sumatra weſtward, and, among the iſlands to the eaſtward, as far as Ceram and Timor. It is a matter of perfect aſtoniſhment, how even the moſt ignorant and credulous of the human race ſhould firmly believe an utter impoſſibility to occur daily; yet it is certain, that not one of the Indians whom captain Cook queſtioned on the ſubject, entertained the leaſt doubt about the matter. The crocodiles ſuppoſed to be thus born, are diſtinguiſhed by the name of Sudaras: and our readers cannot fail of being entertained with the following ſtory reſpecting them, which Mr. Banks heard from a young woman who was born at Bencoolen, and having lived among the Engliſh at that place, had learnt to ſpeak as much of our language as was ſufficient to make her ſtory intelligible.

She ſaid that, when her father was on his death-bed, he laid the ſtrongeſt injunctions on her to feed a crocodile that was his Sudara; that he told her the name by which he might be called up, and the particular part of the river where ſhe would find him. Soon after the death of her father, ſhe haſtened to the river, and calling Radja Pouti (which ſignifies white king) the Sudara crocodile made his appearance, and ſhe fed him with her own hands. She deſcribed him as being more beautiful than crocodiles are in general, for he had a red noſe, and ſpots on his body; his ears were adorned with rings, and his feet with ornaments of gold. This ſtory will appear the more extravagantly ridiculous when it is recollected that crocodiles have not any ears.

A man, whoſe mother was a native of the iſland of Java, and whoſe father was a Dutchman, was engaged in the ſervice of Mr. Banks, during his reſidence at Batavia. This man told his maſter, that ſeveral Dutchmen, and many Javaneſe, as well as himſelf, had ſeen ſuch a crocodile as was deſcribed by the girl who told the preceding ſtory, and that, like her's, its feet were adorned with gold. On Mr. Banks's remarking the abſurdity of theſe tales, and ſaying that crocodiles had not ears, he replied, that the Sudaras differed conſiderably from other crocodiles; that they had ears, though he acknowledged they were ſmall; that their tongues filled their mouths, and that on each foot they had five toes.

While captain Cook was at Batavia, Spaniſh dollars ſold at five ſhillings and five-pence each, and the price is ſeldom much lower. The Chineſe would give only the value of twenty ſhillings for an Engliſh guinea that was almoſt new, and for thoſe that were old, and much worn, only ſeventeen ſhillings.

Captain Cook obſerves, that a remarkable ſubordination prevails among the people in Batavia. Every houſekeeper has a certain ſpecific rank, according to the length of time he has ſerved the company. The different ranks thus acquired are diſtinguiſhed by the ornaments of the coaches and the dreſſes of the coachmen: ſome ride in plain coaches, ſome are allowed to paint them with different devices, and ſome to gild them. The coachmen alſo are obliged to appear in clothes quite plain, or ornamented in various manners and degrees.

The chief officer in this place has the title of governor-general of the Indies, to whom the Dutch governors of all other ſettlements are ſubordinate; and they are obliged to repair to Batavia in order to have their accounts paſſed by him. Should they appear to have been criminal, or even negligent, he detains them during pleaſure; ſometimes three years; for they cannot, without his permiſſion, quit the place. The members of the council, called by the natives Edele Heeren, and by the Engliſh Idollers, are next in rank to the governor-general. Theſe aſſume ſo much ſtate, that whoever meets them in a carriage are expected to riſe up and bow, and after this compliment they drive to one ſide of the road, and ſtop till the members of the council have paſſed: their wives and children expect alſo the ſame homage, and it is commonly paid them by the inhabitants. Some Engliſh captains have conſidered this as a ſlaviſh mark of reſpect, derogatory to their dignity as ſervants of his Britannic majeſty, and for this reaſon have refuſed to pay it: nevertheleſs, when in a hired coach, nothing but a menace of immediate death could prevent the coachman from honouring the Dutch grandee at the expence of their mortification.

With reſpect to the diſtribution of juſtice, it is adminiſtered in Batavia by the lawyers, who have peculiar ranks of diſtinction among themſelves. Their deciſions in criminal caſes ſeem to be ſevere with reſpect to the natives, but lenient, in a partial degree, to their own people. A Chriſtian is always indulged with an opportunity of eſcaping before he is brought to trial, whatever may be his offence, and, when convicted, he is ſeldom puniſhed with death. On the contrary, the poor Indians are hanged, broken upon the wheel, and even impaled alive. As to the Malays and Chineſe, they have judicial officers of their own, named captains and lieutenants, who determine in civil caſes, ſubject to an appeal to the Dutch tribunal. The taxes laid upon theſe people by the company are very conſiderable, among which, that exacted for liberty to wear their hair, is not the leaſt. The time of payment is monthly, and, to ſave the charge and trouble of collecting them, notice is given of this by hoiſting a flag upon the top of a houſe in the middle of the town, and the Chineſe find it their intereſt to repair thither, when a payment is due, without delay.

About 80 miles eaſt of Batavia, is Cherebon, a place of conſiderable extent, and where the Dutch have a factory. The country is very fertile, and produces moſt kinds of proviſions, particularly rice.—The inhabitants are under the dominion of four great lords, called ſultans, one of whom is particularly attached to the Dutch, and, for that reaſon, is diſtinguiſhed from the reſt by the name of the company's ſultan.

Bantam, which was once the metropolis of a great kingdom, is the principal place of commerce at the weſtern part of this iſland. It ſtands in a plain, at the foot of a mountain, from whence iſſues a river that divides itſelf into three ſtreams, one of which runs through the town, and the others furround it. It is 12 miles in circumference; and, before it was reduced by the treachery of the Dutch (who firſt joined the natives againſt their king, and then ſtripped the latter of all regal power) was very populous, well fortified, and adorned with ſeveral elegant buildings and palaces. At this time, however, it is a very ruinous place, inhabited only by the pooreſt people.

Palamboan, the capital of a kingdom or principality of the ſame name, is ſituated in 114 deg. eaſt longitude, and in 7 deg. 30 min. ſouth latitude, on the Straights of Bally, through which the Eaſt India ſhips ſometimes paſs when they are homeward-bound from Borneo.

Mataram, an empire that once extended over the whole iſland, and even now takes up a conſiderable part of it, is under the government of the Dutch, and was the laſt reduced to ſubjection by them on this iſland. The country of Mataram is in general very fertile, and produces great quantities of rice, as alſo plenty of fruit. There are likewiſe various ſorts of animals, particularly horſes, ſheep, goats, and remarkably large oxen. The rivers abound with fiſh, and the woods produce great plenty of game. But the moſt valuable articles of this country are rice, pepper, cadjang, cotton, yarn, cardamom, and indigo; the latter of which is eſteemed to be as good in quality as any found in the Indies.

Mataram, the capital of the kingdom, is the uſual reſidence of the king. His palace is a very handſome ſpacious building, adjoining to which are many good houſes belonging to his nobles, who every day wait on him; and his ſubjects in general pay him the greateſt homage.

Though theſe princes are vaſſals, yet they are permitted to live in as great ſtate as if they were really monarchs; and the orders of the Dutch are always executed in their names. They, therefore, aſſume a dignity not inferior to the moſt deſpotic prince; and, when they go abroad, are attended with every diſtinguiſhed mark of royalty.

Japara is ſituated at the bottom of an eminence, called the Invincible Mountain, on the top of which is a fort, built of wood. It is a very conſiderable place, and has a good road, ſecured by two ſmall iſlands.

The

The Engliſh had once a factory here, but they were driven from it by the Portugueſe.

The natives of this country are very fond of diverſions, particularly the repreſentation of comedies; and they are ſuch ſlaves to cock-fighting, that, by the large ſums they bet, they are often reduced to the moſt abject diſtreſs.

The Inhabitants of Java are chiefly Mahometans, as is alſo the chief, who generally reſides at a place called Kattaſura, where the Dutch have a fort and garriſon. This prince reigns abſolute among his ſubjects, who are very faithful, and pay him the greateſt homage. Like moſt Eaſtern monarchs, he is conſtantly attended by women, and takes as many wives and concubines as he thinks proper. When his courtiers obtain an audience, they approach him with the greateſt humility.

The ISLAND OF SUMATRA is ſituated in the Indian Ocean, between 93 and 104 deg. eaſt long. and 5 deg. 30 min. north lat. It is bounded on the eaſt by Borneo, on the north by Malacca, on the ſouth-eaſt by Java, and on the weſt by the Indian Ocean. It is long and narrow, reaching in a direct line, from the north-weſt to the ſouth-eaſt, and is about 750 miles in length, and 175 in breadth. It is the firſt of the remarkable iſlands that form the Great Archipelago of the Eaſt, the entrance of which is, as it were, blocked up by this Iſland and Java, which form a barrier, ſeparating the Indian from the Chineſe Ocean, with this exception, that, in the centre, between the two iſlands, there is an opening, which appears as if purpoſely deſigned to admit a free paſſage for the advantage of commerce. This opening is called the Straits of Sunda, the ſouth part of which is the north of Java, called Java Head; and the north point is the ſouth of Sumatra, called Flat Point. Theſe two are about ſix leagues aſunder, between which ſhips paſs from Europe directly to Batavia or China, without touching in the Indies. They ſtretch away eaſt from the Cape of Good Hope, and make no land till, having traverſed the whole Indian Sea, they arrive at Java Head.

The air of this iſland is in general very unwholeſome, ariſing chiefly from the two extremes of heat and cold, and the intermixture of wet from very heavy rains. The day and night are equal; and the inconveniences that occur from the exceſſive heat of the former are greatly increaſed by the cold chilling wind of the latter.

A chain of mountains run through the whole iſland, from the ſouth-eaſt to the north-weſt, and here the air is more wholeſome than on the coaſt. There are alſo conſiderable mountains on the weſt coaſt, in one of which is a volcano, that frequently throws out flames of fire.

The monſoons, or periodical winds, ſhift here at the equinoxes, as they do in other parts of the Indian Seas, blowing ſix months in one direction, and ſix months in the oppoſite direction. Near the coaſt there are other periodical winds, which blow the greateſt part of the day from the ſea, and in the night, and part of the morning, from the land; but theſe ſcarce extend ſeven miles from the coaſt.

Of the many ſmall rivers on this iſland, none are navigable; and their waters are very unwholeſome. The river Indapura, which falls into the ſea, on the weſt coaſt, has a water tinged with red, occaſioned, as it is ſaid, by the great quantity of ochre that grows on its banks, which are always covered at the time of the floods. The waters of all the rivers that overflow the low countries are very foul, and not fit for uſe till they have been boiled, and infuſed with tea, or ſome other wholeſome herbs.

Pepper, rice, ſugar, camphire, gold-duſt, bezoar, canes, and cotton, are the moſt valuable produce of this iſland. The ſoil is in ſome parts very fertile, and well watered with rivulets; but, in the low lands, next the ſea, are abundance of bogs and marſhes, which produce only reeds and canes of bamboo.

Moſt kinds of fruits abound here, arrive to the greateſt perfection, and are equal to any found in the Indies: as cocoa-nuts, limes, oranges, mangoes, plantains, guavas, jakas, durains, pine-apples, mangoſtans, and other tropical fruits. They have alſo melons, peas, beans, potatoes, yams, radiſhes, pot-herbs, ſallads, and plenty of all kinds of garden-ſtuff. There is likewiſe a plant grows here called bang, which is ſomewhat like hemp, and, when infuſed in liquor, operates much like opium. This is ſometimes uſed by the natives, particularly when they are engaged in war, as it animates them to perſevere in the moſt dangerous undertakings.

The animals here are horſes, buffaloes, deer, goats, hogs, oxen, and hog-deer, from the latter of which is obtained a ſpecies or kind of the bezoar-ſtone. This ſtone is of a dark-brown colour, and has two ſmall coats, the innermoſt of which is covered with ſmall ſtrings, but the outer coat is quite ſmooth. When the ſtone is diſſolved in any liquor, its taſte is exceeding bitter; but if a ſmall quantity of it is taken by thoſe who have an oppreſſion of the ſtomach, a foul blood, or a want of appetite, it will remove the complaints; and is alſo very efficacious in other diſorders incident to human nature.

There are ſeveral ſorts of wild animals in the woods, and mountains; as, tygers, elephants, rhinoceroſes, monkies, and wild boars. There are alſo ſquirrels, guanoes, porcupines, alligators, ſerpents, ſcorpions, muſketos, and other venomous inſects; and this is ſaid to be the only iſland in the Eaſt Indies where there are bears.

Here are ſeveral ſorts of poultry, particularly fowls and ducks; alſo pigeons, doves, parrots, parroquets, mackaws, and a great variety of ſmall birds.

The rivers abound with fiſh, amongſt which are mullets, cray-fiſh, ſhrimps, eels, oyſters, &c. and they have plenty of turtles. But ſome of the rivers are greatly peſtered with crocodiles.

Great quantities of gold are got out of the rivers and mountains on the north part of the iſland; and the trade of Achen principally depends on this valuable commodity. There are alſo mines of tin, iron, braſs, copper, &c. It has not any wheat or rye, but great quantities of barley, honey, wax, ſugar, ginger, and pepper, with which they load their veſſels every year; and they ſend their pepper and gold in exchange for rice and opium, which our merchants ſend them from Bengal and other parts.

The inhabitants on the coaſt are Mahometans; the mountaineers, or natives, are Pagans. They are in general of a moderate ſtature, and very ſwarthy complexion. They have black eyes, flat faces, and high cheek-bones. Their hair is long and black, and they take great pains to dye their teeth of the ſame colour. They likewiſe beſmear themſelves with oil, as in other hot countries, to prevent being ſtung by the inſects; and let their nails grow exceeding long, ſcraping them till they are tranſparent, and dying them with vermillion.

The poorer ſort have a ſmall piece of cloth faſtened round the waiſt; and about their head they wear a piece of linen, or cap made of leaves, reſembling the crown of a hat; but they have neither ſhoes nor ſtockings. The better ſort wear drawers or breeches, and a piece of calico or ſilk wrapped about their loins, and thrown over the left ſhoulder; and when in towns they wear ſandals on their feet.

They are very proud and revengeful; and ſo indolent that they will neither endeavour to improve themſelves in arts, ſciences, or huſbandry; but ſuffer their manufactures to be neglected, and their lands to lie without cultivation.

Their flying proas, or ſailing veſſels, are greatly admired for the neat and convenient manner in which they

they are conſtructed. They are very expert in building their houſes, but in all other mechanical arts they are very deficient.

Sumatra is divided into ſeveral kingdoms and principalities; but the moſt conſiderable is Achen, which comprehends the whole northern part of the iſland.

Beſides the king of Achen, who is the greateſt monarch in the iſland, there are ſeveral orancayas, or great lords, in this kingdom, who exerciſe ſovereign authority in their reſpective territories, but they all acknowledge the king of Achen their ſuperior, and accept the great offices in his court. In former times, the kings have exerciſed ſuch deſpotic power as to diſplace ſome of theſe, and depoſe others; and, on the contrary, inſtances have been known where theſe princes have depoſed the king, and placed another on the throne.

The king of Achen and theſe princes have often ſtruggled for ſovereign power; and if the former has been abſolute in ſome reigns, he has had a very limited authority in others. The king has the power of diſpoſing of the crown, during his life, to ſuch of his children as he thinks proper, whether born of a wife or concubine: but if the king does not diſpoſe of it in his life-time, there are ſometimes ſeveral competitors for it; and he who is moſt favoured by the orancayas, or vaſſal princes, uſually carries his point: and in theſe caſes the crown is elective.

The capital city of this kingdom is Achen, ſituated in 93 deg. 30 min. eaſt long. and 5 deg. 30 min. north latitude. It ſtands on a plain, about five miles from the ſea, 1000 miles ſouth-eaſt of Fort St. George, in India, and about 450 miles north-weſt of the city of Malacca. The harbour, which is capable of containing any number of the largeſt ſhips, is commanded by a ſpacious fortreſs, encompaſſed by a ditch, well fortified, according to the Indian manner, and mounted with cannon. There are ſeven gates belonging to the city, beſides which there are other redoubts and fortifications in the adjacent marſhes.

In Achen are about 8000 houſes, which are built on poſts, two feet above the ground, on account of the great rains that ſometimes ſo overflow the city, that the inhabitants go from one houſe to another in boats. The floors and ſides are made of ſplit bamboos, and they are covered with reeds, cocoa, or palmetto leaves. They are chiefly divided by paliſadoes, except in two or three particular ſtreets, ſet apart for trade, and one that is particularly inhabited by the Chineſe. The Europeans live as near each other as they can, in a long ſtreet near the river. They conſiſt of Engliſh, Dutch, Danes, and Portugueſe, who, with the Guzurats and Chineſe, are the chief traders in the city.

The king's elephants and magazines are kept in the outer court of the palace; and at proper diſtances are ſeveral ſmall forts, well guarded and ſtored with artillery and fire-arms. But the king's greateſt ſtrength conſiſts in his elephants, which are very numerous, and ſo trained that they will ſtand unmoved at the firing of artillery. It is ſaid that when they paſs the king's apartments they will ſalute him by bending their necks and raiſing their trunks.

The king has alſo a great number of horſes, all of which, as well as the elephants, have rich and magnificent trappings.

He is not at any expence in time of war; for, at his command all his ſubjects are obliged to march at their own expence, and carry with them proviſions for three months. If they are in the field longer than that time, he ſupplies them with rice for their ſupport. On their going out he furniſhes them with arms, a regiſter of which is kept, and they are obliged to reſtore them at their return.

This monarch muſt be very rich, for he is at much leſs expence than any other prince in the Indies. In war he is only at the expence of arms, powder, lead, and rice, which is very trifling; and in peace it does not coſt him any thing, even for the maintenance of his family. He has more fleſh, fowl, and all kinds of proviſions paid him by his ſubjects, than are conſumed in his palace; and the ſurplus is ſold at the market for his benefit. He divides hereditary eſtates among his ſubjects, whom he obliges to furniſh him with a certain quantity of rice every year. This he puts into his magazines, and exports to places where there is a ſcarcity of that article.

He is not at any expence either for his own clothes, or thoſe of his concubines; for, on a certain day in the year, all who have any office or place in the city, are obliged to make him a preſent of one or more garments, according to the income of their places. If the king diſapproves of what is preſented, he returns it back, and the officer that gave it is ſure to be turned out of his place, unleſs he adjuſts the matter, by complimenting him with a ſum of money.

He is heir to all ſubjects who die without male iſſue. If they have daughters unmarried, he ſends them to the palace. He is alſo heir to all foreigners that die within his territories; for when ſuch a perſon is known to be ill, the king's officers take poſſeſſion of his houſe, and, on his death, remove his effects to the caſtle. He has the eſtates of all thoſe put to death; and almoſt every day produces an inſtance of ſome innocent man's ſuffering, purely to gratify his unbounded avarice. If it is a wealthy perſon in office that is pitched on, he is accuſed of mal-adminiſtration; and, to prevent their alienating their eſtates or goods, he takes them by ſurprize, and has their wives, children, ſlaves, cattle, and all their moveables, lodged in the caſtle, before they know their ſentence. Such is the tyranny of this deſpotic prince!

The natives of Achen are proud, envious, and treacherous; deſpiſe their neighbours, and yet pretend to have more humanity than the inhabitants of any other nation. Some of them are good mechanics, eſpecially in building gallies; and they are very dexterous in doing all kinds of ſmith's work. They alſo work well in wood and copper; and ſome of them are ſkilled in making artillery. They live very abſtemiouſly, their chief food being rice, to which ſome of the better ſort add a ſmall quantity of fiſh, and their uſual drink is water. They are very fond of tobacco, though they have but little of their own raiſing, and, for want of pipes, they ſmoke in a bueno, which is the leaf of a tree rolled up, with a little tobacco in it; this they light at one end, and draw the ſmoke through the other, till it is nearly burnt to the lips. Theſe rolls are very curiouſly formed, and great quantities of them are ſold in the public markets.

As Mahometans, agreeably to the laws of the Koran, they are permitted to marry as many women as they pleaſe; but the firſt is entitled to the preference, and the children by her are eſteemed the lawful heirs. If any diſpute ariſe between the huſband and his wives, they may ſeparate, provided they mutually requeſt it; but the ſolicitation of one only will not be ſufficient.

The rites of marriage, among the Sumatrans, conſiſt ſimply in joining the hands of the parties, and pronouncing them man and wife, without much ceremony, except the entertainment given upon the occaſion. But little apparent courtſhip precedes the marriages; their manners do not admit of it, the young people of each ſex being carefully kept aſunder, and the girls being ſeldom truſted from under the wings of their mothers. The opportunities which the young people have of ſeeing each other, are at the public feſtivals. On theſe occaſions the perſons who are unmarried meet together, and dance and ſing in company. The men, when determined in their choice, generally employ an old woman as their agent, by whom they make known their ſentiments, and ſend preſents to the female of their choice. The parents then interfere, and the preliminaries being

ſettled, a feaſt takes place. The greater the concourſe at theſe feſtivals, the more is the credit of the hoſt, who is generally the father of the girl.

Mothers do not carry their children in the arms, as our nurſes do, but ſtraddling on the hip, and uſually ſupported by a cloth, which ties in a knot on the oppoſite ſhoulder. The children are nurſed but little, not confined by any ſwathing or bandages, and being ſuffered to roll about the floor, ſoon learn to walk and ſhift for themſelves. When cradles are uſed, they ſwing, ſuſpended from the ceiling of the room.

At their funerals the corpſe is carried to the place of interment, on a broad plank, which is kept for the public ſervice, and laſts many generations. It is conſtantly rubbed with lime, either to prevent its decay, or keep it pure. No coffin is uſed, the body being ſimply wrapped in white cloth. In forming the grave, after digging to a convenient depth, they make a cavity in the ſide, at bottom, of ſufficient dimenſions to contain the body, by which means the earth lies light upon it; and this cavity, after ſtrewing flowers in it, they ſtop up by two boards, faſtened angularly to each other; ſo that the one is on the top of the corpſe, while the other defends it on the open ſide, the edge reſting on the bottom of the grave. The outer hole is then filled up with earth, and little white flags, or ſtreamers, are ſtuck in order around. They likewiſe plant a ſhrub, bearing a white flower, and in ſome places marjorum. The women who attend the funeral make a hideous noiſe, not unlike the Iriſh howl.

It appears, from the accounts of W. Marſden, Eſq. ſecretary to the preſident and council of Fort Marlbro', that the people of Batta, in the iſland of Sumatra, eat human fleſh; not as a gluttonous delicacy, like the New Zealanders, but as a mode of ſhewing their deteſtation of crimes, and a horrid indication of revenge and inſult to their unfortunate enemies. The objects of this barbarous repaſt are priſoners taken in war, and offenders convicted and condemned for capital crimes. The unhappy object, whether priſoner of war or malefactor, is tied to a ſtake: the people aſſembled throw their lances at him from a certain diſtance, and when mortally wounded, they run up to him, as if in a tranſport of paſſion, cut pieces from the body with their knives, dip them in a diſh of ſalt and lemon-juice, ſlightly broil them over a fire prepared for the purpoſe, and ſwallow the morſels with a degree of ſavage enthuſiaſm. Inſtances have been known where, with barbarity ſtill aggravated, they have torn the fleſh from the carcaſe with their mouths. It is, however, but juſtice to obſerve, that though there have been inſtances of their eating the bodies of their enemies ſlain in battle, that horrid practice but rarely takes place.

Their method of deſtroying tygers is extraordinary, and worthy of notice. Torches, made of dried bamboos, are carried with a view to frighten away the tygers, which are alarmed at the appearance of fire; and, for the ſame reaſon, it is common to make a blaze with wood, in different parts round their villages. Theſe animals prove to the inhabitants, both in their journies, and even their domeſtic occupation, moſt fatal enemies. The number of people annually ſlain hy theſe rapacious tyrants of the woods, is almoſt incredible. Inſtances have been known of whole villages being depopulated by them; yet, from a ſuperſtitious prejudice, it is with difficulty the natives are prevailed on, by a large reward, which the India Company offers, to uſe methods of deſtroying them, till they have ſuſtained ſome particular injury in their own family or kindred. Their traps, of which they can make variety, are very ingeniouſly contrived. Sometimes they are in the nature of ſtring cages, with falling doors, into which the beaſt is enticed by a goat or dog incloſed as a bait. Sometimes they manage that a large timber ſhall fall in a groove acroſs his back. Sometimes he is nooſed about the loins with ſtrong rattans. Sometimes he is led to aſcend a plank nearly balanced, which, turning when he is paſt the centre, lets him fall upon ſharp ſtakes prepared below.

The ſize and ſtrength of the ſpecies which infeſt this iſland are prodigious. They are ſaid to break, with a ſtroke of their fore-paw, the leg of a horſe or a buffalo; and the largeſt prey they kill is, without difficulty, dragged by them into the woods. This they uſually perform the ſecond night, being ſuppoſed, on the firſt, to gratify themſelves with ſucking the blood only. Time is, by this delay, afforded to prepare for their deſtruction; and, to the methods already enumerated, may be added, that of placing a veſſel of water, ſtrongly impregnated with arſenic, near the carcaſe, which is faſtened to a tree, to prevent its being carried off. The tyger, having ſatiated himſelf with the fleſh, is prompted to aſſuage his thirſt with the tempting liquor at hand, and periſhes in the indulgence. Their chief ſubſiſtence is, moſt probably, the unfortunate monkies, with which the woods abound. They are deſcribed as alluring them to their fate by a faſcinating power, ſimilar to what has been ſuppoſed of the ſnake, the alligator, and the crocodile.

In this iſland every old man and woman is a phyſician, their rewards depending on their ſucceſs. The mode of practice is either by adminiſtering the juices of certain trees and herbs inwardly, or by applying outwardly a poultice of leaves, chopped ſmall, upon the breaſt, or part affected, renewing it as ſoon as it becomes dry. For internal pains, they rub oil on a large leaf, of a ſtimulant quality, and, heating it before the fire, clap it on the body of the patient, as a bliſter, which produces very powerful effects. They never uſe bleeding. The ſmall-pox ſometimes viſits the iſland, and makes terrible ravages. It is looked upon as a plague, and drives from the country thouſands, whom the infection ſpares. Their method of ſtopping its progreſs (for they do not attempt a cure) is by converting into an hoſpital, or receptacle for the reſt, that village where lie the greateſt number of ſick, whither they ſend all who are attacked by the diſorder, from the country round. The moſt effectual methods are purſued to prevent any perſon eſcaping from the village, which is burnt to the ground, as ſoon as the infection has ſpent itſelf, or devoured all the victims thus offered to it. Inoculation ſeems to be an idea not thought of. The venereal diſeaſe, though common in the Malay country, is, in this iſland, almoſt unknown. A man returning to his village with the infection, is ſhunned by the inhabitants as an unclean and interdicted perſon. The Malayans cure it with a decoction of a China root, called, by them, gadoong, which cauſes a ſalivation.

Robberies and murders are more frequent here than in any other part of the Indies, notwithſtanding the laws are of the moſt ſevere nature. All offenders are brought to a ſpeedy trial, and the puniſhment is inflicted immediately after conviction. If the offence be of a trifling nature, the puniſhment, for the firſt time, is the loſs only of a hand or foot, and the ſame for the ſecond; but, for the third, or if they rob to a conſiderable amount, they are impaled alive. When the hand or foot is to be cut off, the limb is laid on the edge of a broad hatchet, and the executioner ſtrikes it with a large mallet, till the amputation is perfected; and then they put the ſtump into a hollow bamboo, ſtuffed with rags or moſs, to prevent the criminal from dying by the loſs of blood. After he has thus ſuffered, whether by the king's command, or the ſentence of the judge, all the ignominy of his crime is wiped off; and if any one upbraids him with it, he may kill him with impunity. Murder and adultery are puniſhed with death; and, in this caſe, the criminal has many executioners, he being placed amidſt a number of people, who ſtab him with their daggers; but female offenders are put to death by ſtrangling.

ſtrangling. The king is frequently a ſpectator of theſe puniſhments, and ſometimes acts himſelf as executioner: and though ſuch a ſpectacle muſt, to a feeling mind, appear of the moſt horrid nature, yet, ſo little does he ſeem to be affected by it, that inſtances have been known of his executing a criminal, and immediately going to entertain himſelf with cock-fighting, a diverſion more univerſally eſteemed, than any other in the country. A gentleman, lately arrived from this part of the world, has favoured us with the following particulars relative to that amuſement. The cock-pit (if the expreſſion may be uſed) is a ſpot on the level ground, on a ſtage, erected and covered in. It is incloſed with a railing, which keeps off the ſpectators, none but the handlers and heelers being admitted withinſide. A man who has a high opinion of, and regard for his cock, will not fight him under a certain number of dollars, which he places, in order, on the floor. His poorer adverſary is perhaps unable to depoſit one-half: the ſtanders-by make up the ſum, and receive their dividends in proportion, if ſucceſsful. A father, on his death-bed, has been known to deſire his ſon to take the firſt opportunity of matching a cock for a ſum equal to his whole property, upon a blind conviction of its being invulnerable. Cocks of the ſame colour are never matched, but a grey againſt a pile, a yellow againſt a red, and the like. Great pains are taken in rearing and feeding. Contrary to our laws, the owner is allowed to take up and handle his cock during the battle, to clear his eye of a feather, or his mouth of blood. The cocks are never trimmed, but matched in full feather. The artificial ſpur uſed in Sumatra reſembles the blade of a ſcymetar in ſhape, and proves a more deſtructive weapon than the European ſpur. It has no ſocket, but is tied to the leg, and, in the poſition of it, the nicety of the match is regulated. As, in horſe-racing, weight is proportioned to inches, ſo, in cocking, a bird of ſuperior weight and ſize is brought to an equality with his adverſary, by fixing the ſteel ſpur ſo many ſcales of the leg above the natural ſpur, and thus obliging him to fight with a degree of diſadvantage. It rarely happens that both cocks ſurvive the combat.

Having thus noticed the particulars relative to the kingdom and city of Achen, we ſhall now point out the other places that are diſtinguiſhed in this iſland, beginning with thoſe on the weſtern coaſt. The firſt of theſe is Bencoolen, a ſettlement belonging to the Engliſh, but chiefly inhabited by people of other nations. This town is ſituated in 103 deg. eaſt longitude, and 3 deg. 10 min. ſouth latitude. The adjacent country is mountainous and woody; and, in ſome parts, are volcanos that frequently iſſue out fire. The air is very unwholeſome, and the mountains are generally covered with thick clouds that burſt in ſtorms of thunder, rain, &c. The ſoil is a fertile clay, and the chief produce is graſs; but near the ſea it is all a moraſs. The natives build their houſes on bamboo pillars, as at Achen, but the Engliſh build their's with timber, not only from their being in want of ſtone, but on account of earthquakes which very frequently happen in this part of the iſland.

There is a ſmall river on the north-weſt ſide of the town, by which the pepper is brought here from the inland part of the country; but there is a great inconvenience in ſhipping it, on account of a dangerous bar at the mouth of the river. The road is alſo dangerous for ſhips, as it has no other defence from the violence of the ſea, during the ſouth-weſt monſoons, than a ſmall place, named Rat Iſland, which, with the land of Point Sillabar, makes the haven. The town is about two miles in circumference, and is known, at ſea, by a very high, ſlender mountain, called the Sugar Loaf, which riſes in the country 29 miles beyond the town.

A few years after the Engliſh firſt ſettled on this iſland, which was about the year 1685, the Eaſt India Company built a fort, and called it Fort York. In 1690, a contagious diſtemper raged with ſuch violence, that the governor and council all died in a very ſhort ſpace of time, which was attributed to the town being ſituated on ſo unwholeſome a ſpot, as not to be borne by an European conſtitution. In conſequence of this calamity, the Engliſh, in 1719, began to build a new fort in a more healthy part, and better adapted for regular fortifications; but they had no ſooner raiſed the walls of it, than the natives, who had a long time been at enmity with them, attacked the place, and ſet fire to the principal part of their buildings; on which, the governor, with his ſmall garriſon, precipitately embarked for Batavia, leaving behind them ſeveral cheſts of money, and all the artillery, arms, ammunition, &c. The natives, however, finding themſelves greatly injured by the abſence of the Engliſh, and not having any method of diſpoſing of their pepper, in a ſhort time after invited them to return, and again take poſſeſſion of their new ſettlement. This invitation being accepted, the fort they had begun was ſoon completed, under the name of Marlborough Fort; and they have been in quiet poſſeſſion of the place from that time to the preſent.

Sillabar is an Engliſh ſettlement, ſituated about 15 miles from Bencoolen, where they conſtantly keep a detachment from Marlborough Fort. The town is tolerably large, and before it is a convenient harbour; but it has not any building, or other matter, that demands particular attention.

They have alſo other ſettlements to the north-weſt of the above, particularly at Cattoun, ſituated about 40 miles from Bencoolen; Ippo, about 30 miles farther to the north; Bantall, which is upwards of 100 miles north of Bencoolen; and Mocha, ſituated a little to the ſouth of Indrapour.

The Dutch have likewiſe ſeveral good ſettlements on this iſland, the moſt conſiderable of which is Palimvang, or Pullambam, ſituated about 120 miles north-eaſt of Bencoolen. The chief article of trade here is pepper, of which the Dutch have prodigious quantities.

The Dutch factories here are,

Bancalis, ſituated nearly oppoſite to Malacca, on the banks of a ſpacious river of its own name. The chief articles ſold here by the Company are cloth and opium, in return for which they receive gold-duſt.

Siack is ſituated on the river Andraghina, but is an inconſiderable place, on account of the unwholeſomeneſs of the air.

Padang is ſituated about 60 miles ſouth of the equator, and has a fine river, where large ſhips may come up and ride in ſafety; but it is the moſt inſignificant ſettlement the Dutch have on this iſland.

Priaman, ſituated nearly oppoſite to Padang, about 100 miles north-weſt of Indrapour. It is very populous, and plentifully ſupplied with moſt kinds of proviſions. The natives carry on a conſiderable trade, in gold, with the inhabitants of Manimcabo. The Dutch had a factory here for ſome years, but were at length driven from it by the king of Achen.

Ticow is ſituated about ſeven leagues from Daſſaman, in 20 deg. ſouth lat. The inland part of the country is very high, but that next the ſea is low, covered with woods, and watered with ſeveral ſmall rivers, which render it marſhy. There are, however, many pleaſant meadows, well ſtocked with buffaloes and oxen, which are purchaſed at a very eaſy price. It likewiſe affords plenty of rice, poultry, and ſeveral ſorts of fruits, as durians, ananas, oranges, citrons, pomegranates, melons, mangoes, cucumbers, and potatoes. But its moſt valuable produce is pepper, with which it abounds, and is, in quality, eſteemed ſuperior to that of any other place on the iſland; for which reaſon thoſe parts are exceeding populous.—The city is ſituated about two miles from the ſea, oppoſite to a ſmall iſland. It is but a mean place, for the

the city and ſuburbs do not contain 800 houſes, which are chiefly built with reeds, and are neither ſtrong or covenient.

Barros, one of the moſt conſiderable places on the weſt coaſt, belonging to the king of Achen, is ſituated on a fine river, near about the centre between Ticow and Achen. The Dutch and Engliſh, as alſo the inhabitants of the coaſt, buy up the camphire here, in order to carry it to Surat, and the ſtraits of Sunda.

Andigri is a ſmall province, but is remarkable for producing great quantities of pepper; and gold is cheaper here than in any other part of the iſland.

Jamba alſo produces great quantities of pepper, which is ſaid to be much ſuperior in quality to that of Andigri.

Pedir is a large territory, ſituated about 30 miles from Achen, and has the advantage of an excellent river. The ſoil is very fertile, and the country produces ſuch quantities of rice, that it is called the granary of Achen.

Baſſaman is a large place, ſituated at the foot of a large high mountain, but is remarkable only for producing pepper.

There are ſeveral iſlands belonging to that of Sumatra, among which is one called, by the inhabitants, Pulo Lanchakay, and, by the natives of Achen, Pulo Lada, or Iſland of Pepper, from its producing ſuch a prodigious abundance of that article.

Lingen Iſland is ſituated about 60 miles north-eaſt of Jamby, and about the ſame diſtance to the ſouthward of Jahore. It is 50 miles in length, and 10 in breadth; the interior part of it is very mountainous, but that next the ſea lies low, and is very fertile It produces pepper and canes, and in ſome parts of it are great numbers of porcupines.

Banca Iſland is large, being, at leaſt, 150 miles in length, and about 20 in breadth. The natives, like moſt of the Malayans, are treacherous, and very inhoſpitable to ſuch ſtrangers as unfortunately happen to be ſhipwrecked on the coaſt. At the mouth of the ſtraits of Banca is Lucipara, a ſmall iſland, but ſo barren, that it has but few inhabitants, and only produces a ſmall quantity of pepper.

There are ſeveral other ſmall iſlands belonging to Sumatra, ſome of which are uninhabited, and the reſt ſo trifling, as not to admit of deſcription.

CEYLON was well known to the ancients, and is deſcribed, by Ptolemy, under the name of Taprobane, lies between 5 deg. 30 min. and 10 deg. 16 min. north lat. and between 79 deg. 40 min. and 82 deg. 45 min. eaſt, at the diſtance of near 190 miles from Cape Comorin, on the continent of India. It is above 300 miles in length, about 140 in breadth, and 900 in circumference. The Dutch call their fort at Jaffnapatam, Ham's-Heel, from fancying that the iſland, in form, reſembles a Weſtphalia ham.

Ceylon is one of the moſt pleaſant and fertile iſlands in all the Indies, and the air is much more temperate than could be expected, from its vicinity to the Line. The mountainous parts are woody, but the plains are exceeding fertile; ſprings, meandring ſtreams, and rivers water the whole, but the latter in general are ſo rocky, as not to be navigable. The principal river riſes in Adam's Peak; it is called Malliagouga, waſhes the city of Candy, and diſembogues itſelf into the ocean at Trincomale. The variation of the ſeaſons, and the winds which occaſion the monſoons, are much the ſame on this coaſt as on the coaſt of India. The northern corner of this iſland is the moſt unfertile, on account of its deficiency with reſpect to rivers, rivulets, ſprings, &c. and not enjoying any refreſhing ſhowers; but the other parts are amazing fertile, being plentifully ſupplied with water, and enjoying periodical rains, which always proceed from the ſouthward, but are prevented from reaching the northern diſtrict by a chain of very high mountains.

†

Ceylon produces all the fruits that are known in India, either on the continent, or in the iſlands: hence it is called the *Garden of the Eaſt*, and *Paradiſe of the Indies*; grapes, in particular, are found in perfection during nine months in the year. It alſo produces plenty of ginger, pepper, ſugar, mulberries, palms, cardamum, calacas, cotton, and areka trees; figs, originally planted by the Portugueſe, long-pepper, melons, various ſorts of mangoes, onions, garlic, and other European roots; but, above all, cinnamon.

The cinnamon-trees peculiar to Ceylon, are the beſt of any known. In a very dry ſoil, they are fit to be ſtripped of their bark in two or three years: if the ſoil is a moiſt white ſand, five years are required; but in a wet earth, they are eight or nine years before they become ripe. Thoſe that happen to grow in the ſhade, do not yield ſo fine a flavour as thoſe that are entirely expoſed to the ſun.

The ſpice is of immenſe value to the Dutch, being univerſally admired for the fragancy of its ſcent, and delicacy of its taſte; and the oil which they extract from it is an important article of commerce.

The fruit of the cinnamon-tree is about the ſize of a large hazle-nut, reſembles an acorn, and, when boiled to a liquid, ſerves the domeſtic purpoſe of burning in lamps, inſtead of oil; as alſo the medicinal purpoſe of curing aches, pains, ſores, &c. for which it is in great repute.

A gentleman, long reſident in Ceylon, in an exalted ſtation, ſays, that the cinnamon-plant appears to thrive better, when ſelf-ſown, than when propagated by culture. To this the crows greatly conduce; for, being fond of eating the red and quick-taſted fruit of the cinnamon-tree, they ſwallow, along with the fruit, the kernels, and ſcatter them, thus indigeſted, every where with their dung, by which the ſoil is, at the ſame time, manured, and the ſeed, ſhortly after ſtriking root, ſprings up out of the earth. On this account, no one dares to ſhoot, or otherwiſe kill a crow, under a ſevere penalty.

The ſame author relates the following extraordinary circumſtance, to ſhew the medicinal virtues of the pine-apple, which is likewiſe to be found in Ceylon. An European, that lay ill in this iſland, cried out, day and night, for ſomebody to bring him a pine-apple. It was, however, denied him by the phyſician. In a few days he died, and, being opened, a worm of a large ſize was found in his ſtomach, which it had already begun to eat into. The people who attended the ſick man, remembering what he had longed for, by way of experiment, dropped ſome pine-apple juice on the worm, which died in an inſtant.

The betel (ſo much chewed in Aſia) grows on a ſmall ſhrub; the leaves reſemble thoſe of ivy, and are naturally of a green colour; but the natives whiten them by artificial means, without impairing their virtues; the flavour is exceedingly pleaſant, and the ſcent aromatic.

In preparing the quid, or rather pill, for chewing, they take a piece of chalky earth, or a kind of lime, about as big as a pea, which they mix with a fourth part of the areka nut, wrap the whole in three betel-leaves, and chew it when they think proper. The areka-tree is ſtrait, has no branches, but bears the fruit among a few leaves, at the top. Till a perſon is accuſtomed to this chewing, it occaſions a dizzineſs and ſtupifaction, like tobacco; but, when grown familiar, is much more agreeable.

The mangoes here reſemble nectarines, and are, when ripe, either red, white, or green; they are from the ſize of an egg to that of a very large pear, are delicious when preſerved, and make an admirable pickle.

The jackies produce nuts like cheſnuts, which are ſubſtituted for bread when rice is ſcarce: they are, however, far from being wholeſome.

Ceylon likewiſe produces the ſnake-tree, the root-

tree,

tree, whoſe branches hang to the ground, and take freſh root; and the talipot tree, which is as high as the maſt of a ſhip, but without any branches or leaves, except at the ſummit. The top is, therefore, cut off, and uſed as an umbrella, or ſoldier's tent; and it is very ſtrong and light, and will fold like a fan.

Here are other ſpecies of grain, that are converted either into bread or oil; the moſt ſingular of which is the tanna, celebrated, not only for its goodneſs, but for yielding a thouſand-fold.

The elephants of Ceylon are the largeſt in the univerſe, and, if ſpotted, preferred to all others; the tygers and bears are very fierce; and the buffaloes, oxen, hogs, deer, &c. are excellent eating; nevertheleſs, the natives are fond of the fleſh of goats, ſquirrels, and monkies. The monkies in this iſland are innumerable, and of many different ſpecies; ſome of which do not reſemble any that are to be found in other countries. One ſort have grey hairs, with black viſages, and a white beard from ear to ear, which makes them appear, at a diſtance, like old men; another ſort are of the ſame ſize, but of an amazing whiteneſs. They reſide in the woods, but often make excurſions, and do a great deal of miſchief, digging the dead bodies out of the ground, to feed upon them.

The natives feed ſometimes upon young crocodiles and alligators, and out of their heads take a bone, which, when reduced to powder, is deemed a ſpecific for the ſtone and gravel.

Here are ſwarms of ants, which throw up prodigious large hills, four or five feet in height, and two or three in diameter: theſe they arch in an admirable manner, made ſo ſtrong, that it is difficult to deſtroy them with a pick-axe, and fill them with all kinds of grain for their winter ſubſiſtence.

One ſpecies of bees here build the combs on the boughs of trees. When the inhabitants would take the honey, they hold lighted torches under the trees, which affects the little animals in ſuch a manner, that they fall down dead; the comb is then taken, and the bees gathered up and boiled for food.

Serpents and leeches are very numerous, and, conſequently, very dangerous, as the natives go bare-legged; but, as much as poſſible to prevent them from biting, they rub their legs and feet with a compoſition of aſhes, ſalt, and lemon-juice.

No perſon but the king is permitted to keep turkies, geeſe, ducks, and pigeons: his ſubjects are, however, allowed the uſe of all other fowls, wild and tame. Here are many wild peacocks, and green parrots; but partridges, woodcocks, wood-doves, ſnipes, ſparrows, &c. are not ſo plenty. The moſt ſingular bird, however, is one entirely black, called carlos: it has a large ugly head, a long bill, and ſhort legs: it never lights upon the ground, but ſits almoſt continually on a tree, where it quacks like a duck.

The iſland abounds with ſea and freſh water-fiſh, ſeveral kinds of which are appropriated ſolely to the uſe of the king; and it is death, by the law, for any perſon to catch them but for his uſe.

Though Ceylon abounds with mines of gold, ſilver, and other metals, none are permitted to be worked, but thoſe of iron; and ſuch as produce precious ſtones are all monopolized by the ſovereign. The cat's-eye, which has a variety of fine colours, and needs no poliſhing, is the favourite gem; though their rubies, ſapphires, topazes, hyacinths, turquoiſes, &c. are ſome of the fineſt in the univerſe. The mountains likewiſe produce cryſtal, green, white, and red; brimſtone, ſaltpetre, &c.

The inhabitants of Ceylon are compoſed of Dutch, Portugueſe, Moors, Malabars, and a mungrel breed of all four; but the natives, who reſide in the inland parts, are called Cingulays, or Cinglaſſes. Theſe are of two claſſes, the Cingulays, properly ſo called, who are rather a civilized people; and the Vaddans, who live in the woods, and are quite wild. The firſt are well made, have regular features, are very active, ingenious, hardy, frugal, temperate, and neat; but, to balance their good qualities, they are talkative, yet grave; crafty, yet courteous; and treacherous, though complaiſant. The latter live without civil government, are excellent archers, and their principal buſineſs is to kill and dry veniſon. When they have expended or ſpoiled their arrows, and want new ones made, they go towards the houſe of a ſmith in the night, and hang up a quantity of veniſon, with a leaf faſhioned into the form and ſize of the arrow's point they want, by way of pattern: if the ſmith makes the arrows to pleaſe, and leaves them in lieu of the veniſon, they reward him with more deer's fleſh; but if he neglects them, they are ſure to do him a miſchief; which proves that they poſſeſs integrity and gratitude, as well as a ſpirit of reſentment and malice. That they are provident is likewiſe evident from their ſingular method of preſerving fleſh againſt a time of ſcarcity, which is by rubbing the inſide of a hollow tree with a quantity of honey, filling it with fleſh, and cloſing up the aperture with clay, which preſerves it as effectually as if it was ſalted. They love to live under trees by the ſides of rivers, where they fortify themſelves againſt the attacks of wild beaſts with boughs.

The Chingulays, or more civilized natives of Ceylon; live in houſes that are low, built with ſticks, or canes daubed over with clay, and covered with thatch. They have no chimnies, yet would willingly white waſh their houſes often; but this they dare not do, as the uſe of white waſh is one of the king's peculiar privileges; and it is death by the law to infringe upon any of his prerogatives, however abſurd or repugnant to public utility.

The natives ſit croſs-legged on the floor, which is uſually matted. Cane bedſteads and ſtools, and a few china plates, brazen and earthen veſſels for dreſſing food, or to ſerve as lamps, are the whole of their furniture. The men undreſs themſelves, and ſleep between two mats. The women and children lie upon the floor on a ſingle mat, but keep their cloaths on. But what is the moſt extraordinary in ſo warm a climate, they keep a fire burning all night.

The Chingulays eat but little fleſh through inclination: beef they are prohibited from touching, and even fowls they rather abſtain from. They uſe ſpoons and ladles, but neither knives or forks. The huſband ſits down to meals alone, the wife being obliged to wait upon him with all imaginable obſequiouſneſs; and when he has done, ſhe preſumes to ſit down with her children. Like ſome other Aſiatics, they do not touch the veſſel they drink out of with their lips, but hold it at a diſtance, and pour the liquor into their mouths. Old people let their beards grow long, and wear a cap like a mitre: but with reſpect to the people in general, they wear a waiſtcoat either of blue or white calico, and another piece of calico about the middle, tied round with a ſaſh. In the latter they wear their ornamental weapons, ſuch as a hanger, with an enamelled hilt, and ſcabbard finely emboſſed. The people are obliged to go bare-footed, becauſe none but the king is allowed to wear ſhoes and ſtockings. The women greaſe their hair with oil of cocoa-nuts, and comb it down behind. They wear a flowered waiſtcoat, and calico apron, and adorn themſelves with pendants in their ears, bracelets upon their arms, necklaces about their necks, rings on their toes and fingers, and a girdle of ſilver wires; and upon a viſit, a ſilk hood is added to the reſt of the dreſs.

The Chingulays are divided into five claſſes, viz. the hondrews or nobility, artiſts and mechanics, handicraftſmen of a lower order, ſlaves, and beggars.

They are in general, ſo addicted to the uſe both of betel and tobacco, that they even ſmoke and chew in the night time; and when they are perfectly intoxicated, fall a ſinging till they drop a ſleep; a cuſtom they are taught from their infancy.

Previous to the marriage ceremony, the man ſends a friend to purchaſe the woman's cloaths, which ſhe freely ſells for a ſtipulated ſum. In the evening he carries them to her, ſleeps with her all night, and in the morning appoints the day of marriage, on which he provides an entertainment of two courſes, for the friends of both parties. The feaſt is held at the bride's houſe, when the young couple eat out of the ſame diſh, tie their thumbs together, ſleep together that night, and, on the enſuing morning, depart for the bridegroom's habitation.

The deſign in purchaſing the bride's cloaths is that ſhe and her friends may be ſatisfied with reſpect to the man's circumſtances, as ſhe always aſks as much for them as ſhe thinks it is requiſite that a young couple ſhould poſſeſs upon their firſt entering upon the world, and becoming liable to the expences incurred by ſupporting a young family. Thus, what at firſt appears to be a ridiculous cuſtom, is, in reality, a very prudential maxim.

They are permitted to part from each other whenever they pleaſe: but if there are any children, the man is obliged to maintain the boys, and the woman the girls. They are ſo fond of availing themſelves of this law, that ſome have been known to change a dozen times before they have entirely ſuited their inclinations.

All the male Chingulays are allowed to command thoſe who are within hearing to aſſiſt them upon any emergency in the apprehending of delinquents: but the women are not permitted to mention the king's name, under the ſevere penalty of having their tongues cut out.

Criminals in Ceylon are frequently impaled alive, or have ſtakes driven through their bodies. Some are hung upon trees, and many are worried by dogs, who are ſo accuſtomed to the horrid butchery, that, on the days appointed for the death of criminals, they, by certain tokens, run to the place of execution. But the moſt remarkable criminal puniſhment is by the king himſelf, who rides an elephant trained up on purpoſe, while the beaſt tramples the unhappy wretch to death, and tears him limb from limb.

There are other modes of puniſhing by fines and impriſonment, at the diſcretion of the judges. When the fine is decreed, the officers ſeize the culprit wherever they meet him, ſtrip him naked, (his clothes going as part of payment,) and oblige him to carry a large ſtone, the weight being daily increaſed by the addition of others that are ſmaller, till the money is either paid or remitted.

A creditor will ſometimes go to the houſe of his debtor, and very gravely affirm, that if he does not diſcharge the debt he owes him immediately, he will deſtroy himſelf. This ſo greatly terrifies the other, that he inſtantly muſters all the money he can, even ſells his wife and children not to be deficient, and pays the ſum demanded. This is owing to a law, which ſpecifies, if any man deſtroys himſelf on account of a debt not being diſcharged, the debtor ſhall immediately pay the money to the ſurviving relations, or forfeit his own life, unleſs he is able to redeem it by the payment of a very large ſum to the king. Such has been the revengeful diſpoſition of ſome, that they have put an end to their own exiſtence, in order to overwhelm others, and thus wickedly gratified their malice at the expence of their lives.

A woman muſt not be beaten without permiſſion from the king; but they may be made to carry heavy baſkets of ſand upon their heads as long as the puniſher pleaſes, which is much more dreadful to them than a hearty drubbing. The circumſtances of the children depend upon thoſe of the mother; for if the mother is a free woman, they are free; but if is a ſlave,, they are always vaſſals.

The Chingulays worſhip both God and the devil. The firſt they think they ought, in gratitude, to pay adoration to, for the innumerable bleſſings he beſtows upon them: and the latter they worſhip, that he ſhould do them no miſchief.

Inferiors ſalute their ſuperiors by bowing their bodies and extending their arms, with the palms of their hands upwards; but the great only extend one hand, and not the head. The ſalutation of the women is by clapping their hands together, and then carrying them ſo cloſed to their foreheads.

The begging claſs of Chingulays are mountebanks in their way: the men beat a drum, the women dance, and both ſhew a variety of whimſical tricks. They beg, or rather amuſe people, for their bread, in great companies. They are prohibited by law, from touching the waters in wells or ſprings, and muſt uſe none but what is procured from rivers or ditches. If a nobleman or gentleman commits high treaſon, he is put to death, and his wives and daughters are delivered to ſome of theſe beggars, which is looked upon in ſo diſgraceful a light, that they frequently deſtroy themſelves, to avoid any connections with perſons eſteemed ſo deſpicable.

Their method of teaching children to write here is very ſingular, as they inſtruct them by writing with ſticks in the ſand, and ſoft clay of the roads and ſtreets.

The articles of commerce for exportation are cardamum, jaggory, oil, black lead, turmaric, betel nuts, muſk, ſalt, rice, wax, pepper, coral, amber, pearls, &c. in return for which they import velvets, ſilks, china, red caps, ſpices, opium, China roots, ſandal wood, lead, copper, tin, looking-glaſſes, callicos, bottles, camphire, &c.

Agriculture is followed here by the principal part of the natives. They tread the ground, or rather mud, in which they ſow rice, with buffaloes; but before they put the rice into it, they ſoak it in water till blades begin to ſprout. They embank their wet marſhy lands in order to have foot-paths. When the rice is about ſix inches in height, they weed and tranſplant it. After reaping, the women gather and put it into a pit, where it is threſhed, or rather trod by buffaloes.

The Portugueſe landed in Ceylon in 1505, and about twelve years after they eſtabliſhed factories there, the reigning king permitting them to build forts. Upon his demiſe he declared the king of Portugal his heir; but in proceſs of time, the Portugueſe behaving with great cruelty and arrogance, the young king of Candy invited in the Dutch, in 1639, who, after a tedious war, at the length, in the year 1655, ſubdued the Portugueſe, and became maſter's of the coaſt and trade. The king, their ally, they drove into the mountains, and, with their uſual gratitude, made him their tributary. The Dutch have, in ſubſequent years, committed many cruelties, and the natives frequently retaliate by making incurſions among them, or murdering all they meet with at a diſtance from the forts.

The iſland was formerly divided into nine monarchies, but at preſent it is under the dominion of one king, whoſe court is kept in the center of the iſland, at a place called Digligy-Neur. The palace is but meanly built, though the gates are large, ſtately, and finely carved, and the window-frames made of ebony, and inlaid with ſilver. His elephants, troops, and ſpies are numerous, and his concubines many. The guards are commanded by Dutch and Portugueſe renegado officers. He aſſumes great dignity, and demands much reſpect, which his ſubjects readily pay him, as they imagine that all their kings are immediately upon their demiſe turned into gods. He expects that Chriſtians ſhould ſalute him kneeling and

and uncovered, but requires nothing more of them. His title is Emperor of Ceylon, King of Candy, Prince of Onva and the Four Corles, Great Duke of the Seven Corles, Marquis of Duranura, Lord of the Sea-Ports and Fiſheries of Pearls and Precious Stones, Lord of the Golden Sun, &c. &c. &c. His revenue conſiſts in the gifts and offerings of his ſubjects. His palaces are built upon almoſt inacceſſible places for the greater ſecurity. No bridges are permitted to be erected over rivers or ſtreams, or good roads to be made, to render the country as impaſſable as poſſible. None are allowed to approach his palace without a paſſport ſtamped on clay. The troops are hereditary, and carry as weapons, ſwords, guns, pikes, bows, arrows, &c. They are ſubtle, but not courageous, and will not engage an enemy but by ſurpriſe, and when there is ſome manifeſt advantage in their own favour. It is ſo difficult to penetrate into the inland parts, and all the paſſes are ſo well guarded, that even the Dutch themſelves are unacquainted with the greateſt part of the iſland. The chief city, Candy, has nothing remarkable reſpecting it but its ſituation, being naturally fortified by the ſurrounding rocks: having formerly been burnt ſeveral times by the Portugueſe, and the court being removed to Digligy-Neur, it retains very little of its former conſequence.

The moſt remarkable places on and about the coaſt, are the Iſland of Manaar, Chialo, Columbo, Baticalo, Jaffnapatama, Negumbo, Point de Galle, Trincomale, Batchiarapalle, and the ſeven little iſlands of Ourature, Xho Deſerta, Analativa, Caradiva, Pongardiva, Nainandiva, and Nindundiva.

Adam's Peak, which ſtands on the eaſt of Columbo, is not only the higheſt mountain in Ceylon, but in all India. It receives its name from a tradition of the natives, that Adam was created and buried here. It is ſteep and craggy, and of a conical figure. At the ſummit there is a ſmooth ſtone, on which appears the impreſſion of a large human foot, which the Chingulays affirm to have been made by Adam. This occaſions them to pay a great adoration to it; and, at the commencement of every year vaſt multitudes clamber up to it, notwithſtanding the aſcent is ſo difficult, that iron ſpikes and chains have been fixed to the rocks, in order to facilitate their climbing. In another part of the mountain there is a lake, which the natives, with equal gravity, aver to have been made by the tears which they ſay Eve continued ſhedding, on account of the death of Abel, for 100 years ſucceſſively.

Maldivia Islands, were the firſt iſlands diſcovered by the European navigators on their arrival in the Indies. They are ſituated about 500 miles from Ceylon, and reach from 1 deg. ſouth, to 7 deg. north latitude. They extend about 600 miles in length, and are upwards of 100 in the broadeſt part. They are numerous, but many of them are only large hillocks of ſand, and, from the barrenneſs of the ſoil, are entirely uninhabited. The whole country is divided into thirteen provinces, called attolons, each of which contains many ſmall iſlands, and is of a circular form, about 100 miles in circumference. Theſe provinces all lie in a line, and are ſeparated by channels, four of which are navigable for large ſhips, but are very dangerous, on account of the amazing rocks that break the force of the ſea, and raiſe prodigious ſurges. The currents run eaſt and weſt alternately for ſix months, but the time of the change is uncertain; and ſometimes they ſhift from north to ſouth. At the bottom of theſe channels is found a ſubſtance like white coral, which, when boiled in cocoa-water, greatly reſembles ſugar.

As theſe iſlands lie ſo near the equinoctial on both ſides, the iſland is exceedingly ſultry. The nights, however, are tolerably cool, and produce heavy dews, that are refreſhing to the trees and vegetables. Their winter commences in April, and continues till October, during which they have heavy rains, and ſtrong weſterly winds; but they never have froſt. The ſummer begins in October, and continues ſix months, during which time the winds are eaſterly, and there not being any rain, the heat is ſo exceſſive as ſcarce to be borne.

In general the Maldives are very fertile, and, in particular, produce great quantities of millet, and another grain much like it, of both which they have two harveſts every year. They have alſo ſeveral kinds of roots that ſerve for food, particularly a ſort of bread-fruit, called *nollpou*, which grows wild, and in great abundance. The woods produce excellent fruits, as cocoas, citrons, pomegranates, and Indian figs. Their only animals for uſe are ſheep and buffaloes, except a few cows or bulls that belong to the king, and are imported from the continent; but theſe are only uſed at particular feſtivals. They have little domeſtic poultry, but are well ſupplied with prodigious quantities of wild fowl, which are caught in the woods, and ſold at very low prices. They have alſo plenty of wild pigeons, ducks, rails, and birds reſembling ſparrow hawks. The ſea produces moſt kinds of fiſh, great quantities of which are exported from hence to Sumatra. Among the fiſh is one called a *cowrie*, the ſhells of which are uſed in many parts of the Indies, inſtead of coin; and theſe are the ſame as thoſe known in England by the name of blackamoor's teeth.

There is a very dangerous ſnake that frequents the borders of the ſea. The inhabitants are alſo greatly peſtered with rats, dormice, piſmires, and other ſorts of vermin, which are very deſtructive to their proviſions, fruit, and other periſhable commodities; for which reaſon they build their granaries on piles in the ſea, at ſome diſtance from the ſhore; and moſt of the king's granaries are built in the ſame manner.

The natives are very robuſt, of an olive complexion, and well featured. They are naturally ingenious, and apply themſelves with great induſtry to various manufactures, particularly the making of ſilk and cotton. They are cautious and ſharp in trading, and courageous and well ſkilled in arms.

The dreſs of the common people is only a piece of cotton faſtened round their waiſt, except on feſtival days, when they wear cotton or ſilk jerkins, with waiſtcoats, the ſleeves of which reach only to the elbows. The better ſort tie a piece of cloth between their legs and round the waiſt, next to which they have a piece of blue or red cotton cloth, that reaches to the knees. Within a girdle, on the left ſide, they keep their money and betel, and on the right ſide a knife. They ſet a great value on this inſtrument, from its being their only weapon; for none but the king's officers and ſoldiers are permitted to wear any other.

The women are fairer than the men, and, in general, of a very agreeable diſpoſition. They wear a coat of cotton or ſilk, that reaches from the waiſt to the ancles, over which they have a long robe of taffety, or fine cotton, that extends from the ſhoulders to the feet, and is faſtened round the neck by two gilt buttons. Their hair is black, which is eſteemed a great ornament; and to obtain this, they keep their daughters' heads ſhaved till they are eight or nine years of age, leaving only a little hair on the forehead, to diſtinguiſh them from the boys. They waſh their heads and hair in water to make it thick and long, and let it hang looſe that the air may dry it, after which they perfume it with an odoriferous oil. When this is done, they ſtroke their hair backwards from the forehead, and tie it behind in a knot, to which they add a large lock of man's hair, and the whole is curiouſly ornamented with a variety of flowers.

The houſes of the common people are built of cocoa wood, and covered with leaves, ſewed one within another. But the better ſort have their

houſes built of ſtone, which is taken from under the flats and rocks in the following manner: among other trees in this iſland is one called *candou*, which is exceeding ſoft, and when dry, and ſawed into planks, is much lighter than cork: the natives, who are excellent ſwimmers, dive under water, and having fixed upon a ſtone fit for their purpoſe, they faſten a ſtrong rope to it; after this they take a plank of the candou wood, which, having a hole bored in it, is put on the rope, and forced down quite to the ſtone: they then run a number of other boards till the light wood riſes up to the top, dragging the ſtone along with it. By this contrivance the natives got up the cannon and anchors of a French ſhip, that was caſt away here in the beginning of the laſt century.

The Maldivians are in general a very polite people, particularly thoſe on the iſland of Male; but they are very libidinous, and fornication is not conſidered any crime: neither muſt any perſon offer inſult to a woman that has been guilty of miſconduct previous to marriage. Every man is permitted to have three wives, if he can maintain them, but not more.

They are very abſtemious in their diet, their principal food conſiſting of roots made into meal, and baked. They ſit croſs-legged at their meals, in the ſame manner as in other eaſtern countries. The floor on which they ſit is covered with a fine mat; and, inſtead of table-cloths, they uſe banana leaves. Their diſhes are chiefly of china, all veſſels of gold and ſilver being prohibited by law: they are made round with a cover, over which is a piece of ſilk, to keep out the ants. They take up their victuals with their fingers, and in ſo careful a manner as not to let any fall; and if they have occaſion to ſpit, they riſe from the table and walk out. They do not drink till they have finiſhed their meal, for they conſider that as a mark of rudeneſs; and they are very cautious of eating in the preſence of ſtrangers.

Theſe people are naturally very cleanly, and when they riſe in the morning immediately waſh themſelves, rub their eyes with oil, and black their eye-brows.

Though they are Mahometans, yet they preſerve many Pagan cuſtoms: for when croſſed at ſea, they pray to the king of the winds: and in every iſland there is a place where thoſe who have eſcaped danger make offerings to him of little veſſels made for the purpoſe, in which they put fragrant woods, flowers, and other perfumes, and then turn the veſſel adrift to the mercy of the waves. Such are the ſuperſtitious notions they have of this airy king, that they dare not ſpit to the windward for fear of offending him; and all their veſſels being devoted to him, they are kept equally clean with their moſques. They impute croſſes, ſickneſs, and death to the devil; and in a certain place make him offerings of flowers and banquets, in order to pacify him.

Their moſques are very neat buildings, and made of ſtone well cemented: each of them is ſituated in the center of a ſquare, and round them they bury their dead. The moſque has three doors, each aſcended by a flight of ſteps. The walls within are wainſcoted, and the ceiling is of wood beautifully variegated. The floor is of poliſhed ſtone, covered with mats and tapeſtry; and the ceiling and wainſcotting are firmly joined without either nails or pegs.

Each moſque has its prieſt, who, beſides the public duties of his office, teaches the children to read and write the Maldivian language, which is a radical tongue. He alſo inſtructs them in the Arabic language, and is rewarded for theſe ſervices by the parents.

Thoſe who are very religious go the moſque five times a day; and, before they enter it, they waſh their feet, hands, ears, eyes, and mouth: nor will they neglect doing this on any occaſion whatever. Thoſe who do not chooſe to go to the moſque, may ſay their prayers at home; but if they are known to omit doing one or the other, they are treated with the greateſt contempt, as no perſon will either eat or converſe with them.

They keep their ſabbath on Friday, which is celebrated with great feſtivity; and the ſame is obſerved on the day of every new moon. They have likewiſe ſeveral other feſtivals in the courſe of the year.

When two perſons intend entering into the marriage ſtate, the man gives information of his deſign to the pandiare, or governor, who aſks him if he is willing to have the woman propoſed: on his anſwering in the affirmative, the pandiare queſtions the parents as to their conſent: if they approve of it, the woman is then brought, and the parties are married in the preſence of their friends and relations. A woman cannot part from her huſband without his conſent, though a man may divorce his wife.

On the death of any one the corpſe is waſhed by a perſon of the ſame ſex, of which there are ſeveral in each iſland appointed for that purpoſe. After this is done, it is wrapped up in cotton, with the right hand placed on the ear, and the left on the thigh. It is then laid on the right ſide in a coffin of candou wood, and carried to the place of interment by ſix relations or friends, and followed by the neighbours, who attend without being invited. The grave is covered with a large piece of ſilk or cotton, which after the interment, becomes the property of the prieſt. The corpſe is laid in the grave with the face towards Mahomet's tomb; and after it is depoſited, the grave is filled up with white ſand ſprinkled with water. In the proceſſion both to and from the grave, the relations ſcatter ſhells for the benefit of the poor, and give pieces of gold and ſilver to the prieſt, in proportion to the circumſtances of the deceaſed. The prieſt ſings continually during the ceremony, and when the whole is over, the relations invite the company to a feaſt. They incloſe their graves with wooden rails, for they conſider it as a ſin for any perſon to walk over them; and they pay ſuch reſpect to the bones of the dead, that no perſons dare touch them, not even the prieſts themſelves. They make little difference in their habit on theſe occaſions: the mourners only go bareheaded to the grave, and continue ſo for a few days after the interment.

If a perſon dies at ſea, the body after being waſhed, is put into a coffin, with a written paper mentioning his religion, and requeſting thoſe who may meet with the corpſe to give it decent interment. They then ſing over it, and, after having compleated their ceremonies, they place it on a plank of candou wood, and commit it to the waves.

Male, the moſt conſiderable of the Maldive iſlands, is the reſidence of the king. It is ſituated in the center of the reſt, and is about five miles in circumference. The king has here a magnificent palace, in which his beds are hung like hammocks between two pillars ornamented with gold; and when he lies down he is rocked to ſleep by his attendants. His uſual dreſs conſiſts of a coat made of fine white cloth or cotton, with white and blue edgings, faſtened with buttons of ſolid gold: under this is a piece of red embroidered tapeſtry that reaches down to his heels, and is faſtened with a large ſilk girdle fringed, and a great gold chain before, with a lock formed of the moſt precious and valuable ſtones. He wears a ſcarlet cap on his head, which is a colour ſo eſteemed that no other perſon dare preſume to uſe it. This cap is laced with gold, and on the top of it is a large gold button with a precious ſtone. The grandees and ſoldiers wear long hair, but the king's head is ſhaved once a week: he goes bare-legged, but wears ſandals of gilt copper, which muſt not be worn by any other perſons except thoſe of the royal family.

When he goes abroad his dignity is particularly diſtinguiſhed by a white umbrella, which no other perſons, except ſtrangers, are permitted to uſe. He has

has three pages near his perſon, one of whom carries his fur, another his ſword and buckler, and a third a box of betel and areka, which he almoſt conſtantly chews.

When the queen goes abroad, all the women in their reſpective diſtricts meet her with flowers, fruits, &c. She is attended by a great number of female ſlaves, ſome of whom go before to give notice to the men to keep out of the way; and four ladies carry a veil of white ſilk over her head that reaches to the ground. She and her ladies frequently bathe in the ſea for their health, for the convenience of which they have a place on the ſhore cloſe to the water, which is incloſed, and the top of it covered with white cotton.

The principal part of the nobility and gentry live in the north parts of this iſland, for the convenience of being near the court: and ſo much is this diviſion eſteemed, that when the king baniſhes a criminal he is thought to be ſufficiently puniſhed by being ſent to the ſouth.

The king's guards conſiſt of 600, who are commanded by his grandees; and he has conſiderable magazines of armour, cannon, and ſeveral ſorts of ammunition. His revenue conſiſts chiefly of a number of iſlands appropriated to the crown, with certain taxes on the various productions of others; in the money paid to purchaſe titles and offices, and for licences to wear fine cloaths.

All the ambergris found in this country, (which produces more than any other part of the Indies) is alſo the property of the king; and ſo narrowly is it watched, that whoever is detected in converting it to his own uſe, is puniſhed with the loſs of his right hand.

The government here is abſolute monarchy, for every thing depends on the king's pleaſure. Each attolon, or province, has a naybe or governor, who is both a prieſt and a doctor of the law. He not only preſides over the inferior prieſts, and is veſted with the management of all religious affairs, but he is likewiſe entruſted with the adminiſtration of juſtice, both in civil and criminal caſes. They are, in fact, ſo many judges, and make four circuits every year throughout their reſpective juriſdictions.

The puniſhments for crimes are various: if a man is murdered the wife cannot proſecute the criminal; but if the deceaſed has left any children, the judge obliges him to maintain them till they are of age, when they may either proſecute or pardon the murderer. The ſtealing any thing valuable is puniſhed with the loſs of a hand, and for trifling matters they are baniſhed to the ſouthern iſlands. An adultreſs is puniſhed by having her hair cut off, and thoſe guilty of perjury pay a pecuniary mulct. Notwithſtanding the law makes homicide death, yet a criminal is never condemned to die unleſs it is expreſsly ordered by the king; in which caſe he ſends his own ſoldiers to execute the ſentence.

The principal articles exported from theſe iſlands are, cocoa-nuts, cowries, and tortoiſe-ſhell, the laſt of which is exceeding beautiful, and not to be met with in any other place except the Philippine Iſlands. The articles imported are, iron, ſteel, ſpices, china, rice, &c. all of which are engroſſed by the king, who ſells them to his ſubjects at his own price.

Their money is ſilver, and of one ſort only, called lorrins, each of which is about the value of 8d. It is about two inches in length, and folded, the king's name being ſet upon the folds in Arabic characters. They ſometimes uſe the ſhells of cowries, inſtead of ſmall change, 1200 of which make a lorrin; but in their own markets they frequently barter one thing for another. Their gold and ſilver is all imported from abroad, and is current here by weight, as in many other parts of the Indies.

Theſe iſlands are happily ſituated for producing mutual commerce to the reſpective inhabitants: for though the thirteen attolons, or provinces, are in the ſame climate, and all of them very fertile, yet they produce ſuch different commodities, that the people in one cannot live without what is found in another. The inhabitants have likewiſe ſo divided themſelves, as greatly to enhance this commercial advantage; for all the weavers live in one iſland, the goldſmiths in another, and ſo on of the different manufactures. In order, however, to make the communication eaſy, theſe artificers have ſmall boats built high on both ſides, in which they work, ſleep, and eat, while ſailing from one iſland to another to expoſe their goods to ſale, and ſometimes they are out a conſiderable time before they return to their fixed habitations.

CHAP. XVIII.

Iſlands off the Aſiatic Coaſts, and various Ports diſcovered by the Captains Cook, Clerke, Gore, King, and other Navigators, not included in our firſt Chapter of New Diſcoveries.

ACCORDING to our plan laid down, we come now to treat of ſuch iſles, as not being immediately within the track of thoſe deſcribed under the firſt general head of New Diſcoveries, being obſerved at various times, and ſome only ſeen without being viſited, we promiſed to claſs together in a ſeparate arrangement.

We ſhall begin with Kerguelen's Land, which was firſt ſeen by a French navigator, whoſe name it bears. It is ſituated in 48 deg. 41 min. ſouth lat. and 76 deg. 50 min. eaſt long. and was viſited by captain Cook in 1776. Having come to an anchor in the harbour, in order to procure water, and nearly completed their quantity, the commander allowed the ſhips crews (Reſolution and Diſcovery) the 27th of December, to celebrate Chriſtmas; in conſequence of which, many of them went on ſhore, and made excurſions into the country, which they found deſolate and barren. In the evening, one of them preſented a quart bottle to captain Cook, which he had found on the north ſide of the harbour, faſtened with ſome wire to a projecting rock. This bottle contained a piece of parchment, with the following inſcription:

Ludovico XV. Galliarum
rege, et de Boynes
regi a Secretis ad res
maritimas annis 1772 *&*
1773.

Captain Cook, as a memorial of the Britiſh veſſels having been in this harbour, wrote on the other ſide of the parchment as follows:

Naves Reſolution
et Diſcovery
de Rege Magnæ Britanniæ,
Decembris 1776.

It was then put again into the bottle, accompanied with a ſilver two-penny piece of 1772, the mouth of the bottle being covered with a leaden cap, and placed the next morning in a pile of ſtones, erected for that purpoſe on an eminence, near the place where it was firſt found. Here captain Cook diſplayed the Britiſh flag, and named the place Chriſtmas-Harbour; but he forbore giving any new name to this deſolate land.

"No place (ſays Mr. Anderſon, who examined the country) hitherto diſcovered in either hemiſphere, affords ſo ſcanty a field for the naturaliſt as this ſterile ſpot. Some verdure indeed appeared, when at a ſmall diſtance from the ſhore, which might raiſe the expectation of meeting with a little herbage; but

all this lively appearance was occaſioned by one ſmall plant, reſembling ſaxifrage, which grew up the hills in large ſpreading tufts, on a kind of rotton turf, which, if dried, might ſerve for fuel, and was the only thing ſeen here that could poſſibly be applied to that purpoſe. Another plant, which grew nearly to the height of two feet, was pretty plentifully ſcattered about the boggy declivities; it had the appearance of a ſmall cabbage when it was ſhot into ſeeds. It had the watry acrid taſte of the antiſcorbutic plants, though it materially differed from the whole tribe. When eaten raw, it was not unlike the New Zealand ſcurvy-graſs, but when boiled, it acquired a rank flavour. At this time none of its ſeeds were ripe enough to be brought home, and introduced into our Engliſh kitchen-gardens.

"Near the brooks and boggy places were found two other ſmall plants, which were eaten as ſalad; the one like garden-creſſes, and very hot, and the other very mild. The latter is a curioſity, having not only male and female, but alſo androgynous plants. Some coarſe graſs grew pretty plentifully in a few ſmall ſpots near the harbour, which was cut down for our cattle. In ſhort, the whole catalogue of plants did not exceed eighteen, including a beautiful ſpecies of lichen, and ſeveral ſorts of moſs. Nor was there the appearance of a tree or ſhrub in the whole country.

"Among the animals, the moſt conſiderable were ſeals, which were diſtinguiſhed by the name of ſea-bears, being the ſort that are called the urſine-ſeal. They come on ſhore to repoſe and breed. At that time they were ſhedding their hair, and ſo remarkably tame, that there was no difficulty in killing them. No other quadruped was ſeen; but a great number of oceanic birds, as ducks, ſhags, petrels, &c. The ducks were ſomewhat like a widgeon, both in ſize and figure. A conſiderable number of them were killed and eaten. They were excellent food, and had not the leaſt fiſhy taſte. The Cape petrel, the ſmall blue one, and the ſmall black one, or Mother Carey's chicken, were not in plenty here; but another ſort, which is the largeſt of the petrels, and called by the ſeamen Mother Carey's gooſe, is found in abundance. This petrel is as large as an albatroſs, and is carnivorous, feeding on the dead carcaſes of ſeals, birds, &c. The greateſt number of birds here were penguins, which conſiſt of three ſorts. The head of the largeſt is black, the upper part of the body of a leaden grey, the under part white, and the feet black: two broad ſtripes of a fine yellow deſcend from the head to the breaſt: the bill is of a reddiſh colour, and longer than in the other ſorts. The ſecond ſort is about half the ſize of the former: it is of a blackiſh grey on the upper part of the body, and has a white ſpot on the upper part of the head: the bill and feet are yellowiſh. In the third ſort, the upper part of the body and throat are black, the reſt white, except the top of the head, which is ornamented with a fine yellow arch, which it can erect as two creſts. The ſhags here are of two ſorts, viz. the leſſer cormorant, or water-crow; and another with a blackiſh back and a white belly. The ſea-ſwallow, the tern, the common ſea-gull, and the Port Egmont hen, were alſo found here. Large flocks of a ſingular kind of white bird flew about here, having the baſe of the bill covered with a horny cruſt. It had a black bill and white feet, was ſomewhat larger than a pigeon, and the fleſh taſted like that of a duck.

"The ſeine was once hauled, when were found a few fiſh about the ſize of a ſmall haddock. The only ſhell-fiſh ſeen here were a few limpets and muſcles.

"Many of the hills, notwithſtanding they were of a moderate height, were at that time covered with ſnow, though anſwering to our June. It is reaſonable to imagine that rain muſt be very frequent here, as well from the marks of large torrents having ruſhed down, as from the appearance of the country, which, even on the hills, was a continued bog or ſwamp.

"The rocks conſiſt principally of a dark blue, and very hard ſtone, intermixed with particles of glimmer, or quartz Some conſiderable rocks were alſo formed here of a browniſh brittle ſtone."

Paternoſter Iſlands, were ſo called from the great number of rocks, which ſailors have likened to the beads with which the Roman Catholics tell their paternoſters. They abound in corn and fruits, and are rather populous.

Georgia, a cluſter of barren iſlands, about 54 deg. 30 min. ſouth lat. and 36 deg. 30 min. weſt long. One of them is between fifty and ſixty leagues in length. They contain nothing worth remarking.

Iſland of Handſome People lies in 10 deg. ſouth lat. and 185 deg. eaſt long. It is eighteen miles in circumference, and was diſcovered by De Quiros in 1696. Notwithſtanding the exceſſive heat of the climate, the natives are remarkably fair and handſome, from whence the iſland had its name. They are covered only from the waiſt downwards, with mats of palm, and wear a mantle of the ſame on their ſhoulders. Their canoes are trees hollowed out, and their thatched houſes ſtand together in cluſters.

Horn or Hoorn Iſland, is ſituated in 14 deg. 56 min. ſouth lat. and 179 deg. eaſt long. and was diſcovered in 1616, by Shouten. The male natives of this iſland are tall, well-made, and robuſt. They are nimble runners, expert ſwimmers, and good divers. Their complexion is a yellowiſh brown; and they take great pleaſure in dreſſing their hair, which is black. Some tie it, others friz it. Some let it grow down the waiſt, and tie it in five or ſix tails; and others dreſs it right an end, ſtanding up like hogs briſtles, ten or eleven inches long; but they do not ſuffer the beard to grow. The women are ſhort of ſtature, deformed both in features and body, and rather indecent in their behaviour. Both ſexes go naked, except a piece of covering between their legs; and the women rub their heads and cheeks with ſomething red.

Their land produces ſpontaneouſly a great variety of fruits, ſuch as cocoas, bananas, yams, &c. for they are ignorant of cultivation. At low-water the women catch fiſh, which is eaten raw. They have alſo ſome hogs, but their pork is ſpoiled by the cookery.

Prince Edward's Iſlands, lying in 51 deg. ſouth lat. were diſcovered by two French navigators, on their paſſage from the Cape of Good Hope to the Philippine Iſlands. They are two in number, and, as they had no names in the French Chart of the Southern Hemiſphere, captain Cook, when he ſaw them in 1776, gave them this appellation.

That which lay moſt to the ſouth, appeared to be about fifteen leagues in circuit, and the moſt northerly about nine leagues. There are four others contiguous, and which, from the names of the diſcoverers, are called Marion and Crozet's Iſlands.

Adventure-Iſland, ſo called from the ſhip Adventure, in which captain Furneaux ſailed to the South Seas, is ſituate in lat 43 deg. 21 min. ſouth, and long. 147 deg. 29 min. weſt. The natives are deſcribed as mild and cheerlful, with little of that wild appearance which ſavages in general have, but poſſeſs neither genius nor activity.

Reſolution, a ſmall iſland, ſo called by Captain Cook, from his own ſhip the Reſolution, lies in lat. 17 deg. 24 min. ſouth, and long. 141 deg. 45 min. weſt.

Palm-Iſland is ſituated on the coaſt of New South Wales, as are alſo the iſlands Solitary, Furneaux, Marias, Cumberland, Northumberland, and Direction, ſo called by Captain Cook, who firſt explored this coaſt, and thus denominated them.

The Prince of Wales's Iſlands lie at the northern extremity of New Holland. They were obſerved at a diſtance

a diſtance to abound with trees and graſs, and were known to be inhabited, from the ſmoke that was ſeen aſcending in many places.

The Bay of Iſlands, containing a cluſter of little iſles, is ſituate on the coaſt of New Zealand: among which are included thoſe called Gannet, Banks's, Solander's, Trap's, &c.

Potoe is an iſland ſituated about two leagues to the weſtward of the Grand, or principal of the Ladrones. It is rocky, and of mall extent.

Centry-Box-Iſland lies about a league and an half from the ſouth point of Chriſtmas-Harbour, in Kerguelen's-Land; it was ſo called, from an opinion of its reſembling a centry-box in its figure.

Solor lies to the ſouth of the Iſland of Celebes, in lat. 9 deg. ſouth, and long. 123 deg. 55 min. eaſt. It contains nothing remarkable.

The Nicobar-Iſlands lie at the entrance of the Gulph of Bengal. The natives there are tall and well-proportioned, with long faces, black eyes, black lank hair, and copper-coloured ſkins, and they are ſaid to be an harmleſs, good ſort of people. They go naked, except a covering about the waiſt. They have neither temples nor idols, nor does there ſeem to be any great ſuperiority among them. They are excellent ſwimmers, and ſometimes will overtake ſmall veſſels under ſail; live in little huts, having no towns, and the country is almoſt covered with wood.

They have no corn, but a fruit which ſerves them inſtead of bread, and they catch plenty of fiſh. The largeſt of theſe iſlands, which gives name to the reſt, is about forty miles in length, and fifteen in breadth, at the utmoſt.

Portland-Iſland lies to the ſouthward of the Society-Iſles, and was ſo called by Captain Cook, who diſcovered it on his firſt voyage, from its reſemblance to that of the ſame name in the Britiſh Channel. Some parts of this iſland appeared to be cultivated, and pumice-ſtones in great quantities lying along the ſhore within the bay, indicated that there was a volcano in the country. High palings upon the ridges of hills were alſo viſible in two places, which were judged to be deſigned for religious purpoſes.

Bare-Iſland was ſo called by Captain Cook, as it appeared to be barren, and inhabited only by fiſhermen. It lies in lat. 39 deg. 45 min. ſouth.

Eaſt-Iſland lies in lat. 37 deg. 42 min. ſouth. It appeared to Captain Cook, who diſcovered it on his firſt voyage, ſmall and barren like the former.

White-Iſland is contiguous to the laſt-mentioned.

The Mayor and Court of Aldermen, a cluſter of ſmall iſlands lying in lat. 37 deg. 59 min. ſouth, about twelve miles from the main, are high, and were alſo remarked for barrenneſs.

Mercury-Iſlands, a cluſter of different ſizes. The Bay is called alſo Mercury-Bay, and lies in lat. 36 deg. 47 min. ſouth, long. 184 deg. 4 min. weſt, and has but a ſmall entrance.

The Hen and Chickens, are ſmall iſlands ſituated in lat. 35 deg. 46 min. ſouth.

Poor Knights. Theſe form a cluſter of iſlands, lying in lat. 36 deg. 36 min. ſouth, on which were ſeen a few towns which appeared fortified, and the land round them ſeemed to be well peopled.

Cavalles-Iſlands, ſo called by Captain Cook, from the name of ſome fiſh the crew purchaſed of the Indians. Theſe people were very inſolent, uſing many frantic geſtures, and throwing ſtones at the crew. Some ſmall ſhot were fired, and one of them being hit, a precipitate retreat was the conſequence.

Three Kings. The chief of theſe iſlands lies in lat. 34 deg. 12 min. ſouth, and long. 187 deg. 48 min. weſt. Birds were ſhot upon it, which were very good eating, and reſembled the geeſe of Europe.

Hamote, a little iſland in lat. 41 deg. ſouth, near Queen Charlotte's Sound.

Entry-Iſle, is an high iſland ſituated about nine or ten leagues from Cape Keamaroo, which lies in 41 deg. 44 min. ſouth lat. and 113 deg. 30 min. weſt longitude.

Iſland of Lookers-on, ſituated contiguous to the former, was ſo called by Captain Cook, becauſe the natives could not be prevailed on to approach the ſhip though they admired it.

Magnetical-Iſland, ſo called by Captain Cook, becauſe the compaſs did not traverſe well when the ſhip was near it. It is ſaid to be high, rugged, rocky, and barren, yet ſmoke was ſeen in ſeveral parts about it: it was concluded not to be deſtitute of inhabitants.

The Siſters. Theſe are two iſlands of very ſmall extent, plentifully ſtocked with wood, ſituate in the lat. of 5 deg. ſouth, and long. 106 deg. 12 min. eaſt, near ſouth and north from each other, and encompaſſed by a reef of coral rocks, the whole four or five miles in circuit.

Caracatoa is the ſouthernmoſt of a cluſter of iſlands lying in the entrance of the Streights of Sunda. Its ſouthern extremity is ſituated in the lat. of 6 deg. 9 min. ſouth, and long. 105 deg. 15 min. eaſt. Its whole circumference does not exceed nine miles. The iſland conſiſts of elevated land, gradually riſing from the ſea, and is entirely covered with trees, except a few ſpots cleared by the natives for the purpoſe of forming rice fields. The population of the iſland is inconſiderable. The coral reefs afford turtles in abundance, but other refreſhments are very ſcarce there.

Pulo-Bally is an iſland about two miles round, and lies in the lat. of 00 deg. 30 min. ſouth. There is good anchorage to the eaſtward of it in 12 and 13 fathom water, muddy ground. Freſh water and wood are here in plenty.

Schouten-Iſlands, ſo called from Schouten, a Dutch navigator, who diſcovered them in 1616, lie in lat. 00 deg. 46 min. ſouth.

Selang lies in only 50 min. of ſouth lat. It is not flat, or very high. It forms two harbours with the main land, an outer and an inner harbour. There is no danger in running into either, but what is plainly ſeen. The inner harbour is about two miles broad, and three long, and the general depth ten fathoms water.

Pulo-Gag lies in 18 min. ſouth lat. and is an iſland of middling height. When plainly ſeen, it appears like the land of Europe, not being woody, as the iſlands in theſe parts generally are. The valley is ſaid to have a rich ſoil, and many ſago trees upon it. It is not inhabited, though travellers by water often put into the bay to paſs the night, where they alſo ſometimes employ ſeveral days in fiſhing.

Princes Iſland lies in the weſtern mouth of the Streights of Sunda. It abounds with vegetables of various kinds, deer, turtle, &c. Our India ſhips uſed to touch here to take in water, but they have omitted this practice ſome years ſince: though Captain Cook ſays the water is exceeding good, if filled towards the head of the brook, which circumſtance perhaps was not always ſufficiently attended to.

Tomoguy is an iſland ſituated in 00 deg. 15 min. ſouth lat. and, in ſhape, reſembles a horſe-ſhoe. On the iſland riſes a hill, which takes up about three fourths of its compaſs, and there are plantations of tropical fruits and roots along the hill's ſide.

Waglol is a ſmall flat iſland. At moſt of theſe iſlands, lives one or more of certain chiefs called Synagees, who repair on board ſuch veſſels as viſit them, in order to beg preſents. The dreſs of one of them is thus deſcribed: one half of the coat and long drawers was clouded red, white, and yellow; the other half blue, white, and green, clouded alſo; not unlike the whimſical dreſſes of maſquerades. His turban, which was pinked, was made of coarſe white calico. The Mahometans upon theſe iſlands live moſtly upon fiſh and ſago bread. Sometimes they mix a cocoa-nut, raſped down with the ſago flour,

flour, and putting this into a thin Chineſe iron-pan, they keep ſtirring the mixture on the fire, and eat it warm. They alſo eat the ordinary white ſwallo, a root which is found every where in the ſand at low water: they eat it raw, cut up ſmall, and mixed with ſalt and lime-juice. They have the following peculiar method of bleeding in this country. They put the rough ſide of a certain leaf, about as large as a man's hand, on that part where they want to extract the blood, then with the tongue they lick the upper ſide of the leaf, and the under ſide is preſently all over bloody. A particular kind of green fruit grows in theſe parts, which the natives eat. It is as long as the hollow part of a quill, and almoſt as ſmall. They call it ciry. This fruit is very good in a curry or ſtew, leaving a fine aromatic flavour on the palate.

The two cluſters of iſlands Bo and Popo, lie nearly in the ſame parallel of latitude, 1 deg. 17 min. ſouth. They are about five leagues aſunder. Bo conſiſts of ſix or ſeven iſlands.

Theſe iſlands, which have a good many inhabitants, can ſupply plenty of cocoa-nuts, ſalt, and dried fiſh. To the weſtward of the cluſter, but contiguous to it, are about nine or ten ſmall low iſlands. To the eaſtward, on two iſlands, are two little hills, which, at a diſtance, look like tea-cups turned upſide down. Here reſides a rajah, and the iſles are ſaid to be well inhabited.

Here not only women often kill or burn themſelves with their deceaſed huſbands, but men alſo, in honour of their deceaſed maſters, as authentic accounts inform us. Thoſe who determine on this, are not limited to time; they name, perhaps, a diſtant day, and in the mean while, their intention being made known, there is no honour the natives can think of, but they pay to this devotee: he is careſſed wherever he goes. On the fatal day, by the ſide of a great fire, a looſe ſtage of boards is erected; on this he dances, working himſelf up to a fit. He then ſkips to the end of a plank, which tilting, he falls headlong into the flames, and is conſumed immediately.

The north coaſt of the Iſland of Waygiow, which lies about half a degree to the northward of the equator, is near fifteen leagues in length. The hill on Gibby Monpine (a particular quarter of Waygiow) which, from its ſhape, is called the Cock's-Comb, may be ſeen about twenty leagues off. Some white ſpots appear on it. Oppoſite to the entrance of the harbour are two little iſlands, one ſhaped like a ſugar-loaf, the other with a hillock on it. At the bottom of this hillock is a piece of freſh water, where there is anchorage in twelve fathoms ſand. The two iſlands are connected by a reef of coral rocks, dry at low water. There are ſaid to be 100,000 inhabitants upon the iſland, who wage perpetual war with one another. Offak harbour lies in 00 deg. 10 min. north lat. Near this iſland two fiſhes were taken, the heads of which were remarkable for an horn that projected from between their eyes. The horn was about four inches long, equal in length to the head. Altogether the head was like that of an unicorn. The natives called it Een Raw, that is the fiſh Raw. The ſkin was black, and the body about twenty inches long. Its tail was armed with two ſtrong ſcythes, with their points forwards on each ſide.

The Iſland of Abdon lies in only 36 min. north lat. It is about three miles round, and 200 feet high. Konibar is about the ſame height and ſize: it is north of Abdon. The reſt of the ſixteen iſlands that form this cluſter, are flat and low, except Aiow Babar, which riſes about 500 feet. There are ſaid to be plantations of yams, potatoes, ſugar-canes, and other tropical productions on Konibar.

The inhabitants of theſe iſlands have turtle in ſuch abundance, and other fiſh (eſpecially cockles about the bigneſs of a man's head) that they neglect agriculture. When they want bread, they carry live turtle, and their eggs, with dried fiſh, to Waygiow, which they truck for ſago, either baked or raw; nay, perhaps, go to the woods and provide themſelves, by cutting down the trees.

Sangir is an oblong iſland, extending from 3 deg. 30 min. to 4 deg. 30 min. north lat. It is broadeſt towards the north, and tapers ſmall towards the ſouth. About the middle of the weſt coaſt of the iſland is the town, harbour, and bay of Taroona, oppoſite which, on the eaſt coaſt, is alſo a town and harbour, called Tabookang. It abounds in cocoa-nuts, as do many iſlands that lie near it. A fathom of ſmall braſs wire will purchaſe 100 cocoa-nuts, an ordinary knife 300, and a battel (60 lb.) of cocoa-nut oil may be had for four knives here.

Tulour, or Tanna Labu, lies in 4 deg. 45 min. north lat. It is ſituated about ſeventy miles eaſt of the north part of Sangir. It is of middling height. The inhabitants live on the ſea-coaſt, and have their plantations up the country.

Salidabo-Iſland lies ſouthward of Tulour, being divided only by a narrow ſtreight, about a mile wide. It is not above eight or ten miles in circumference, contains ſeveral villages, and is particularly well cultivated.

Kabruang lies to the ſouth-eaſt of Salidabo, and is parted from it by a ſtreight about four miles wide. This iſland is in high cultivation, and alſo contains ſeveral villages.

Tagulanda contains about 2000 inhabitants, who are Pagans. On the iſland are many goats, ſome bullocks, and cocoa-nuts in abundance. The Dutch keep here a corporal and two ſoldiers, alſo a ſchool-maſter for teaching the children the principles of Chriſtianity. Three prongs, a kind of large chopping-knives, will purchaſe a bullock, and a thouſand cocoa-nuts may be had for one of them.

Banka-Iſland is near Tagulanda, and remarkable for a high hill. It has a harbour on its ſouth-end, is pretty well inhabited, and abounds in cocoa-nuts, limes, nankas or jacks, turtle, other fiſh, and ratans.

Telluſyang-Iſland, that is, Harbour of Syang, is contiguous to Banka-Iſland. This harbour, which is ſaid to be a good one, is on the ſouth end of the iſland, which has a hill upon it. There are ſome wild cattle, but no other inhabitants. Theſe iſlands are much frequented by cruiſers, not only from Sooloo, but from Mindanao.

Sooloo-Iſland is ſituated in 6 deg. north lat. and 119 deg. eaſt long. It is thirty miles long, twelve broad, and contains a great number of inhabitants. It is governed by a king of its own. It is well cultivated, and affords a fine proſpect from the ſea. Indeed, the iſland being rather ſmall for its number of inhabitants, they ſtudy agriculture more than thoſe on the adjacent ones, where land is not deemed ſo valuable. As they cannot depend on a crop of rice, not being ſure of rain in due ſeaſon, they cultivate many roots; the Spaniſh, or ſweet potatoe; the clody, or St. Hillano yam; the China yam, both red and white; ſending to Mindanao for what rice they conſume. They have great variety of fine tropical fruits. Their oranges are full as good as thoſe of China. They have alſo a variety of the fruit called jack, or naka; a kind of large cuſtard-apple, named madang; mangoes; and a fruit they call bolona, which has a white inſide, and is like a large plum or mango. They enjoy, in great abundance, a very innocent and delicious fruit, called lancey. The trees in the woods are loaded with this fruit, which is large, and ripens well. The Sooloos having great connexion with China, and many Chineſe being ſettled among them, they have learned the art of engrafting and improving their fruits. Here is no ſpice tree but the cinnamon. Though this iſland, from its ſituation, enjoys perpetual ſummer, yet up the country it is always cool, eſpecially under the ſhade of the toak trees, which are very numerous. This tree has a

broad leaf, which, when bruiſed between the fingers, ſtains the hand red. The induſtrious Chineſe gather theſe leaves, and the leaves of the fruit-tree called madang, to line the baſkets of cane or bamboo, in which they pack up the Sooloo-root, which they export in great quantities from this place.

The Sooloos are not only neat in their clothes, but dreſs gaily. The men go generally in white waiſtcoats, buttoned down to the wriſts, with white breeches, ſometimes ſtrait, ſometimes wide. The women are handſome in general, and, by compariſon, fair. Thoſe of rank wear waiſtcoats of fine muſlin, cloſe fitted to their bodies; their necks, to the upper parts of the two breaſts, being bare. From the waiſt downwards, they wear a looſe robe, girt with an embroidered zone or belt about the middle, with a large claſp of gold, and a precious ſtone. This being looſe, like a petticoat, comes over the drawers, and reaches to the middle of the leg, the drawers, which are of fine muſlin, reaching to the ancle.

The ſultanſhip in Sooloo is hereditary, but the government mixed. About fifteen datoos, who may be called the nobility, make the greater part of the legiſlature. The title is hereditary to the eldeſt ſon, and they ſit in council with the ſultan. The ſultan has two votes in this aſſembly, and each datoo has one. The common people of Sooloo, called tellimanhood, do not enjoy much real freedom. It is ſaid that their haughty lords, when viſiting their eſtates, will ſometimes, with impunity, demand and carry off young women, whom they happen to fancy, to ſwell the number of their ſandles (concubines) at Sooloo. Indeed, the lower claſs groan under various kinds of tyranny. The nobles here are extremely diſſolute. Thoſe who have more than one wife, keep each in a ſeparate houſe; but the circumſtance is not very common, as their diſſoluteneſs conſiſts in their numerous concubines and intrigues; for here women have as much liberty in going abroad as in Europe.

The Sooloos have a very good breed of horſes, and their women are very expert in riding. Their manner is to ride backwards and forwards the length of a long broad ſtreet, upon ſandy ground, forcing their horſes on a quick trot, and checking them when they attempt to gallop. The horſes accuſtomed to this, trot very faſt. Riding is an exerciſe in uſe all over the iſland among women of faſhion.

Here are wild elephants, the offspring (as is ſuppoſed) of thoſe ſent in former days from the continent of India as preſents to the king's of Sooloo. Thoſe animals avoid meeting with horned cattle, though they are not ſhy of horſes. Sooloo has ſpotted deer, and abundance of goats and black cattle, but the people ſeldom milk their cows. They have very few ſheep; but the wild hogs are numerous, and do much miſchief by breaking down fences. After harveſt the inhabitants hunt the elephants and wild hogs, endeavouring to deſtroy them. Of birds, there are here abundance of diminutive cocatoos, and ſmall green parrots. At Sooloo, and the iſlands adjacent, the pearl-fiſhery has been famous for many ages. In the ſea between Mindanao and Sooloo is a pearl-fiſhery not inferior to any in the Indies, either in point of colour or ſize. This, indeed, is the ſource of their wealth.

The Sooloos have in their families many ſlaves whom they purchaſe from the different cruiſers. Sometimes they purchaſe whole cargoes, which they carry to Borneo, where, if the females are handſome, they are bought up for the Batavia market. The maſters ſometimes uſe their ſlaves cruelly, aſſuming the power of life and death over them. Many are put to death for trifling offences, and their bodies left above ground. An attempt of elopement here is ſcarcely ever forgiven.

The ſtate of Sooloo is important: the inhabitants are very powerful, not only moſt of the adjacent iſlands being under them, but great part of Borneo. They have the character of being treacherous, and of endeavouring always to ſupply by fraud what they cannot effect by force.

Pangatarran, lying a little to the ſouthward of the former, is a long flat iſland, has no freſh water, nor is any good anchoring near, except in ſome few places. It abounds in cocoa-nuts and a fruit called Guava.

Ramancor lies in lat. 9 deg. 25 min. north, and long. 109 deg. 45 min. eaſt. It is about twenty-three miles in circumference, very ſandy. A few villages, and a temple, are all the buildings to be ſeen here.

Pulo-Sapata is ſituated in lat. 10 deg. 4 min. north, and long. 109 deg. 10 min. eaſt. It is elevated, ſmall, and unfertile.

Prata lies in lat. 20 deg. north. Near the ſouthern extremity of the iſland ſome of the crew of the Reſolution imagined they ſaw from the maſt-head ſeveral openings in the reef, which ſeemed to promiſe ſecure anchorage. The extent of the Prata ſhoal being about ſix leagues from north to ſouth, may be accounted conſiderable.

Myo lies in lat. 1 deg. 23 min. north. Tyfory is a flat iſland not ſo large as Myo, and lies about W. by S. from it, diſtant five or ſix miles. When the Spaniards had the Moluccas, this place was inhabited; but the Dutch will not now permit any one to live there, leſt the ſmuggling of ſpices ſhould prove the conſequence.

Karakita, Palla, Siao, and Grave, are the principal of a cluſter of iſlands lying between the lat. of 3 and 4 deg. north. A ſchool-maſter, a corporal, and a few ſoldiers, are kept by the Dutch at Siao.

The Rabbit is a ſmall rocky iſland with a few cocoa-nut trees upon it, and many rocks like ſugar-loaves round it. It lies to the eaſtward of Karakita about four miles, and derived its name from the animal whoſe ſhape it is ſuppoſed to reſemble.

Sulphur-Iſland, diſcovered by Captain Gore, is in 24 deg. 50 min. north latitude, and 140 deg. 56 min. eaſt longitude. Its length is about five miles. The ſouth point is an elevated barren hill, rather flat at the ſummit, and when ſeen from the weſt ſouth-weſt, exhibits evident tokens of a volcanic eruption. The ſand, earth, or rock, for it was difficult to diſtinguiſh of which of theſe ſubſtances its ſurface was compoſed, diſplayed various colours; and it was imagined that a conſiderable part was ſulphur, not only from its appearance, but from the ſtrong ſulphurous ſmell perceived in approaching the points. As the Reſolution paſſed nearer the land than the Diſcovery, ſeveral of the officers of that ſhip thought they diſcerned fire proceeding from the top of the hill: theſe circumſtances induced Captain Gore to beſtow on this diſcovery the appellation of Sulphur-Iſland.

Burney's-Iſland is ſituated on the north-eaſt coaſt of Aſia, in 67 deg. 45 min. north latitude. The inland country about this part abounds with hills, ſome of which are of conſiderable elevation. Captain Cook obſerves, that the land (except a few ſpots on the coaſt) appeared to be covered with ſnow.

St. Lawrence's-Iſland, according to the moſt accurate obſervations, lies in 63 deg. 47 min. north lat. and 188 deg. 15 min. eaſt long. and is three leagues in circumference. The northern part of it may be diſcerned at ten or twelve leagues diſtance.

Bhering's-Iſland, ſo called from the navigator who diſcovered it; lies in 58 degrees north latitude. Karakinſkoi, Maidenoi, Ataka, and Shaimea, are all iſlands that lie contiguous, and very thinly, if at all inhabited, having ſcarcely any marks of cultivation.

Gore-Iſland lies in about 64 deg. north lat. and 191 deg. eaſt long. It is about thirty miles in extent, and appeared to our navigators to be barren and deſtitute of inhabitants, and received its appellation from Captain Cook, who diſcovered it in the courſe of his laſt voyage.

With regard to the language of all the Oriental iſlands, nothing certain can be ſaid. Each iſland has a particular tongue; but the Malayan, Chineſe, Portugueſe, Dutch, and Indian words, are ſo frequent among them, that it is difficult for an European, who is not very expert in thoſe matters, to know the radical language. The ſame may be almoſt ſaid of their religion; for though its original is certainly Pagan, yet it is intermixed with many Mahometan, Jewiſh, Chriſtian, and other foreign ſuperſtitions.

The ſea which ſeparates the ſouthern point of the peninſula of Kamtſchatka from Japan, contains a number of iſlands in a poſition from north-north-eaſt to ſouth-ſouth-weſt, which are called the Kurile-Iſlands. They are upwards of twenty in number, are all mountainous, and in ſeveral of them are volcanoes and hot ſprings. The principal of theſe iſlands are inhabited; but ſome of the little ones are entirely deſert and unpeopled. The foreſts in the more northern ones are compoſed of laryx and pines; thoſe to the ſouthward produce canes, bamboos, vines, &c. In ſome of them are bears and foxes. The ſea otter appears on the coaſts of all theſe iſlands, as well as whales, ſea horſes, ſeals, and other amphibious animals. Some of the inhabitants of theſe iſlands have a great likeneſs to the Japaneſe in their manners, language, and perſonal appearance; others very much reſemble the Kamtſchadales. The northern iſlands acknowledge the ſovereignty of the empire of Ruſſia; but thoſe to the ſouth pay homage to Japan. The Kurilians diſcover much humanity and probity in their conduct, and are courteous and hoſpitable; but adverſity renders them timid, and prompts them to ſuicide. They have a particular veneration for old age. Their language is agreeable to the ear, and they ſpeak and pronounce it ſlowly. The men are employed in hunting, fiſhing for ſea animals and whales, and catching fowl. The women have charge of the kitchen, and make clothes. In the northern iſlands they ſew, and make different cloths of the thread of nettles. The ſouthern iſlanders are more refined and poliſhed than the northern, and carry on a ſort of commerce with Japan, whither they export whale-oil, furs, and eagles feathers to fledge arrows with. In return, they bring Japaneſe utenſils of metal and varniſhed wood, ſkillets, ſabres, different ſtuffs, ornaments of luxury, tobacco, all ſorts of trinkets and ſmall wares.

A DESCRIPTION OF THE DEAD SEA, AND ITS ENVIRONS, IN PALESTINE.

Extracted from Mariti's Travels into Syria, &c.

"THE name, Dead Sea, is of modern date, for the ancients called it the Lake Aſphaltites, the Sea of Sodom, the Salt Sea, the Lake of Sirbon; and in our days the Arabs name it Bahheret-Lut; that is to ſay, the Sea of Lot.

"Joſephus, who cauſed this lake to be meaſured, found that it was 580 furlongs in length, and 150 in breadth, which may make ſeventy-two and a half Italian miles one way, and eighteen and three quarters the other. It is 180 miles in circumference. The lofty mountains of the ancient country of the Moabites, ſurround it on the eaſtern ſide, and diſcharge into it the waters of the Arnon and the Zaret, which fall down their ſides in long caſcades. It is bounded on the weſt and ſouth by high mountains alſo; ſome of which, compoſed of blackiſh rock, ſerve as barriers to the vaſt deſerts of Judea; and the reſt, clothed with verdant groves, form a part of Idumea. It is likewiſe on the weſt that the brook Kedron falls into this lake. The northern ſide is entirely open, and ſhews the delightful plains of Avlona, which bring as a tribute to the Dead Sea the rapid waters of the Jordan.

"We are informed, that this vaſt baſon was covered formerly with fruit-trees, and abundant crops, and that from the boſom of the earth, buried under its waters, aroſe the ſuperb cities of Sodom, Gomorrah, Adam, Zeboim, and Segor; all rendered illuſtrious by the preſence of a king. There is nothing, therefore, in the univerſe, which is not ſubject to viciſſitudes and changes.

"The air is pure, the fields are extremely verdant, and my eye was delighted with the limpidneſs of the water, which fell in ſheets from the ſummits of the mountains. The ſterility to which part of theſe plains was condemned from the creation of the world, renders the contraſt produced by the fertile appearance of Avlona much more agreeable. But how comes it that two travellers ſhould differ ſo much in their ideas? It is, becauſe a capuchin carries every where along with him the five ſenſes of the faith, while I am endowed with thoſe only of nature.

"I endeavoured here to explain a phenomenon, which has engaged the attention of many others, as well as of myſelf. This vaſt baſon, which is continually receiving the waters of different torrents, rivulets, and ſtreams, has no viſible outlet. Do its waters, therefore diſcharge themſelves by ſubterranean paſſages into the Mediterranean, or Red-Sea, as is pretended; or muſt we adopt the opinion of Arabian philoſophers, who conclude, and not without ſome foundation, that they are diſſipated by evaporation?

"The water of this lake is clear and limpid, but bitter and exceſſively ſalt. No kind of fiſh are produced in it; and thoſe even which are ſometimes carried thither by the rapidity of the Jordan, inſtantly die.

"The water of the Dead Sea is favourable to ſwimmers; but people, if they cannot ſwim, may be drowned there as well as elſewhere.

"No plants of any kind grow in this lake. The bottom of it is black, thick, and fetid; and the earth in the nighbourhood is of the ſame colour, and as inflammable as coal.

"Branches of trees, which fall into it, become petrified in a little time by the force of the ſalt which adheres to them, and penetrates to the very pith of the wood. Some of theſe petrified branches, of which the curious are fond, may be procured at Jeruſalem.

"It has been ſaid, that the approach of this ſhore was mortal to birds; yet it is frequented by abundance of the feathered tribe, and particularly by ſwallows, which, with their light wings, ſkim this liquid plain, and ſport on its ſurface.

"On certain days in the year, this ſea is covered with a black thick fog, which does not extend further than its ſhores; but when the rays of the ſun acquire force, they ſoon diſſipate this body of vapours.

"The Dead Sea produces a kind of bitumen, called the Jewiſh, which may be found floating on the water like large lumps of earth, and which, being driven by the winds to the eaſtern and weſtern ſhores, adheres to them. It is then collected by the Arabs, and divided between them and the baſha of Damaſcus, who purchaſes their ſhares of it for ſome pieces of money, or ſuch ſtuffs, as they uſe for clothing. This bitumen is a ſulphurous ſubſtance, mixed with ſalt, which is gradually condenſed by the heat of the ſun. It is as brittle as black pitch, to which it has a great reſemblance. It is combuſtible, and exhales, while burning, a ſtrong and penetrating ſmell. The ancient Arabs uſed it for daubing over the bottoms of their veſſels, and the Egyptians for embalming the bodies of their dead. The natives give this bitumen the name of *lamar*."

A MAP of AFRICA, from the best AUTHORITIES.

A NEW

HISTORICAL AND COMMERCIAL

SYSTEM OF GEOGRAPHY.

AFRICA.

INTRODUCTION.

THE third grand diviſion of the globe, called Africa, is neither ſo fertile as the others, nor ſo populous as either Aſia or Europe: it nevertheleſs abounds in riches, and might, by a proper degree of ſkill and induſtry, be rendered of much greater importance than it is at preſent. It is generally repreſented as bearing ſome reſemblance to the form of a pyramid, the baſe being the northern part of it, which runs along the ſhores of the Mediterranean; and the point or top of the pyramid the Cape of Good Hope.

Africa is ſurrounded on every ſide with water, except where it joins to Aſia by the iſthmus of Suez, which ſeparates the Mediterranean from the Red Sea, and is only about ſixty miles over. Being thus a peninſula, it hath a prodigious extent of ſea-coaſt, and is moſt advantageouſly ſituated for commerce; but navigation is neither eſteemed nor cultivated by the inhabitants.

The utmoſt length of this country, from north to ſouth, from Cape Bona in the Mediterranean, in 37 deg. north, to the Cape of Good Hope, in 34 deg. 7 min. ſouth lat. is 4300 miles; and the broadeſt part from Cape Verd, in 17 deg. 20 min. to Cape Guardafui, near the Streights of Babelmandel, in 51 deg. 20 min. eaſt long. is 3500 miles from eaſt to weſt. It is bounded on the north by the Mediterranean, which ſeparates it from Europe; on the eaſt by the iſthmus of Suez, the Red Sea, and the Indian Ocean, which divide it from Aſia; on the ſouth, by the Southern Ocean; and on the weſt, by the great Atlantic Ocean, which ſeparates it from America.

As the equator divides Aſia almoſt in the middle, and the far greateſt part of it is within the tropics, the heat is in many places almoſt inſupportable to an European; it being there increaſed by the rays of the ſun from vaſt deſerts of burning ſands. The coaſts, however, and banks of the rivers, ſuch as the Nile, are generally fertile, and there moſt parts of the country are inhabited.

Africa is watered by ſeveral very noble rivers, of which the moſt conſiderable are the Niger and the Nile. The Niger falls into the Atlantic, or Weſtern Ocean, at Senegal, after a courſe of 2800 miles: it increaſes and decreaſes as the Nile, fertilizes the country, and has grains of gold in many parts of it. The Nile, after dividing Egypt into two parts, diſcharges itſelf into the Mediterranean, after a prodigious courſe from its ſource in Abyſſinia. The Gambia and Senegal are only branches of the Niger.

The moſt conſiderable mountains in Africa are the Atlas, a prodigious chain extending from the Weſtern Ocean to the borders of Egypt. It owes its name to a king of Mauritania, a great aſtronomer, who uſed to obſerve the heavenly bodies from its ſummit; and from this circumſtance the poets repreſent him as bearing the heavens on his ſhoulders. The Mountains of the Moon are ſtill higher than Atlas: they extend from Abyſſinia to Monomotapa. Thoſe of Sierra Leona, or the Mountains of the Lions, dividing Nigritia from Guinea, and a ridge of lofty mountains, called the Mountains of God, from their being remarkably ſubject to tempeſts of thunder and lightning. The Peak of Teneriffe, which the Dutch make their firſt meridian, is about two miles high, in the form of a ſugar-loaf, and is ſituated on an iſland of the ſame name, near the coaſt. Beſides theſe, there are many others of great height and vaſt extent, whoſe bowels contain a profuſion of the richeſt metals, and give riſe to the many rivers that water the ſoil of this neglected country.

The moſt noted capes, or promontories in Africa, are Cape Verd, ſo called, becauſe the land is always covered with green trees, and moſſy ground: it is the moſt weſterly point of the continent of Africa. The Cape of Good Hope, ſo denominated by the Portugueſe, when they firſt went round it in 1498, and diſcovered the paſſage in Aſia, is the ſouth extremity of Africa, in the country of the Hottentots, at preſent in the poſſeſſion of the Engliſh, and the general rendezvous of ſhips of every nation who trade to India, being about half way from Europe.

Babelmandel, which joins the Red Sea with the Indian Ocean, is the only ſtreight in Africa.

As this continent ſtands as it were in the centre of the globe, and has thereby a much nearer communication with Europe, Aſia, and America, than any of the other quarters has with the reſt, its ſituation is conſequently rendered extremely favourable for commerce. It is however the misfortune of Africa, that though it has 10,000 miles of ſea-coaſt, with noble, large, deep rivers, penetrating into the very heart of the country, it ſhould have no navigation, nor receive any benefit from them; that it ſhould be inhabited by vaſt multitudes of people, ignorant of commerce, and of each other. At the mouths of the rivers are moſt excellent harbours, deep, ſafe, and calm, and ſheltered from the wind, and capable of being made perfectly ſecure by fortifications; but quite deſtitute of ſhipping, trade, and merchants, even where there is plenty of merchandiſe. Though it comprehends a full quarter of the globe, is ſtored with an inexhauſtible treaſure, and capable under proper improvements, of producing ſo many things delightful as well as convenient within itſelf, yet it ſeems to be almoſt entirely neglected, not only by the natives, who are quite unſolicitous of reaping the benefits which nature has provided for them, but alſo by the more civilized Europeans who are ſettled in it, particularly the Portugueſe. That it abounds with gold, we have not only the teſtimony of the Engliſh, French, Dutch, and Portugueſe, who have ſettlements on the coaſt, but that of the moſt credible hiſtorians.

In ancient times, this country contained ſeveral kingdoms and ſtates, eminent for arts, for wealth, for power, and for the moſt extenſive commerce.—The kingdoms of Egypt and Ethiopia were particularly celebrated; and the rich and powerful ſtate of Carthage extended her commerce to every part of the then known world; even the Britiſh ſhores were viſited by her fleets, till the Romans deſtroyed her navigation,

navigation, ravaged her territories, and laid her capital in the duſt. From that period both the arts and commerce in Africa declined. Agriculture was neglected, and the manufactures, for which the natives were once ſo famous, were no longer practiſed.—Upon the decline of the Roman empire, in the fifth century, the northern parts of Africa were over-run by the Vandals, a barbarous and ferocious people from the north, who contributed ſtill more to the deſtruction of arts and ſciences. Theſe were driven out by the Saracens in the ſeventh century, and were afterwards ſucceeded by the Turks; and both being of the Mahometan ſuperſtition, whoſe profeſſors carried deſolation with them wherever they came, the ruin of that once flouriſhing part of the world was completed.

With reſpect to religion, the inhabitants of this continent may be divided into three ſorts, Pagans, Mahometans, and Chriſtians. The firſt are the moſt numerous, poſſeſſing the greateſt part of the country, from the Tropic of Cancer to the Cape of Good Hope, and they are generally black. The Mahometans, who are of a tawny complexion, poſſeſs Egypt, and almoſt all the northern ſhores of Africa, or what is called the Barbary Coaſt. The people of Abyſſinia, or the Upper Ethiopia, are denominated Chriſtians, but retain many Pagan and Jewiſh rites. There are alſo ſome Jews on the north of Africa, who manage all the little trade carried on in that part of the country.

The inhabitants are unacquainted with ice, hail, or ſnow; and in theſe ſcorching regions, the natives would as ſoon expect that marble ſhould melt, and flow in liquid ſtreams, as that water by freezing ſhould loſe its fluidity, be arreſted by the cold, and, ceaſing to flow, become like the ſolid rock. They are but ſeldom bleſſed with rain, and depend on the overflowing of the rivers for the fertilization of the ſoil in many parts, while other regions are altogether ſteril, and uninhabitable burning ſands. The barrenneſs in ſeveral places, the brutality and ſavage diſpoſition of the natives, and the ferocity of the innumerable wild beaſts in moſt of its countries, evince, that the rays of the ſun are here ſo fervid and powerful, as to dry and burn up the juices of the vegetable, and overheat the blood of the animal creation, ſo that the firſt are debilitated, and the latter rendered furious and ungovernable.

The moſt judicious geographers, and the learned in general, are much divided in their opinions reſpecting the modern diviſions of Africa; the reaſon of which is, that ſcarcely any traveller has penetrated into the middle of the country; on theſe accounts, we muſt acknowledge our ignorance of the bounds, and even the names of ſeveral of the inland nations, which may be ſtill reckoned among the unknown and undiſcovered parts of the world; but, according to the beſt accounts and ſurveys, Africa may be divided according to the following table.

A GENERAL TABLE OF THE CONTINENT OF AFRICA, &c.

Included under the general Names of

Nations.		Length.	Breadth.	Principal Cities.	Dif. & Bear. from London.	
Barbary	Morocco	500	480	Morocco	1080	S.

CHAP. I.

EGYPT.

Situation, Extent, Diviſions, Climate, Soil, Mountains, Inhabitants, Government, Cities, &c.

THIS kingdom is ſituated between the 20th and 32 deg. of north latitude, and the 28th and 36 deg. of eaſt long. It is about 600 miles in length, and 250 in breadth; bounded by the Mediterranean ſea, on the north; by Abyſſinia, or the Upper Ethiopia, on the ſouth; and by the deſert of Barca, and the unknown parts of Africa, on the weſt; and includes 140,700 ſquare miles.

The whole country is diſtinguiſhed by the northern and ſouthern diviſions; which are ſubdivided into Lower Egypt and Upper Egypt. The chief towns in Lower Egypt are, Grand Cairo, Bulac, Alexandria, Roſetta, Damietta. Upper Egypt has for its principal towns, Sayd or Thebes, and Coſſiar.

The climate of Egypt is in general very unhealthy: the high rocks and mountains which encompaſs it on the eaſt, and the ſandy deſarts of Lybia and Barca on the weſt, rendering it prodigiouſly hot, particularly in the months of April and May. They always reckon two ſummers in this kingdom; the firſt in March, April, and May, is the moſt unwholeſome, becauſe of the unequal weather, attended with violent and parching winds, which blow at that ſeaſon; but in the ſecond, viz. in June, July, and Auguſt, the weather is more ſettled, and the air much cooler. During the autumn and winter, Egypt is one of the moſt pleaſant and delightful countries in the world.

The ſoil of this kingdom is luxuriant even to a proverb, owing to the annual overflowing of the Nile, for it ſeldom rains except in winter. The fertility of the ſoil is ſuch, after the waters of this river begin to retire, that the labour of the huſbandman is next to nothing. In October and May he throws his wheat and barley into the rich mud or ſlime which the Nile leaves behind, without adding any manure, except mixing with it a little ſand. He turns his cattle out to graze in November; and in about ſix weeks nothing can be more charming than the proſpect which the face of the country preſents, in riſing corn, vegetables, and verdure of every ſort. Oranges, lemons, and fruits, perfume the air. The culture of pulſe, melons, ſugar-canes, and other plants which require moiſture, is ſupplied by ſmall, but regular cuts, from ciſterns and reſervoirs. Dates, plantains, grapes, figs, and palm-trees, from which wine is made, are here plentiful. Sugar-canes are alſo produced in this country; and the meadows yield the richeſt paſture in the world, the graſs being uſually as high as the cattle. March and April are the harveſt months, and they produce three crops; one of lettuces and cucumbers (the latter being the chief food of the inhabitants) one of corn, and one of melons.

The animals of Egypt ſeem to partake of the fecundity of the ſoil; for the cows, it is ſaid, always bring two calves at a time, and ſheep yean twice in a year, having two lambs at the firſt and one at the ſecond; a goat is often followed by four kids, which ſhe has brought in ſix months. Oxen abound here, and 200,000 of theſe animals are daily employed by the inhabitants in raiſing water for the uſe of the fields and gardens. The Egyptian horſes are held in great eſteem, and a fine breed of aſſes are likewiſe found here; alſo wild aſſes, camels, oxen, antelopes, tygers, and hyænas: but the moſt remarkable animals are the crocodile, the hippopotamus, or river horſe; the chameleon, the ichneumon, or Egyptian rat, and a large ſpecies of ape, with a head ſomewhat reſembling that of a dog, from which circumſtance the Greeks gave it the appellation of cynocephalus. The crocodile is an amphibious animal, reſembling a lizard. They have four ſhort legs, with large feet armed with claws; their backs are covered with impenetrable ſcales, and they are commonly about twenty feet in length. Theſe animals wait for their prey in the ſedge, and other coverts on the ſides of the Nile, and often ſurpriſe travellers, who, deceived by the colour,

take them for trunks of old trees. Their method of attacking a man, is to beat him down, either with their fore-paws or their tail. The natives have two methods of deſtroying them; the firſt is by a piece of fleſh faſtened on a hook, and thrown into the river by a rope, the other end of which is faſtened to a ſtake; when the crocodile has ſeized the bait, they drag him to the ſhore, and eaſily diſpatch him. The other is by ſtriking them when aſleep by the river ſide, under the belly, with a pole armed with a barbed point of iron, faſtened to a ſtake; but this is a very dangerous method, and therefore leſs practiſed than the former. The hippopotamus is larger than an ox, which the hinder parts greatly reſemble: the head is like that of a horſe, and it has thick large feet, with prodigious claws. This is likewiſe an amphibious animal, and often leaves the Nile to feed in the meadows, but immediately retires into the water on the approach of any perſon. The ichneumon is about the ſize of a cat, and covered with rough hair, ſpotted with white, yellow, and aſh colour: its noſe is formed like that of a hog, and the animal uſes it to turn up the earth. The legs are ſhort and black; the tail reſembles that of a fox. The ichneumon is ſaid to be of infinite uſe in Egypt, from its natural antipathy to the crocodile, whoſe eggs it deſtroys. The chameleon is not unlike a lizard in ſhape, and changes colour as the ſpectator changes his poſition.

Egypt abounds in birds both wild and tame, particularly oſtriches, eagles, hawks, and a prodigious number of water-fowl, among which are pelicans, flamingoes, herons, &c. but thoſe peculiar to the Nile are the ibis, the gooſe with golden feathers, the rice hen, or hen of Dimyat, and the ſak-ſak. The ibis is of as great ſervice to the inhabitants as the ichneumon, by deſtroying the flying ſerpents, which the ſouth wind brings from the deſerts of Lybia. At the proper ſeaſon of the year, theſe birds, by a peculiar inſtinct, are ſaid to wait on the frontiers for theſe ſerpents, and devour them in their flight before they enter Egypt. The bill and legs of this bird reſemble thoſe of a ſtork, and its uſual food, beſides ſerpents, are ſnails, locuſts, and other inſects. The oſtrich is of a prodigious ſize, and if purſued will ſtrike with its legs like a horſe.

Among the reptiles found in Egypt are baſiliſk or cockatrice, and the aſp, whoſe bite ſtupifies the paſſenger, and throws him inſenſibly into a deep ſleep, which puts a period to his exiſtence.

The only river in Egypt is the Nile above-mentioned, on the annual inundation of which the fertility of the greateſt part of that kingdom depends. According to the beſt geographers, the time of this flux correſponds exactly with the rainy ſeaſons between the tropics; for they commence in the mountains about the beginning of May, and the waters of the Nile begin to ſwell about the middle of that month; ſo that there are fifteen days allowed for the courſe of the water from Ethiopia to Egypt. As a further proof that this inundation is cauſed by the violent rains in Ethiopia, let it be obſerved, that about a fortnight after they begin to abate, which happens in September, the river begins to ſink in Egypt; and ten days after the rains are entirely ceaſed, which is about the beginning of October, the Nile is reduced to its uſual channel.

Though the river begins to ſwell in May, no public notice is taken of it till the latter end of June, by which time it has generally riſen about ſeventeen feet, and then the public criers proclaim it through the capital and other cities, and continue to publiſh, in the ſame manner, how much it increaſes every day, till it has riſen to about thirty-four feet, when the dam of the Chali, or great canal at Bulak, which paſſes through the middle of Cairo, is cut down, by means of which the water is diſperſed over all the lands. When the river is at its proper height, the inhabitants celebrate a kind of jubilee, with all ſorts of feſtivities. When the water riſes about forty-nine feet, it is a ſign of a plentiful year; but if it exceeds that height, it is productive of infinite miſchief; for beſides ſweeping away the houſes and drowning the cattle, it engenders a great number of inſects, which deſtroy the harveſts.

The day on which the banks of the canal are cut is obſerved as one of the greateſt feſtivals in Egypt. The baſhaw always attends, accompanied by the great officers of ſtate, and an innumerable concourſe of people; though we are told, the ſpectacle itſelf is not very magnificent. This officer is very careful that the river is arrived at its proper height before the canal is opened; for if it wants but an inch of it when he orders the dam to be cut down, and the year ſhould afterwards prove unfruitful, he is obliged to pay the Turkiſh emperor his tribute; but if this precaution is obſerved, and the harveſts prove unfavourable, no tribute can be claimed by that prince, the produce being then ſcarce ſufficient to maintain the inhabitants.

In order to aſcertain the daily increaſe of the water, the gradual riſe of it is very exactly meaſured, either by wells ſunk, or pillars erected and divided for that purpoſe, and termed nilometers or mikyaſes. That in the caſtle of Old Cairo is a large ſquare reſervoir, round which runs a handſome gallery, ſuſtained by twelve marble pillars, which form arches, with a baluſtrade, for the convenience of thoſe who look into the water. In the midſt of the baſon, through which a canal from the Nile paſſes, is an octagonal pillar of white marble, divided into twenty-two equal parts, by which the riſing of the water is determined; and the whole ſo accurately finiſhed, that the water in the reſervoir is always exactly on a level with that in the river.

As it is impoſſible for the Nile, without aſſiſtance, to overflow all the plains of Egypt, canals and trenches have been cut with vaſt labour and expence, from one extremity of the kingdom to the other, in order to convey the water to every part; ſo that each town and village has its canal, which is opened at proper times, that the land may be overflowed. By this method the inhabitants are alſo ſupplied with water for every other uſe, there being no more than two ſprings in the whole country. In the Lower Egypt, at the height of the Nile's flood, nothing is to be ſeen in the plains but the tops of foreſts and fruit-trees, their towns and villages being built upon eminences either natural or artificial, ſo that the inhabitants at that time have no communication with each other but by boats.

When the country is all verdant, it is very pleaſant to ſail up the Nile. A number of villages are ſcattered along each ſide of the river. The houſes are indeed low, and built of unburnt bricks; but, intermixed as they are with palm-trees, and pigeon-houſes of a ſingular form, they preſent to the eye of a ſtranger an uncommon and pleaſing proſpect. Near ſeveral of theſe villages are ſeen large heaps of the ruins of ancient cities.

The navigation of the Nile would be ſtill more agreeable, were it not infeſted by pirates. But when a great number of people are on board a veſſel, they keep on their guard; and diſcharge a few ſhots from time to time, to ſhew that they are provided with fire-arms; this keeps the villains in awe, and renders the paſſage leſs dangerous. There is much more danger in truſting to a Reis, or maſter of a veſſel, with whom you are unacquainted, who may favour the robbers, and ſhare their plunder. Whole villages are ſaid to follow this trade; and for this reaſon the boats never ſtop in their neighbourhood.

The inhabitants on the banks of the Nile are very dexterous in the art of ſwimming, which they frequently exerciſe in ſtealing from the boats, if not with open force, yet with a degree of addreſs and audacity

audacity worthy the moſt noted pickpockets. The following is a recent inſtance of their ſubtilty and boldneſs. The ſervants of a Pacha, newly arrived, caught one of them in the act, ſeized him, and brought him before the Pacha, who threatened him with inſtant death; but the rogue aſked leave to exhibit one of his tricks, ſaying, that he hoped his dexterity might procure his pardon. He obtained leave. Then collecting ſeveral effects in the tent, he wrapped them up, coolly, in the mode in which the Egyptians wrap up their clothes when they are to paſs a river. After playing ſome time with this parcel, he put it on his head, threw himſelf into the Nile, and, before the Turks were ſo far recovered from their ſurprize as to level their muſquets at him, was ſafe on the oppoſite bank.

M. Niebuhr (from whom we have extracted the above particulars concerning this celebrated river) ſays, through all the Lower Egpyt he ſaw no crocodiles in the two great branches of the Nile up which his company ſailed; and adds, as the notion of the Egyptians, that in the Mikkias, near Cairo, there is a taliſman, the virtue of which hinders thoſe amphibious animals from deſcending lower in the river: but, reſpecting this circumſtance our author very judiciouſly obſerves, that "the charm is not in the Mikkias, but in the population and cultivation of the country; for ravenous animals, whether of the ſea or land, are ſoon intimidated by the frequent aſpect of man. Men, too, in their anxiety to rid themſelves of ſuch deſtructive enemies, gradually thin their numbers, and at length entirely exterminate them."

The Egyptians trade with the Arabs for coffee, drugs, frankincenſe, ſpice, calicoes, and other merchandiſe, formerly imported into Europe in prodigious quantities; but that branch of trade is now greatly declined. Moſt of the European powers have conſuls in Egypt; ours reſide at Cairo. Several Engliſh veſſels arrive annually at Alexandria, ſome of which are laden on account of the owner; but the principal part are freighted by the Jewiſh, Armenian, and Mahometan traders.

It is difficult to aſcertain the manufactures carried on in Egypt; it is however known, that the inhabitants export great quantities of unmanufactured, as well as prepared flax, thread, cotton, calicoes, and leather of different kinds, which are landed at Suez, and from thence ſent to Europe. Their other productions for exportation are wax, ſal ammoniac, ſaffron, ſugar, ſenna, and caſſia. The internal traffick of the kingdom is chiefly carried on by caravans.

Egypt being inhabited by ſeveral different people, viz. Turks, Arabs, Moors, Greeks, Jews, Franks, and Coptics, their ſtature, complexion, habits, &c. are conſequently various. The Arabs are of a deep ſwarthy complexion, and are repreſented by the beſt authorities as retaining the patriarchal mode of tending their flocks, and many of them without any fixed place of abode. The Turks, who reſide in Egypt, retain all their original pride and inſolence; and wear the Turkiſh habit, to diſtinguiſh themſelves from the Arabs and Coptics.

The Coptics, who are the deſcendants of the original Egyptians, are an ill-looking ſlovenly people, immerſed in indolence, and, in their complexions, they are rather ſun-burnt than ſwarthy or black. Their anceſtors were once Chriſtians, and in general they ſtill pretend to be of that religion; but Mahometaniſm is the prevailing worſhip among the natives. The Coptics are generally excellent accomptants, and many of them live by teaching the other natives to read and write.

The Arabs and Coptics dreſs very plain, their chief finery being an upper garment of white linen, with a long cloth coat, either over or under it. The Chriſtians and Arabs of the meaner kind content themſelves with a linen or woollen wrapper, which they fold, blanket-like, round their body. The dreſs of the women is tawdry and unbecoming; but their clothes are ſilk, when they can afford it; and ſuch of them as are not expoſed to the ſun, have delicate complexions and features. The Jews wear blue leather ſlippers, the other natives of the country red, and the foreign Chriſtians yellow.

The occult ſciences, or, as they were formerly termed, the black art, was ſuppoſed to have arrived to a higher degree in Egypt than in any other country whatever; and, even at preſent, jugglers, fortune-tellers, mountebanks, and travelling ſlight-of-hand men, ſwarm in that country; and their prognoſtications, whether fortunate or otherwiſe, are received with the greateſt faith by the deluded Egyptians. The diverſions and exerciſes of the inhabitants are much the ſame as thoſe of Perſia and other parts of Aſia. The dancing camels, however, exhibited here, ſeem peculiar to this kingdom.

Egypt at preſent is not near ſo populous as formerly, its ſcarcity of inhabitants being principally owing to their being ſlaves to the Turks. They are, however, ſtill numerous; but what has been ſaid of the populouſneſs of Cairo, as if it contained two millions, is a mere fiction. As moſt of the people live on the banks of the Nile, and the reſt of the country is inhabited by Arabs, and other nations, we cannot preciſely aſcertain its population in general.

With reſpect to their religion, we learn, from hiſtory, that the ancient Egyptians worſhipped the planets, and ſeveral ſorts of birds and wild beaſts, among which were the crocodile, the ichneumon, and the ibis. Some of them adored even leeks and onions; but the general object of their worſhip was a large black ox, which they termed Apis. The Turks, Moors, and Arabs, ſettled in Egypt, are all Mahometans; and the two latter are ſtrict obſervers of their religion: they riſe very early, in order to be preſent at the public devotions, which are performed by break of day, and attend again at noon, at ſun-ſet, and at the ſetting of the watch, when it begins to be dark. The bulk of the Mahometans are enthuſiaſts, and profeſs great veneration for a ſet of people among them called ſanto's, or fellows who pretend to a ſuperior degree of holineſs, but are deſpiſed by the Turks as inſolent hypocrites. Many of them will appear in the ſtreets perfectly naked, and, in that manner, will intrude without any ceremony into the beſt houſes, ſit down to dinner, and leave the table when they are ſatisfied, no one daring to oppoſe them.

The Egyptian Turks mind religious affairs very little; and it would be hard to ſay what ſpecies of Chriſtianity is adopted by the Chriſtian Coptics, which are numerous here, but they profeſs to be of the Greek church, and enemies to that of Rome. In religious, and indeed many civil matters, they are under the juriſdiction of the patriach of Alexandria, who, by the dint of money, generally purchaſes a protection at the Ottoman court. It is affirmed that Chriſtianity was firſt planted here by St. Mark.

Egypt, in ancient times, was the ſeat of learning; the Greeks derived all their knowledge from this ſource. Geometry was invented in Egypt; and it is with great reaſon ſuppoſed, that Pythagoras acquired his knowledge of the true ſyſtem of the world from the Egyptian prieſts. The Ptolemies are celebrated for the encouragement they gave to literature: to their munificence we owe the Septuagint tranſlation of the ſcriptures; and they formed at Alexandria a library ſuperior to any thing the world ever ſaw. But the firſt caliphs, who were the immediate ſucceſſors of Mahomet, made war from conſcience and principle upon all kinds of literature, except the koran; and hence it was that the valuable manuſcripts contained in this moſt magnificent library were applied, for ſome months, in cooking their victuals, and warming their baths; and the ſame fate, through Mahometan bigotry and ignorance, attended upon the other Egyptian libraries

libraries of ineſtimable value. With regard to the architecture, ſculpture, and painting, of the ancient Egyptians, ſufficient ſpeciments ſtill remain to convince us, that they excelled every thing then known in the world; nor has the grandeur of their deſigns been ever equalled in any age or nation. But how is this country fallen! It once poſſeſſed the ſeat of eminence, and held the ſceptre of learning: it is now ſunk into the abyſs of ignorance, and exhibits a melancholy ſpectacle of the inſtability of human greatneſs; for the Turks have rivetted the chains of barbarous ignorance which the lower race of caliphs, who were the diſgrace of human nature, impoſed. Arithmetical calculations, adapted to the diſpatch of buſineſs; the jargon of aſtrology, a few noſtrums in medicine, and ſome fooliſh attempts to deceive the vulgar by a pretence to magic; now compoſe all the learning of Egypt.

Among the curioſities of Egypt are the pyramids, which are the moſt ſtupendous, though to appearance the moſt uſeleſs, ſtructures ever raiſed by the hands of men: they are, to the number of twenty, diſperſed about the Arabian deſert. One of the three largeſt of them we ſhall give a particular deſcription of here. It is ſituated on the top of a rock, in the deſert above mentioned, about a quarter of a mile to the weſt of the plains of Egypt, above which the rock riſes with an eaſy aſcent upwards of 100 feet. Each ſide of this pyramid, at the baſe, is 693 feet; its perpendicular height 499 feet; but, if meaſured along the ſloping ſide of the pyramid, it is equal to the breadth of the baſe. It covers an area of 480,249 ſquare feet, which is equal to eleven acres of ground. The aſcent to the top of this pyramid is by 207 ſteps placed on the outſide, every ſtep being the depth of one entire ſtone, and many of them thirty feet in length. On the north ſide, an artificial bank of earth is raiſed thirty-eight feet, and from this there is a narrow ſquare paſſage, which leads into the pyramid. This paſſage is about three feet and a half high, three and a quarter broad, and extends, on a declivity, ninety-two feet and a half. It is ſo contracted towards the end, that the ſpectators are obliged to creep upon their bellies for a conſiderable diſtance, which at length brings them into a place ſomewhat larger, and inhabited by a prodigious number of large bats. On the left hand, adjoining to the entrance, is a ſtone eight or nine feet high, which, being climbed, leads to the entrance of the firſt gallery, an hundred and ten feet in length, five feet in height, and as many in breadth, the whole conſiſting of white poliſhed marble. This gallery leads by a gentle aſcent to a ſecond, which is an hundred and twenty-four feet in length, twenty-ſix feet in height, and ſix broad. This is alſo of white poliſhed marble, cut into vaſt ſquares, the junctures are ſo cloſe and exact as to be ſcarce diſcernible by the moſt curious eye; and on each ſide there are benches of the ſame materials. The paſſage from this gallery is through a ſmall ſquare hole into ſome cloſets, or little chambers, lined with Thebaic marble, which lead to a very noble hall or chamber, ſituated exactly in the centre of the pyramid. The floor, ſides, and roof, of this room, are formed of exquiſite tables of Thebaic marble. It is about thirty-four feet in length, ſeventeen in breadth, and nineteen and a half in height. From the top to the bottom of it there are but ſix ranges of marble, and the blocks which cover it are of a ſtupendous length, nine of them forming the roof. In the middle of the hall is a marble cheſt ſeven feet long, ſuppoſed to be the tomb of Cheops, or Chemnis, king of Egypt, who is ſaid to have founded the pyramid; but there is no appearance of a corpſe having ever been laid in it.

At ſome diſtance from the above pyramid, and in the ſame deſerts, are ſituated the mummy-pits, the ſhalloweſt of which are thirty-two feet deep. At the bottom are ſquare openings or paſſages, ten or fifteen feet long, which lead into ſquare arched rooms, in which the embalmed bodies lie, ſome of them in cheſts or coffins of wood, others in ſtone coffins, and others are only wrapped in pieces of linen cloth, gummed or glued together. With theſe mummies are uſually found the figures of birds and beaſts, and little images of ſeveral ſorts, ſome of copper, others of ſtone, and others of different ſorts of earth.

Near the largeſt pyramid ſtands what is uſually called the ſphinx, which, if entire, ſhould reſemble a woman in the upper part, and a lion in the lower. Nothing more of this figure, however, is diſcernible, than from the ſhoulders upwards, and yet it is near thirty feet in height. Many are of opinion, that it was hewn out of the rock on which it ſtands, and that there was never any more of it than what is now viſible.

We muſt not omit another curioſity mentioned by all ancient and modern authors, which is a labyrinth near the banks of the Nile, ſaid to have been contrived by King Pſamniticus. The greater part of it is under ground, and contains, within the compaſs of one wall, twelve palaces and 1000 houſes; the walls, pillars, and roofs, were of marble, and it is aſſerted that neither wood nor cement was uſed in the whole fabric. This labyrinth had only one entrance, and ſo many intricate turnings and windings, that it was impoſſible for a ſtranger to find his way without a guide; which occaſions its name.

On a mountain near Oſyut, are upwards of 1000 beautiful grottoes, one of which is large enough to contain ſix hundred horſe. It is cut out of the rock with the chiſſel, and ſupported by vaſt ſquare pillars of the ſame rock. Various apartments have been made, and wells ſunk in moſt of theſe caverns, and at the extremities of them are catacombs, hallowed, which contain a great number of mummies; formerly there were tombs adorned with ſculptures in baſſo relievo, but theſe have been defaced by the Arabs. The obeliſk, or needle, of Cleopatra, ſituated in Alexandria, conſiſts of a ſingle block of granite, ſixty-three feet high, covered with hieroglyphics. This was another exactly ſimilar, but now thrown down, are ſuppoſed to have ſtood at the entrance of the palace of that celebrated princeſs. The lake Mœris, which was dug by order of Herodotus Mœris, king of Egypt, in order to correct the irregularities of the Nile, was at once a curious, uſeful, and ſtupendous undertaking. Herodotus ſays, it was 450 miles in circumference, and, in moſt places, 300 feet in depth. But at preſent, according to the obſervation of Dr. Pococke, it is no more than fifty miles long and ten broad. In ſhort, a volume would not be ſufficient to deſcribe the aſtoniſhing remains of ancient temples, palaces, ſtatues, paintings, &c. ſo profuſely ſcattered over great part of Egypt. Some of the ancient ſtructures, particularly the palace of Memnon, ſtill exhibit ſuch ſpecimens of grandeur as are not to be equalled in the whole world.

The cuſtom of hatching chickens in ovens is common in Egypt, and now practiſed in ſome parts of Europe. The papyrus is one of the natural curioſities of this country; but we know not the manner of preparing it: the pith of it is a nouriſhing food.

No country in the world contains more inſcriptions, engraved on ſtones of the moſt durable nature, than Egypt: but the pains taken to inform us has been rendered fruitleſs by the imperfection of the mode of writing this people employed. Inſtead of characters expreſſive of the different ſounds in their language, or ſigns marking each a ſyllable, with a determinate idea affixed to it, ſuch as the Chineſe uſe; the ancient Egyptians made uſe of emblems, to mark ideas ſomehow referable to them, although by a very forced and diſtant analogy. This is what we, after the Greeks, call hieroglyphic writing.

M. Niebuhr makes the following judicious remarks on the ſubject: "I would willingly hope,

ſays he, that the key to thoſe myſterious writings of the ancient Egyptians may yet be recovered. Various learned men have diſplayed aſtoniſhing ſagacity and penetration in decyphering inſcriptions in unknown languages, where there has been a conſiderable quantity of characters for them to exerciſe their conjectures upon. Travellers ſhould therefore collect as many as poſſible of the hieroglyphic characters, and publiſh them carefully, that we may thus be furniſhed with more points of compariſon for theſe ſymbols through a greater variety of combinations.

"The ſtudy of the ancient language of Egypt would be equally neceſſary for this purpoſe. I ſuſpect that the true nature of hieroglyphics has hitherto been miſtaken, while all the ſymbolical figures and characters have been ſuppoſed to be of the ſame ſort. After copying a conſiderable number of hieroglyphics from obeliſks, ſarcophagi, urns, and mummies, I thought I could alſo diſtinguiſh, in theſe ſmaller hieroglyphics, ſome marks of alphabetic characters, or at leaſt of a mixed ſpecies of writing bearing ſome reſemblance to the alphabetical. Wherefore, by the ſtudy of the language of the Pharaoh's we may come, with more eaſe, to decypher theſe ſmall characters."

The hieroglyphic inſcriptions are found chiefly in Upper Egypt, where all the monuments, and even the walls, of thoſe ſuperb temples which are ſtill ſtanding, are covered over with inſcriptions of this ſort. They are no leſs common upon the tombs of the mummies at Sakara. The embalmed bodies have covers full of hieroglyphics; and the ſepulchral urns are marked with them. Such as have been painted upon wood and cloth are in as good a ſtate of preſervation as thoſe which are engraven upon ſtone. It is very probable, that in the caverns of Sakara, if theſe were examined, there are other more precious antiquities.

Since Egypt has been ſubject to the Turkiſh emperors, they have always governed it by a viceroy, under the title of the pacha or baſhaw of Grand Cairo. and is one of the greateſt officers of the Ottoman empire. But the kingdom is ſubdivided into twenty-four provinces, each of which is governed by a ſangiack, or bey; ſo that the government of Egypt is both monarchical and republican, the governors of which are natives, and ſeem to be veſted with ſovereign power in their reſpective diſtricts; the grand ſeignior having thought proper to indulge them in this reſpect, rather than hazard the revolt of ſo rich a province; and by this means the Egyptians have an inheritance in their own lands, a privilege enjoyed by few of the Turkiſh ſubjects beſides themſelves. It is the buſineſs of the viceroy to keep theſe petty princes, who are termed ſcheicks, at variance with each other, which he never fails to do, and by that means prevents their uniting againſt the Porte, which has formerly been the caſe; and even the baſhaws themſelves had been known to revolt againſt their emperors.

The republican, or rather the ariſtocratical part of the government of Egypt conſiſts of a divan, compoſed of the twenty-four ſangiacks, beys, or lords. The head of them is called the ſheikbellet, who is choſen by the divan, and confirmed by the baſhaw. Every one of the ſangiacks is arbitrary in his own territory, and exerts ſovereign power; the major part of them reſide at Cairo. If the grand ſeignior's pacha acts in oppoſition to the ſenſe of the divan, or attempts to violate their privileges, they will not ſuffer him to continue in his poſt; the Porte is obliged to ſend another. They have an authentic grant of privileges, dated in the year 1517, in which year Egypt was conquered from the Mamalukes by the ſultan.

The Turks always keep a numerous army of regular troops, and alſo a militia in Egypt, which ſerve merely as nurſeries for the Ottoman troops; for the viceroy never ventures to employ them againſt the Arab or Egyptian beys already mentioned, many of whom have ſeparate armies of their own. The regular forces are ſaid to amount to about ſix or eight thouſand, and the militia to between three and four thouſand.

The grand ſeignior never impoſes any ſevere taxes on the Egyptians, leſt ſuch a meaſure ſhould induce them to revolt; ſo that, except what the viceroy and his creatures extort from the people illegally, the whole revenue raiſed by the government does not amount to a million of our money, of which, it is ſaid, two-thirds are ſpent within the kingdom; the remainder is remitted to the grand ſeignior's treaſury.

The cities and principal towns in Egypt are ſo numerous, that it is impoſſible to deſcribe even the moſt conſiderable of them, all therefore we can do is, to ſelect ſuch as are moſt worthy the attention of our readers.

Cairo, now Maſn, the preſent capital of Egypt, is ſituated on the Nile, and conſiſts of two cities, a mile diſtant from each other, viz. Old Cairo, and Cairo properly ſo called. The firſt of theſe is now reduced to a very ſmall compaſs, not being more than two miles round; but the ſecond, which is ſituated about a mile from the river, extends eaſtward near two miles to the mountains, and is about ſeven miles in circumference. It is ſaid to have been formerly much larger, being then the centre of trade from the Eaſt-Indies. There are three or four very grand gates, erected by the Mamalukes, the workmanſhip of which is very good, and the architecture, though ſimple, has a magnificent appearance. The caſtle, ſaid to have been built by Saladin, is ſituated on a rocky hill, which ſeems to have been ſeparated by art from the mountain Jebel Duiſe. It is walled round, but being entirely commanded by an eminence on the eaſt, it could make but a poor defence ſince the invention of cannon. The caſtle is at preſent parted into three diviſions, which are occupied by the pacha, the janiſſaries, and the Aſſabs. The palace of the pacha is falling into ruins, and is unworthy of being the dwelling of the governor of a great province. But the Turkiſh pachas are in general ill lodged: they all know that they are not to be long in power, and no one cares for making reparations to accommodate his ſucceſſor. The quarter of the janiſſaries is ſurrounded with ſtrong walls, which are flanked with towers, and it has more the appearance of a fortreſs.

At the weſt end of the caſtle are the remains of very magnificent apartments, ſome of them covered with domes, and adorned with Moſaic pictures, formerly perhaps belonging to the ancient ſultans, but at preſent only uſed for weaving, embroidering, and otherwiſe preparing the hangings, every year ſent to Mecca. The grand ſaloon, commonly called Joſeph's Hall, is now entirely open, except on the ſouth ſide; and, from an eminence near it, which by the large and beautiful pillars of red granite with which it is adorned, ſeems to have been a terrace to the above ſaloon, there is a moſt delightful proſpect of Cairo, the pyramids, and all the adjacent country.

The ſtreets, like thoſe of all the Turkiſh cities, are very narrow, the moſt ſpacious of them not exceeding one of our lanes in breadth; and they are peſtered with jugglers and fortune-tellers. The houſes, which are generally built round a court, have very little beauty on the outſide, uſe only being there conſidered. Below they are of ſtone, and above of a ſort of cage-work, ſometimes filled up with unburnt bricks, having very few windows. The inſides are much more regular: thoſe belonging to the principal men have a ſaloon for common uſe, and another for ſtate; and as they have four wives, each of them has a ſaloon, with the neceſſary apartments. Theſe have no communication with the other parts of the houſe,

except the common entrance for the ſervants, and the private entrance, of which the maſter keeps the key.

There are ſeveral magnificent moſques in and about Cairo; but the moſt celebrated, both with regard to the ſolidity of its building, and a certain grandeur and magnificence that ſtrikes every ſpectator in a ſurpriſing manner, is the moſque of Sultan Haſſen, built at the foot of the caſtle-hill. It is very lofty, of an oblong ſquare figure, crowned with a corniſh all round, that projects a great way, and is adorned with a particular ſort of groteſque carvings, after the Turkiſh manner. The entrance is very beautifully inlaid with ſeveral ſorts of marble, and finely carved at top: formerly the aſcent was by ſeveral ſteps, which are deſtroyed, and the door walled up, becauſe, in times of public inſurrections, the rebels made uſe of this moſque as an aſylum, and place of defence. Cairo is commonly viſited by the plague once in three or four years, when it rages with incredible violence, and carries off great numbers of the people, but always gradually declines in proportion to the ſwelling of the Nile. The conveniency of water-carriage renders this city a place of great traffick; ſo that all the country, particularly in the neighbourhood of the Nile, is ſupplied with merchandize of all kinds from Cairo.

One of the favourite diverſions of the citizens is their dancing camels, which, when young, they place upon a large heated floor, the intenſe heat whereof makes the poor creature caper, and, being plied all the time with the ſound of drums, the noiſe of that inſtrument ſets them a dancing all their lives after.

In the neighbourhood of Cairo are ſeveral remarkable places: among others, the three villages of Bulak, Foſtat, Geeſh, which are all ſo near the city, that they may be reckoned ſuburbs to it.

Bulak, which was undoubtedly the Latopolis of the ancient Greeks, is at preſent a very conſiderable town, and the port of Cairo. All goods from Damietta and Roſetta, and all exports from Egypt by the Mediterranean, paſs this way. For this reaſon, a large cuſtom-houſe is eſtabliſhed here; and a vaſt bazar, or covered market-place, called kiſſarie. Here are alſo magazines of rice, ſalt, nitre, and of various productions of Upper Egypt. Here is alſo a houſe belonging to the ſultan, in which is kept the corn that he ſends annually to Mecca and Medina.

Foſtat, or Maſr-el-atik, although greatly decayed, may ſtill be conſidered as a town of the middle ſize. It has a cuſtom-houſe, where the duties on goods from Upper Egypt are paid. In a large ſquare, encloſed within a wall, government ſtore up, in the open air, a conſiderable quantity of grain every year. Some authors ſpeak of this as a granary built by the patriarch Joſeph; but the wall is plainly of a later date than even the conqueſt of Egypt by the Arabians.

The old city of Maſr is inhabited, at preſent, by none but Chriſtians. In it are to be ſeen ſeveral churches of the Greeks and Cops, with a convent of Monks of the latter nation. A grotto, under one of the Coptic churches, is regarded with high veneration, becauſe it is ſuppoſed to have been the retreat of the Holy Family, when they fled into Egypt. The Greeks have a church famous for a miracle of a ſingular nature:—fools recover their wits, upon being bound to a certain pillar of it.

Between this city and Cairo is an aqueduct, which was conſtructed in the beginning of the ſixth century by Sultan Gari, and conveys water into the neighbourhood of the caſtle. Near the canal is a convent of Derviſes, celebrated for the elegance of the building, and the opulence of the foundation; and near this convent are large ſquares, in which the principal inhabitants of Cairo amuſe themſelves with military exerciſes.

†

The ſmall village of Geeſh ſtands on the ſouthern bank of the Nile, oppoſite to Maſr-el-atik. Its origin is unknown. The heights around it, which have no doubt been raiſed by the accumulation of the dirt from the city, ſeem to beſpeak its antiquity. M. Niebuhr found nothing remarkable about it, except ſome country houſes belonging to rich inhabitants of Cairo, and ſome manufactories.

Matara, a town, or rather village, about two leagues from the capital, is ſeated nearly on the ruins of the ancient Heliopolis. It is, however, more famous among the Chriſtians for a ſycamore whoſe trunk is ſaid to have afforded ſhelter to the Holy Family, in their flight. This ſycamore ſhould ſeem to have the power of renewing itſelf: for, of the crowds of ſuperſtitious perſons who viſit it, each uſually cuts off and carries away a piece. This village was formerly famous for the cultivation of thoſe trees which afford Egyptian balſam: but none of them is now to be ſeen here; the laſt died in the beginning of the ſeventeenth century. The Turks are not a people diſpoſed to reſtore ſo valuable a plant.

Four leagues eaſtward from Cairo is Birket-el-Hadgi, or the Pilgrim's Pool, a pretty conſiderable lake, which receives its water from the Nile. Upon its banks are ſeveral villages, and a great many ruinous country-houſes. There is nothing to render this place remarkable, except at the time of the ſetting out of the caravan from Mecca, when the pilgrims encamp near it for a few days; as they do alſo upon their return. On the 20th of May 1762, two days before the departure of the caravan, M. Niebuhr tells us, he had the curioſity to viſit this camp, but found little about it worth viewing; that he ſaw indeed a very few elegant tents; but every thing elſe was ſhockingly, naſty, diſorderly, and paltry.

Alexandria, (or Scandria, as the Turks and Arabs call it) the ancient capital of Egypt, was founded by Alexander the Great, and is ſituated forty miles weſt from the Nile, where it forms a ſpacious haven, in the form of a creſcent, and is 120 miles north-weſt of Cairo. It was formerly a very magnificent city, containing ſuperb buildings, and noble walls, ſome of which are ſaid to be ſtill ſtanding. It was once, in ſome degree, the emporium of the world, and, by means of the Red Sea, furniſhed Europe, and many parts of Aſia, with the rich merchandizes and productions of the Eaſt. Some ſtately ruins are ſtill viſible, together with many pieces of porphyry, and other fine marbles; but the greater part has been either carried away, or employed in building the preſent city, which is nothing more than an ordinary ſea-port, known by the name of Scanderoon. Mr. Niebuhr obſerves, that the Mahometans in general, and eſpecially the inhabitants of Alexandria, break down the fineſt monuments of antiquity, to employ the fragments in the moſt wretched ſtructures imaginable. Whenever they are at a loſs for materials for building, they ſcruple not to dig up the foundation ſtones of the ancient walls and palaces.—If one happens to find a beautiful column in his garden, he will rather make mill-ſtones of it, than preſerve it.

However, he ſays, there ſtill exiſts one noble remain in the city, which could neither be broken nor carried away: this is the Obeliſk of Cleopatra, not before noticed, and is a ſingle piece of red granite. Although a part of its baſe be ſunk into the earth, it ſtill appears above ground to the height of ſixty-two feet; the circumference of the baſe is ſeven feet and a half. It is inſcribed with ſome ancient characters, engraven an inch deep; but the modern Egyptians cannot read them.

Another monument, the famous pillar of Pompey, which is a fine piece of antiquity, owes alſo its preſervation to its bulk. It was erected in ancient Alexandria, but ſtands at preſent at the diſtance of a quar-

ter

ter of a league from the New-Town; and is ſaid to have been erected by Julius Cæſar, in memory of his victory over that great man, who, eſcaping from the battle of Pharſalia to the Egyptian coaſt, was there treacherouſly murdered. The pillar conſiſts of three ſtones of red granite; the whole, including the pedeſtal and foundation, being eighty-nine feet high, and adorned with a capital of the Corinthian order.

New Alexandria owes its preſent ſtate to the Arabs, who encloſed it with a very thick wall, near fifty feet high. This wall, which is becoming ruinous, and a ſmall fort upon the peninſula, with a garriſon of fifty ſoldiers, are all the means that the city poſſeſſes for its defence: but its governor depends on the Pacha of Kahira, and, of conſequence, not on the ariſtocracy of the beys, but on the grand ſeignior. The fineſt building in the city is a moſque, which, in the time of the Greek empire, was a church dedicated to St. Athanaſius. It is very large, and ornamented with noble columns. A great number of Greek manuſcripts are ſtill ſaid to be preſerved in it; but, Mr. Niebuhr adds, that as no Chriſtian dare examine any thing within a moſque, he ſaw only its outſide.—Alexandria has fallen by degrees from its ancient grandeur, population, and wealth. The filling up of the branch of the Nile, upon which this city ſtands, and which is now no longer navigable, is what has chiefly contributed to its decline: it is however cleanſed from time to time, as it ſupplies the city with ſoft water, which could no where elſe be obtained.

According to the tradition of the Arabs, when Alexandria was taken by the Saracens, it contained four thouſand palaces, as many baths, and four hundred ſquares: even now the moſques, bagnios, &c. erected within theſe ruins, preſerve an inexpreſſible air of majeſty. This city ſtill retains ſome trifling remains of its former trade; but the inhabitants are, in general, poor, ignorant, and indolent. Oppoſite Alexandria is the ſmall iſland of Pharos, whereon the light-houſe, known by the ſame appellation, and eſteemed one of the Wonders of the World, formerly ſtood. The mole which was built to form a communication with the iſland of Pharos is 1000 yards in length, and though near 2000 years old, ſuch were its excellent materials, as to reſiſt in a great meaſure the violence of winds and waves ever ſince. All the parts of the city were magnificent in proportion, as appears from their ruins, particularly the ciſterns and aqueducts.

Suez, which gives name to the iſthmus that joins Africa with Aſia, is ſituated on the northern coaſt of the Red Sea. It was formerly a place of great trade, but has been upon the decline ever ſince the Portugueſe diſcovered a paſſage to the Eaſt Indies by the Cape of Good Hope. Near this city the children of Iſrael are ſuppoſed to have marched in their way towards the Red Sea. It is now a ſmall city, and gives name to the iſthmus that joins Africa with Aſia.

Roſetta, called by the Arabs, Raſhid, is a healthy, pleaſant, and populous city, is ſituated twenty-five miles to the north-weſt of Alexandria, and at the mouth of one of the branches of the Nile. It is two miles long, and half a mile broad. The inhabitants employ themſelves in conveying the European merchandizes, which are brought hither from Alexandria to Cairo in boats. A vaſt number of vice-conſuls and factors reſide here, in order to expedite all letters and bills brought from Alexandria: thoſe of any conſequence, are conveyed from hence by land, acroſs the deſerts, to Cairo. Roſetta is recommended not only for its beautiful ſituation, but delightful proſpects, which command the fine country, or iſland of Delta. In the environs are many country-houſes belonging to Chriſtian merchants, with fine gardens, producing the choiceſt fruits of the Eaſt. The Mahometan inhabitants are alſo extremely civil and polite here.

Damietta, ſuppoſed to be the ancient Peluſium, is ſituated at the mouth of the eaſtern branch of the Nile, about an hundred miles from Roſetta. It is an ill-built, but large and populous city, containing about twenty-five thouſand inhabitants, excluſive of ſtrangers.

Bulac is ſituated about two miles weſt of Cairo, to which city it is the port town, and a place of vaſt trade, containing about four thouſand families. It is at this place that the banks of the Nile are annually cut, in order to fill the canals, as already mentioned.

Sayd, ſituated on the weſt banks of the Nile, 200 miles ſouth of Cairo, and ſuppoſed to be the ancient Egyptian Thebes, is the capital of Upper Egypt, and was formerly one of the fineſt cities in the univerſe; but it is now very inconſiderable, and only remarkabe for the amazing antiquities it contains, conſiſting of vaſt columns of marble and porphyry, which lie half buried in the ground, and ſtatues and obeliſks of a prodigious ſize, adorned with hieroglyphics.

Colliar is ſituated on the weſt coaſt of the Red Sea.

The general practice of ſtrangers, who viſit the three laſt-mentioned places, is, to hire a janiſſary, whoſe authority commonly protects them from the inſults of the other natives.

HISTORY OF EGYPT.

Egypt has long been a celebrated kingdom; it was peopled by Mizraim, the ſon of Ham, ſoon after the confuſion at Babel, and has almoſt from its firſt ſettlement been celebrated by the hiſtorians of all nations. An uninterrupted ſeries of kings filled the Egyptian throne, till the invaſion of Cambyſes II. king of Perſia, in the year before Chriſt 520, when a period was put to that famous monarchy. Moſt of the ſuperb ſtructures, whoſe ruins are the admiration of modern times, were erected during the reigns of theſe princes deſcended from the line of the Pharaohs. After the conqueſt of Egypt by Cambyſes, it continued a province of Perſia, till the deſtruction of that empire by Alexander the Great, who, after wreſting the Perſian diadem from Darius, built the celebrated city of Alexandria, then the emporium of the rich merchandize of the Indies. On the death of Alexander, Egypt fell to the lot of Ptolemy, one of the generals of that great prince, when it once more became an independent kingdom. This event happened about 300 years before the Chriſtian æra. The line of the Ptolemies ſwayed the Egyptian ſceptre between 2 and 300 years, and were famous for their magnificence, and the encouragement they gave to learning. The celebrated library of Alexandria, ſaid to contain 700,000 volumes, owed its origin to Ptolemy Philadelphus, the ſecond prince of that dynaſty. By his order alſo the Old Teſtament was tranſlated from the Hebrew into Greek, and is well known to the learned under the name of the Septuagint. This dynaſty terminated with the death of the celebrated Cleopatra, wife and ſiſter to Ptolemy Dionyſius, when Egypt was reduced to a Roman province. In this ſtate it continued till the deſtruction of that empire by the Goths and Vandals. After this memorable period, namely, about the year 640, Omar ſubjected Egypt to the Mahometan power, and the caliphs of Babylon were ſovereigns of the country till 870, when the Egyptians ſet up a governor of their own, named Ahmed Eben Tolun, and hence it is called the dynaſty or line of Tolun. This line continued till about the year 1140, and was ſucceeded by the Turkiſh line of caliphs, or kings of Egypt, the firſt of which was Syrachock, who being ſent by the ſultan with an army into Egypt,

Egypt, conquered the country, but aſſumed the regal authority himſelf.

Between the year 1150 and 1190, in the time of the Cruſades, Egypt was governed by Noraddin, the Saracen ſultan of Damaſcus, whoſe ſon, the famous Saladin, was ſo dreadful to thoſe Chriſtian adventurers, and retook from them Jeruſalem. He inſtituted the military corps of Mamalukes, like the janiſſaries of Conſtantinople, who, about the year 1242, advanced one of their own officers to the throne, and ever after choſe their prince out of their own body. Egypt for ſome time made a figure under thoſe illuſtrious uſurpers, and made a noble ſtand againſt the growing power of the Turks, till Selim, the Turkiſh emperor, about the year 1517, gave the Mamalukes ſeveral bloody defeats, and reduced Egypt to its preſent ſtate of ſubjection to the Ottomans. But while this conqueror was ſettling the government of Egypt, great numbers of ancient inhabitants withdrew into the deſerts and plains, under one Zinganeus, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way.—Selim and his officers, perceiving that it would be a matter of great difficulty to extirpate thoſe marauders, left them at liberty to quit the country, which they did in great numbers, and their poſterity is known all over Europe and Aſia by the name of Gipſies.

The late Dr. Smollett, ſpeaking of Egypt, ſays, "It was from hence that the vagrant race called Gipſies came, and diſperſed themſelves into every kingdom of Europe and Aſia. They were originally called Zinganees, from their captain Zinganeus, who, when ſultan Selim made a conqueſt of Egypt about the year 1517, refuſed to ſubmit to the Turkiſh yoke, and retired into the deſerts, where they lived by rapine and plunder, and frequently came down into the plains of Egypt, committing great outrages in the towns upon the Nile, under the dominion of the Turks. But being at length ſubdued, and baniſhed Egypt, they agreed to diſperſe themſelves in ſmall parties into every country of the known world, and as they were natives of Egypt, a country where the occult ſciences, or black art, as it was called, was ſuppoſed to have arrived to great perfection, and which in that credulous age was in great vogue with perſons of all religions and perſuaſions, they found no difficulty to maintain themſelves by pretending to tell fortunes and future events." Many of them, however, have of late been incorporated with and adopted the manners and cuſtoms of the people with whom they live.

The moſt important event reſpecting the hiſtory of this country, is the following: A few years ago, an attempt was made to deprive the Ottoman Porte of its authority over Egypt, by Ali Bey, whoſe father was a prieſt of the Greek church. Ali embraced the Mahometan religion; and as he was poſſeſſed of great ability and addreſs, he ſoon became very popular. However, a falſe accuſation having been made againſt him to the grand ſeignior, his head was ordered to be ſent to Conſtantinople. Ali, being appriſed of the deſign, ſeized and put to death the meſſenger who brought the mandate, and ſoon afterwards found means to put himſelf at the head of an army; taking likewiſe advantage of the diſtreſsful and dangerous ſituation to which the Turkiſh empire was reduced, by the war it was engaged in with the Ruſſians, he boldly aſcended the throne of the ancient ſultans of Egypt. But not content with that kingdom, he alſo laid claim to Syria, Paleſtine, and that part of Arabia which had formerly been under the dominion of the ancient ſultans. Accordingly he marched at the head of his troops to ſupport theſe pretenſions, and actually ſubdued ſome of the neighbouring provinces of Arabia and Syria.

Whilſt Ali was employed in theſe great enterpriſes, he was not leſs attentive to the eſtabliſhing a regular form of government, and introducing order into a country that had been long the ſeat of anarchy and confuſion. In like manner he extended his views to commerce; for which purpoſe he gave great encouragement to the Chriſtian traders, and took off ſome grievous and ſhameful reſtraints and indignities to which they were ſubjected by the arbitrary power of the governors. With the ſame views, he wrote a letter to the republic of Venice, with the greateſt aſſurances of his friendſhip, and that their merchants ſhould meet with all poſſible protection and ſafety. His great deſign was ſaid to be, to make himſelf maſter of the Red Sea, to open the port of Suez to all nations, but particularly to the Europeans, and to make Egypt once more the great centre of commerce.

The conduct and views of Ali diſplayed an extent of thought and ability that indicated nothing of the barbarian, and beſpoke a greatneſs of mind capable of founding an empire; but he was not finally ſucceſsful. However, for ſome time he proved extremely fortunate: having aſſumed the titles and ſtate of the ancient ſultans of Egypt, and being ably ſupported by Sheik Daher, and ſome other Arabian princes, who warmly eſpouſed his cauſe. In almoſt all his enterpriſes againſt the neighbouring Aſiatic governors and baſhas he likewiſe ſucceeded, and repeatedly defeated them; but he was at length deprived of the ſovereignty by the baſe and ungrateful conduct of his brother-in-law, Mahommed Bey Aboudaab, who, on the 7th of March, 1773, totally defeated his troops, wounded, and took him priſoner: he afterwards died of his wounds, and was buried at Grand Cairo.

Aboudaab for ſome time governed Egypt as Sheik Ballet, and marched into Paleſtine to ſubdue Sheik Daher; but after behaving with great cruelty to the inhabitants of the places he took, he was found dead in his bed one morning at Acre, ſuppoſed to be ſtrangled. Sheik Daher accepted the Porte's full amniſty, and embraced the captain pacha's invitation to dine on board his ſhip, when the captain produced his orders, and the brave Daher, Ali Bey's ally, had his head ſtruck off in the 85th year of his age: thus forfeiting his life in conſequence of his own credulity, and the falſe aſſurances of his treacherous enemies.

CHAP. II.

THE STATES OF BARBARY:

Containing the Kingdoms of Morocco, Fez, Algiers, Tunis, Tripoli, and Barca.

Boundaries, Climate, Soil, Produce, Inhabitants, Animals, Cities, Towns, Mountains, Rivers, &c.

MOROCCO.

THIS empire, which now comprehends the kingdoms of Morocco and Fez, is bounded by the Mediterranean ſea, on the north; by Tafilet, on the ſouth; by the river Mulvia, which ſeparates it from Algiers, on the eaſt; and by the Atlantic ocean, on the weſt; extending from 28 to 36 deg. north latitude, and from 4 to 9 deg. weſt longitude from London. It is about 500 miles in length, and 480 miles in breadth, where broadeſt.

FEZ, lies between the kingdom of Algiers, to the eaſt, and Morocco to the ſouth: it is ſurrounded in other parts by the ſea. This country, now united to Morocco, is about 125 miles in length, and nearly the ſame in breadth.

ALGIERS, which was formerly a kingdom, is 480 miles in length from eaſt to weſt, and from 40 to 100 miles in breadth. It is ſituated between 30 and 37 deg. north lat. and between 1 deg. weſt, and 9 deg. eaſt long. being bounded on the eaſt by the kingdom of Tunis, on the north by the Mediterranean, on the ſouth by Mount Atlas, and on the weſt by the kingdoms of Morocco and Tafilet.

TUNIS, anciently the republic of Carthage, is in length from north to ſouth 220 miles, in breadth from eaſt to weſt 170, and bounded by the Mediterranean on the north and eaſt; by the kingdom of Algiers, on the weſt; and by Tripoli, with part of Biledulgerid, on the ſouth. It extends from 33 deg. 30 min. to 37 deg. 12 min. north lat. and from 8 deg. to 11 deg. eaſt long.

TRIPOLI, including Barca, is bounded by the Mediterranean ſea, on the north; by the country of the Beriberies, on the ſouth; by the kingdom of Tunis, Biledulgerid, and a territory of the Gadamih, on the weſt; and by Egypt, on the eaſt; extending along the coaſt about 1000 miles, excluſive of the creeks and projections of the ſhore.

We may with propriety conſider the Barbary ſtates as forming a great political confederacy, however independent each may be as to the exerciſe of its internal policy; and with reſpect to the manners and cuſtoms of the inhabitants in general, the difference is not greater than happens in the ſeveral provinces of the ſame kingdom.

The climate of Morocco, Fez, Algiers, and indeed all the other ſtates, is extremely hot towards the ſouth, but in general is tolerably healthy, being cooled by the ſea-breezes, and defended by high mountains from the ſultry ſouth winds, which give them a temperature not to be expected from their ſituations ſo near the tropic. But if the rainy ſeaſon, which begins in October, continues too long, it occaſions peſtilential fevers; and the north-weſt winds, which prevail in March, ſometimes greatly affect the lungs and nerves, and injure the products of the earth. In other reſpects the ſky is ſerene, and the air clear and wholeſome. Fine ſprings are found in moſt moors, and alſo winding rivers, which for the moſt part have their ſource in Mount Atlas, and diſembogue themſelves in the Mediterranean ſea, or Atlantic ocean.

Under the Roman empire, theſe ſtates were juſtly denominated the garden of the world; and to have a reſidence there, was conſidered as the higheſt ſtate of luxury. The produce of their ſoil formed thoſe magazines which furniſhed all Italy, and great part of the Roman empire, with corn, wine, and oil. Though the lands are now uncultivated, through the oppreſſion and barbarity the inhabitants labour under, yet they are ſtill fertile, not only in the articles above ſpecified, but in dates, figs, raiſins, almonds, apples, pears, cherries, plums, citrons, lemons, oranges, pomegranates, with plenty of roots and herbs in their kitchen-gardens. Excellent hemp and flax are produced on their plains; and perſons who have lived there for ſome time aſſure us, that the country abounds with all the neceſſaries and luxuries of life; for the great people here find means to evade the ſobriety preſcribed by the Mahometan law, and drink freely of excellent wines and ſpirits of their own growth and manufacture. Great quantities of ſaltpetre and excellent ſalt have been produced in Algiers, and in ſeveral places of Barbary lead and iron have been found. Honey and wax are alſo produced here in great quantities.

The deſerts in the ſtates of Barbary abound with lions, tygers, leopards, hyænas, and monſtrous ſerpents; but neither the elephant nor the rhinoceros are to be found there. Camels and dromedaries, aſſes, mules, and kumrahs (a moſt ſerviceable creature) begot by an aſs upon a cow, are their beaſts of burden. The Barbary horſes were formerly very valuable, and thought equal to the Arabian: and though their breed is now ſaid to be decayed, yet ſome very fine ones are now and then imported into England. Their cows are but ſmall, and give little milk. Their ſheep and goats are very large; though the former yield but indifferent fleeces. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weaſels, moles, chameleons, and all kinds of reptiles are found here. The apprehenſions travellers through ſome parts of Barbary are under, of being bitten or ſtung by the ſcorpion, the viper, or the venomous ſpider, rarely fail to interrupt their repoſe, which is a refreſhment very agreeable and highly grateful to a weary traveller.

Eagles, hawks, quails, partridges, and all kinds of wild fowl, are found on this coaſt; and of the ſmaller birds, the capſa ſparrow is remarkable for its beauty, and the ſweetneſs of its note, which is thought ſuperior to that of any other bird; but it cannot live out of its own climate.

The ſeas and bays of Barbary abound with the fineſt and moſt delicious fiſh of every kind, which were preferred to thoſe of Europe by the ancients.

The principal mountains is that chain termed Mount Atlas, which runs the whole length of Barbary, from eaſt to weſt, and, paſſing through Morocco, terminates upon that ocean which ſeparates the eaſtern from the weſtern continent, and from this ridge of mountains has obtained the appellation of the Atlantic Ocean.

Theſe mountains afford mines of exceeding fine copper; and it has been aſſerted, that the country contains mines of gold and ſilver, but none of them are open at preſent.

The chief rivers are the Malva, which riſes in the deſerts, and, running from ſouth to north, divides Morocco from Algiers; the Suz, the Rabbatta, the Ommirabih, the Larache, the Sebon, the Darodt, the Tenſiſt, Peban, and the Gueron. All theſe have their ſource in the Atlas mountains, and fall into the Atlantic ocean.

As to their commerce and manufactures, an inland traffick is carried on by the inhabitants of this empire with Arabia and Negroland. To the former they ſend woollen manufactures, Morocco-leather, indigo, cochineal, and oſtrich feathers; in return for which, they receive ſilks, muſlins, and drugs. To Negroland they ſend ſalt, ſilk, and woollen manufactures, which they change for gold, ivory, and negroes, who are chiefly imported to recruit the emperor's black cavalry. This trade is conducted by caravans. The greateſt part of their foreign commerce is carried on in Engliſh and French bottoms, for they have few veſſels of their own, except corſairs. Their exports conſiſt in copper, Morocco-leather, hides, exceeding fine wool, oſtrich feathers, barilla, ſoap, wax, honey, horſes, gums, raiſins, olives, almonds, dates, and other fruits.

The commercial affairs of this empire, and, indeed, of all Barbary, are managed by Jews and Chriſtians, ſettled in thoſe countries. The chief manufactures are leather, fine mats, embroidered handkerchiefs, ſword knots, and carpets. The Jews and Chriſtians have, likewiſe, eſtabliſhed thoſe of ſilk and linen.

The natives of this empire, known by the appellation of Moors, are of a ſwarthy complexion; but from the prodigious number of negroes imported thither from Guinea, there are almoſt as many blacks as whites. The Mooriſh women are, in general very handſome, and not being expoſed to the ſun, like the men, remarkably fair. The Moors are ſaid to be a covetous, inhoſpitable people, who commit every ſpecies of villany and fraud to acquire riches; yet ſuch is the tyranny of their government, that a man, when he has obtained the wealth he ſo ardently ſought, is obliged to conceal it, leſt it ſhould become a prey to the rapacious emperor. But the people who inhabit the hills, and are therefore little acquainted with the vices of the court, or trade,

appear to be by far the moſt honeſt and free people in this country; for the government, leſt they ſhould endeavour to diſown its authority, treat them rather as allies than ſubjects.

The Moors marry very young, many of their females not being more than twelve years of age at their nuptials; ſo that they are ſometimes grand-mothers when they arrive at twenty-two, and are reckoned old at thirty. As Mahometans, it is well known that their religion admits of polygamy to the extent of four wives, and as many concubines as they pleaſe; but, if we except the very opulent, the people ſeldom avail themſelves of this indulgence, ſince it entails on them a vaſt additional expence in houſekeeping, and in providing for a large family. Whatever inſtitution is contrary to truth and ſound morality, will in practice refute itſelf: nor is any further argument than this ſingle obſervation wanting, to anſwer all the abſurdities which have been advanced in favour of a plurality of wives.

In contracting marriage, the parents of both parties are the only agents; and the intended bride and bridegroom never ſee each other till the ceremony is performed. The marriage-ſettlements are made before the cadi, and then the friends of the bride produce her portion, or, if not, the huſband agrees to ſettle a certain ſum upon her, in caſe he ſhould die, or divorce her on account of barrenneſs, or any other cauſe. The children of the wives have all an equal claim to the effects of the father and mother, but thoſe of the concubines can each only claim half a ſhare.

When the marriage is finally agreed upon, the bride is kept at home eight days to receive her female friends, who pay congratulatory viſits every day. At the ſame time, a talb attends upon her, to converſe with her relative to the ſolemn engagement on which ſhe is about to enter: on theſe occaſions, he generally accompanies his admonitions with ſinging a pious hymn, which is adapted to the ſolemnity. The bride alſo, with her near relations, go through the ceremony of being painted afreſh.

During this proceſs, the bridegroom, on the other hand, receives viſits from his male friends in the morning, and in the evening rides through the town accompanied by them, ſome playing on hautboys and drums, while others are employed in firing vollies of muſketry. In all theſe feſtivities, the diſcharge of muſketry forms a principal part of the entertainment. Contrary to the European mode, which particularly aims at firing with exactneſs, the Moors diſcharge their pieces as irregularly as poſſible, ſo as to have a continual ſucceſſion of reports for a few minutes.

On the day of marriage, the bride in the evening is put into a ſquare or octagonal cage, about twelve feet in circumference, which is covered with fine white linen, and ſometimes with gauzes and ſilks of various colours. In this vehicle, which is placed on a mule, ſhe is paraded round the ſtreets, accompanied by her relations and friends, ſome carrying lighted torches, others playing on hautboys, and a third party again firing vollies of muſketry.

In this manner ſhe is carried to the houſe of her intended huſband, who returns about the ſame time from performing ſimilar ceremonies. On her arrival, ſhe is placed in an apartment by herſelf, and her huſband is introduced to her alone, for the firſt time, who finds her ſitting on a ſilk or velvet cuſhion, ſuppoſing her to be a perſon of conſequence, with a ſmall table before her, upon which are two wax candles lighted. Her ſhift, or more properly ſhirt, hangs down like a train behind her, and over it is a ſilk or velvet robe with cloſe ſleeves, which at the breaſt and waiſt is embroidered with gold: this dreſs reaches ſomething lower than the calf of the leg. Round her head is tied a black ſilk ſcarf, which hangs behind as low as the ground. Thus attired, the bride ſits with her hands over her eyes, when her huſband appears, and receives her as his wife, without any further ceremony; for the agreement made up by the friends before the cadi, is the only ſpecific contract which is thought neceſſary.

For ſome time after marriage, the family and friends are engaged in much feaſting, and a variety of amuſements, which laſt a longer or ſhorter time, according to the circumſtances of the parties. It is often cuſtomary for the man to remain at home eight days, and the woman eight months after they are firſt married. If the huſband ſhould have any reaſon to ſuſpect that his wife has not been ſtrictly virtuous, he is at liberty to divorce her and take another; and the woman is at liberty to divorce herſelf from her huſband, if ſhe can prove that he does not provide her with a proper ſubſiſtence. If he curſes her, the law obliges him to pay her, for the firſt offence eight ducats; for the ſecond, a rich dreſs of ſtill greater value; and the third time ſhe may leave him entirely. He is then at liberty to marry again in two months. A woman convicted of adultery, is puniſhed with immediate death.

When any perſon dies, a certain number of women are hired for the purpoſe of lamentation, in the performance of which, nothing can be more grating to the ear, or more unpleaſant, than their frightful moans, or rather howlings: at the ſame time, theſe mercenary mourners beat their heads and breaſts, and tear their cheeks with their nails. The bodies are uſually buried a few hours after death. Previous to interment, the corpſe is waſhed very clean, and ſewed up in a ſhroud, with the right hand under the head, which is pointed towards Mecca: it is carried on a bier, ſupported upon men's ſhoulders, to the burying-place, which is always, with great propriety, on the outſide of the town, for they never bury their dead in the moſques, or within the bounds of an inhabited place. The bier is accompanied by numbers of people, two abreſt, who walk very faſt, calling upon God and Mahomet, and ſinging hymns adapted to the occaſion. The grave is made very wide at the bottom, and narrow at the top, and the body is depoſited without any other ceremony than ſinging and praying, in the ſame manner as on their way to the grave.

They have no tombs in this country, but long and plain ſtones; and it is frequently cuſtomary for the female friends of the departed to weep over their graves for ſeveral days after their funeral.

When a woman loſes her huſband, ſhe mourns four months and eight days, during which period ſhe is to wear no ſilver or gold; and if ſhe happens to be pregnant, ſhe is to mourn till ſhe is brought to bed. For the above time, the relations of her late huſband are obliged to ſupport her. We do not learn that any mourning is due from the huſband for the loſs of his wife; but it is cuſtomary, particularly among the great people, for a ſon to mourn for his father, by not ſhaving his head, or any part of his beard, and by not cutting his nails for a certain ſpace of time.

It is obſervable, that how depraved ſoever the Moors may be in every other reſpect, they pay the greateſt duty and reſpect to their parents, princes, and ſuperiors. Their method of expreſſing reverence both to the Divine Being, and to man, is by pulling off their ſlippers, which they always leave at the door of the houſe or moſque they enter; and when they attend their prince in the ſtreets, they always follow him bare-footed.

The dreſs of the Moors conſiſts of a linen ſhirt or drawers, over which they tie a ſilk or cloth veſtment with a ſaſh, and wear upon that a looſe coat. Their arms and legs are always bare, but they have ſlippers on their feet, and perſons of rank ſometimes wear buſkins. They ſhave their heads, on which they wear a turban, made either of ſilk or fine linen; and

and this they never pull off, either to their ſuperiors or in their temples. The habit of the women is nearly ſimilar to that of the men, only inſtead of a turban, they wear a round cap of fine linen: their drawers are much longer and larger; and when they appear in the ſtreets, their faces are covered with a linen cloth, in the manner of a veil. The dead are always carried to the grave in their uſual dreſs.

The religion of the natives is the Mahometan, ſome according to the tenets of Ali, while others adhere to thoſe of Hamed, a modern ſectariſt, and an enemy to the ancient doctrine of the caliphs; but foreigners are allowed the free and open profeſſion of their different religions; and even the ſlaves are indulged with their prieſts and chapels. Indeed religion, among the Moors, ſerves only as a cloak for villany, under which they commit the moſt atrocious crimes with impunity.

The language of theſe ſtates varies according to the different parts of them: in ſome of the inland countries the ancient African is ſpoken, and in the ſea-port towns a corrupt Arabic; beſides which, the ſeamen are well acquainted with the dialect known in all the parts of the Mediterranean, by the appellation of *Lingua Franca*, which is a medley of living and dead languages, Italian, French, Spaniſh, &c.

With reſpect to the population of the empire of Morocco, its inhabitants were far more numerous than at preſent, if, as travellers ſay, its capital contained 100,000 houſes, whereas it is thought not to contain now above 25,000 people; nor can we think that the other parts of the country are more populous, if it be true that their king or emperor has in his armies 80,000 foreign negroes, horſe and foot.

The capital of Morocco, which gives name to the whole empire, is ſituated in 30 deg. 40 min. north lat. and 7 deg. weſt long. on an extenſive and delightful plain, between two rivers, the Nephtis and the Agmed, and is watered by a third, the Tonſiſt. It was formerly a very large and ſplendid city, but now above one third of it lies in ruins. Moſt of its magnificent ſtructures are demoliſhed, three baths only remaining. The royal palace is encloſed with a high wall ſurrounded with a large ditch, and flanked with towers. The common houſes are chiefly of mud, plaſtered over, and flat at the top. The Jews reſide in a ſeparate quarter of the town, walled in for that purpoſe. This city was formerly the reſidence of the court, which is now removed to Mequinez, in the kingdom of Fez, thirty miles diſtant from the capital.

Fez, originally the capital of that kingdom, is ſituated in 38 deg. north lat. and 4 deg. weſt long. and near 260 leagues north-eaſt of Morocco. This city is eſteemed the general magazine of Barbary, whither all European goods are brought and exchanged, and ſent into the other provinces to be bartered for thoſe of the country. It is computed to contain near 300,000 inhabitants, of which 5000 are Jews, who always act as brokers between the Chriſtians and Mahometans. The moſques, baths, caravanſeras, ſeraglios, colleges, warehouſes, and other buildings, are very numerous. Its moſques amount to 500; one of them magnificent beyond deſcription, and about a mile and a half in circumference. The Emperor has a palace in the city, but ſeldom viſits it. It is ſaid that the inns, excepting thoſe to which the Chriſtians reſort, are infamous brothels, where the moſt wicked and unnatural crimes are ſuffered to be perpetrated.

Mequinez, ſuppoſed to be the ancient Gilda, and now the chief reſidence of the Emperor of Morocco, is in 34 deg. north lat. and 6 deg. weſt long. ſituated on a capacious plain on the river Sebu. The royal palace, though much decayed, is ſtill exceedingly ſuperb: it ſtands on an eminence, is about three miles in compaſs, and ſurrounded with ſtrong walls. The environs of the city conſiſt of fine parks, and olive-grounds.

Algiers ſtands in 36 deg. 30 min. north lat. and 34 deg. 15 min. eaſt long. and is ſituated upon the Mediterranean Sea, which waſhes it upon the north and north-eaſt ſides. This city is not above a mile and a half in circuit, though it is computed to contain near 120,000 inhabitants, 15,000 houſes, and 107 moſques. Their public baths are large, and handſomely paved with marble. The proſpect of it from the ſea is very beautiful, being built on the declivity of a mountain; but though the city has for ſeveral years braved ſome of the greateſt powers in Chriſtendom, yet ſome affirm it could make but a faint defence againſt a regular ſiege, and that three Engliſh fifty-gun ſhips might batter it about the ears of the inhabitants from the harbour. If ſo, the Spaniards muſt have been very deficient either in courage or ſkill. They attacked it in the year 1775 by land and by ſea, but were repulſed with great loſs, though they had near 20,000 foot, and 2000 horſe, and forty-ſeven king's ſhips of different rates, and 346 tranſports. In the year 1783, and the following, they alſo renewed their attacks by ſea, in order to deſtroy the city and gallies; but after ſpending a quantity of ammunition, bombs, &c. were forced to retire, without either its capture or demolition. The mole of the harbour is 500 paces in length, extending from the continent to a ſmall iſland, where there is a caſtle and large battery. The ditch is twenty feet wide, and ſeven deep; but at preſent it is almoſt choked up with mud.

Tunis, the capital of the kingdom of the ſame name, is in 36 deg. 43 min. north lat. and 10 deg. 25 min. eaſt long. at about the diſtance of 300 miles from Algiers. The ſituation of this city is exceedingly unhealthful, from the marſhes and lakes that ſurround it, and the deficiency of freſh water. It has fortifications, and is about three miles in circumference. The houſes are not magnificent, but neat and commodious, as is the public exchange for merchants and their goods; but, like Algiers, it is diſtreſſed for want of freſh water. This capital contains 10,000 families, and above 3000 tradeſmen's ſhops, and its ſuburbs conſiſt of 1000 houſes. The Tuniſians are exceptions to the other ſtates of Barbary, for even the moſt civilized of the European governments might improve from their manners. Their diſtinctions are well kept up, and proper reſpect is paid to the military, mercantile, and learned profeſſions. They cultivate friendſhip with the European ſtates; arts and manufactures have been lately introduced among them; and the inhabitants are ſaid at preſent to be well acquainted with the various labours of the loom. A wonderful regularity reigns through the ſtreets and city.

The genteeler part of the men are in general ſober, orderly, and clean in their perſons, and their behaviour polite and complaiſant. The Tuniſian women are exceſſively handſome in their perſons; and though the men are ſun-burnt, the complexion of the ladies is very delicate; nor are they leſs neat and elegant in their dreſs; but they improve the beauty of their eyes by art, particularly the powder, of lead-ore, the ſame pigment, in the opinion of Dr. Shaw, that Jezebel made uſe of, when ſhe is ſaid to have painted her face, 2 Kings ix. 30. the words of the original being, that ſhe ſet off her eyes with the power of lead-ore.

Tripoli was once the richeſt, moſt populous, and opulent, of all the ſtates on the coaſt of Barbary, but it is now greatly reduced. It is bounded on the north by the Mediterranean, on the ſouth by Zaara, or the Deſert, on the eaſt by Barca, and on the weſt by Tunis and Biledulgerid. It extends along the coaſt about 700 miles, that is, from 10 deg. 13 min. to 25 deg. 27 min. eaſt long. The air is clear, but leſs healthy than that of Tunis. The ſoil is the richeſt in

Barbary; and the vallies, where cultivated, produce large quantities of corn, grapes, olives, dates, and the various fruits natural to warm climates. The animals are the ſame as thoſe of Algiers.

The capital city of Tripoli is but ſmall, yet populous, and the natives, though barbarous, are flouriſhing. Its ſituation is on a ſandy ſoil, near the margin of the ſea; ſtrong walls, defended by formidable ramparts, and flanked by pyramidical towers, ſurrounded it. Here are but two gates, the north gate towards the ſea, and the ſouth gate towards the country; and the whole city forms the figure of a creſcent, the concave part of which encloſes the haven. At the extreme points of the harbour, which is very commodious, are ſome military works; thoſe to the eaſt are in bad condition, but on the weſtward there is a ſtrong caſtle well fortified. The houſes in general are very mean and low built, and the ſtreets narrow and crooked; yet ſome remaining monuments of magnificence ſeem to confirm the prevailing opinion of the inhabitants, that it was once remarkable for the ſplendor of many of its public buildings. This city is diſtreſſed by the ſcarcity of corn, and the want of ſweet water.

The city of Oran, lying upon this coaſt, is about a mile in circumference, and is fortified both by art and nature. It was a place of conſiderable trade, and the object of many bloody diſputes between the Spaniards and Moors.

Conſtantina was the ancient Cirta, and one of the ſtrongeſt cities of Numidia, being inacceſſible on all ſides except the ſouth-weſt.

Sallee, ſituate in 33 deg. 48 min. north lat. and 6 deg. 25 min. weſt long. is an ancient city mentioned by Ptolemy, and ſtands on the river Gueron, which divdes it into two parts. It is defended by two caſtles, which communicate with each other, but the fortifications are irregular and ill-deſigned. All articles of commerce here pay a tenth part to the emperor.

Tangier, ſituated about two miles within the Streights of Gibraltar, was given by the crown of Portugal as part of the dowry of Queen Catharine, conſort of Charles II. of England. It was intended to be to the Engliſh what Gibraltar is now; and muſt have been a valuable acquiſition, had not the miſunderſtandings between the king and his parliament occaſioned him to blow up its fortifications, and demoliſh its harbour; ſo that from being one of the fineſt cities in Africa, it is now little better than a fiſhing town.

Ceuta, upon the ſame ſtreight, almoſt oppoſite to Gibraltar, is ſtill in the hands of the Spaniards, but often, if not always beſieged or blocked up by the Moors.

Barca, the ancient Cyrene, and once famous for the temple of Ammon, is now truly a deſert, ſcarce a town or cultivated ſpot of ground being to be found in the whole country. It is bounded on the north by the Mediterranean; on the ſouth by Biledulgerid; on the eaſt by Egypt; and on the weſt by Tripoli. It is about 200 miles in length, from north to ſouth, and 160 in breadth, from eaſt to weſt.

Tetuan, which lies within 20 miles of Ceuta, is now but an ordinary town, containing about 800 houſes; but the inhabitants are ſaid to be rich, and tolerably civilized.

Suz, Tafilet, and Geſula, form no part of the ſtates of Barbary, though the King of Morocco pretends to be their ſovereign; nor is any thing particularly curious contained in them.

Zaara is divided by the Arabs into three parts, by the names of Cahel, Zahara, and Aſgar. It is a deſert country, thinly peopled, and nearly deſtitute of both water and proviſions. The ſoil is in general very dry and ſandy, and the climate being exceeding hot, it is deficient of thoſe eſſentials produced in more fertile countries.

The ſubjects of the Barbary ſtates, in general, ſubſiſting by piracy, are allowed to be bold, intrepid mariners, and will fight deſperately when they meet with a prize at ſea. They are, notwithſtanding, greatly inferior to the Engliſh and other European ſtates, both in the conſtruction and management of their veſſels. They are, if we except the Tuniſians, void of all arts and literature.

The miſery and poverty of the inhabitants of Morocco, who are not immediately in the emperor's ſervice, is beyond all deſcription. The chief furniture of their houſes conſiſts of carpets and mattreſſes, on which they ſit and lie. In eating, their ſlovenlineſs is ſhocking; but thoſe who inhabit the inland parts of the country, are an hoſpitable, inoffenſive people; and indeed it is a general obſervation, that the more diſtant the inhabitants of thoſe ſtates are from the ſeats of their government, their manners are the more pure. Notwithſtanding their poverty, they have a livelineſs about them, eſpecially thoſe who are of the Arabic deſcent, that gives them an air of contentment; and having nothing to loſe, they are peaceable among themſelves.

The Moors are ſuppoſed to be the original inhabitants, but are now blended with the Arabs, and both are cruelly oppreſſed by a handful of inſolent, domineering Turks, the refuſe of the ſtreets of Conſtantinople. They are prohibited gold and ſilver veſſels; and their meat, which they ſwallow by handfuls, is boiled or roaſted to rags. Adultery in the women, as before obſerved, is puniſhed with death; but though the men are indulged with a plurality of wives and concubines, they commit the moſt unnatural crimes without fear of puniſhment.

With reſpect to the antiquities and curioſities to be met with in Barbary, the reader can ſcarcely doubt that the countries which contained Carthage and the pride of the Phœnician, Greek, and Roman works, are replete with the moſt curious remains of antiquity; but they lie ſcattered among the barbarous and ignorant inhabitants. Some remains of the Numidian and Mauritanian ſplendor are ſtill to be met with. Theſe point out the ſituation of the celebrated cities of Carthage, the Julia Cæſarea of the Romans, nearly equal in ſplendor to Carthage itſelf; Hippo, Utica, and ſeveral others. The principal ruins of Carthage conſiſt of ſpacious ciſterns or reſervoirs for holding water, together with conſiderable remains of the aqueduct by which the water was brought above thirty miles from the mountains to the city. About fifty miles to the ſouth of Tunis, is ſtill remaining a very conſiderable part of a Roman amphitheatre; it is of an oval form, three ſtories high, and would hold 30,000 ſpectators: but the city to which this noble ruin belonged is unknown. Nor are the ruins of claſſical antiquity the only ones found in this country. The caliphs of Bagdad have left many amazing monuments of their magnificence. Little can be ſaid reſpecting the natural curioſities of this country; the principal are the rich lead mines in the mountains of Beni-Boo-Taleb; the prodigious ſalt pits which take up an æra of ſix miles; a little to the ſouthward of Arzew, the Tiblet Mineſs, an entire mountain of ſalt, and the Hammam, or bath of Merega. Dr. Shaw mentions ſeveral ſprings in this country, whoſe waters are ſo hot as to boil a large piece of mutton in a ſhort time.

HISTORY OF THE STATES OF BARBARY.

FEW countries in the world have experienced greater viciſſitudes of fortune than that at preſent known by the name of the States of Barbary. It is ſuppoſed to have been originally peopled from Egypt; but at what time, or who led the firſt colony thither, are particulars that cannot now be known. Careful only

only of procuring paſture and water for their numerous flocks and herds, the firſt inhabitants wandered from one place to another without forming any ſettlement, or erecting houſes for their abode. About the year before Chriſt 891, Dido, ſiſter to Pygmalion, king of Tyre, fled from her brother, at the head of a conſiderable colony, and built the famous city of Carthage, the capital of a republic celebrated for its riches and commerce. This republic continued in a ſtate of opulence and power, at once the envy and terror of the neighbouring nations, about 700 years; when the fortune of the Romans prevailed, and the pride of Carthage was humbled in the duſt. But though the power of Carthage was no more, the country flouriſhed under the Roman government, and became one of the richeſt jewels in the imperial crown. Bleſſed with a fertile ſoil, and a warm luxurious climate, the number of inhabitants rapidly increaſed, and ſeveral very magnificent cities, afterwards famous in hiſtory, were erected. The Chriſtian religion was planted here in the time of the apoſtles themſelves, and flouriſhed till the fifth century, when the Vandals trampled on the Roman eagles, and put a period to the greatneſs of the African colonies.

Theſe fierce invaders of Africa did not however long poſſeſs the country they had conquered: the Greek emperors drove out the northern barbarians, and reſtored, in ſome meaſure, the arts and manufactures, againſt which, as well as religion, the ferocious Vandals had declared perpetual war. But this did not reſtore peace and tranquillity to theſe parts of Africa: they were alternately ravaged by the Moors and Vandals; and at laſt totally conquered by the caliphs of Bagdad, in the ſeventh century.

The religion of Mahomet was now eſtabliſhed in Africa; the few remains of ancient greatneſs were deſtroyed by the bigotted followers of that impoſtor; and the country was divided among the chiefs of the caliph's army. Reſtleſs from nature, and inſtigated to conqueſt by the tenets of their religion, the Moors paſſed over into Europe, and reduced the greater part of Spain. But victory now began to forſake their ſtandards. They were ſeveral times defeated by the European armies, and at laſt, about the year 1492, totally driven out of Spain by Ferdinand and Iſabella. The only aſylum open to the Mahometan fugitives was Africa, where they ſettled among their friends and countrymen on the Barbary coaſt. This expulſion of the Moors occaſioned a perpetual war between them and the Spaniards; and finding themſelves incapable of defence againſt the Chriſtians, they had recourſe to the Turks for aſſiſtance. Accordingly the two famous brothers, Barbaroſſa, admirals of the Turkiſh fleet, were ſent to Barbary. Succeſs attended the Turkiſh forces; the Spaniards, who had made themſelves maſters of great part of the country, were obliged to retire, and the Moors hoped to enjoy the happineſs of freedom and peace. For ſome time they flattered themſelves with a long ſeries of proſperity, but their hopes were ſoon rendered abortive: they found that they had only exchanged one maſter for another, and that the yoke of their deliverer was full as heavy as that of the Spaniards. The emperor Charles V. made a noble attempt to reduce Algiers and Tunis. He ſucceeded with regard to the former; but, before he could conquer the latter, a dreadful ſtorm deſtroyed the greater part of his fleet, then attending his army encamped in the neighbourhood of Algiers, and he was obliged to embark precipitately, juſt as that city was reduced to the laſt extremity. Since that time they have continued to carry on the trade of piracy againſt the Chriſtians, and have lately ſhaken off the Turkiſh yoke.

The emperors of Morocco are the ſucceſſors of the ſovereigns of that country, called Xeriffs, whoſe power reſembled that of the caliphs of the Saracens. Their hiſtory is hardly any thing elſe than a ſeries of murders, and the moſt deteſtable crimes. Muley Moloc alone, in the long dynaſty of the emperors, was a great prince. He gained a complete victory over the Portugueſe, whoſe king, Don Sebaſtian, was killed in the action. They have always carried on a piratical war againſt Spain and Portugal, and often againſt the other European powers, who frequently condeſcend to purchaſe a peace with thoſe imperious infidels, though their marine is truly deſpicable; nor does the crown of Great-Britain ſometimes diſdain to procure their friendſhip by preſents, as in the year 1769.

CHAP. III.

OF THE SLAVE COAST.

NEGROLAND is ſituated between 10 and 11 degrees of north lat. and between 18 deg. weſt, and 28 deg. eaſt long. being about 2576 miles in length from eaſt to weſt, and 68 in breadth from north to ſouth. It is bounded on the north by Zaara, on the ſouth by Guinea, on the eaſt by unknown countries, and on the weſt by the Atlantic ocean.

The Niger or Senegal, and the Gambia, are the moſt remarkable rivers, on which are ſeveral European ſettlements. The Engliſh trade to James Fort, and other ſettlements near and up the river Gambia, where they exchange their woollen and linen manufactures, their hardware and ſpirituous liquors, for perſons of the natives; a negro's wealth conſiſting in the number of his family, whom he ſells like ſo many cattle, and often at an inferior price. By the treaty of peace in 1783, the river of Senegal, with its dependencies, were given up to France.

Next to the ſlave trade, gold and ſilver form the principal branches of African commerce. The Dutch, Engliſh, and French, have their ſettlements for this purpoſe on the ſame coaſt.

Guinea is diſtinguiſhed into Upper and Lower. Conſidered as one country, it lies between 9 deg. 18 min. north, and 16 deg. 45 min. ſouth lat. extending in length above 2500 miles along the ſea-coaſt; but its breadth is not determined.

Beſides gold, ivory, and ſlaves, this country affords indigo, bees-wax, gum-ſenega, gum-tragacanth, and other gums and drugs.

Upper Guinea is divided generally into three parts, Malagueta, Guinea Proper, and Benin-Guinea Proper, contains the Tooth and Gold Coaſt; the former exends from Cape Palmas to the river Sueira da Caſta, and the latter from thence to the river Volta.

Lower Guinea, or Congo, extends about 990 miles along the coaſt, from Cape Lopo to Cape Negro. This large country is divided into Loango, Congo Proper, Angola, and Benguela, and watered with many rivers, and would be very fruitful, if better cultivated. The mountains abound with gold, ſilver, and copper.

Poultry, oxen, cows, ſheep, goats, elephants, tygers, leopards, civet-cats, &c. are very numerous here; and ſeveral ſorts of corn and fruits very plentiful.

The inhabitants of this extenſive territory agree with each other in many material circumſtances: they are all of a black complexion, are idolaters in the worſt ſenſe of the word, and the governments every where monarchical. Deſpotiſm reigns, unlimited by laws, by cuſtoms, or by conſcience. Learning is unknown, and the arts of peace were never practiſed among them. Some attempts have indeed been made by the Portugueſe, and other European nations, to withdraw the veil of ignorance, and diffuſe the rays of learning and religion over

thoſe poor deluded people; but all their endeavours have been hitherto abortive: ignorance ſtill maintains her ſeat, and idolatry of the groſſeſt kind is the eſtabliſhed religion of this unhappy country.

Reſpecting the climate and produce of this part of Africa, it may be obſerved, that the fertility of a country ſo prodigiouſly extenſive, might be ſuppoſed more various than we find it is; in fact, there is no medium here with regard to the advantages of ſoil; it is either perfectly barren, or extremely fertile; this ariſes from the intenſe heat of the ſun, which, where it meets with ſufficient moiſture, produces the utmoſt luxuriancy; and in thoſe countries where there are few rivers, reduces the ſurface of the earth to a barren ſand. Of this ſort, are the countries of Anian and Zaara, which, for want of water, and conſequently of all other neceſſaries, are reduced to perfect deſerts, as the name of the latter denotes. In thoſe countries, on the other hand, where there is plenty of water, and particularly where the rivers overflow the land part of the year, as in Abyſſinia, the productions of nature, both of the animal and vegetable kinds, are found in the higheſt perfection and greateſt abundance.

The annual Britiſh exports to Africa are eſtimated at 500,000l. ſterling, including a conſiderable quantity that is annually exchanged with America and other foreign traders on the coaſt; about 50,000l. of this is returned in ivory, gold-duſt, gum, &c. The greateſt part of the profits of the ſlave-trade is raiſed on the ſugar plantations. Were Africa civilized, and could we obtain the affections of the natives, and introduce gradually our religion, manners, and language among them, we ſhould open a market that would fully employ our manufacturers and ſeamen, in all probability, to the end of time; and, while we enriched ourſelves, we ſhould contribute to their happineſs.

The eaſt and weſt coaſt of Africa, from the tropic of Capricorn to the equator, are in the poſſeſſion of the Portugueſe. This immenſe tract they became maſters of by their ſucceſſive attempts, and happy diſcovery of the navigation of the Cape of Good-Hope. From the coaſt of Zanguebar, on the eaſtern ſide, they trade not only for gold, ivory, and gums, but likewiſe for ſeveral other articles, as ſenna, aloes, civet, ambergris, and frankincenſe. There ſtill remains a part of the weſtern coaſt of Africa to be conſidered, where the Dutch have ſettlements. This part is inhabited by a very different people, and governed in a very different manner. Strangers at once to the arts of civil life, and to the cuſtoms of the negroes, they continue under a kind of patriarchal government, and a few itinerant families form a nation.

SIERRA LEONE.

Climate. Productions in general. Perſons, Manners, and Cuſtoms of the Natives.

THE climate of this country is in general very unwholeſome, particularly in the mountainous parts, were, during four months in the year, it rains, thunders, and is ſo intolerably hot, that the people are obliged to keep cloſe in their huts; and the air is corrupted in ſuch a manner by the lightning, that all animal food is reduced in a few hours to a ſtate of putrefaction. The flat open country, however, is not ſo bad; for though in ſummer the heat is exceſſive in the former part of the day, yet it is very temperate in the afternoon, from the refreſhing breezes that generally blow from the ſouth-weſt.

The banks of Sierra Leone are lined with mangrove trees, the leaves of which exactly reſemble thoſe of an European laurel. The whole country abounds in millet and rice, which is the principal food of the natives. It alſo produces great plenty of oranges, lemons, bananas, Indian figs, ananas, pompions, water melons, yams, potatoes, wild pears, white plums, and ſeveral ſorts of pulſe.

Here are the palm, the cocoa, and the cotton tree; and on the mountains are abundance of palm and laurel trees. Indeed the whole abounds with trees of various ſorts, ſo cloſe together, that it may be called one continued foreſt.

They have a great plenty of deer, hogs, goats, and fowls, which the natives ſell to the Europeans for a ſmall quantity of brandy, a liquor they prefer to all others.

In the mountains are great numbers of wild animals, as elephants, lions, tygers, wild boars, and roe-bucks; alſo apes of ſeveral ſorts, and ſerpents, the latter of which are ſo large, that, it is ſaid, they will ſwallow a child whole. The apes, monkies, and baboons, are ſo numerous, that they make great deſtruction in the plantations.

In the woods are great numbers of birds of different ſizes and plumage, as pigeons, parrots, paroquets, and Guinea-hens, the latter of which are about the ſize of a pheaſant, and are very beautiful; but it is difficult to catch them on account of the thickneſs of the trees. They have alſo ſeveral other ſorts of fowl, among which are white pelicans as large as ſwans, herns, curlews, boobies, and a bird called ox-eyes.

The bay and entrance of the river abound with a great variety of fiſh, as raies, thornbacks, and a fiſh called the old-wife. There are alſo gar-fiſhes, cavalloes, ſharks, ſword-fiſhes, dog-fiſhes, and one called the ſhoe-maker, having on each ſide the mouth pendants like barbel, and the noiſe they make is ſomething like that of a hog's grunting. Among the fiſh, however, caught here, the moſt common are old-wives, pilchards, the becune, the monk or angel-fiſh, and the mullet.

The great plenty of fiſh found in the bay and river of Sierra Leone, are of infinite ſervice to the European ſailors, not only for proviſions, but alſo for traffick; for the natives are ſo indolent, that they will not be at the trouble to catch them, but content themſelves with ſuch as are left by the ebb tides among the rocks.

On the ſides of the bay are great plenty of oyſters, ſome of which are of ſuch a ſize, that one of them would ſerve a moderate man for a meal; but they are ſo tough as to be ſcarce eatable, unleſs firſt boiled, and then fried in ſmall pieces.

The trees that grow on the ſides of the bay make excellent haunts for crocodiles; as alſo for the manatea, or ſea-cow, which are here in great abundance.

The manatea, or ſea-cow, is ſuppoſed by ſome to be an amphibious creature, but this opinion has been ſufficiently confuted; for it is always found in large rivers or bays, and feeds upon ſea-weeds that grow near the ſhore. The ſkin is thick, rough, bare, and ſcarcely penetrable. The body is long, and the head very ſmall in proportion to it. Theſe animals have no teeth, but inſtead thereof two ſtrong white bones, that run the whole length of both jaws. The noſtrils reſemble thoſe of an horſe. The eyes are fixed in the centre of the head. The breaſts are placed between the arms, one under each, are of a convex form, and about a foot and a half in diameter. They are hard, rough, and wrinkled; and when they give ſuck, the teats are four inches long.

Theſe animals keep together in large companies, and are very careful of their young. They bring them forth in autumn, and have but one at a time. The manatea has no voice or cry, and the only noiſe it makes is in fetching its breath. The fat, which lies between the cuticle and the ſkin, when expoſed to the ſun, has a fine ſmell and taſte: it has alſo this peculiar property, that the heat of the ſun will not ſpoil it, or make it become greaſy. The taſte is like the oil of ſweet almonds, and the only effect it has on the body, is that of keeping it open. The fibres and lean

lean parts are like beef, but more red and harſh, and may be kept a great while in the hotteſt weather without tainting. The fat of the young ones is like pork, and the lean greatly reſembles veal. In the head are four ſtones of different ſizes, which are ſomewhat like bones, and are uſed in medicine. They are ſaid to be good againſt agues, and to cleanſe the kidnies of gravel. Hoffman affirms they are exceeding uſeful in caſes of epilepſy.

When the negroes catch theſe creatures, they go in a canoe, and paddle towards it with as little noiſe as poſſible, it being exceeding quick in hearing. As ſoon as they find themſelves near enough, the man who is placed ready at the head of the canoe, ſtrikes a harpoon fixed at the end of a long pole into it, and then lets go. The beaſt immediately makes towards the mangroves, and the water being ſhallow, they follow it cloſe, and repeat the ſtrokes till they have wearied it out, when they drag it aſhore, and complete their conqueſt.

The inhabitants of Sierra Leone are not ſo black as thoſe of the neighbouring countries; neither have they ſuch flat noſes or thick lips. The men are in general tall and well made, of a cheerful diſpoſition, and not given to quarrel: the women are ſhort and robuſt, owing to their being conſtantly employed in labour; for beſides the buſineſs of houſewifery, they work hard in tillage, make palm-oil, and ſpin cotton.

Their dreſs reſembles that of the country in general. They are naturally temperate and ſober; and though they are exceeding fond of brandy and other ſpirituous liquors, yet they never drink to exceſs, conſidering drunkenneſs as one of the greateſt crimes that can be committed.

Their houſes or huts are low, and thatched with ſtraw: ſome are round, ſome ſquare, and others are oblong; and moſt of them are ornamented in the front with two wings of a ſpiral form. They are kept very clean, being ſwept at leaſt once every day.

Their furniture conſiſts of two or three earthen pots to boil their victuals in, a gourd or two to fetch palm wine, and half a gourd for a cup; a few earthen diſhes, a baſket or two for the wife to gather cockles in, and a knapſack for the huſband, made of the bark of trees, to carry his proviſion when he goes abroad. Their bedſteads are made of billets of wood laid acroſs each other, on which they lay a mat, and ſleep without any covering.

Their weapons are ſwords, daggers, darts, bows and arrows. The points of their arrows are infected with the juice of a poiſonous fruit, which is ſo inconceivably ſubtle and quick, that wherever it ſtrikes, it is ſure to prove fatal. Some of them have alſo guns, which they are very fond of, and uſe with great dexterity.

Their food conſiſts chiefly of roots, herbs, fruits, cockles, and oyſters; and their common drink is water. They plant about their houſes gourds, potatoes, pompions, and tobacco, the latter of which they are very fond of, particularly in ſmoking.

They are very fond of dancing, and generally ſpend their evenings in that diverſion. Their muſic conſiſts of two or three drums, made of a hollow piece of wood, and covered with the ſkin of a kid.

Every town or village has one peculiar houſe, to which the women ſend their daughters at a certain age, who are there taught for a year to ſing, dance, and perform other exerciſes, by an old man appointed for that purpoſe; and when the year is expired, he leads them to the market-place, where they publicly exhibit ſuch performances as they have been taught at ſchool. During this time, if any of the young men are diſpoſed to marry, they make choice of thoſe they like beſt, without regard either to birth or fortune. When the man has declared his intention, the parties are conſidered as actually married, provided the bridegroom can make ſome preſents to the bride's parents, and to the old man who was her tutor.

When they bury their dead, they put into their graves all their beſt goods, and erect a roof over it, which cover with linen cloth. The corpſe is always attended to the grave by a number of people hired as mourners, who howl and cry in proportion as they are paid for their attendance.

ACCOUNT OF THE BRITISH ESTABLISHMENT AT SIERRA LEONE.

It having been repreſented, by way of petition, to the parliament of Great Britain, that the eſtabliſhing of a general trade and commerce from theſe kingdoms to and with the coaſts of Africa, and from thence to and with the ſeveral inferior kingdoms and countries of that continent (not hitherto explored or traded with by Europeans) would be highly beneficial to the manufactories and trading intereſts of theſe kingdoms; an act was accordingly obtained in the year 1791 (to have continuance for thirty-one years) "For eſtabliſhing a company for carrying on trade between the kingdom of Great Britain and the coaſts, harbours, and countries of Africa; and for enabling the ſaid company to hold, by grant from his majeſty, his heirs and ſucceſſors, and from the native princes of Africa, a certain diſtrict of land, commonly called *The Peninſula of Sierra Leone*, now veſted in his majeſty, or belonging to the ſaid princes, for the better enabling the ſaid company to carry on the ſaid trade."

As a foundation for this deſign, a great number of gentlemen, merchants, and other perſons of great reſpectability and opulence, formed themſelves into a ſociety, and ſubſcribed conſiderable ſums of money; and, having obtained the ſanction and protection of parliament, were made a diſtinct and ſeparate body corporate, for the eſtabliſhing and carrying on the ſaid trade, by the name or ſtyle of *The Sierra Leone Company*; with power to raiſe, by ſubſcriptions, a capital joint ſtock, not exceeding the ſum of 500,000l.

This company are not permitted to borrow or obtain any money but by ſubſcription: nor is it lawful for them, either directly, or indirectly, to deal or traffick in the buying or ſelling of ſlaves, or in any manner whatſoever to have, hold, appropriate, or employ any perſon or perſons in a ſtate of ſlavery in the ſervice of the ſaid company, which is ſet on foot with the moſt beneficent and laudable views, reſpecting the true intereſts and happineſs of the native Africans.

And for the better ordering and managing the ſaid company's affairs, thirteen directors (two of whom are to be appointed chairman and deputy-chairman) are to be annually choſen, who are to take an oath of fidelity to the truſts repoſed in them; but that no perſon is to be choſen a director, unleſs he is poſſeſſed of one ſhare at leaſt in the capital joint ſtock of the company. Secretaries, agents, and ſervants, are alſo to take the proper oaths.

The ſaid company have moreover "Full power, liberty, and privilege, to purchaſe of and from all kings, princes, and chiefs, or other powers having right to make ſale thereof, ſo much land as ſhall include the whole tract or diſtrict ſo commonly called or known by the name of *The Peninſula of Sierra Leone* aforeſaid, as the ſame is bounded on the north by the river Sierra Leone, on the ſouth by the River Caramanca, on the eaſt by the river Bunce, and on the weſt by the ſea."

The act alſo provides, that nothing therein contained, ſhall extend to affect the rights of any other Britiſh ſubjects trading to Africa, ſo as to prevent or obſtruct the ſhips or veſſels belonging to Britiſh ſubjects from anchoring in Sierra Leone, or Caramanca rivers, or in any of the creeks, bays, or harbours within the limits ſpecified in the ſaid act, for the purpoſe of refitting and repairing as heretofore, &c.

We are aſſured that this ſettlement was planned, and is intended to be conducted upon the pureſt and moſt valuable principles of philanthropy and benevolence; one main object being, the civilization and moralizing of that claſs of human beings, whoſe minds are, perhaps, of all others, the moſt rude and uncultivated; namely, the African blacks. The abominable traffick of buying and ſelling ſlaves, ſo ſhocking to all the tender feelings of mankind, and even the uſe of ſuch ſlaves is by the act expreſsly prohibited; but, on the other hand, the negro inhabitants of this colony being all free, and eſteemed as brethren, will be taught the excellent doctrines and benign ſocial duties of the Chriſtian religion, and be trained up to become uſeful, and, no doubt, ſome of them ornamental branches of ſociety; they being found in general equally ſuſceptible of education and tuition with the reſt of their more enlightened fellow-creatures.

CAFFRARIA.

This vaſt tract of country is ſituated between Cape Negro, on the weſtern coaſt of Africa, in 15 deg. 30 min. ſouth lat. and the river del Spiritu Santo, or Manica, on the eaſtern coaſt of this continent, in the lat. of 25 deg. ſouth. The Cape of Good-Hope forms the ſouthern extremity of Caffraria.

The air is very hot, and would be ſuffocating, if the heat was not mitigated by the winds which blow continually from the Southern Ocean. Violent ſtorms alſo frequently ariſe, which, though they render the coaſt very dangerous, are abſolutely neceſſary to the health of the inhabitants, who are always afflicted with pains in the head, if there happens to be a calm of any long continuance. The ſoil in the vallies is in general fertile, but there are very few vegetable productions peculiar to this country; but the fruits and plants of the torrid zone, as well as thoſe of Europe, flouriſh exceedingly: and in the Dutch Company's ſettlements at the Cape, all kinds of fruit, cabbages, cauliflowers, potatoes, and other garden ſtuff and roots are found in great plenty; together with pine-apples, oranges, lemons, grapes melons, &c. Every cottage has its vineyard, which yields wine enough for the family. They ſow all manner of grain, oats and lentils excepted; in December it is all ripe, and then they begin their harveſt. In January they tread out the corn in the fields, and by the latter end of February it is all houſed. The inland parts of the country are moſtly filled with woods and foreſts.

The animals found here are lions, tygers, leopards, elephants, rhinoceroſes, elks, zebras, or wild aſſes, monkies, and other common quadrupeds. A particular kind of eagles, called dung birds, are found here: they will attack a horſe or a cow in great flights, and making a hole in the belly of the beaſt with their beaks and talons, perfectly ſcoop out the inſide, leaving only the bones and hide.

Caffraria is in general a mountainous country; but the three principal eminences are in the neighbourhood of the Cape, and called the Table-Hill, Lion-Hill, and Wind-Hill, which is likewiſe called the Sugar-loaf-Mountain, from its form. On the top of Table-Hill, are ſeveral fine ſprings of water, clear as cryſtal, and of an exquiſite taſte. On aſcending this mountain, the eye is delighted with the view of its fertility, and every part of it is adorned with the moſt ſtately trees, while its top and ſides are enamelled with a variety of flowers, the beauty and fragrance of which, perhaps, exceed any produced in Europe. Lion-Hill is ſeparated from Table-Hill by a valley, and on it a hut is erected for the ſhelter of two centinels, who are always poſted there to give notice to the fort at the Cape, when a veſſel is making for the harbour. Wind-Hill is the loweſt of the three, being ſhaped like a ſugar-loaf, and abounds in excellent paſture. There are no navigable rivers in this country; but the brooks and rivulets, which deſcend from the mountains, tend greatly to the fertilization of the land.

The inhabitants, known by the name of Hottentots, are of a middling ſtature, with ſmall limbs, but very ſeldom deformed. They eſteem a flat noſe as one of the eſſential parts of beauty, and therefore as ſoon as a child is born, they break the griſtle of its noſe. Their eyebrows are large, their eyes black, their lips thick, their hair ſhort, black, and curled, like that of Negroes, their teeth remarkably white, and their complexion rather tawney than black; but in order to darken it, they beſmear their bodies all over with greaſe and ſoot, which gives them a very nauſeous ſmell.

Theſe people reſide in different hordes or villages, on the banks of rivers, and near the foreſts, where they form ſo many diſtinct villages and independent republics. Their villages, called kraals, conſiſting of about twenty huts, are all circular; and the huts of which they are compoſed being covered with ſkins, and are ſo very low, that a man muſt ſtoop very much, or crawl on his knees, to get into them. Some of theſe kraals contain upwards of 100, and ſometimes 500 ſouls. Theſe huts ſerve chiefly to contain proviſions, and their implements of huſbandry; the owner himſelf never occupying them, unleſs when it rains: at other times, he paſſes his leiſure hours in ſleeping at the door of his hut, where he lies on his belly, and expoſes his back to the ſun and the weather, waking now and then to amuſe himſelf with ſmoking a certain ſtrong-ſcented herb, which hath much the ſame effect as our tobacco. All their furniture conſiſts of two or three earthen veſſels for dreſſing their victuals, which is generally herbs, fleſh, ſhell-fiſh.

Though the Hottentots are, without exception, the naſtieſt and moſt indolent people in the world; yet ſuch as confine themſelves to the natural diet of their country, live to a great age: but many of them drink prodigious quantities of brandy, and other ſpirituous liquors, unknown among them till introduced by the Dutch, and this intemperance never fails to ſhorten their lives.

The employment of the natives is purely paſtoral; their principal and almoſt only occupation being the care of their herds of ſheep and kine. Of theſe each village or kraal hath one common herd; every inhahitant taking it in his turn to be herdſman. In order to prevent the inroads of beaſts of prey, particularly wolves, and other furious animals that occaſionally make excurſions towards the Cape, and deſtroy the tame cattle: the herdſman goes or ſends every day round his diſtrict, in order to diſcover if any beaſt of prey be lurking in that quarter. In which caſe, he aſſembles the whole village together, and makes his report; when a party of the ſtouteſt among them arm themſelves with javelins and poiſoned arrows, and follow the perſon who may have diſcovered the beaſt, to the cave or covert where he is lodged. Here they arrange themſelves in two lines; the herdſman entering the cave, and endeavouring to provoke the beaſt to follow him, where he is inevitably deſtroyed.

United among themſelves by the bonds of fraternal concord, the inhabitants of the ſame village live in conſtant peace. But on the firſt injury that is offered them by any of the neighbouring tribes, they take a cruel revenge. The ſubject of their mutual complaints is generally the ſtealing of a ſheep or cow, and ſometimes only a ſuſpicion of it; the conſequences, however, when they determine on revenge, are uſually very terrible; for they take all poſſible means, after having made this determination, to perſuade the aggreſſors that the injury is forgotten; but no ſooner do they find their diſſimulation hath taken effect in the ſecurity of the enemy, than they fall ſuddenly upon them with poiſoned weapons, ſparing neither

neither age nor ſex, but rooting up at once the whole community. Such is the method of going to war among theſe people.

In this country, the care of houſehold affairs belongs to the department of the females. The men, indeed, are the butchers, and prepare the meat for dreſſing; but the care of providing the vegetables is aſſigned only to the women. Accordingly, the mother of a family ſets out in a morning, attended by ſuch of her children as are able to follow her, carrying the reſt in her arms or on her back. In this manner ſhe ſearches the woods and river-ſides for roots, pulſe, or fruit; of which having gotten a ſufficient quantity, ſhe returns, lights a fire on a large ſtone before the cabin, and when the victuals are dreſſed, the huſband ſits down to his meal with the reſt of the family.

The women are clothed with ſheep-ſkins, as well as the men; wearing the woolly part of this mantle outwards in ſummer, and inwards during the winter. They wear one ſkin over their ſhoulders, the ends of it croſſing each other before, and leaving their neck bare; another ſkin is faſtened round their middle, and reaches down to their knees. Thoſe of them who are ambitious to pleaſe, adorn themſelves with necklaces of ſhells: for even in this country the ſex have their charms, which they endeavour to heighten by ſuch arts as are peculiar to themſelves, and would meet with little regard elſewhere. To this end, they greaſe their faces, necks, and all the naked parts of their bodies with mutton ſuet, in order to make them ſhine. They alſo braid or plait their hair, to give themſelves an additional elegance. After a Hottentot lady has thus bedizened and tricked herſelf up, and thereby exhauſted all the arts of her toilette, her pride is wonderfully flattered; while the ſplendor of her appearance gives her the higheſt degree of ſatisfaction, how unfavourable ſoever nature may have been to her with regard to ſhape and ſtature.

The Hottentots have neither temples, idols, nor any peculiar place of worſhip; they celebrate indeed ſeveral nocturnal dances, with ſinging, at the new and full of the moon; but theſe are performed near their huts, and ſeem to be rather paſtimes, or merry meetings, than any thing relative to religious worſhip. They are ſo attached to their own country and manners, and ſuch enthuſiaſts for liberty, that all the attempts of the Europeans, particularly of the Dutch at the Cape of Good-Hope, have been hitherto ineffectual for making the leaſt impreſſion on theſe ſavage mortals, or giving them the leaſt inclination, or even an idea of the European manner of life. There is even an inſtance of a Hottentot, who had been taken from Caffraria by the Dutch while an infant, and being inſtructed in the cuſtoms, learning, and religion of the Europeans, became a proficient in literature; but on returning to his native country, he abandoned all the advantages of education, returned his European dreſs to his maſter, put on the ſheep-ſkin mantle, and never more appeared among the Dutch.

The inhabitants of the Cape expoſe their female children in the foreſts, where they leave them either to ſtarve, or be devoured by wild beaſts. They uſe the ſame barbarous method with their old men, when they become uſeleſs and decrepit. This, however, is done contrary to the advice, and without the conſent of the chief men of the kraal. And here it may be proper to mention, that in every kraal the oldeſt man is always the firſt in order and dignity; and his advice is generally followed in affairs relative to the welfare of the whole, as he is ſuppoſed to have had moſt experience.

The principal place for commerce in Caffraria, is the Cape of Good-Hope, which was firſt diſcovered by the Portugueſe in 1493, but they never made any ſettlement. In 1600 the Dutch viſited it, but for many years after only touched at it, in their voyages to and from the Eaſt-Indies, in order to take in freſh proviſions. At laſt, in the year 1650, Van Riebeck, having repreſented to the directors of the Dutch Eaſt-India company the great advantages which would accrue to them if they could eſtabliſh a ſettlement at this place, was ordered to ſail thither with four ſhips equipped with all neceſſary materials. On his arrival, he made the inhabitants a great variety of preſents, conſiſting of braſs toys, beads, tobacco, brandy, &c. by which, together with his engaging behaviour, they were ſo charmed, that a treaty was directly concluded, whereby it was agreed, that the Dutch ſhould have full liberty to ſettle there, in conſideration of ſuch a certain quantity of toys and commodities delivered to the natives, as were worth 50,000 guilders. A fort, dwelling-houſes, ware-houſes, &c. were ſoon after erected. After this, new ſettlers arriving daily, they were obliged to extend themſelves along the coaſt, and at preſent are divided into four principal colonies: The firſt is at the Cape; the ſecond is termed the Hellenbogeſh; the third the Drakenſton, and the fourth, the Waveriſh. But in order to provide againſt a future increaſe of inhabitants, the Dutch Eaſt-India company has purchaſed from the natives all that tract of land called Terra de Natal, for which they paid in toys and other commodities to the amount of 30,000 guilders.

Beſides the Cape and Terra de Natal, the country of Caffraria contains Mataman and Terra de Fumos.

Having thus ſurveyed the weſtern coaſt of Africa, we ſhall proceed to the eaſtern, the firſt diviſion of which, beyond Caffraria, is called

FEZZAN, BORNOU, AND CASHNA.

It having been long a ſubject of complaint that Europeans know very little, if any thing, of the interior diſtricts of Africa, we are happy to find that a number of learned and opulent individuals have formed themſelves into a ſociety for the purpoſe of exploring them. The aſſociation was formed on the 9th of June, in the year 1788; and on the ſame day a committee of its members, viz. Lord Rawdon, the Biſhop of Llandaff, Sir Joſeph Banks, Mr. Beaufoy, and Mr. Stuart, were inveſted with the direction of its funds, the management of the correſpondence, and the choice of the perſons to whom the geographical miſſion was to be aſſigned. Perſuaded of the importance of the object which the aſſociation had in view, their committee loſt no time in executing the plan which it had formed. Two gentlemen were recommended to them; and appearing to be eminently qualified for making the projected reſearches, they were choſen. One was a Mr. Ledyard; the other a Mr. Lucas.

Such a perſon as Mr. Ledyard was formed by nature for the object in contemplation: and were we unacquainted with the ſequel, we ſhould congratulate the ſociety on being ſo fortunate as to find ſuch a man for one of their miſſionaries: but the reader will ſoon be acquainted with the melancholy circumſtance to which we allude.

"From two ſuch geographical miſſionaries (obſerves a very reſpectable literary journaliſt) much information was no doubt expected; and though the views of the ſociety are not yet fully anſwered, the communications which it has received, are of a nature which will excite, though not fully gratify the curioſity of geographers.

"Mr. Ledyard undertook, at his own deſire, the difficult and perilous taſk of traverſing from eaſt to weſt, in the latitude attributed to the Niger, the wideſt part of the continent of Africa. On this bold adventure he left London, June 30, 1788, and arrived at Cairo on the 19th of Auguſt.

"Hence, he tranſmitted ſuch accounts to his employers, as manifeſt him to have been a traveller who obſerved, reflected, and compared; and ſuch was the information which he collected here from the travelling ſlave-merchants, and from others, reſpect-

ing the interior diſtricts of Africa, that he was impatient to explore them. He wrote to the committee, that his next communication would be from Sennaar (600 miles to the ſouth of Cairo :) but death, attributed to various cauſes, arreſted him at the commencement of his reſearches, and diſappointed the hopes which were entertained of his projected journey.

" Endowed with a ſoul for diſcovery, and formed by nature for achievements of hardihood and peril, the death of Mr. Ledyard muſt be conſidered as a public misfortune.

" With a mixture of regret and diſappointment, we turn from poor Ledyard, to notice Mr. Lucas's communications, which occupy the greateſt part of the volume publiſhed by the aſſociation. He embarked for Tripoli, October 18, 1788, with inſtructions to proceed over the Deſert of Zahara to Fezzan, to collect, and to tranſmit by way of Tripoli, whatever intelligence the people of Fezzan, or the traders thither, might be able to afford reſpecting the interior of the continent ; and to return by the way of Gambia, or the coaſt of Guinea.

" Inſtructions to undertake great enterpriſes are more eaſily given than executed. So Mr. Lucas found ; and ſo the reader, to his diſappointment, will find likewiſe. Only a part of the plan was this geographical miſſionary able to carry into execution. He ſets out, indeed, mounted on a handſome mule, preſented to him by the bey, the baſhaw's eldeſt ſon, in company with ſhereefs, for the kingdom of Fezzan; reſolved, we will ſuppoſe, to penetrate from Tripoli even unto Gambia : but his peregrinations, which began Feb. 1, 1798, terminated at Meſurata, on February 7.

" Deprived of viſiting Fezzan, and the other inland diſtricts of Africa, Mr. Lucas ſolicits the information of his fellow travellers, and tranſmits to the ſociety the reſult of his conferences. A memoir compiled in this way, from the reports of a ſhereef Imhammed, will not be deemed very ſatisfactory ; and yet it certainly merits conſideration, as it is, in part, corroborated by other teſtimonies."

Having no other ſources of information, however, we muſt, for the preſent, content ourſelves with theſe communications. From the various conferences of Mr. Lucas with the ſhereef Imhammed, the following narrative is compoſed :

" It deſcribes the kingdom of Fezzan to be a ſmall circular domain, placed in a vaſt wilderneſs, as an iſland in the midſt of the ocean, containing near a hundred towns and villages, of which Mourzook is the capital, diſtant, ſouth from Meſurata, about 390 miles. In this kingdom are to be ſeen ſome venerable remains of ancient magnificence, ſome diſtricts of remarkable fertility, and numerous ſmoaking lakes, producing a ſpecies of foſſil alkali called *trona*. Agriculture and paſturage are the principal occupations of the Fezzanners ; they do not appear to have any coin ; their medium of commerce is gold-duſt ; their houſes, or rather huts, are built of clay, and are covered with branches of trees, on which earth is laid. As rain never falls at Fezzan, this covering is a ſufficient protection. Their dreſs reſembles that of the Moors of Barbary : but, during the heats of ſummer, which are intenſe, they only wear drawers, and a cap to protect their heads from the immediate action of the ſun. To theſe, many particulars are added of their perſons, diſeaſes, and mode of cure ; of their religion, government, taxes, animal and vegetable productions. Their ſovereign, who is a tributary of the baſhaw of Tripoli, adminiſters impartial juſtice.

" The narrative proceeds to ſtate, that ſouth-eaſt of Mourzook, at the diſtance of 150 miles, is a ſandy deſert, 200 miles wide; beyond which are the mountains of Tibeſti, inhabited by ferocious ſavages, tributary to Fezzan. The valleys between the mountains are ſaid to be fertiliſed by innumerable ſprings, to abound with corn, and to be celebrated for their breed of camels. The tribute of the Tibeſtians to the king of Fezzan is twenty camel-loads of ſenna.

" This kingdom is inconſiderable, when compared with the two great empires of Bornou and Caſhna, which lie ſouth of Fezzan, occupying the vaſt region which ſpreads itſelf from the river of the Antelopes for 1200 miles weſtward, and includes a great part of the Niger's courſe. Caſhna, we are informed, contains a thouſand towns and villages ; and in Bornou, which is ſtill more conſiderable, thirty languages are ſaid to be ſpoken. The latter is repreſented as a fertile and beautiful country ; its capital being ſituated within a day's journey of the river Wod-el-Gazel, which is loſt in the ſandy waſtes of the vaſt deſert of Bilma, and is inhabited by herdſmen, dwelling, like the old patriarchs, in tents, and whoſe wealth conſiſts in their cattle. Horſes and horned cattle, goats, ſheep, and camels, are the common animals of the country. (Bornou, or Bernoa, is a word ſignifying the land of Noah ; for the Arabs conceive, that, on the retiring of the deluge, its mountains received the ark.) Though they cultivate various ſorts of grain, the uſe of the plough is unknown ; and the hoe is the only inſtrument of huſbandry. Here grapes, apricots, and pomegranates, together with limes and lemons, and two ſpecies of melons, the water and the muſk, are produced in large abundance ; but one of the moſt valuable of its vegetables is a tree called kedeyna, which, in form and height, reſembles the olive, is like the lemon in its leaf, and bears a nut, of which the kernel and the ſhell are both in great eſtimation, the firſt as a fruit, the laſt on account of the oil which it furniſhes when bruiſed, and which ſupplies the lamps of the people of Bornou with a ſubſtitute for the oil of olives. Bees, it is added, are ſo numerous, that the wax is often thrown away as an article of no value in the market. Many other particulars are added, for which we muſt refer to the work. The population is deſcribed by the expreſſion, a countleſs multitude. We ſhall paſs over the nature of their religion, which is Mohammedan ; of their government, which is an elective monarchy ; and the ſingular mode of their electing a new king from among the children of the deceaſed ſovereign : but the account of the preſent ſultan, his wive , and his children is too curious not to be exhibited.

" The preſent ſultan, whoſe name is Alli, is a man of an unoſtentatious, plain appearance ; for he ſeldom wears any other dreſs than the common blue ſhirt of cotton or ſilk, and the ſilk or muſlin turban, which form the uſual dreſs of the country. Such, however, is the magnificence of his ſeraglio, that the ladies who inhabit it are ſaid to be 500 in number, and he himſelf is deſcribed as the reputed father of 350 children, of whom 300 are males ; a diſproportion which naturally ſuggeſts the idea that the mother, preferring to the gratification of natural affection the joy of ſeeing herſelf the ſuppoſed parent of a future candidate for the empire, ſometimes exchanges her female child for the male offſpring of a ſtranger.

" We are told that fire-arms, though not unknown to the people of Bornou, are not poſſeſſed by them.

" South-eaſt from Bornou, lies the extenſive kingdom of Begarmee ; and, beyond this kingdom, are ſaid to be ſeveral tribes of negroes, idolaters, and feeders on human fleſh. Theſe, we are told, are annually invaded by the Begarmeeſe ; and when they have taken as many priſoners as their purpoſe may require, they drive the captives, like cattle, to Begarmee. It is farther ſaid, that if any of them, exhauſted by fatigue, happen to linger in their pace, one of the horſemen ſeizes on the oldeſt, and cutting off his arm, uſes it as a club to drive on the reſt.

" We are not much diſpoſed to give credit to this relation. That the negroes, who are ſold for ſlaves, are different from the other Africans, is not probable ;

and

and that they ſhould be driven along with the mangled limbs of their aſſociates, utterly exceeds belief.

The empire of Caſhna bears a great reſemblance to that of Bornou.

"After peruſing what is here related of the extent, population, fertility, manufactures, and commerce of theſe regions, we may be permitted to wonder at their having remained altogether unknown to Europeans. We cannot but ſuſpect conſiderable exaggerations. That the interior parts of Africa are peopled, the caravans which go from Cairo and Tripoli, and which are often abſent three years, ſufficiently evince: but that they are divided into regular and civilized ſtates, may be a queſtion. A thouſand towns and villages in one empire, and thirty different languages ſpoken in the other, manifeſt a diſpoſition in the ſhereef Imhammed to enlargement, or, at leaſt, to retail looſe reports. That they ſhould be acquainted with, yet not poſſeſs fire-arms, nor make any attempt to navigate the Niger, nor even to take the fiſh that abound in its waters, but little accords with the hiſtory of their commerce, and of their progreſs in manufactures.

"Let us, however, make all poſſible deductions, and be ever ſo incredulous as to ſome particulars, the proſpect which this narrative opens to us of the interior of Africa (the greater part of which we have been accuſtomed to conſider as conſigned, by nature, to perpetual ſterility and deſolation) muſt afford great pleaſure; and though, as we have already remarked, it is far from being ſatisfactory, or from having anſwered the object of the miſſion, it may be regarded by the ſociety as that ſort of evidence which ſhould encourage them to perſevere, and ought to induce Europeans, without delay, actually to explore the central provinces of the African continent."

MONOMOTAPA.

This country is bounded by the kingdom of Safala, on the eaſt; by the mountains of Caffraria, on the weſt; by the river Del Spiritu Santo, on the ſouth; and the river Cuama, which ſeparates it from Monoemugi, on the north. It is divided into ſeven provinces or petty kingdoms, the governors of which are vaſſals to the emperor; the capital town of the whole country is Manica.

The air is eſteemed ſalutary, and the ſoil fertile, producing ſugar-canes, and a great number of fine trees. There are no beaſts of burden in this country, but many elephants, and vaſt herds of horned cattle. Gold is alſo found in plenty here.

The people, who are not very numerous, are only cloathed from their waiſts downwards. Their arms are bows and arrows, darts, poinards, cutlaſſes, and ſabres: and it is aſſerted, that there are ſome warlike females in this country, who, like the ancient amazons, cut off their left breaſts, that they may ſhoot their arrows with more freedom. The emperor aſſumes great ſtate and magnificence, and has 1000 wives, but only one reigns as empreſs, and her eldeſt ſon ſucceeds to the throne.

MONOEMUGI

Joins to Monomotapa, and is divided into ſeveral principalities. The air is in general exceeding hot, and very unhealthy. The natural produce of this kingdom is gold, palm-wine, oil, and ſuch quantities of honey, that half of it is loſt every year, the inhabitants not being able to conſume it. Theſe people vary according to the principality they reſide in; thoſe of Alaba are a cruel race, called Galas, who offer human ſacrifices, and ſpare none that are hardy enough to venture through their country. Others wander from place to place, and ſubſiſt by plunder; and many of them are ſaid to be cannibals. Amber-beads are the current coin of this country, gold and ſilver being ſo common, that it is of no value among them.

ZANGUEBAR

Includes the countries of Magadoxa, Melinda, Mombaza, Quiloa, Moſambique, and Sofala; all of which are either in alliance with, or ſubject to the Portugueſe. Magadoxa is a barren country: the people are a mixture of Pagans, Mahometans, and Chriſtians. Melinda is a very pleaſant, fruitful, and healthy country: it contains ſeventeen churches, nine religious houſes, the governor's palace, the town-hall, and the magazine, all which exceed in grandeur any thing of the kind to be found in Africa. They carry on a conſiderable trade with the Portugueſe, in gold, ivory, ſlaves, &c. Mombaza, to the ſouth of Melinda, reſembles it greatly in ſoil, produce, &c. The peninſula of Quiloa enjoys a fruitful ſoil, with a very unſalutary air; however, many excellent ſugar-canes are produced here. Part of the inhabitants are Pagans, and the reſt idolaters. The king, it is ſaid, pays an annual tribute of gold to the Portugueſe, amounting to 100,000 cruſadoes. Moſambique lies ſouth of Quiloa. The air is hot, and the ſoil in moſt places ſandy and barren. This country produces gold, elephants teeth, all the tropical fruits, black cattle in abundance, hogs, and ſheep. The Portugueſe ſhips take in refreſhments here. Sofala is ſituated ſouth of Moſambique, and is in ſome parts a barren deſert, while others are remarkably fruitful. Gold is found in great plenty here: the inhabitants aſſert that the mines yield annually upwards of four millions of metigals at twelve ſhillings each. This country is ſuppoſed to be the ancient Ophir. The capital, ſituated on a river, is about ſix leagues from the ſea-coaſt, and in the poſſeſſion of the Portugueſe, who built a ſtrong fort there in 1500. Their chief trade conſiſts in gold, ambergris, ſlaves, and ſilk ſtuffs.

ETHIOPIA

Comprehends Nubia, Abyſſinia, Aboſh or Abex, and Anian. It is bounded to the north by Egypt and the deſert of Barca; to the ſouth, by Zanguebar and Caffraria; to the eaſt by the Red Sea and the eaſtern ocean; and to the weſt by Guinea, Nigritia, and Zaara.

Nubia is bounded by Egypt, on the north; by Abyſſinia, on the ſouth; by the coaſt of Abeſh, on the eaſt; and by Zaara and Nigritia, on the weſt. Its dimenſions have not yet been aſcertained by geographers, and the ſame uncertainty attends its government and religion; but among them are found Chriſtians, Jews, Mahometans, and Pagans. This country is ſaid to abound in gold, muſk, ſandal-wood, and ivory; here are alſo elephants, horſes, camels, lions, and every other animal, both wild and tame, to be met with in the neighbouring country.

ABYSSINIA

Has now ſcarce any communication with other parts of the world; Abex, which extends itſelf along the weſtern coaſt of the Red Sea, being in the poſſeſſion of the Turks, and part of it ſurrounded with mountains. The inland parts are ſaid to be exceeding fertile, being diverſified with woods and plains well planted with palm-trees, dates, and cedars, and watered by ſeveral noble rivers, particularly the Nile. Abyſſinia abounds with gold, ſilver, copper, and precious ſtones. Its animals are horſes, zebras, elephants, camels, dromedaries, oxen, ſheep, mules, aſſes, &c. here are alſo prodigious numbers of large locuſts, which are excellent eating; flying and other ſerpents are alſo ſeen here, particularly one ſort, which is ſo much of the colour of the duſt in which it harbours, and on which it ſubſiſts, that it is not eaſily avoided, though

though its ſting is attended with immediate death, both to man and beaſt.

In their perſons the Abyſſinians do not at all reſemble the negroes of Guinea, the ſouth part of Africa; having, on the contrary, regular features, and ſome of them being very handſome. The olive complexion is eſteemed the fineſt by them, and next to that the jet black. They poſſeſs a vaſt ſhare of vivacity and natural wit, are of a teachable diſpoſition, and fond of learning, but enjoy very few opportunities of attaining it. Perſons of rank among them wear veſts made of ſilks, ſtuffs, or cotton; but the poor people have only a ſmall piece of ſkin or coarſe ſtuff, wrapped about their waiſts. In their eating they abſtain from all things prohibited to the Jews, and their drink is mead, metheglin, and a liquor made from wheat or rice.

The Abyſſinians exchange their gold, emeralds, and horſes with the Turks, for ſilks, ſtuffs, calicoes, linens, and carpets. The Jews are ſaid to be the only weavers and ſmiths among them; and as for other handicrafts, every man breeds up his children to the trade or profeſſion that he uſes himſelf. Their religion ſeems to be a mixture of Chriſtianity and Judaiſm, greatly reſembling that of the Copts of Egypt, both in its manner and form.

The power of the Abyſſinian monarch was formerly unlimited, but at preſent he can tranſact no affairs of conſequence without the concurrence of the grandees. He paſſes the principal part of the year in the field, attended by great bodies of horſe and foot, with whom he makes a tour through different parts of his dominions; and on every occaſion aſſumes great ſtate.

Abex and Anian are bounded on the north and weſt by Egypt and Abyſſinia; on the eaſt by the Red Sea, and the Indian, Ethiopic, or Eaſtern Ocean; and on the ſouth by Zanguebar; extending from the fifth degree of north latitude to the twentieth.

Anian, ſituated upon the eaſtern ocean, is a ſandy barren deſert. The air is exceeding hot, and the chief part of the inhabitants conſiſt of ſome Arab tribes, that live in camps, for there are very few towns. The principal place in it is Adea.

Abex, ſituate to the northward of Anian, is in poſſeſſion of the Turks, who keep ſtrong garriſons in Suaquem and Arquico, which are the two principal ports, and about 150 miles diſtant from each other. This country is in general a fruitful tract, abounding in moſt of the neceſſaries of life.

The hiſtory of this continent is at once imperfect and unintereſting. Probably theſe countries never afforded any events worthy being recorded. Buried in ignorance from the earlieſt ages, and ſeparated from other nations by extenſive deſerts of burning ſands, the ancients knew very little of the inhabitants of theſe countries. Some voyages were indeed made to their coaſts; but all the intelligence they have tranſmitted to poſterity, amounts to no more than that they were an ignorant, rude, inhoſpitable people, and deſtitute of every particular that conſtitutes humanity, except the form. They conſidered them as a different ſpecies of beings, or at leaſt, that a ſavage life during a long ſeries of years had ſo impaired their faculties, that they were incapable of improvement. They ſtill continue in the ſame deplorable ignorance, ſo that it is in vain to expect any hiſtorical monuments in this country.

It muſt be ſhocking to every reaſonable mind to reflect, that upwards of 200 years the European nations have traded with Africa in human fleſh, and encouraged in the negro countries wars, rapine, deſolation, and murder, that the Weſt India iſlands may be ſupplied with that commodity. The annual exportation of poor creatures from Africa for ſlaves, hath exceeded 100,000, numbers of whom are driven down like ſheep, perhaps 1000 miles from the ſea-coaſt, who are generally inhabitants of villages that have been ſurrounded in the night by armed force, and carried off to be ſold to our traders; and it appears, that from Santallpollonia to Athera, which is upwards of 250 miles, the police and puniſhment of all crimes are ſupported by the ſlave trade.

This ſhameful practice is become ſo prevalent among the natives, that they who commit crimes or treſpaſſes againſt their laws, are, at the deciſion of twelve elders, ſold for ſlaves for the uſe of their government, and the ſupport of their chiefs. Theft, adultery, and murder, are the higheſt crimes, and whenever they are detected, ſubject the whole family to ſlavery. But any individual condemned to ſlavery for the crime of his relation, may redeem his own perſon, by furniſhing two ſlaves in his room.—When a man commits any of the above cardinal crimes, all the male part of his family are conſigned to ſlavery; if a woman be guilty, the female part is ſold.

An Engliſh gentleman, who lately viſited all the chiefs of the negroes in our ſettlements, remarks to the following effect: "While on the coaſt, I ſaw ſuch inſtances of cruelty relative to the ſlave trade, as made my very boſom bleed. This traffick in crimes makes the chiefs vigilant: nor do our planters, who purchaſe them, uſe any pains to inſtruct them in religion, to make them amends for the oppreſſion thus exerciſed on them. I am ſorry to ſay, they are unnaturally averſe to every thing that tends to it; yet the Portugueſe, French, and Spaniards, in their ſettlements, ſucceed in their attempts to inſtruct them, as much to the advantage of the commerce as of religion. It is for the ſake of Chriſtianity, and the advantages accompanying it, that Engliſh ſlaves embrace every occaſion of deſerting to the ſettlements of theſe nations." As the truth of theſe remarks is confirmed by daily obſervation, it is therefore certainly high time for the legiſlature to enact laws for putting an end to this moſt infamous of all trades, ſo diſgraceful to the Chriſtian name, and ſo repugnant to the principles of our conſtitution. As a means to remedy this evil, the negroes already in our iſlands ſhould be properly treated, made free, and encouragement given to their population. There are ſufficient numbers to cultivate the ſugar plantations without any future ſupply, and which would be more profitable to the planters, as well as the kingdom in general. But we need ſay nothing further on this head, as we find that ſome reſpectable, generous-hearted perſons, impreſſed with tender feelings for the miſeries of their fellow-creatures in this reſpect, have taken the matter in hand, whoſe laudable endeavours and remonſtrances, aided by thoſe of others of like benevolent ſentiments, we truſt will be conducive to aboliſh this nefarious traffick, and thereby avert the juſt vengeance of Heaven, long impending over us on that account.

CHAP. IV.

THE AFRICAN ISLANDS.

Situation, Extent, Produce, Inhabitants, Mountains, Rivers, Animals, &c.

THESE iſlands are very numerous; ſome of them are ſituated in the Eaſtern or Indian Ocean, and others in the Weſtern or Atlantic. The chief of the former are Zoeſtra, Babel-Mandel, the Comora Iſlands, Madagaſcar, Bourbon, and Mauritius: but, beſides theſe, a multitude of ſmaller iſlands, ſome of them hardly any thing more than a barren rock, are ſcattered in this immenſe ocean, particularly near the Equator, and on both ſides of the Iſland of Madagaſcar, as will be perceived by conſulting the map of Africa.

Zoestra,

ZOESTRA, by ſome thought to be the Dioſcorides of Ptolemy and Pliny, is ſituated in 12 deg. 10 min. north lat. and in 53 deg. 16 min. eaſt long. about thirty leagues to the eaſtward of Cape Gardaſu, on the moſt eaſterly point of the continent of Africa. It is eighty miles in length, and fifty-four broad, and has two good harbours, where formerly ſuch European ſhips as had loſt their paſſage to India uſed to take ſhelter. It is a populous and plentiful iſland, yielding moſt ſorts of plants and fruits common between the Tropics; and alſo frankincenſe, gum-tragacanth, aloes, ambergris, dragon's-blood, and coral. The weather is exceeding hot, though there are ſeveral lofty mountains in the iſland, whoſe ſummits are perpetually covered with ſnow. The inhabitants came originally from Arabia, profeſs the Mahometan religion, and are governed by a ſheik, who is probably tributary to the Turks.

BABEL-MANDEL is ſituated at the entrance of the Red Sea, in 12 deg. 6 min. north lat. and in 44 deg. 30 min. eaſt long. about forty-four miles from the Arabian and Abyſſinian ſhores. Its ſituation rendered it of the utmoſt conſequence, while the trade to India was carried on by the Red Sea, the entrance of which it entirely commands; hence the long wars between the Abyſſinians or Ethiopians, who contended with great fury for the poſſeſſion of this iſland; but ſince the diſcovery of a paſſage to the Indies by the Cape of Good Hope, the importance of the iſland has greatly declined, and it is now entirely abandoned. The iſland is of little value, being not five miles in circumference, and a barren, ſandy ſpot.

The COMORA ISLANDS are Joanna, Mayotta, Mehilla, Angezeia, and Comora; ſituated between 10 and 14 deg. of ſouth lat. and between 41 and 46 deg. of eaſt long. They lie in the ſtreight called the Channel of Moſambique, about midway between Madagaſcar and the continent of Africa. The principal iſland is Joanna, which claims a ſovereignty over, and exacts tribute from the others. It is about thirty miles long, and fifteen broad, and affords plenty of proviſions, and ſuch fruits as are common to the torrid zone. The inhabitants are negroes of the Mahometan perſuaſion, and entertain our ſeamen with great humanity. The India ſhips bound to Bombay uſually put in here for refreſhments.

MADAGASCAR is the largeſt of the African iſlands, and is ſituated between 10 and 26 deg. of ſouth lat. and between 43 and 51 deg of eaſt long. It lies about 300 miles to the eaſtward of the coaſt of Africa; is near 1000 miles in length from north to ſouth, and 250 in breadth from eaſt to weſt. The ſea rolls with great rapidity, and is exceeding rough between this iſland and the Cape of Good Hope, forming a channel or paſſage, through which all European ſhips generally paſs, unleſs prevented by ſtorms, in their voyage to and from India.

Few iſlands in the world are more pleaſant, fertile, and deſirable than Madagaſcar. It is adorned with a pleaſing variety of hills, vallies, woods, and open plains; watered with numerous rivers, and the air is rendered cool and healthy by the conſtant breezes from the ſea. It abounds in ſugar, honey, vines, fruit-trees, vegetables of various kinds, valuable gums, corn, cattle, fowls, precious ſtones, iron, copper, tin, and ſome ſilver.

The iſland of Madagaſcar was diſcovered in 1506, by Lawrence Almeyda; but the Perſians and Arabs knew it from time immemorial, under the name of Sarandib. The whole iſland is divided into twenty-eight provinces, which are, Anoſſi, Manapani, the Valley of Amboule, Vohitzan, Watte-Manahore, Yoondre, Etomampo, Adohimouſſy, Erengdranis, Vohitz-Anghombes, Manacarongha, Mantatane, Antaveres, Ghalemboule, Tamatave, Jahave, Voulou-Voulou, Andaſoutchy, Manghabey, Adeimoutchy, Mandrarey, Ampatre, Caremboule, Mahafalbey, Houlouvey, Sivah, Yoandrhou, and Machicores.

The natives are called Malegaches, or Madecaſſes. They are portly in their perſons, and riſe above the middle ſtature. The colour of their ſkin is different: among one tribe it is of a deep black, and among another tawny: ſome have a copper-coloured tint; but the colour of the greater part is olive. All thoſe who are black have woolly hair, like the negroes on the coaſt of Africa: thoſe who have a complexion ſimilar to that of the Indians and Mulattoes, have as lank hair as the Europeans.—Their noſes are not flat; they have a broad open forehead; their lips are thin; and their features are regular and agreeable.

Theſe people generally diſplay in their countenance a peculiar character of frankneſs and good-nature. They never ſhew a deſire of learning any matters, but thoſe which relate to the ſimpleſt wants of mankind; and this deſire is always extremely moderate: they are very indifferent reſpecting knowledge which cannot be obtained without reflection. A general want of care, and a general apathy, renders every thing that requires attention, inſupportable to them. Sober, light, and active, they ſpend the greateſt part of their lives in ſleeping, and in amuſing themſelves.

With reſpect to religion, they have neither moſques nor temples, and entertain a very imperfect notion of Mahomet. They offer ſacrifices of beaſts and rice on particular occaſions, and many of them obſerve the Jewiſh ſabbath. They have alſo ſome knowledge of the principal events recorded in Sacred Hiſtory, as the creation of the world, the fall of man, the lives of Noah, Abraham, Moſes, and David; and hence ſome have conjectured that they are deſcended from the Jews. Perhaps the colony that firſt ſettled here were compoſed of Arabians and Jews, who by a long promiſcuous intercourſe, have formed a religion partaking equally of both. The Pagan inhabitants are idolaters, and, like thoſe on the continent of Africa, worſhip ſtocks and ſtones. No hiſtorical accounts of this country are to be depended on till the year 1642, when a French officer obtained permiſſion from Cardinal Richlieu for nine years, excluſive of all others, to ſend ſhips and forces to Madagaſcar, and the neighbouring iſlands, in order to eſtabliſh a colony, plantation, and commerce. This gentleman erected a ſociety for this purpoſe, under the name of a French Eaſt-India Company, and the grant was drawn out, with the addition of ten years more privilege, or, in other words, extended to the year 1661. In the interim, that is immediately ſubſequent to the making out of the grant in 1642, the firſt ſhip was ſent under the command of Captain Coquet, who was going to load ebony at Madagaſcar, on the account of himſelf and ſome private merchants; but had orders to take with him two governors, whoſe names were Pronis and Fouquenbourg, and twelve other Frenchmen; theſe being commanded to land and remain there, till the arrival of a ſhip from France, which was to ſail in November.

Coquet got to Madagaſcar in September, having, in his way, anchored at the Iſle of Bourbon, which he took poſſeſſion of in the name of the King of France; touching afterwards at the Iſle of St. Mary, he did the ſame; and arriving at the Bay of Antongil, in Madagaſcar, he acted in a ſimilar manner. Pronis and Fouquenbourg were at length landed in the port of St. Lucia, in the province of Manghabei.

The expected ſhip from France arrived on the firſt of April, in the enſuing year. It was named the St. Lawrence, and was under the command of Captain Giles Reſimont. This officer brought ſeventy men with him to reinforce Pronis. The inhabitants, jealous that the French would obtain too firm a footing in their country, meditated an oppoſition; but their intentions were prevented, or at leaſt delayed,

by the prudent conduct and timely presents of Pronis. Upon this success, Pronis sent twelve men to penetrate into the province of Matatan, six of whom were cut off by the natives, and the rest compelled to retreat; and soon after Captain Resimont's son, and six sailors, were murdered in the province of Vohitsbang. This opposition was owing to the secret intrigues of the leading men in Anossi, who, from their maritime situation, did not dare to offend the French themselves, but stirred up the people of other provinces to oppose and murder them upon all occasions.

In 1644, Pronis thought proper to remove from St. Lucia to the Bay of Tholongare, where he began to fortify himself; and having reduced almost the whole province of Anossi by force of arms, he built Fort Dauphin, the situation being excellent, the harbour commodious and finely sheltered, and the entrance very convenient for shipping of any burthen. Behind the fort, he erected several other buildings, with large enclosures, which produced various sorts of fruits, kitchen herbs, &c.

In the year 1650 the fort took fire by some unforeseen accident, and was totally destroyed. Soon after, however, it was rebuilt, and strongly garrisoned; the French being always at variance, and frequently at war with the natives.

In the year 1651, the celebrated French governor, Flacourt, at the head of eighty Frenchmen, and a great number of armed negroes, ravaged the country to a considerable distance from the fort, carrying off great quantities of cattle, and destroying all the houses and huts in his way. This occasioned the natives to conceive an extraordinary aversion to the French; and what added to their dislike was, that whenever any prisoner fell into the hands of the French, they looked upon them all in an equal light, and sold them indiscriminately to the then Dutch governor of the island of Mauritius, not making any distinction between deeans or lords, freemen or slaves; or shewing any greater respect to their ladies, when captives, than to women of a lower rank. The French finding, at length, that the idea of conquering Madagascar was chimerical, and that the danger and expences of maintaining a colony, and keeping up a fortress here, were not recompensed by the profits accruing from the settlement, thought proper at once to abandon the island, and all projects relative to it.

Mauritius, or Maurice-Island, is situated in 20 deg. 15 min. south lat. and 56 deg. 8 min. east long. It is of an oval figure, about 150 miles in circumference, and has the advantage of an excellent harbour, capable of holding fifty sail of the largest ships, secure against all winds; the water is 100 fathoms deep at the entrance. The climate is at once both healthy and agreeable. The island is watered with several rivers, and the finest ebony in the world grows upon its mountains. The soil, though not remarkable for its fertility, affords pasture sufficient for vast numbers of black cattle, deer, goats, and sheep. Rice, tobacco, and all kinds of tropical fruits are produced here in plenty. This island was discovered by the Dutch in 1598, who gave it the name of Maurice-Island, in honour of Prince Maurice their stadtholder. It continued for some time in their possession, but at present it belongs to the French, who have given it the name of the Isle of France.

The Isle of Bourbon is situated in 21 deg. 9 min. south lat. and in 54 deg. 12 min. east long. It is of an oval figure, and about ninety miles in circumference. It has no harbour, but several good roads, though these are not always sufficient to shelter ships against the furious storms which generally happen at the shifting of the monsoons. On the southern extremity of the island is a large volcano, which continually throws out prodigious quantities of flame, smoke, and a sulphureous lava, and appears dreadful in the night to mariners, as the adjacent sea is full of sunken rocks. The climate, though extremely hot, is very healthy, being constantly refreshed with cooling breezes from the sea. The hurricanes already mentioned are often dreadful; they seem to shake the very foundations of the island, while the inhabitants are filled with terror. Brooks and streams of water are found in almost every part of the island, by which the soil is rendered extremely fertile in fruits and pasture. Tobacco flourishes here exceedingly, though not a native plant of the island. Many of the trees yield odoriferous gums and resins, particularly benzoin in great plenty. Aloes, white pepper, and all the tropical fruits abound here. The pastures feed great numbers of black cattle, goats, and hogs. The rivers are well stocked with fish, and the coast with land and sea tortoises. Ambergris, coral, and shells remarkable for their beauty, are found on the shore. The French, on their expulsion from Madagascar, in 1672, retired to this island, where they have now several considerable towns. A governor is also established here, and their East-India ships stop at this island for refreshments. There are a great many more small islands about Madagascar, and on the eastern coast of Africa, laid down in maps, but no description of them has yet been given.

Having thus described the principal islands in the Eastern or Indian Ocean, it remains that we pass round the Cape of Good-Hope, and survey those that are scattered in the Western, or Atlantic Ocean, that immense collection of water, which separates Europe and Africa from America. The islands in the Atlantic Ocean are very numerous, but the principal are St. Helena, Ascension, St. Matthew, St. Thomas, Anaboa, Princes-Island, Fernandopo, Cape-Verd islands, Goree, the Canaries, the Madeiras, and the Azores.

St. Helena is situated in 16 deg. 4 min. south lat. and in 6 deg. 4 min. west long. It is a very high and steep rock, situated in the midst of the ocean, about twenty miles in circumference, and accessible only at the landing-place, in a valley on the east side of the island; but even here the waves dash with such impetuosity against the shore, that it is difficult landing; and a battery of guns almost level with the water defends it. The only anchoring-place is in the road called Chapel-Valley Bay. Though the island appears at sea as a barren rock, the inland parts are agreeably diversified with vallies and plains, adorned with fruit-trees. The English plantations there afford potatoes, yams, plantains, bananas, kidney-beans, and Indian corn; but most part of the latter is generally destroyed by rats, so that the flour made use of there is wholly imported from England; and in a scarcity, they eat yams and potatoes instead of bread. Some bullocks, hogs, and plenty of poultry, are found on this island, which belongs to the English East-India Company, being given to them by Charles II. There are about 200 families upon it, who greatly resemble the English both in their persons and manners. The East-India homeward-bound ships take in water and fresh provisions here, in exchange for shirts, drawers, or any light clothes, pieces of calico, silks, muslin, arrack, sugar, &c. but the island is so small, and the wind so much against the outward-bound ships, that they very seldom see it. The Company's affairs there are managed by a governor, deputy-governor, and store-keeper, who have standing salaries allowed by the Company, besides a public table, well furnished, for the entertainment of all commanders, masters of ships, and principal passengers.

Ascension-Island is situated in 17 deg. of west long. and the 7th of south lat. 600 miles north-west of St. Helena. It received its name from being discovered by the Portuguese on Ascension-day; and it is a mountainous, barren, uninhabited island, about twenty miles in circumference; but the East-India ships usually touch here, to furnish themselves with turtle,

turtle, which are found in great plenty, and are very large, ſome of them weighing above 100 pounds each.

ST. MATTHEW is a ſmall iſland lying in 6 deg. 1 min. weſt long. and 1 deg. 30 min. ſouth lat. 300 miles to the north-eaſt of Aſcenſion-Iſland, and was diſcovered by the Portugueſe, who planted and kept poſſeſſion of it for ſome time, but afterwards deſerted it. As this iſland has little in it to invite other nations to ſettle there, except a ſmall lake of water, it now remains uninhabited.

ST. THOMAS, PRINCES-ISLAND, ANABOA, and FERNANDOPO, are all ſituated in the Gulph of Guinea, between Congo and Benin. They were firſt diſcovered by, and are now in poſſeſſion of the Portugueſe, and furniſh their ſhipping with freſh water and proviſions as they paſs by. We are informed, there are 15,000 Negro Chriſtians in St. Thomas's inſtructed to read and write, who daily attend divine worſhip, clean and well clothed; a circumſtance which redounds greatly to the honour of the Portugueſe government, at the ſame time that it reflects diſgrace on our Weſt-India legiſlators, for their neglect in this particular.

CAPE DE VERD ISLANDS owe their appellation to a cape of that name on the African coaſt, near the river Gambia, oppoſite to which they lie, at the diſtance of 300 miles, between 23 and 26 deg. weſt long. and 14 and 18 deg. north lat. They were diſcovered by the Portugueſe in 1460, and are about twenty in number, of which the following are the chief, namely, St. Jago, Bravo, Fogo, Mayo, Bonaviſta, Sal, St. Nicholas, St. Lucia, St. Vincent, Santa Cruz, and St. Antonio, and are ſubject to the Portugueſe; the others are barren rocks. The air in general is very hot, and in ſome of them very unwholeſome. Europeans, or their deſcendents, and negroes, inhabit theſe iſlands.

ST. JAGO is the largeſt, moſt fertile, and the beſt inhabited of them all. It is 150 miles in circumference, but many parts of it are mountainous, and a great deal of the land is barren. Its produce is ſugar, cotton, ſome wine, Indian corn, cocoa-nuts, oranges, and other tropical fruits; but the plant of moſt conſequence is madder, which grows in abundance among the cliffs. Roots and garden ſtuff of all kinds abound here, as well as hogs and poultry. The monkies in this iſland are eſteemed handſomer than thoſe of any other part of the world. They are exceeding ſmall, and of a green colour, except their faces, which are black. The Portugueſe viceroy reſides in this iſland.

On the eaſt ſide of the iſland ſtands BAYA, or PRAYA (famous for an action between an Engliſh and French ſquadron in a former war) it has a good port, and is ſeldom without ſhips; thoſe outward-bound to Guinea, or the Eaſt-Indies, from England, Holland, and France, often touch here for freſh water and proviſions.

MAYO, or MAY, and SAL, abound in ſalt, and the Engliſh trade with the inhabitants of the former for vaſt quantities of this commodity. The ſalt is made by the heat of the ſun from the ſea-water, which, at ſpring-tides, is received into a ſort of pan, formed by a ſand-bank, extending along the coaſt for two or three miles. The ſalt coſts nothing but a ſmall gratuity for raking it together, wheeling it out of the pond, and carrying it on aſſes to the boats; the negro governor, however, expects a ſmall preſent from every commander that loads with ſalt, and delights in being invited on board their ſhips. The Engliſh veſſels, which annually reſort hither to lade with ſalt, frequently amount to 100, and there is generally a man of war to protect them. They likewiſe often take in a freight of aſſes, which they carry to Barbadoes, and other Britiſh plantations. The ſea-water is ſo clear on this coaſt, that an Engliſh ſailor, who dropped his watch, perceived it at the bottom, though many fathoms deep, and had it brought up by one of the natives, who are in general expert at diving. The inhabitants of this iſland, even the governor and prieſts, are all negroes, and ſpeak the Portugueſe language.

FOGO is remarkable for having in it a volcano, which continually emits ſulphureous exhalations, and the eruptions and flame, like thoſe of Mount-Ætna, ſometimes burſt forth with ſuch violence, that the adjacent parts are in a manner covered with pumice-ſtones.

The inhabitants of all theſe iſlands are Europeans, or deſcendents of families originally from Europe, and a great number of negroes: theſe latter, who inhabit the iſlands of Mayo, profeſs the Roman Catholic religion.

The ISLAND of GOREE is ſituated within cannon-ſhot of Cape-Verd, in 14 deg. 43 min. north lat. and 17 deg. 20 min. weſt long. It was ſo called by the Dutch, from an iſland and town of the ſame name in Holland. It is a ſmall ſpot, not exceeding two miles in compaſs, but being deemed a place of importance, from its ſituation for trade ſo near the Cape-Verd, it has therefore been a bone of contention between European nations. The Dutch firſt took poſſeſſion of it; and from them the Engliſh took it in 1663; but the Dutch retook it in 1665; the French ſubdued it in 1677, and in their poſſeſſion it remained till 1759, when the Britiſh arms being every where triumphant, it was reduced by Commodore Keppel, but reſtored to the French in 1763. It was retaken by the Engliſh in the war of 1774, but at the peace of 1783 was again reſtored to the French, in whoſe poſſeſſion it now remains.

The CANARIES, formerly called The Fortunate Iſlands, are ſituated between the 12th and 19th deg. of weſt long. and between the 27th and 29th deg. of north lat. they lie about 150 miles ſouth-weſt of Morocco. They are ſeven in number, viz. Grand Canaria (or Great Canary, which gives name to all the reſt) Palma, Hiero, Gomera, Teneriffe, Fuerteventura, and Lancerota. Theſe iſlands were firſt diſcovered and planted by the Carthaginians; but when the Romans deſtroyed that republic, a ſtop was put to navigation, particularly on the weſtern coaſt of Africa, and theſe iſlands were again buried in obſcurity for many ages. At laſt, in 1405, they were once more viſited by the Spaniards. When they firſt landed, the natives, who were very numerous, ſpoke a different language from any of the nations on the continent. They were robuſt, active, and well ſkilled in the management of bows, arrows, and darts. They were alſo idolaters, worſhipping the ſun and ſtars. When they became acquainted with the Spaniſh language, they could give no account of their anceſtors, or from what country they came. In their ſtature and complexion, they reſembled the natives of the north of Africa, but they retained none of their cuſtoms, were maſters of no ſcience, nor did they know there was any country in the world beſides their own. Having ſtruggled for the preſervation of their liberties till 1460, they were then forced to yield to the ſuperior force of their invaders, who tranſported a great number of them into Spain, where they ended their days in ſlavery. Thoſe who were ſuffered to remain on the iſland, endeavoured to ſecure their ancient eſtates by ſubmitting entirely to the Spaniſh yoke, and are now remarkable for their probity and civility to ſtrangers.

Theſe iſlands enjoy a pure and temperate air, and the ſoil is ſo fruitful, that it frequently yields two crops in a year. They abound in the moſt delicious fruits, among which are grapes from whence that rich wine is made, known to us by the name of Canary, and of which it is ſaid, that in time of peace 10,000 hogſheads are annually exported to England. Cattle, &c. are very numerous here; and among the birds, are thoſe little beautiful creatures that bear

 the

the country's name, and are now ſo common, and ſo much admired in Europe; but their wild notes in their native land far excel thoſe ſung by them when confined in a cage in a foreign country.

TENERIFFE is about fifty miles in length, and twenty in breadth. The country is fertile, though much incumbered with mountains, particularly that called the Peak, which, according to the accounts of ſome navigators, may be ſeen in clear weather at the diſtance of 120 miles. The Peak is an aſcent in the form of a ſugar-loaf, about fifteen miles in circumference, and, according to the account publiſhed in the Philoſophical Tranſactions, near three miles perpendicular.

Its appearance at ſun-ſet is very ſtriking; when the ſun was below the horiſon, and the reſt of the iſland appeared of a deep black, the mountain ſtill reflected its rays, and glowed with a warmth of colour which no painting can expreſs. There is no eruption of viſible fire from it, but a heat iſſues from the chinks near the top, too ſtrong to be borne by the hand when it is held near them.

The air and climate are ſaid to be remarkably healthful, and particularly adapted to afford relief in phthiſical complaints. By reſiding at different heights in the iſland, ſuch a temperature may be procured as is beſt ſuited to the conſtitution. Perſons may continue where the air is mild and ſalubrious, as they may aſcend till the cold becomes intolerable; but no perſon, it is ſaid, can live comfortably within a mile of the perpendicular height of the Peak after the month of Auguſt.

The road of Santa Cruz (ſays Captain Cook, who touched at this famous iſland in his laſt voyage) is ſituated on the ſouth-eaſt ſide of the iſland, before the town of the ſame name. It is ſaid to be the principal road of Teneriffe for ſhelter, capacity, and the goodneſs of its bottom. The water to ſupply the ſhipping, and for the uſe of the inhabitants of Santa Cruz, is derived from a rivulet that runs from the hills, which is conveyed into the town in wooden troughs. As theſe troughs were repairing at the time Captain Cook viſited the iſland, freſh water was extremely ſcarce.

It might naturally be concluded, from the appearance of the country about Santa Cruz, that Teneriffe is a barren ſpot; Captain Cook was convinced, however, from the ample ſupplies his people received, that it not only produced ſufficient to ſupply its own inhabitants, but alſo enough to ſpare for viſitors. Though wine is the chief produce of the iſland, beef may be had at about three-pence ſterling a pound. The oxen, however, are ſmall, lean, and boney. Sheep, goats, hogs, and poultry, may be had on terms equally reaſonable. A great variety of fruits are to be had in plenty; as pears, figs, grapes, mulberries, muſk-melons, &c. beſides others that were not then in ſeaſon. The pumpkins, potatoes, and onions, which grow here, are excellent.

On this iſland, Indian corn is produced and ſold at about three ſhillings and ſix-pence per buſhel. The fruits and vegetables are, in general, very cheap. Though the inhabitants are but indifferently ſupplied with fiſh by the adjoining ſeas, they are engaged in a conſiderable fiſhery on the coaſt of Barbary, and the produce of it ſells at a very moderate price.

Voyagers aſſure us, that Teneriffe is a more eligible place than Madeira for ſhips to touch at which are bound on long voyages: but the wine of the latter is infinitely ſuperior to that of the former. The difference of their prices is almoſt as conſiderable as their qualities; for the beſt Teneriffe wine was ſold for 12l. a pipe, whereas a pipe of the beſt Madeira was worth conſiderably more than double that ſum.

The country riſes behind the town of Santa Cruz gradually to a moderate height; afterwards it continues to riſe ſouth-weſtward towards the celebrated Peak of Teneriffe. But our voyagers were much diſappointed in their expectations with reſpect to its appearance, and particularly as to its height.

Eaſtward of Santa Cruz, the iſland appears perfectly barren. Ridges of high hills run towards the ſea, between which are deep vallies, terminating at mountains that run acroſs, and are higher than the former. Mr. Anderſon went on ſhore to one of theſe vallies, intending to reach the top of the remoter hills; but time would not permit him to get further than their baſe. The lower hills produce great quantities of the *Euphorbia Canarienſis*. The people on the ſpot imagine its juice to be ſo cauſtic as to corrode the ſkin; but Mr. Anderſon convinced them to the contrary, by thruſting his finger into a plant full of it. The inhabitants dry the buſhes of euphorbia, and carry them home for fuel. The city of Santa Cruz, though not large, is well built. The churches have not a magnificent appearance without, but they are decent and tolerably handſome within. Almoſt facing the ſtone pier, which runs into the ſea from the town, is a marble column, lately erected, enriched with human figures which reflect honour to the ſtatuary.

The city of Laguna is ſituated about the diſtance of four miles from Santa Cruz. Mr. Anderſon and three others took a view of it; but the ſight of it did not reward them for their trouble, as the roads were very bad, and their cattle but indifferent. Though the place is extenſive, it hardly deſerves to be dignified with the name of a city. There are ſome good houſes, but the diſpoſition of the ſtreets is very irregular. Laguna is larger than Santa Cruz, but much inferior to it in appearance.

From Santa Cruz to Laguna, the road runs up a ſteep, barren hill; but lower down they ſaw ſome fig-trees and corn-fields. The corn, however, is not produced here without great labour, the ground being greatly encumbered with ſtones. Nothing elſe preſented itſelf deſerving notice, except a few aloe plants in flower on the ſide of the road.

In this iſland the laborious work is chiefly performed by mules, horſes being ſcarce, and reſerved for the uſe of the officers. Oxen are alſo much employed here. Some hawks and parrots were ſeen, which were natives of the iſland; as alſo the ſea-ſwallow, ſea-gulls, partridges, ſwallows, canary-birds, and blackbirds. There were alſo lizards, locuſts, and three or four ſorts of dragon-flies.

A gentleman of acknowledged veracity informed Mr. Anderſon, that a ſhrub is common here agreeing exactly with the deſcription given by Linnæus of the tea-ſhrub, as growing in China and Japan. It is conſidered as a weed, and large quantities of it are rooted out of the vineyards every year. The Spaniards, however, who inhabit the iſland, ſometimes make uſe of it, and aſcribe to it all the qualities of the tea imported from China. The ſame gentleman mentioned to Mr. Anderſon another botanical curioſity, which is called the *impregnated lemon*. It is a diſtinct and perfect lemon encloſed within another. There is alſo a certain grape growing here, which is deemed an excellent remedy in phthiſical complaints.

From near the top of the Peak ſmoke continually iſſues; but they have had no earthquake or eruption ſince 1704, when the port of Garrachica was deſtroyed, being filled up with the burning lava that flowed into it; and houſes are now built where ſhips formerly lay at anchor.

A very conſiderable trade is carried on at Teneriffe, 40,000 pipes of wine being annually made there, which is conſumed in the iſland, or made into brandy, and ſent to the Spaniſh Weſt-Indies. Indeed, the wine is the only conſiderable article of the foreign commerce of Teneriffe, unleſs we reckon the large quantities of filtering-ſtones brought from Grand Canaria.

The inhabitants found here when the Spaniards diſcovered the Canaries, are no longer a diſtinct race of people, having intermarried with Spaniſh ſettlers: their

their deſcendants, however, may be known from their being remarkably tall, ſtrong, and large-boned. The men are tawny, and the women are pale. The inhabitants of Teneriffe, in general, are decent, grave, and civil, retaining that ſolemn caſt which diſtinguiſhes thoſe of their country from others. The ancient inhabitants of this iſland were called Guanches. The origin of them is not certainly known, but their ſepulchral caves are very remarkable. They had an uncommon veneration for the corpſes of their anceſtors, which were depoſited in caves formed by nature in the rocks. They were preſerved in goat-ſkins, bound round by belts of the ſame, ſo exactly and uniformly encloſing the body, as to excite admiration, each round being juſt proportioned to the part; and this method preſerved the bodies. The eyes, which are cloſed, the hair, ear, noſe, teeth, lips, and beard, are found entire. They are placed on wooden couches, which the natives had the art of rendering ſo hard, that they are impenetrable to iron. Some of the caves contained 2 or 300 bodies.

GRAND CANARIA, or GREAT CANARY, is about 150 miles in circumference. The capital, called Palma, is ſituated on the weſt ſide of the iſland, and has a caſtle, but its beſt defence is a vaſt number of ſunken rocks, which render the approach to the ſhore very dangerous. It is an epiſcopal ſee; the inquiſition, the ſupreme council, or aſſembly of the ſtates of the ſeven iſlands, and ſeveral convents of monks, friars, and nuns, are eſtabliſhed here.

PALMA is ſituated about fifty miles to the weſt of Teneriffe, and 200 weſt of the continent of Africa. It lies in 29 deg. north lat. and 18 deg. weſt long. It is about thirty miles long, twenty broad, and ſeventy in circumference. This iſland, beſides ſugar and wines, produces gum-dragon and pitch; pine-apples are alſo plentiful here. Poultry and animals are much the ſame here as in Canaria; except, indeed, among the animals, it particularly abounds with rabbits. It is ſubject to earthquakes; and in 1750, a large body of fire iſſued from a volcano in one of the mountains, and took its courſe with great rapidity to the town of Palma, from whence it ſpread to the ſea, and there diſcharged itſelf.

On the north-eaſt part is a lofty and ſpacious mountain called the Cauldron, from having a hollow in it. The deſcent within the cauldron, which proceeds gradually from the ſummit, contains a ſpace of about 30 acres, and on the declivity of the inſide are ſeveral ſprings that form a ſtream which iſſues out from the extremity of the mountain. Near the ſea ſhore, on the ſouth ſide of the iſland is a medicinal well of hot water, and at a village called Uguar, is a cave, at the extremity of which is a curious grotto with the roof ſtuck with large flakes of ſlate ſtones, from between which conſtantly iſſues a flow of clear and wholeſome water.

In the winter the air is ſo exceeding ſharp up the mountain, that the inhabitants are obliged to keep fires burning night and day; whereas near the ſea-ſide they only have them for cooking and other occaſional purpoſes. In the months of July, Auguſt, and September, the heat near the ſea ſhore is intolerable, while in the mountainous parts the air is pleaſant and refreſhing.

Their beſt vines grow in a ſoil called the Brenia, where it is ſaid they make at leaſt 12,000 caſks of wine every year. The wines differ in their quality from thoſe made in the other iſlands; but they are very rich, and have an excellent flavour. They have likewiſe great plenty of honey, and moſt kinds of fruit, the latter of which grow in ſuch abundance, that they export great quantities of them to the other iſlands.

Palma, the principal town in this iſland, ſo called after its name, is tolerably large, and well inhabited. The houſes are low, but ſpacious; and in one part of the town is a very handſome church. A conſiderable trade is carried on here in wines, which are exported to various parts, but particularly to the Weſt-Indies.

There is another very neat town in this iſland, called St. Andrew's where there are four engines for making ſugar; but the land hereabouts is very poor, ſo that the inhabitants are ſupplied with grain, and other neceſſary articles, from the iſland of Teneriffe.

The chief port is called Palma; and is ſituated on the ſouth ſide of the iſland. The road is about a quarter of a mile from the ſhore; and though it is open to the eaſterly winds, the ſhips ride with great ſafety.

The iſland of HIERO, having neither ſpring, fountain, nor well, is ſaid to have been formerly ſupplied with water by means of a particular ſpecies of trees, which yielded a large quanity in the night, when their tops were always enveloped in a cloud; but now the inhabitants ſave the rain-water in ciſterns, and, when that fails, filtrate brackiſh water through ſand.

GOMERA is ſituated to the weſt of Teneriffe, in 28 deg. north lat. and 18 deg. weſt long. from London. It is about 30 miles long. 20 broad, and 60 in compaſs. This is a very plentiful iſland, being watered by many rivulets that flow from the mountainous parts, and give fertility to the vallies beneath: beſides this, water may be had in any part of the iſland, by digging to the depth of about ſix feet. The inhabitants have great plenty of all the neceſſaries of life, particularly cattle, poultry, wine, roots, fruit, honey, and ſugar. There is but one ſmall town, near the ſea-ſhore, and called after the name of the iſland.

FUERTEVENTURA is about 24 leagues diſtant from Grand Canaria. It is about 65 miles in length, and of a very unequal breadth, conſiſting of two peninſulas, joined by an iſthumus of 12 miles over. On the north ſide there is a haven called Chabras, and another, which is very commodious, towards the weſt. Wheat, barley, kine, goats, and orchel, are found in this iſland, which belongs to the lord of Lancerota.

The iſland of LANCEROTA, or Langarote, lies in 28 deg. 40 min. north lat. and 13 deg. 5 min. weſt long. It is ſituated about 18 leagues ſouth-eaſt of Grand Canaria, and is nearly 32 miles long, and 22 broad. The whole iſland is parted in the middle by a ridge of rocks, on which feed goats, ſheep, camels, genets, and aſſes.

The vallies are dry and ſandy, reſembling the rye fields in England; but they yield tolerable good barley and wheat: the firſt harveſt being about April, and the ſecond in September. The principal commodities are goats fleſh and orchel, and the whole is an eſtate or earldom, belonging to the family of Herrara, the head of that family being always lord of Fuerteventura and Lancerota. The people, however, in both iſlands have the liberty of appeal to the king's judges in Grand Canaria. Boats go from hence weekly to Grand Canaria, Teneriffe, and Palma, laden chiefly with dried goats fleſh, which is uſed in the manner of bacon, and is not bad eating.

This iſland was attacked in 1596, and taken by the Engliſh under the command of Leonidas, Earl of Cumberland, who, after ranſacking it, departed the iſland.

Lancerota is very high, and may be ſeen at a great diſtance, its appearance being black and barren. The principal port, which lies on the ſouth-eaſt ſide of the iſland, is called Porte de Naos, and the harbour is tolerably ſecure for ſmall veſſels; indeed, it is deemed the beſt belonging to the Canary Iſlands, and is much frequented for its conveniency in repairing and cleanſing ſhips. This port is without any town, or indeed houſes, except ſtore-houſes, magazines, and barracks for ſoldiers. The caſtle at the weſt end of

the harbour is of no conſequence, as a ſhip of force might eaſily batter it down. A channel divides Lancerota from the little iſland called Gracioſa, which is uninhabited; and this channel is named the harbour of El Rio. Near this harbour is a ſalt-work in Lancerota, which turns to a tolerable account.

Kubicon, or Cayas, is the principal town of this iſland. It is about ſix miles from Porte de Naos, and is what was formerly called Lancerota. At preſent it contains about 200 indifferent houſes.

The inhabitants of this iſland chiefly uſe rain water, which is caught in pits and ciſterns adapted for that purpoſe, as they have but few wells or ſprings. The breed of horſes has dwindled and degenerated in this iſland, as well as in Fuerteventura. Aſſes are preferred here as they are there, and for the ſame reaſons. The aſſes, indeed, in both theſe iſlands, are uſed not only for carrying burthens and riding, but for ploughing up the land; ſo that they are deemed of general utility.

No venomous creature infeſts either Lancerota, or Fuerteventura, except the black ſpider. This, however, is ſufficient to terrify the people, as its ſting is extremely painful, and very dangerous.

The ſeas which interſect and ſurround theſe iſlands afford the inhabitants plenty of fiſh, particularly cod, much finer than what is caught on the banks of Newfoundland; and a very ſingular fiſh, called the picudo, or ſea pike, the bite of which is as venomous as that of a viper; yet, when dreſſed, it is pleaſant and wholeſome food.

The MADEIRAS, which conſiſt of three iſlands, are ſituated between the 17th and 18th deg. of weſt long. and between the 32d and 33d of north lat. they lie about 100 miles north of the Canaries, and as many weſt of Sallee in Morocco.

Mattera, the principal iſland of the three, which has given name to the others, is about 75 miles in length, 60 in breadth, and 180 in circumference.—Though there is ſome reaſon to ſuppoſe that this iſland was not unknown to the ancients, yet it lay concealed for many generations, till the Portugueſe diſcovered it in 1519, took poſſeſſion of it, and are, even at this time, almoſt the only people who inhabit it. According to ſome authors, John Machin, an Engliſhman, diſcovered this iſland in 1344; but, allowing this to be true, it is certain that the Engliſh never made any ſettlement. At their firſt landing, the Portugueſe, finding the country little better than a thick foreſt, gave it the name of Madeira, or Mattera, and, in order to render the land capable of cultivation, ſet fire to the woods. It is now very fertile, yielding corn, ſugar, honey, wax, and the moſt delicious fruits; particularly oranges, lemons, pomegranates, and grapes. It is ſaid that this was the firſt place in the weſt, where the ſugar manufacture was ſet on foot, and indeed the produce exceeds that of every other country, being extremely beautiful, and poſſeſſing a natural ſcent of violets: but the Portugueſe, finding that the profit on this article began to decline, have deſtroyed the chief part of their ſugar canes, and planted vineyards, which produce ſeveral ſorts of excellent wines, particularly Madeira, malmſey, and tent, of all which the inhabitants make and ſell prodigious quantities. It is ſaid that no leſs than 10,000 hogſheads are annually exported, the chief part of which go the Weſt Indies, particularly Barbadoes, where the heat of the climate adds greatly to its perfection: it is afterwards ſent to England. Beſides numerous groves of cedar trees, with which the whole iſland is adorned, it produces thoſe which yield dragon's blood, maſtic, and other gums. It abounds alſo with boars and other wild beaſts, and with all ſorts of fowls. The inhabitants excel even thoſe of Genoa in making ſweetmeats, marmalades, and perfumed paſtes, and likewiſe in preſerving citrons, oranges, &c.

The moſt conſiderable town in the whole iſland is ſituated at the bottom of a large bay, on the ſouth part of it, and called Fonchial. It is defended towards the ſea by a high wall and a battery of cannon, which, together with the large ſtones that cover the beach, and the violent ſurf that continually beats againſt it, renders the place very ſecure againſt the attacks of an enemy.

Of the other two iſlands, that called Porto Santo, which is only eight miles in circumference, lies at a ſmall diſtance from Madeira, and is under the juriſdiction of the ſame biſhop and governor. It is exceeding fertile, and abounds in excellent honey and wax. The other is ſcarce worthy notice, being not only of very ſmall extent, but likewiſe entirely barren; for which reaſon the Portugueſe have given it the expreſſive appellation of the Deſolate Iſle.

The AZORES, likewiſe called the Weſtern Iſlands, are ſituated between the 25th and 32d deg. of weſt long. and between the 37th and 40th of north lat. lying almoſt in the mid-way between Europe, Africa, and America. They are nine in number, viz. Santa Maria, St. Miguel, Tercera, St. George, Gracioſa, Fayal, Pico, Flores, and Corvo. They were diſcovered in the middle of the 15th century, by Joſhua Vanderberg, a merchant of Bruges in Flanders, who, in a voyage to Liſbon, was by ſtreſs of weather driven to theſe iſlands, which he found deſtitute of inhabitants, and called them the Flemiſh Iſlands. On his arrival at Liſbon, he boaſted of this diſcovery, on which the Portugueſe ſet ſail immediately, and took poſſeſſion of them, to whom they now belong, and were by them called Azores, from the great number of hawks and falcons which they found there.

The moſt conſiderable of theſe iſlands is St. Miguel, or St. Michael, being 100 miles in circumference. It is very fertile and populous, producing plenty of corn and wine, and containing upwards of 50,000 inhabitants, excluſive of eccleſiaſtics, monks, and nuns. Its two principal towns and harbours are Porta Delgada and Villa Franca. This iſland was twice invaded and plundered by the Engliſh in the reign of Queen Elizabeth.

All theſe iſlands have one or more harbours; but the beſt among them is in Tercera, which is very ſpacious, and guarded by two forts, that at the ſame time defend Angra, the capital. This city is the reſidence of the governor of the Azores, and the biſhop. It alſo contains eight convents, ſeveral courts and offices, and five churches, beſides the cathedral, and is a populous well built town.

The reſt of the iſlands are equally fertile, and it may be obſerved of the Azores in general, that they enjoy a very clear and ſerene ſky, with a ſalubrious air, but are ſubject to violent earthquakes, by which they have frequently ſuffered, and likewiſe by inundations.

Before we take leave of Africa, it may be neceſſary to remark, what we have hinted before, that notwithſtanding the amazing diſcoveries of Columbus, anno 1492, there ſtill remain ſome countries, either abſolutely unknown, or very ſuperficially ſurveyed. It is, however, certain, that the rivers in this quarter of the globe bring down large quantities of gold, and that the ancients drew prodigious riches from a country bleſſed with a variety of climates, ſome of them the fineſt in the world. But it muſt at the ſame time be acknowledged, that the moderns are acquainted only with the ſea-coaſts of Africa, and thoſe very imperfectly; the internal parts being little known to us: nor have we any ſatisfactory accounts of their inhabitants, productions, or trade, which may in a great meaſure be aſcribed to the rude and barbarous ſtate wherein the natives have continued for a ſucceſſion of ages, which, together with the great danger that muſt attend penetrating into a country over-run with the moſt ferocious animals, render a complete ſurvey of it abſolutely impracticable.

A NEW

A NEW

HISTORICAL AND COMMERCIAL

SYSTEM OF GEOGRAPHY.

AMERICA.

INTRODUCTION.

IN this fourth diviſion of the terraqueous globe, ſeveral important objects preſent themſelves to our conſideration, namely, a deſcription of the New World, comprehending the continent of America, the Weſt-Indies, and various iſlands and places in the ſouthern hemiſphere.

Few diſcoveries have produced greater conſequences than that of America, which, being ſeparated by vaſt and boiſterous oceans from the reſt of the world, continued ſeveral thouſand years unknown. Venice and Genoa had long poſſeſſed the valuable commerce of the Eaſt, then carried on by the Red Sea; and, in conſequence of that lucrative traffick, were become the greateſt maritime powers of Europe; but though, by frequent voyages, ſeveral improvements had been introduced in the practical part of navigation, and mathematical learning began to be eſteemed in Europe; yet the knowledge of mankind was even then very imperfect, and hardly extended beyond their ſenſible horizon. However, from the ſubſequent relations, it will appear, that even the ages of ignorance are not deſtitute of men, whoſe geniuſes, ſoaring far above the contracted ſphere of their cotemporaries, make diſcoveries in ſcience thought impoſſible, and form deſigns which at once excite the envy and aſtoniſhment of mankind. As this fertile and extenſive country owes leſs to the hand of art, and more to that of nature than any other quarter of the globe; we ſhall therefore, previous to a geographical account of it, give our readers a circumſtantial detail of its firſt diſcovery.

The 15th century ſeems to have been an æra allotted by Providence for changing the diſpoſitions of mankind, and enriching the world with the moſt important diſcoveries; ſuch as, the invention of printing, the making of gunpowder, the improvement of navigation, the revival of ancient learning, and the reformation of religion—events which will render that period famous to the lateſt poſterity. It was towards the cloſe of it, when Chriſtopher Columbus, a native of Genoa, poſſeſſed of great knowledge, penetration, and ſkill in the mathematics, conceived the ſtupendous project of ſailing weſtward to the Indies, and of opening to his country a new ſource of opulence and power. This noble propoſal being rejected by the Genoeſe as chimerical, Columbus, ſtung with indignation and diſguſt, retired from his country, and applied to the court of France; but the French, with their uſual levity and ſelf-ſufficiency, laughed at and ridiculed both the projector and his deſign. A ſimilar application was made to Henry VII. of England; but the cautious politics of that prince prevented his embarking in a great but uncertain undertaking. He met with no better encouragement from the Portugueſe, who, contenting themſelves with creeping along the coaſt of Africa, and diſcovering one cape after another, had no thoughts of venturing boldly into the open ſea, and of riſking the whole at once. Columbus, however, whoſe ſpirit was too great to be broken by theſe repeated diſappointments, at length applied to the court of Spain, where, after eight years attendance, he met with ſucceſs, chiefly through the ſuperior penetration and intereſt of Queen Iſabella, who patronized the plan, and raiſed money upon her jewels to defray the expence of the expedition.

In the year 1492, Columbus ſet ſail with three ſhips only, upon the moſt adventurous attempt ever undertaken by man; and in the fate of which the inhabitants of two worlds were intereſted. In this voyage, he had many difficulties to encounter with; the moſt affecting was, the variation of the compaſs, then firſt obſerved, and which ſeemed to indicate that the laws of nature were altered on an unknown ocean, and the only guide he had left was ready to forſake him; and his ſailors, always diſcontented, now broke out into open mutiny, threatening to throw him overboard, and inſiſted on their return, but by his own firmneſs and perſeverence, after a voyage of thirty-three days, he landed on one of the Bahama iſlands.

On Thurſday, the 11th of October 1492, about ten at night, the admiral firſt diſcovered a light upon the iſland of Guanahani, or St. Salvador, as the admiral named it, in conſideration that the ſight of it delivered both him and his men from periſhing. About two in the morning, the ſhip called the Pinta, the beſt ſailer of the three, and which, therefore, uſually kept a head of the admiral, gave the ſignal for land, which was ſeen with the naked eye, when they were ſcarce two leagues from the ſhore, by Roderick de Triana, one of the common ſeamen on board the Pinta, who had not, however, a reward that was promiſed to the firſt diſcoverer, it being adjudged that the admiral was the firſt diſcoverer, becauſe he ſaw a light on the iſland the night before. The crew of the Pinta inſtantly ſang the Te Deum, as a hymn of thankſgiving to God, and were joined by thoſe of the other ſhips, with tears of joy, and tranſports of congratulation. This office of gratitude to heaven was followed by an act of juſtice to their commander; they threw themſelves at the feet of Columbus,

with

with feelings of ſelf-condemnation mingled with reverence, and implored him to pardon their ignorance, incredulity, and inſolence.

The day appearing, the ſhips came to an anchor very near the iſland, which they computed to be about fifteen leagues in length, and found it to be populous, well planted, and watered with a great lake, but generally flat, low land, without hills: the natives came down crowding to the ſhore, and ſeemed aſtoniſhed at the ſight of the ſhips; and the admiral believing there was no great danger to be apprehended from them, went on ſhore, richly dreſſed, in his boat, with the royal ſtandard, and a naked ſword in his hand; as did the other two captains in their boats with warlike muſic and colours flying. They no ſooner came on ſhore, but they kneeled down, gave God thanks for their ſucceſs, and kiſſed the ground with tears of joy; after which the admiral ſtood up, and having reared the royal ſtandard, called the iſland by the name of St. Salvador, taking poſſeſſion of it in the name of their Catholic majeſties, with great ſolemnity; after which his people recognized him their admiral and viceroy, and ſwore to obey him during the voyage.

The Indians, in the mean time, ſtood gazing at the Spaniards, without attempting to oppoſe them, while they were thus taking poſſeſſion of their country; and the admiral ordered ſome ſtrings of glaſs-beads, caps, and toys of ſmall value, that made a glittering ſhow, to be diſtributed amongſt the natives; at which they ſeemed infinitely pleaſed, and immediately hung the beads about their necks, teſtifying, by all the ſigns imaginable, the value they ſet upon theſe preſents. They were all perfectly naked, of a middle ſtature, and olive complexion, their features juſt, only their foreheads of the largeſt; their eyes black as well as their hair, which was generally cut ſhort about their ears, though others wore it long, and tied up; ſome of them alſo had their bodies painted with a kind of vermillion, and others only painted their faces with it. The principal ornament about them was a thin gold plate, in the form of a creſcent, which hung from the noſe over the upper-lip, and on their arms were ſpears, pointed with the bones of fiſh. When the admiral returned to his ſhips, they followed him; ſome ſwimming, and others in their canoes, a veſſel made out of the body of a tree, ſome of which would hold forty men and others not more than two. When they came on board, they brought parrots and cotton-yarn, and all the merchandize they had to exchange for European trifles. They ſeemed to ſet a value upon every piece of broken glaſs or earthen-ware, jumping into the ſea, and ſwimming to ſhore with ſuch trifles, with abundance of joy. But they admired nothing more than the ſwords, and bright arms of the Spaniards, being at that time perfectly ignorant of the uſe of iron.

The admiral demanding, as well as he could by ſigns, from whence they had their gold plates, they pointed to the ſouth and ſouth-weſt, where they gave the Spaniards to underſtand, there were ſeveral large countries well furniſhed with that precious metal. The admiral rowed in his boats round the iſland, to diſcover if there was any thing worth ſettling there, being followed by the iſlanders every where, who ſeemed to adore him and his people, as if they were come from heaven. From this iſland he ſailed to another of the Bahama iſlands, which he called St. Mary of Conception, and having viewed this, and ſeveral more of theſe iſlands, and found nothing to invite him to ſtay here, he took ſeven of the natives with him, and ſet ſail for the great Iſland of Cuba, which lies to the ſouthward of the Bahama iſlands, arriving there on Sunday, the 28th of October: here they found ſome houſes on the ſhore, but the people all fled up into the mountains on their approach; whereupon two Spaniards and two Indians were ſent up into the country to get intelligence; who, returning again the 5th of November, reported they travelled about twelve leagues within the land, that they came to a town conſiſting of fifty large timber-houſes, thatched, which contained about 1000 people, who came with great reſpect, and kiſſed the two Spaniards' feet, giving them boiled roots to eat. They entreated them alſo to remain in their country; and, when they ſaw them reſolved to return to their ſhips, would accompany their gueſts thither; for the two Indians had informed the natives there was no danger to be feared from the Spaniards. There were ſeveral other towns the Spaniards reported they had ſeen in their journey, where they were hoſpitably entertained, and ſaid the country was well planted with oaks, pines, palms, and cotton-ſhrubs, and ſown with Indian corn. But it being demanded of the natives, if they had any gold or precious ſtones, they pointed towards the eaſt, intimating, that in a great country, called Bohio, and which the Spaniards afterwards named Hiſpaniola, there was plenty of theſe things. Whereupon the captain determined to ſail eaſtward, and taking twelve of the natives of Cuba, men, women, and children, with him, the huſband of one of the women, and father of two of the children, who had been carried on board, came in a canoe to the ſhip, and deſired he might alſo go with them, and not be parted from his wife and children; whereupon the captain ordered him to be taken on board; and ſetting ſail from Cuba the 5th of December, arrived the next day at the iſland of Bohio, about ſixteen leagues to the eaſtward of Cuba; and here obſerving the country to reſemble that of Spain in ſeveral particulars, he gave it the name of Hiſpaniola; called its principal port Nativity; built a fort, placed a garriſon in it of thirty-three men, and then returned to Spain to give an account of his expedition.

The Spaniſh court was then at Barcelona; he entered that city in triumph, and was received by the court with the utmoſt demonſtrations of joy; and by the people with the loudeſt acclamations. He had the honour of publicly preſenting the plan, and of giving an account of his diſcoveries, to the king and queen of Spain perſonally. The Spaniards now were as eager to promote his deſigns, as they had before been dilatory. He ſet ſail a ſecond time, with a fleet of ſeventeen veſſels, containing 1500 men. In this ſecond voyage, he diſcovered Jamaica, and other iſlands; but the admiration which firſt attended his actions, being changed into envy, his enemies prejudiced the court againſt him, and he was obliged to return to Europe to juſtify his conduct.

After having cleared himſelf from the aſperſions of his foes, he proceeded on his third, and moſt important voyage; the ſucceſs of which is thus deſcribed: "On the 1ſt of Auguſt 1498, the man ſtationed in the round top ſurpriſed them with the joyful cry of land. They ſtood towards it, and diſcovered a conſiderable iſland, which the admiral called Trinidad, a name it ſtill retains. It lies on the north coaſt of Guiana, near the mouth of the Orinoco. This river, though only of the third or fourth magnitude in the New World, far ſurpaſſes any of the ſtreams in our hemiſphere. It rolls towards the ocean ſuch a vaſt body of water, and ruſhes into it with ſuch impetuous force, that when it meets the tide, which on that coaſt riſes to an uncommon height, their colliſion occaſions a ſwell and agitation of the waves, no leſs ſurpriſing than formidable. In this conflict, the irreſiſtible torrent of the river ſo far prevails, that it freſhens the ocean many leagues with its flood. Columbus, before he could perceive the danger, was entangled among thoſe adverſe currents, and tempeſtuous waves; and it was with the utmoſt difficulty that he eſcaped through a narrow ſtreight; which appeared ſo tremendous, that he called it La Boca del Drago. As ſoon as the conſternation which this occaſioned permitted him to reflect upon the nature of an appearance ſo extraordinary, he diſcerned in it

a ſource of comfort and hope; he juſtly concluded, that ſuch a vaſt body of water, as this river contained, could not be ſupplied by any iſland, but muſt flow through a country of immenſe extent, and of conſequence, that he was now arrived at that continent which it had long been the object of his wiſhes to diſcover. Nor was he miſtaken; for it amply anſwered his expectations." Many reaſons obliged him to return to Hiſpaniola, in his way to which he diſcovered the iſlands of Cubagua and Margarita, which afterwards became remarkable for their pearl fiſhery.

This great man, however, was obliged to ſubmit to innumerable mortifications; for ſuch were the clamours of his enemies, and the ingratitude of the court of Spain, that after all his ſervices in making one half of the world known to the other, he was treated like a traitor, and carried to Europe in irons. When he arrived in Spain, the court began to be aſhamed of their ungenerous treatment of this great man, and orders were inſtantly iſſued to ſet him at liberty. He vindicated his conduct, in the preſence of the king and queen, in the moſt ſatisfactory manner, and gave ample evidence of the malevolence of his enemies. Ferdinand and Iſabella expreſſed their ſorrow for what had happened, diſavowed their knowledge of it, and joined in promiſing him protection and future favour. This great man, however, retained a deep ſenſe of the indignity with which he had been treated; the fetters that he had been loaded with were conſtantly hung up in his chamber, and he gave orders that when he died they ſhould be buried in his grave. But, notwithſtanding the ill treatment which he had received, he undertook another voyage, in order to make further diſcoveries; in the courſe of which he underwent great fatigues; and, returning to Spain, ended his life at Valladolid, on the 20th of May 1506, in the 59th year of his age; dying, it is ſaid, with abundance of reſignation, under a ſenſe, no doubt, that the moſt important ſervices, attended by the moſt ſurpriſing ſucceſs, were thrown away upon an ungrateful nation: he ſaw they could not procure him a continuance of the fame he had ſo juſtly acquired, or a moment's repoſe in his old age; and that there was no reſt, or real felicity to be found on this ſide the grave. After his death indeed, his Catholic majeſty was ſo juſt to this great man, as to bury him magnificently in the cathedral of Seville, and to erect a tomb to his memory, with an inſcription, importing,

A new-found world, Columbus brave
To Caſtile and to Leon gave.

Columbus had the glory of rendering one half of the world known to the other; a glory ſo much the more precious, as it was unſullied by cruelty or rapine, which disfigured all the exploits of thoſe who came after him, and completed his plan. The ſucceeding governors of Cuba and Hiſpaniola endeavoured to purchaſe, by the blood of the natives, thoſe advantages which Columbus had obtained by his wiſe conduct and moderation. The above-mentioned iſlands contained mines of gold. The Indians only knew their ſituation; and the inſatiable avarice of the Spaniards, too furious to work by the gentle means of perſuaſion, hurried them on to acts of the moſt ſhocking violence and barbarity againſt thoſe unhappy men, who, they believed, concealed from them part of their treaſure. The ſlaughter once begun, they ſet no bounds to their fury; in a few years they depopulated Hiſpaniola, which contained 3,000,000 of the inhabitants; and Cuba, that had about 600,000. Bartholomew de la Caſas, a witneſs of thoſe atrocious depopulations, ſays, that the Spaniards went out with their dogs to hunt after men. The unhappy ſavages, almoſt naked and unarmed, were purſued like deer in the thick of the foreſts, devoured by dogs, killed by gun-ſhot, or ſurpriſed and burnt in their habitations. The ſame want of regard either to juſtice or mercy marked the future proceedings of the Spaniards; impelled by a thirſt for gold, Cortez and Pizarro made entire conqueſts of the rich kingdoms of Mexico and Peru, and, after numberleſs acts of the baſeſt treachery and tyranny, reduced the ſurviving parties to the moſt abject bondage and ſubjection. Theſe conqueſts were no leſs extraordinary for the trivial means by which they were accompliſhed, than for the ſhortneſs of time in which they were completed; for, from the departure of Columbus, in 1492, to the entire reduction of Chili; which happened in 1541, ſeven large kingdoms, inhabited by a vaſt number of warlike nations, were reduced under the Spaniſh yoke.

CHAP. I.

A General Deſcription of the Manners, Cuſtoms, Government, Religion, Character, &c. of the Natives of America.

WE now proceed to the ſtudy of thoſe particulars reſpecting different nations, which has always been conſidered as one of the moſt important branches of human learning. Perhaps in America only, it is poſſible to attain a thorough knowledge of mankind, unbiaſſed by education, unimproved by learning, and untainted by corruption. Though divided into an infinite number of nations and tribes, they differ very little from each other in their manners and cuſtoms, and all form a ſtriking portrait of the moſt diſtant nations. Whoever examines with attention the manners of the Americans, ſtudies, in ſome meaſure, the antiquities of all nations; and from which conſiderable light may be thrown upon many paſſages in ancient writers, both ſacred and profane.

The Americans are tall, and have ſtraight limbs: their bodies are ſtrong, but of a ſpecies of ſtrength rather adapted to ſupport a ſeries of hardſhip, than to perform laborious work: it is the ſtrength of a beaſt of prey, rather than that of a beaſt of burden. Their bodies and heads are flattiſh, the effect of art; their features are regular, but their countenances fierce; their hair long, black, and ſtrong, as that of a horſe. They have no beards. The colour of their ſkin is of a reddiſh brown, which, being admired among them, is improved by the conſtant uſe of bears fat and paint.

The character of the Indians is founded upon their circumſtances and way of life; on any ſerious occaſion they are grave even to ſadneſs; obſervant of thoſe in company; reſpectful to the aged; of a temper cool and deliberate, they never ſpeak before they have well conſidered the matter, and are ſure the perſon who ſpoke before them has entirely finiſhed. Hence they have the greateſt contempt for the vivacity of the Europeans, who continually interrupt each other, and frequently ſpeak all together. Nothing is more edifying than their behaviour in their aſſemblies and public councils. Every man there is heard in his turn, according as his years, his wiſdom, or his ſervices to his country have ranked him. No indecent condemnation or ill-timed applauſe is ever heard. The young attend for inſtruction. Here they learn the hiſtory of their nation; here they are inflamed with the ſongs of thoſe who celebrate the heroic actions of their anceſtors; and here they are taught the intereſts of their country, and the manner in which they ought to be purſued, The laws of hoſpitality are ſacred among them. Their generoſity to their friends is unbounded; but to the enemies of his country, or to thoſe who have privately offended,

the American is implacable. He conceals his ſentiments, he appears reconciled, until by ſome treachery or ſurpriſe he has an opportunity of executing a horrible revenge. To ſuch extremes do the Indians puſh their friendſhip or their enmity; and ſuch indeed, in general, is the character of all uncultivated minds.

The prevailing paſſion of the Americans is liberty in its fulleſt extent. To this they ſacrifice every thing. This is what renders a life of uncertainty and want ſupportable; and their education is directed principally to cultivate and cheriſh this diſpoſition. They know no puniſhment but death; and even when this is inflicted, it is rather a conſequence of a ſpecies of war declared againſt a public enemy, than an act of judicial power executed on a citizen or ſubject. This free diſpoſition is general, and though ſome tribes are found in America, with a head, whom they call a king, his power is rather perſuaſive than coercive, and he is reverenced as a father more than feared as a monarch. He has no guards, no priſons, no officers of juſtice. The other forms, which may be conſidered as a ſpecies of ariſtocracy, have no more power. In ſome tribes, indeed, there ſubſiſts a kind of hereditary nobility, who, when they come to years of diſcretion, are entitled to a ſeat and vote in the council of their nation, from which the reſt are excluded. Their great council is compoſed of theſe heads of tribes and families, with ſuch whoſe capacity has raiſed them to the ſaid degree of conſideration. Theſe councils are public, and in them all matters which concern the ſtate are propoſed and determined. Here their orators are employed, and diſplay thoſe talents which diſtinguiſh them for eloquence and the knowledge of buſineſs, in both which ſome of them are admirable. Their principal ſkill conſiſts in giving an artful turn to affairs, and in expreſſing their thoughts in a bold, figurative manner, ſtronger than the refined nations of Europe can bear, and with geſtures equally violent, but often extremely natural and expreſſive.

The ſame council of their elders regulates whatever regards the internal peace and order of the ſtate. Their ſuits are few and quickly decided, having neither property nor art ſufficient to render them perplexed or tedious. Criminal matters come before the ſame juriſdiction, when they are ſo flagrant as to become a national concern. In ordinary caſes, the crime is either revenged or compromiſed by the parties concerned. The ſupreme authority of the nation beholds the action without concern, and never rouſes its ſtrength, nor exerts the fulneſs of a power more revered than felt, but upon the ſame ſignal occaſion. Then the power ſeems equal to the occaſion. Every one haſtens to execute the orders of their ſenate; nor ever was there an inſtance of diſloyalty or rebellion known among this people. Governed as they are by manners, not by laws, example and education inſpire them with the moſt religious regard for their conſtitution, and the cuſtoms of their anceſtors.—Family love, ſo rare among us, is a virtue among them, of which all partake. Friendſhips are found among them that may vie with thoſe of fabulous antiquity; and where ſuch friendſhips exiſt, the families concerned congratulate themſelves as upon an acquiſition that promiſes to them a mutual ſtrength, and to their nation the greateſt honour and advantage.

This band of friendſhip connects the whole ſociety; and the loſs of any one of their people, whether by war or a natural death, is lamented by the whole town to which he belongs. No buſineſs, however important, is taken in hand, no rejoicing, however intereſting the occaſion, is heard, till all the pious ceremonies due to the dead are performed; and theſe are always executed with the greateſt ſolemnity. The dead body is waſhed, anointed, and painted, ſo as in ſome meaſure to abate the horrors of death. It is then followed by the whole village with mourning and lamentations to the grave, and there interred in the moſt pompous ornaments of the deceaſed.—His bow and arrows, together with the things he moſt valued, and proviſions for the long journey he is to take, are placed by him in the grave. After the funeral, thoſe who are nearly allied to him conceal themſelves a conſiderable time in their huts to indulge their grief. The compliments of condolence are never omitted, nor are preſents wanting on this occaſion. After ſome time, they reviſit the grave, they renew their ſorrow, they clothe the remains of the body in new ornaments, and repeat the ſolemnities of the firſt interment.

But the moſt ſtriking inſtance of their friendſhip, and, at the ſame time, the greateſt inſtance of their regard to their deceaſed brethren, is what they call the feaſt of the dead, or the feaſt of ſouls: a feaſt celebrated every eight or ten years. The day for this ceremony is appointed in the council of their chiefs, who give orders for every thing neceſſary for celebrating it with pomp and magnificence. The riches of the nation is exhauſted on this occaſion, and all the ingenuity of the Indians diſplayed. The neighbouring people are invited to partake of the feaſt, and be witneſſes of the ſolemnity. All thoſe who have died ſince the laſt feaſt of ſouls are now taken out of their graves. Thoſe who have been interred at the greateſt diſtance from the villages are diligently ſought for, and brought to this great rendezvous of carcaſes.

The horror of this general diſinterment is painted in a ſtriking manner, by the ingenious Lafitau:—"Without queſtion, ſays that elegant writer, the opening of theſe tombs diſplays one of the moſt ſtriking ſcenes that can be conceived;—this humbling portrait of human miſery, in ſo many images of death, wherein ſhe ſeems to take a pleaſure in painting herſelf in a thouſand ſhapes of horror, in the ſeveral carcaſes, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered, others have a ſort of parchment upon their bones, ſome look as if they were baked and ſmoked, without any appearance of rottenneſs; ſome are juſt turning towards the point of putrefaction, while others are ſwarming with the worms, and drowned in corruption. I know not which ought to ſtrike us moſt, the horror of ſo ſhocking a ſpectacle, or the tender piety and affection of theſe poor people towards their departed friends; for nothing ſurely deſerves our admiration more, than the eager diligence and attention with which they diſcharge this melancholy duty of their tenderneſs; handling the carcaſes, loathſome and diſguſting as they are, cleanſing them from the worms, and carrying them upon their ſhoulders through tireſome journeys of ſeveral days, without being diſcouraged by their inſupportable ſtench, and without ſuffering any other emotions to ariſe, than thoſe of regret for having loſt perſons who were ſo dear to them in their lives." When all the bodies they can poſſibly collect are brought to the great rendezvous of mortality, they are dreſſed in the fineſt ſkins they can procure. A feaſt is held on this ſolemn occaſion, when their great actions are celebrated, and all the tender intercourſes that took place between them are recounted. A large pit is dug in the ground, and the bodies re-interred with pomp, with mourning, and with lamentation. In this manner they endeavour to ſoothe the calamities of life by the honours they pay to their dead; honours which are the more cheerfully paid, becauſe each in his turn expects to receive them himſelf. Though among theſe ſavage natives this cuſtom is impreſſed with ſtrong marks of the ferocity of their nature, an honour for the dead, a tender feeling of their abſence, and a revival of their memory, are ſome of the moſt excellent inſtruments for ſmoothing our rugged

nature

nature into humanity. In civilized nations ſuch ceremonies are leſs practiſed, becauſe other inſtruments for the ſame purpoſes are leſs wanted; but it is certain a regard for the dead is ancient and univerſal.

The principal occupations of a North American Indian are hunting and war. He is never conſidered as a brave and uſeful man among his tribe, till he has increaſed the ſtrength of his country with a captive, or adorned his hut with the ſcalp of an enemy. When their chiefs reſolve upon a war, they do not always declare what nation they mean to attack, that the enemy upon whom they intend to fall may be off his guard. Sometimes whole years are ſuffered to elapſe, that the vigilance of the enemy may be entirely ſuſpended by the uncertainty of the danger: in the mean time, they are not idle at home. The principal captain ſummonſes the youth of the town to which he belongs, the war-kettle is ſet on the fire; the war-ſong and dances commence; the hatchet is ſent to all the villages of the ſame nation, and to all its allies, who are expected not only to adopt their enmities, but to have their reſentment wound up to the ſame pitch of reſentment with themſelves: the fire catches, the war-ſongs are heard in all parts, and the moſt hideous howlings, without intermiſſion, day and night, are heard over that whole tract of country. The women add their cries to thoſe of the men, lamenting the friends they have loſt either in war, or by a natural death, and demanding their places to be ſupplied by captives from the enemy. A variety of ceremonies ſucceed; none are forced into the war; but when they have given ſmall billets of wood to the war-captain, they are conſidered as enliſted, and it is then death to recede. All the warriors have their faces blackened with charcoal, intermixed with daſhes and ſtreaks of vermillion, which give them a moſt horrid appearance. They then exchange their clothes with their friends, and diſpoſe of all their finery to the women, who accompany them to a conſiderable diſtance, to receive thoſe laſt tokens of their inviolable friendſhip and eſteem.

The requiſite qualities of an Indian warrior are vigilance and attention, to give and to avoid a ſurpriſe, and patience and ſtrength to endure the intolerable fatigues and hardſhips which always attend it. The nations of Indians in America are ſeparated by vaſt deſert frontiers, and hid in the boſoms of thick, gloomy, and almoſt boundleſs foreſts: theſe muſt be traverſed before they meet an enemy, who often reſides at ſo great a diſtance as it is reaſonable to ſuppoſe muſt prevent either quarrel or danger. But it ſhould be remembered, that the Indians take no pains to give their wars even a colour of juſtice. Their only motives for attacking an enemy are either to obtain the glory of the victory, or to procure captives, in order to increaſe the ſtrength of their nation, or to furniſh them with victims for the exerciſe of their brutal fury.

The nation they intend to attack is ſometimes wholly ignorant of any danger, and falls an eaſy prey to the unexpected fury of the invaders; but it more frequently happens that the nation devoted to deſtruction has notice of the deſign, and is prepared to take the ſame advantage of the leaſt want of vigilance in the aggreſſors. They never fight in the open field but on ſome very extraordinary occaſions. Secrecy is the ſoul of all their actions, and on this the ſucceſs of the expedition entirely depends. During their tedious march they light no fire to warm themſelves, or dreſs their victuals, but ſubſiſt wholly on the miſerable pittance of a little meal mixed with water; they lie cloſe to the ground during the whole day, and march only in the night, and even then with the greateſt precaution. When they diſcover an army of the enemy, they throw themſelves flat on their faces among the withered leaves, the colour of which their bodies are painted to reſemble exactly. They generally let a part paſs unmoleſted, and then riſing a little, and ſetting up a moſt tremendous ſhout, which they call the War-hoop, they pour a ſtorm of muſket-bullets upon the enemy. The party attacked returns the ſame cry, and every man ſhelters himſelf behind a tree, and returns the fire of the adverſe party the moment they riſe themſelves from the ground to give the ſecond fire. After fighting for ſome time in this manner, they leave their covert, and ruſh upon each other with ſmall axes, which they dart with great addreſs and dexterity. The conteſt is ſoon decided, and the conquerors ſatiate their ſavage fury with the moſt horrid inſults and barbarities on the dead bodies of the enemy, which they ſcalp, and treat in a manner ſhocking to humanity.

The fate of a North American Indian, who has the misfortune to be taken priſoner, is ſtill more ſevere, unleſs he has the good fortune to pleaſe the capricious humour of the enemy; it being cuſtomary to offer a ſlave to each cottage that has loſt a friend, and he is either received into the family, or ſentenced to death. If the former, the priſoner is adopted in the place of the father, ſon, or huſband that is loſt; and no other mark of captivity remains, than a prohibition of returning; to attempt this would be certain death: but if the priſoner is refuſed, it is no longer in the power of any one to ſave him. The nation is aſſembled; a ſcaffold is raiſed, and the priſoner is faſtened to the ſtake. He immediately opens his death-ſong, and prepares for the enſuing ſcene of cruelty with a moſt undaunted courage, while his perſecutors make ready to put it to the utmoſt proof by every torment which the mind of man, ingenious in miſchief, can invent. The priſoner ſuffers all their tortures with a conſtancy and reſolution that appears more than human. Not a groan, not a ſigh, not a diſtortion of countenance eſcapes him; he poſſeſſes his mind entirely in the midſt of his torments; and (aſtoniſhing to relate!) the women, forgetting the human as well as the female nature, and transformed into ſomething worſe than furies, will even outdo the men in this horrid tragedy. It is ſhocking to dwell on a ſcene of cruelty, which degrades human nature to a degree below the ferocious beaſts of the foreſt: let it ſuffice to ſay, that the torments inflicted, could only be invented and executed by perſons nurſed in barbarity, and wholly deſtitute of the common feelings of mankind for objects in diſtreſs. Theſe circumſtances of cruelty, however, ſerve to ſhew, in the ſtrongeſt light, to what an inconceivable degree of barbarity and infernal rage the paſſions of men may carry them, when untamed by the refinements of poliſhed ſociety, and uninfluenced by the benign dictates of Chriſtianity; a religion that teaches compaſſion to our enemies, which is neither known nor practiſed in other inſtitutions; and which will tend to make us more ſenſible, than ſome appear to be, of the value of commerce, the arts of civilized life, and the light of literature, which, if they have abated the force of natural virtues, by the luxury which attends them, have taken out likewiſe the ſting of our natural vices, ſoftened the ferocity of the human race, improved their intellectual powers, rendered men more uſeful members of ſociety, and, in ſome meaſure, deſerving of the character of rational and accountable beings.

Religion is little known, and leſs practiſed by the American Indians: if we except the inhabitants of Mexico and Peru. The Indians have no temples. Some of them have very little idea of a God: others entertain better notions; they hold the exiſtence of a Supreme Being, eternal and incorruptible, who has power over all things that exiſt. Satisfied with this acknowledgment, they pay him no ſort of worſhip. There are, indeed, nations, who ſeem to pay ſome religious homage to the ſun and moon; and as moſt of them have a notion of the exiſtence of inviſible beings who intermeddle in their affairs, they often

often mention demons and other ſpirits, particularly one whom they call Areſkoui, or the god of war, whom they always invoke before they march againſt an enemy. They have alſo ceremonies that ſeem to ſhew they had once a more regular form of religious worſhip; for they make a ſort of oblation of their firſt fruits; obſerve certain ceremonies at the new and full moon, and have in their feſtivals many things that very probably flowed from a religious origin, though they now perform them as things handed down from their anceſtors, without knowing or enquiring into the reaſon. Though deſtitute of religion, they abound in ſuperſtitions. They are great obſervers of omens and dreams, and pry into futurity with the greateſt eagerneſs. Hence their country abounds in diviners, augurs, and magicians; and on their predictions they firmly rely in all their affairs, whether they relate to health, to war, or to hunting.

Agriculture, and the whole care of the family, devolves upon the women: but though they bear the laborious weight of œconomy, they are far from being the ſlaves they appear, and are not at all ſubject to the great ſubordination in which they are placed in countries where they ſeem to be more reſpected. On the contrary, all the honours of the nation are on the ſide of the women. They even hold their councils, and have their ſhare in all deliberations which concern the ſtate; nor are they found inferior to the part they act. Polygamy is practiſed in ſome nations, but it is not general. Incontinent before wedlock, but after marriage the chaſtity of their women is remarkable. The puniſhment of the adultereſs, as well as the adulterer, is in the hands of the huſband himſelf; and it is often ſevere, as it is inflicted by one who is at once the injured party and the judge.

The continent of America, often known by the name of the New World, extends from about 80 deg. north lat. to the Streights of Magellan, in 53 deg. ſouth lat. ſome geographers extend it to the ſouthern extremity of Terra del Fuego, in the lat. of 55 deg. 42 min. but as that country is an iſland, it ought not to be conſidered in the dimenſions of the American continent. The breadth is very various; in ſome places it ſtretches from the 35th to the 136th deg. of long. It is above 9000 Engliſh miles in length, and enjoys the principal climates of both hemiſpheres. It is bounded on the north by unknown countries; on the ſouth by the Southern Ocean; on the eaſt by the Atlantic; and on the weſt by the Great South Sea, or Pacific Ocean. It conſiſts of two large continents, joined together by a narrow neck of land, called the Iſthmus of Darien; and diſtinguiſhed by the epithets north and ſouth. A great variety of iſlands are ſcattered on both ſides of America; but the moſt remarkable are ſituated in a large gulf formed by the coaſts of the northern and ſouthern continents, and thoſe of the Iſthmus of Darien. Some of theſe iſlands are very large, moſt of them fertile, and the greater part full of inhabitants. They are called the Weſt Indies, and will be deſcribed in their proper place.

Theſe continents are ſubdivided into a great number of parts; but before we proceed to lay down theſe ſubdiviſions, and to deſcribe the different countries, it will be proper to take notice of ſome mountains and rivers, which, as it were, diſdain to be confined within the limits of any particular province. The moſt remarkable mountains in South America, form that prodigious chain called the Andes, or Cordilleras. This ridge begins in the Terra Magellanica, the ſouthernmoſt country of South America, traverſes the kingdom of Chili, the provinces of Buenos Ayres, Peru, and Quito; where, contracting themſelves, as it were, for a paſſage through the Iſthmus of Darien, they again expand their ample dimenſions, and continue their courſe through the provinces and kingdoms of Nicaragua, Guatemala, Coſta Rica, St. Miguel, Mexico, La Puebla, and others; with ſeveral arms or ramifications for ſtrengthening, as it were, the conjunction between the northern and ſouthern continents of America. In the province of Quito the Andes form a double chain, called the Cordilleras of the Andes; and between theſe two ridges, the city of Quito, and a large extent of fertile lands are ſituated. The mountains which form the Andes extend above 5000 Engliſh miles in length: nor is their height leſs remarkable than their extent; their ſummits are always covered with ſnow, even in the midſt of the torrid zone. Many of them are volcanoes, and the greater part of them mines of the moſt precious metals. North America has alſo ſeveral lofty and extenſive chains, the principal of which are called the Allegany, or Apalachian mountains.

North America is watered by innumerable rivers, ſome of which are very remarkable, and will be deſcribed in their reſpective provinces. The river Miſſiſſippi, riſing from unknown ſources, runs a prodigious courſe from north to ſouth, and receives the vaſt tribute of the Ohio, the Ouabache, and other immenſe rivers, navigable almoſt to their very ſources, and laying open the inmoſt receſſes of that continent. Near the heads of theſe rivers are five great lakes, or rather ſeas of freſh water, communicating with each other, and all with the ocean by the river St. Laurence. Theſe afford ſuch an inlet for commerce, as muſt be productive of the greateſt advantages, whenever the adjacent countries ſhall be fully inhabited by an induſtrious and civilized people. The eaſtern ſide of North America is watered by the noble rivers of Hudſon, Delawar, Suſquehanna, Patowmack, and ſeveral others of great depth, length, and commodious navigation. Many parts are indeed ſo interſected with navigable rivers and creeks, that great numbers of the planters may, without exaggeration, be ſaid to have each a harbour at his own door.

South America has three of the largeſt rivers in the world, the river of the Amazons, the river Plata, and the river Oroonoko. The firſt has its ſource in the lake of Lauricocha, near the city of Guanaco, in 11 deg. ſouth lat. In its courſe, it receives all the rivers and ſtreams iſſuing from the eaſtern Cordilleras of the Andes, between its ſource, and the government of Popayan, and at laſt becomes rather a ſea than a river, and falls into the ocean under the equinoctial. Its length, reckoning its turnings and windings, is at leaſt 3300 miles. The river Plata riſes in the audience of the ſame name in the eaſtern Cordillera of the Andes, and after running through many territories, and adding fertility to a great extent of country, falls into the ocean with ſuch rapidity, that the water is freſh many leagues from the land. The Oroonoko has its riſe near Popayan, in Terra-Firma, and, after a courſe of 700 miles, falls into the ſea in 9 deg. 13 min. north latitude.

The vaſt extent of South America, which lies on each ſide of the equator, occaſions it to have a variety of ſoils as well as climates. Here are produced moſt the metals, minerals, plants, fruits, trees, and wood, to be met with in other parts of the world, and many of them more valuable and in greater quantities. Europe has been ſupplied with ſuch immenſe quantities of gold and ſilver from America, that thoſe valuable metals are become much more common than formerly; and the gold and ſilver of Europe now bear little proportion to the high price they bore upwards of a century ago. This country alſo produces diamonds, pearls, emeralds, amethyſts, and other coſtly ſtones, which, by being brought in great numbers into Europe, have contributed likewiſe to reduce their value.

Spaniſh America, beſides the chief part of the above-mentioned productions, abounds with a great number of other commodities, which, though of leſs

price, are of much greater uſe. They conſiſt of cochineal, indigo, annatto, logwood, braſil, fuſtic, pimento, lignum vitæ, rice, ginger, cocoa, ſugar, cotton, tobacco, barillas, red-wood, the balſams of Tolu, Peru, and Chili; Jeſuits-bark, mechoacan, ſaſſafras, ſarſaparilla, caſſia, tamarinds, hides, furs, ambergris, and a great variety of woods, roots, and plants, which, before the diſcovery of America, the Europeans bought of the Venetians and Genoeſe at an extravagant price. The ſoil of this continent is ſo fertile, that many exotic productions are raiſed here in great perfection. A variety of excellent fruits alſo grow wild here, as pine-apples, pomegranates, citrons, lemons, oranges, malicatons, cherries, pears, apples, figs, grapes, great numbers of culinary, medicinal, and other herbs, roots, and plants.

America, ſo far as known, is chiefly claimed, and divided into colonies, by the Spaniards, Engliſh, and Portugueſe; for the French and Dutch having only ſome forts upon Surinam and Guiana, ſcarcely deſerve to be conſidered as proprietors of any part of the ſouthern continent. The Spaniards, who were the firſt diſcoverers of this country, have the largeſt and richeſt portion, extending from New Mexico and Louiſiana, in North America, to the Streights of Magellan, in the South Sea, excepting the large province of Braſil, which belongs to the Portugueſe.

Before the late unhappy war, Great-Britain was, next to Spain, the moſt conſiderable proprietor of America: ſhe derived her claim to North America from the firſt diſcovery of that continent by Sebaſtian Cabot, in the name of Henry VII. anno 1497, about ſix years after the diſcovery of South America by Columbus. This country was at firſt called Newfoundland, and it was a long time before the Engliſh attempted to ſettle it. The great Sir Walter Raleigh firſt ſhewed the way, by planting a colony in the ſouthern part, to which he gave the name of Virginia, in honour of his miſtreſs Queen Elizabeth. From this period, till the concluſion of the late war, the French laid a claim to, and actually poſſeſſed Canada and Louiſiana, which included all that extenſive inland country reaching from Hudſon's-Bay, on the north, to Mexico and its gulf on the ſouth; regions which all Europe could not people in many ages: but no territory, how extenſive ſoever, nor could the moſt boundleſs empire gratify the ambition of that aſpiring nation; wherefore, during the moſt ſolemn treaties, they continued to make gradual advances upon the Engliſh back ſettlements, and rendered their acquiſitions more ſecure and permanent, by a chain of forts well ſupplied with all kinds of warlike ſtores. They laboured at the ſame time, by various arts, induſtriouſly to gain the friendſhip of the Indians, even by intermarriages, and not only trained theſe ſavages to the uſe of arms, but infuſed into them the moſt unfavourable notions of the Engliſh, and the ſuperior ſtrength of their nation.

The Britiſh colonies, thus hemmed in, and confined to a ſlip of land along the ſea-coaſt, by an ambitious and powerful nation, the rivals and natural enemies of Great-Britain, began in 1755 to take the alarm. The Britiſh empire in America, ſcarcely raiſed from its infant ſtate, was threatened with a total diſſolution. In their diſtreſs, they ſolicited the aſſiſtance of the mother country. The bulwarks and thunder of England, accompanied with powerful armies, commanded by a ſet of heroes, the Scipios of that age, were ſent to their relief. A long war ſucceeded, in which the coloniſts took an active part, and ſucceſs every-where attended the Britiſh arms; ſo that after a very bloody and obſtinate conteſt, the French were driven from Canada and its dependencies, and obliged to relinquiſh all that part of Louiſiana lying on the eaſt ſide of the Miſſiſſippi. Thus at an immenſe expence, and with the loſs of many brave men, our colonies were preſerved and ſecured to us, whereby we had poſſeſſion of a territy, which, from north to ſouth, extended near 400 miles in a direct line; but to the weſtward our boundaries reached to countries unknown, even to the native Indians; a tract ſuppoſed to be nearly equal to all Europe. But all our flattering proſpects reſpecting the American poſſeſſions are now annihilated by the late unhappy war, which, after a continuance of eight years, with a prodigious expence of blood and treaſure, terminated in their entire diſunion from Great-Britain, and in the eſtabliſhment of a new republic, ſtyled, *The Thirteen United States of America.* This vaſt country is waſhed all the way by the Atlantic Ocean on the eaſt, and by the Gulf of Mexico on the ſouth.

The Spaniards, Engliſh, and French, poſſeſs the multitude of iſlands which lie between the two continents of North and South America. Three or four ſmall iſlands indeed belong to the Dutch, but theſe, in any other hands, would be of no conſequence; and the Danes have one or two, but they are too inconſiderable to entitle the owners to a claim on America. The French, it is ſaid, have lately ceded to Sweden the ſmall iſland of St. Bartholomew.

In deſcribing the ſituation, extent, and boundaries of the numerous colonies which now compoſe that great empire, we have totally rejected the accounts given us by partial writers, who have wandered ſo widely from the truth, and who ſeem either unacquainted with the ſubject, or have been at no pains to conſult the lateſt and moſt authentic materials. This we thought neceſſary to premiſe, that the reader may be prepared for the following Table, being compoſed from the lateſt treaties and partitions, and the beſt maps and drawings; the ſureſt guides in giving the geography of theſe important provinces.

The following Tables, exhibit the Situation of the Countries which compoſe North-America with reſpect to each other, and the ſeveral Particulars relative to each.

Colonies.	Length.	Breadth.	Sq. Miles.	Chief Towns.	Belonging to
New Britain	850	750	318,750		Great-Britain
Province of Quebec	600	200	100,000	Quebec	Ditto
New Scotland, New Brunſwick	350	250	57,000	Halifax, Shelburne	Ditto
New England*	550	200	87,000	Boſton	United States
New York	300	150	24,000	New York	Ditto
New Jerſey	160	60	10,000	Perth Amboy	Ditto
Pennſylvania	300	240	15,000	Philadelphia	Ditto
Maryland	140	135	12,000	Annapolis	Ditto
Virginia	750	240	80,000	Williamſburgh	Ditto
North Carolina, South Carolina, Georgia	700	380	110,000	Edenton, Charleſton, Savannah	Ditto
Eaſt Florida, Weſt Florida	500	440	100,000	St. Auguſtine, Penſacola	Spain
Louiſiana	1200	645	516,000	New Orleans	Ditto
New Mexico and California	2000	1000	600,000	St. Fee, St. Juan	Ditto
Mexico, or New Spain	2000	600	318,000	Mexico	Ditto

* It may be neceſſary to obſerve here, in order to prevent miſtakes, that though the above Table, containing the territories now belonging to the United States of America, is ſtrictly accurate; yet as New-England therein compriſes four provinces, viz. New-Hampſhire, Maſſachuſett's-Bay, Rhode-Iſland and Providence Plantations, with Connecticut; and Pennſylvania includes Delaware; thoſe four, therefore when added to the reſt beginning at New-York, will compoſe the whole Thirteen Provinces claimed by, and appropriated to the Americans, when they withdrew their allegiance from Great-Britain, and aſſerted in Congreſs their independence, on the 4th of July 1776; and which provinces are generally arranged in the following order: New-Hampſhire, Maſſachuſett's-Bay, Rhode-Iſland and Providence Plantations, Connecticut, New-York, New-Jerſey, Pennſylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia.

GRAND DIVISIONS OF SOUTH AMERICA.

Nations.	Length.	Breadth.	Chief Towns.	Belonging to
Terra Firma	1400	700	Panama	Spain
Peru	1800	500	Lima	Ditto
Amazonia	1200	960	Little known	
Guiana	780	480	Surinam, Cayenne	Dutch and French
Braſil	2500	700	St. Salvador	Portugal
Paraguay	1500	1000	Buenos Ayres	Spain and Jeſuits
Chili	1200	500	St. Jago	Spain
Terra Magellanica, or Patagonia	700	300	Not ſettled	Ditto

CHAP. II.

NEW-BRITAIN.

Its Situation, Boundaries, Mountains, Rivers, Soil, Woods, Vegetables, Animals, Natives, and Hiſtory.

THIS country, which lies round Hudſon's-Bay, and is commonly called the country of the Eſquimaux, comprehending Labrador, New North and South Wales, is ſituated between 50 and 62 deg. of north lat. and between 50 and 95 deg. of weſt long. It is bounded by unknown lands and frozen ſeas about the pole, on the north; by the Atlantic ocean and Baffin's Bay, on the eaſt; by the bay and river of St. Laurence and Canada, on the ſouth; and by unknown lands, on the weſt.

The mountains towards the north are exceeding lofty, and their tops perpetually covered with ſnow: as the winds blow from thence three quarters of the year, the winter all over this country is extremely ſevere and cold.

The chief rivers are the Mooſe, Severn, Rupert, Nelſon, Albany, and Black River. Hudſon's-Bay, which includes ſeveral others, is the principal; its extent in length is about 690 miles, its northern boundry is placed at Davis's Streights; the other chief ſtreights are thoſe of Hudſon and Belleiſle.

The ſoil of this country is in general barren, owing to the great ſeverity and rigour of the climate; even the hardy pine-tree is not ſeen, and the cold womb of the earth produces only ſome miſerable ſhrubs; every kind of European ſeed brought hither has periſhed; but as the place from whence the ſeed comes is of great moment, it is therefore probable that the ſeed of corn brought from the northern parts of Sweeden and Norway, might thrive better in this inhoſpitable climate.

The woods in this part of the world abound in mooſe-deer, elks, ſtags, rein-deer, bears, tygers, buffaloes, wolves, foxes, beavers, otters, lynxes, ermins, martens, ſquirrels, wild-cats, and hares. The fowls found here are geeſe, buſtards, ducks, partridges, and many other ſorts, both wild and tame. In the

ſeas are found whales, morſes, ſeals, cod, and a white fiſh preferable to herrings; and the rivers and freſh waters furniſh plenty of pike, perch, carp, and trout.

One general remark here may not be improper: it is this, that the animals of America are neither ſo large nor ſo fierce as thoſe of Aſia and Africa; and even thoſe which are ſent hither from Europe are found to degenerate. The tapurette, which is the largeſt animal found in the New World, does not exceed in ſize a well grown calf; whereas the Aſiatic elephant often grows to above fifteen feet in height; and there is ſtill a greater diſproportion between the lama of America, and the African camel. The tyger of Bengal has been ſometimes known to meaſure twelve feet in length, while the congar, or tyger of America, does not exceed three; and the American toqua and toquaretti are deſpicable, in compariſon of the Aſiatic leopard and panther. It is obſervable, however, that though the quadrupeds of the new continent are greatly inferior in ſize to thoſe of the old, they are much more numerous; the goat, exported from Europe to South America, will, in a few generations, become much leſs, as well as more prolific, and, inſtead of one or two kids at a time, generally produces five, ſix, and ſometimes more. The wiſdom and goodneſs of Providence is very conſpicuous, in cauſing the ſmalleſt animals to multiply in the greateſt proportion, and the moſt formidable to be leſs prolific; for had the elephant, the rhinoceros, and the lion been endued with the ſame degree of fecundity with the rabbit or the rat, all the arts of man would not have been ſufficient to check their outrage, and we ſhould ſoon perceive them become the tyrants of thoſe who now call themſelves the maſters of the creation, to the endangering the utter extirpation of the human ſpecies.

In ſummer the animals in the northern extremities of America are of a variety of colours, as in other parts of the world: but as ſoon as the winter approaches, they gradually change; the beaſts and many of the birds, becoming as white as the ſnow with which the ground is covered. Even the dogs and cats carried from England to Hudſon's-Bay, are ſubject to the ſame alteration, and acquire a much longer, ſofter, and thicker fur, than they had in their own climate.

The lands near the ſouth parts of Hudſon's-Bay produce large timber and plenty of herbage, and, if properly cultivated, might yield corn. About Fort Nelſon, the country, which is low and marſhy, produces juniper, birch, poplar, and a ſmall tree of the ſpruce kind; but there is little other herbage, beſides moſs.

The Eſquimaux Indians, who inhabit the inland parts of Labrador, are the moſt cowardly, ferocious, and untractable people in America. They lead a vagrant life, have no ſettled habitations, nor do we know of any villages or towns among them; but they are extremely numerous, and ſo miſchievous, that often, during the night, they will cut the cables of ſhips, that they may enjoy their wrecks in the morning. They trade with the European veſſels, exchanging the furs of their country for knives, ſciſſors, pots, kettles, and other hardware; but they are never ſuffered to come on board in too great numbers, inſtances having been known where they have maſtered the crew, and plundered the ſhip. The food of theſe, and the American Indians in general, conſiſts chiefly in what they take by hunting and fiſhing. They clothe themſelves in winter with beaver ſkins, which they oil and greaſe in the ſame manner as they do their own in ſummer, which prevents both the cold and heat from penetrating them. They wear a kind of buſkins on their legs, and ſhoes of deer ſkins; they uſe alſo beaver ſkins and furs for their beds and covering in the night. A number of Indian men, and ſome women, come down annually, in about ſix hundred canoes, to Fort-Nelſon, in order to trade with the Engliſh. Theſe people are of a darker complexion, and ſmaller ſize than thoſe of Labrador, but they are much more gentle and tractable. They wear ſcarce any cloaths in ſummer, but anoint themſelves with bear's greaſe, or the oil of ſeals, which defends them from the attacks of muſquetoes, bugs, and other troubleſome inſects. Many of them come from very diſtant countries, and their voyages are rendered ſtill longer, by being obliged to go on ſhore every day to hunt for proviſions, their canoes, or kiacks, which they manage very dexterouſly, being only large enough to contain two perſons, and a parcel of beaver-ſkins. The people of this country bear no reſemblance in their ſhapes and faces to the ſouthern Americans; but are much more like the Laplanders and Samoïeds of Europe, from whom they are very probably deſcended.

The commerce with this country is carried on by a company conſiſting of nine or ten perſons, called the Hudſon's-Bay company, who, in 1670, obtained an excluſive charter for trading to this bay, and they have acted under it ever ſince with great benefit to themſelves, though comparatively with little advantage to Great-Britain. The fur and peltry trade might be carried on to a much greater extent, were it not entirely in the hands of this excluſive company, whoſe intereſted, not to ſay iniquitious ſpirit, has been the ſubject of long and juſt complaint. The company employ four ſhips, and 130 ſeamen. They have ſeveral forts; viz. Prince of Wales's Fort, Churchill River, Nelſon, New Severn and Albany, which ſtand on the weſt ſide of the bay. In May 1782, the French took and deſtroyed theſe forts, ſettlements, &c. by which the company ſuſtained a loſs of near 500,000l. They export commodities to the value of 16,000l. and in return they bring home to the amount of 29,340l. which yield to the revenue 3,734l. This includes the fiſhery in Hudſon's-Bay. Small as this commerce is, it affords immenſe profits to the company, and even ſome advantage to our manufactures here; for as the Indians are not very nice in their choice, ſuch commodities of Britiſh manufacture are ſent them, as we have great plenty of, ſome of which would not meet with a market elſewhere. In exchange for theſe, they have deer, beaver, and other ſkins, caſtor, feathers, whalebone, and blubber. Since our conqueſt of Canada, the trade of this company is leſs advantageous; but the profit it affords in its preſent reſtrained ſtate, prove inconteſtably the immenſe benefit that would accrue to Great-Britain, by throwing open the trade to Hudſon's-Bay.

HISTORY OF NEW-BRITAIN.

Theſe northern countries and ſeas were not diſcovered till long after the other parts of the new world were known; and might perhaps ſtill have remained in obſcurity, had not the active genious of mankind prompted them to make diſcoveries of a very different nature. As early as the year 1576, a project ſtarted in England, for the diſcovery of a North-Weſt paſſage to China, and the Eaſt-Indies. Frobiſher only diſcovered the main of New-Britain, or Terra de Labrador, and thoſe tracts which bear his name; but failing in his principal attempt, the deſign was laid aſide till the year 1585, when John Davis ſailed from Portſmouth, and ſurveyed the coaſts of Labrador; but did not extend the diſcoveries of his predeceſſor. Hudſon a very able ſeaman, and experienced, made three voyages, the firſt in 1607, the ſecond in 1608, and the third in 1610. Fearleſs of dangers, and proof againſt the piercing cold of the climate, this intrepid mariner penetrated as far as 80 degrees and a half north latitude; he even wintered here, and would, in all probability, have

finiſhed the diſcovery, had not his men mutinied, and committed their brave commander, with ſeven of his faithful adherents, to the fury of the icy ſeas, in an open boat; where they were either ſwallowed up by the waves, or, gaining the inhoſpitable ſhore, deſtroyed by the ſavages. This was an irreparable loſs to the public, as moſt of the diſcoveries he had made were buried with him. Other attempts towards a diſcovery were made in 1612 and 1667; and a patent for planting the country, with a charter for a company, was obtained in 1670. Captain Ellis, in 1746, wintered as far north as 57 degrees and an half; and Captain Chriſtopher attempted further diſcoveries in 1761.

Beſides theſe voyages, which ſatisfy us that we muſt not look for a paſſage on this ſide of the latitude 67 degrees north, we are indebted to the Hudſon's-Bay Company for a journey by land; which throws much additional light on this matter, by affording what may be called demonſtration, how much farther north, at leaſt in ſome parts of their voyages, ſhips muſt go, before they can paſs from one ſide of America to the other. The northern Indians, who come down to the company's factories to trade, had brought to the knowledge of our people a river, which, on account of much copper being found near it, had obtained the name of the Copper-Mine-River. The company, being deſirous of thoroughly inveſtigating this matter, directed Mr. Hearne, a young gentleman in their ſervice, who, from his ſkill in the ſciences, was extremely well qualified for the purpoſe, to proceed over land, under the convoy of thoſe Indians, for that river; which he had orders to ſurvey, if poſſible, quite down to its exit into the ſea; to make obſervations for fixing the latitudes and longitudes; and to bring home maps and drawings both of it, and of whatever occurred worthy of notice in the courſe of his journey.

Mr. Hearne accordingly ſet out from Prince of Wales's Fort, on Churchill River, on December 7, 1770, and on the 13th of June 1771 reached the Copper-Mine-River, and found it all the way, even to its exit into the ſea, incumbered with ſhoals and falls, and emptying itſelf into it over a dry flat of the ſhore, the tide being then out, which ſeemed, by the edges of the ice, to riſe about twelve or fourteen feet. This riſe, on account of the falls, will carry it but a very ſmall way within the river's mouth, ſo that the water in it was not in the leaſt brackiſh; Mr. Hearne is, however, ſure of the place it emptied itſelf into being the ſea, or a branch of it, by the quantity of whale-bone and ſeal-ſkins which the Eſquimaux had at their tents, and alſo by the number of ſeals which he ſaw upon the ice. It appears by the map which Mr. Hearne drew of this ſingular journey, that the mouth of the copper-mine lies in lat. 72 deg. N. and long. 25 deg. W. from Churchill-River, that is, about 119 deg. W. of Greenwich.

Mr. Hearne's journey back from the Copper-Mine to Churchill, laſted till June 30, 1772; ſo that he was abſent upwards of a year and a half. The unparalleled hardſhips he ſuffered, and the eſſential ſervice he performed, have met with a ſuitable recompence from his employers. This gentleman has been ſeveral years governor of Prince of Wales's-Fort, on Churchill-River, where, in 1782, he was taken priſoner by the French; but he afterwards returned to his ſtation. We now ſee, from the particulars of this extenſive diſcovery, that the continent of North-America ſtretches from Hudſon's-Bay, ſo far to the north-weſt, that Mr. Hearne travelled near 1,300 miles before he arrived at the ſea; and that the whole of his track to the northward of 61 deg. N. lat. lay near 600 miles due weſt of the weſtern coaſt of Hudſon's-Bay; at the ſame time that his Indian guides were certain that a vaſt tract of land ſtretched ſtill further in the ſame direction.

CHAP. III.

CANADA.

Situation, Extent, Climate, Mountains, Rivers, Animals, Foreſts, Produce, Lakes, Inhabitants, Government, and Religion.

THIS country, after its reduction by the Engliſh, in the war of 1756, was formed into a Britiſh colony, called the Province of Quebec. It is ſituated between 61 and 81 deg. weſt long. and between 45 and 52 deg. north lat. its length is 600 miles, breadth 200, and contains 100,000 ſquare miles. It is bounded on the north and eaſt, by New-Britain and Hudſon's-Bay; on the ſouth, by Nova-Scotia, New-England, and New-York; and on the weſt by unknown lands.

All that vaſt tract on the back of the Britiſh ſettlements, from Canada and the Lakes, to the Pacific Ocean, which waſhes America on the weſt, is perfectly unknown to us, no European having ever travelled thither. From the climate and ſituation of the country, it is ſuppoſed to be fruitful: it is inhabited by innumerable tribes of Indians, many of whom uſed to reſort to the great fair of Montreal, even from the diſtance of 1000 miles, when that city was in the hands of the French. In ſome of theſe inhoſpitable regions, their nights are from one to ſix months, and the earth bound up in impenetrable ſnow; ſo that the miſerable inhabitants live under-ground great part of the year; but when the ſun reviſits them, they have a day of equal length.

The climate of Canada varies greatly in this extenſive tract; but along the banks of the river St. Laurence, it is prodigiouſly cold in winter, and exceeding hot in ſummer, as moſt of thoſe parts of America commonly are, which do not lie too far to the northward. The reſt of the country, as far it is known, being interſected with large woods, lakes, and rivers, is ſtill colder. Notwithſtanding the length and ſeverity of the winters here, the ſoil is in general very good, and in many parts affords a pleaſing view by its fertility, producing wheat, barley, rye, with many other ſorts of grain, fruits, and vegetables; tobacco is alſo much cultivated here, and thrives well. The iſle of Orleans, near Quebec, and the lands upon the river St. Laurence, are remarkable for the richneſs of their ſoil; and the meadow grounds in Canada, which are well watered, yield excellent graſs, and breed vaſt numbers of great and ſmall cattle.

Some authors aſſert, that ſilver has been found in the mountains of Canada: this may be true, but we do not find that any great advantage has hitherto been made by it. Near Quebec, however, is a fine lead-mine; and coals are found in great plenty here.

The rivers in this province are very numerous, and many of them large, bold, and deep, running through a prodigious tract of territory. The principal are, the Outawais, St. John's, Seguinay, Deſprairies, and Trois Rivieres, but they are all ſwallowed by the river St. Laurence, which has its ſource in the lake Ontario, and, after a courſe of near 750 miles, falls into the ſea at Cape Roſieres. It receives the Outawais at Montreal, forms ſeveral fine iſlands, and meets the tide above 400 miles from its mouth. It is navigable for large ſhips many miles above Quebec, and at Cape Roſieres, where it falls into the ſea, it is above 90 miles in breadth, and is ſo deep, that, in the war of 1756, ſhips of the line contributed to reduce that capital. It has ſeveral falls or cataracts in its courſe, ſo that the navigation is interrupted; but the difficulties might be eaſily ſurmounted, and the navigation continued to Lake Ontario. In its progreſs it forms a great variety of bays, harbours, and iſlands, many of them fruitful, and extremely pleaſant. The

French have a great many ſettlements made on its banks, where the ſoil is very fruitful, and all the neceſſaries of life may with very little trouble be procured. It is not improbable that Canada, and thoſe vaſt regions to the weſt, will be enabled of themſelves to carry on a conſiderable trade upon the great lakes of freſh water which theſe countries environ.

Here are fine lakes; that of Ontario, which is the ſmalleſt, is not leſs than 200 leagues in circumference, and therefore larger than any other piece of freſh water in the old world. The lake Eri, or Oſwego, is longer, but not ſo broad, and about the ſame in extent. The lake Huron is much broader than either of the former, and about 300 leagues in circuit. The Lake Michigan is about equal to that of Huron in circumference, but narrower and longer; and lake Superior far exceeds all the reſt. It has ſeveral large iſlands, and is not leſs than five hundred leagues in circumference. A ſmall flux and reflux have been obſerved, but not regulated by the courſe of the moon, but riſing and falling as it were inſtantaneouſly; the ſurface of the rocks near the banks being covered and uncovered ſeveral times in a quarter of an hour, even when a calm prevails, and the ſurface of the lake is ſmooth and level. They are all navigable by veſſels of very conſiderable burden, and all communicate with one another. The navigation is indeed ſtopped between lake Ontario and lake Erie, by the moſt tremendous cataract in the world, called the Falls of Niagara. The ſtreight which connects the two lakes is here about two miles broad, but ſeparated by an iſland into two ſtreams, the largeſt of which is about half a mile in breadth. This ſtream, which forms the grandeſt part of the cataract, is croſſed by a rock in the form of a half moon, from which the water tumbles near 160 feet perpendicularly. Imagination itſelf can hardly paint a more awful ſcene than this amazing ſheet of water hurled headlong from ſo great a height on the rocks below. The traveller is ſtruck with conſternation at ſo tremendous a ſight, while his ears are deafened with the prodigious roarings of the waters. The vapours ariſing from the cataract form a kind of cloud, or pillar of ſmoke, which in calm ſerene weather may be ſeen at a great diſtance; and when the ſpectator is in a proper poſition with regard to the ſun, this cloud or vapour exhibits a beautiful rainbow. The noiſe of this cataract is plainly heard at fifteen miles diſtance. Many beaſts and water-fowl loſe their lives by attempting to croſs the river at the iſland already mentioned, where the ſtream is extremely rapid, ſo that before they can reach the further ſhore, they are hurried over the precipice and daſhed to pieces. Many of the Indians have met with the ſame fate either by drunkenneſs, or want of care. Perhaps no place in the world is frequented by ſuch a number of eagles as are invited hither by the carnage of deer, elks, bears, &c. on which theſe birds feed. Theſe lakes, whenever the adjacent countries are ſettled by a civilized and commercial people, muſt prove of the greateſt advantage; the adjacent country indeed ſeems to have been intended by nature for the ſeat of a numerous and trading people. We have already obſerved, that the river St. Laurence communicates with lake Ontario; and as that river might be rendered navigable, a communication would be opened with the Atlantic Ocean, and conſequently with all the parts of Europe.

As we are now entering upon the cultivated provinces of Britiſh America, and as Canada is upon the back of the United States, and contains almoſt all the different ſpecies of animals, wood, and vegetables that are found in theſe colonies, we ſhall here ſpeak of them at ſome length, in order to avoid repetitions. The animals make the moſt curious and hitherto the moſt intereſting part of the natural hiſtory of Canada, which abounds in ſtags, elks, deer, bears, foxes, martins, wild cats, ferrets, weaſels, large grey ſquirrels, hares, and rabbits. In the ſouthern parts of it are found great numbers of wild bulls, various kinds of roebucks, deer of a ſmall ſize, goats, wolves, &c. and the marſhes, lakes, and pools, throughout the country, are filled with beavers, of which remarkable animal ſome further account will doubtleſs be expected.

The beaver is near four feet in length, its head greatly reſembling that of a mountain rat. The ſnout is long, the eyes ſmall, the ears ſhort, round, and hairy on the outſide, but ſmooth within. The legs, particularly the fore ones, are ſhort, and the nails of the fore feet ſtand obliquely, and are hollow like quills; but the hind feet are flat, and furniſhed with membranes or webs between the toes. The tail, which is almoſt oval, is a foot in length, an inch thick, four inches broad at the root, five in the middle, and three at the extremity. It is covered with ſcales, indented in ſuch a manner as to be eaſily ſeparated after the death of the animal. The jaws are amazingly ſtrong, and each furniſhed with ten teeth, two inciſive and eight molar. They live from fifteen to twenty years, and the female generally brings forth four young ones at a time. It is an amphibious quadruped, never continues any length of time in the water, but cannot exiſt without frequently bathing in it. Beavers are of different colours, black, brown, white, yellow, and ſtraw colour; the black and the white are the moſt valuable. The fur of the beaver is of two kinds, the dry and the green; the firſt is the ſkin before it has been applied to any uſe, and the ſecond are the furs, ſeveral of which being ſewed together, are worn by the Indians, who rub them over with unctuous ſubſtances, which render them pliable, and at the ſame time give the fine down which is manufactured into hats, &c. that oily quality proper for mixing with the dry fur, when worked. Of late years both the Dutch and the Engliſh have diſcovered the art of making excellent cloths, gloves, and ſtockings, from the beaver fur. The ſkin is not the only thing for which this animal is valuable; it produces that uſeful drug called caſtoreum, contained in bags formed by nature for this purpoſe only, in the lower part of the belly. The fleſh of the beaver is ſaid to be exceeding good eating; the tail is eſteemed the moſt delicious diſh that can be imagined. The ſagacity of theſe animals in erecting their huts, and providing againſt the approach of winter, is ſo amazing, that the ſavages ſuppoſe them rational creatures, who live in ſocieties, and are governed by a leader or chief, like themſelves. It muſt indeed be allowed, that the curious accounts given of this animal by ingenious travellers, the manner in which it contrives its habitation, provides food to ſerve during the winter, and always in proportion to the continuance and ſeverity of it, are ſufficient to ſhew the near approaches of inſtinct to reaſon, and even, in ſome inſtances, the ſuperiority of the former. The Americans have two or three different ways of taking beavers; they ſometimes ſhoot them, at others take them in traps, which laſt method they prefer, becauſe it does not damage the ſkin. There is a diminutive ſpecies of beaver, called the muſk-rat, which reſembles that animal in every reſpect but the tail, and affords a very ſtrong muſk.

The buffalo of Canada is larger than that of Europe, but their appearance is much the ſame; the body is covered with a black wool, which is very valuable, and the hide is as ſoft and pliant as chamois leather, but ſo exceeding ſtrong, that the Indian bucklers, which are made of it, are almoſt proof againſt a muſket-ball. The elk is of the ſize of a horſe or mule, and its colour a mixture of light grey and dark red. They delight in cold climates, where, during the winter, they live upon the bark of trees. When this animal is hunted, he becomes very violent; ſometimes ſpringing furiouſly on his purſuers, and

trampling them to death. To prevent this, the hunter throws his clothes to him, and while the deluded animal ſpends his fury on theſe, he takes proper meaſures to kill him. Wolves are exceeding ſcarce in Canada, but they afford the fineſt furs in all the country. The black foxes are alſo very uncommon there, but highly valued. Thoſe of other colours are common; and ſome on the Upper Miſſiſſippi are of a ſilver colour, and very beautiful. The Canadian wood-rat, which is likewiſe of a fine ſilver colour, is as large again as the European rat, and has a fine buſhy tail: the female has a bag under her belly, which ſhe opens and ſhuts at pleaſure; and here ſhe conceals her young when purſued. The pole-cat of Canada is entirely white, except the tip of the tail, which is as black as jet. When purſued, he lets fly his urine to annoy the aſſailants, which, it is ſaid, infects the air for a quarter of a league round: hence he is called by the inhabitants the devil's brat, or the ſtinkard. There are two ſorts of bears in this country; one of a reddiſh, and the other of a black colour; but the firſt is the moſt dangerous. The bear is not naturally fierce; for he is never known to attack a man, unleſs when wounded or oppreſſed by hunger. There is a carnivorous animal found here, called the Carcajou, which is of the cat kind, with a tail of ſuch prodigious length, that Charlevoix declares he has twiſted it ſeveral times round his body. It is ſaid that this animal, winding himſelf about a tree, will dart from thence upon the elk, twiſt its ſtrong tail round its body, and tear open its throat in an inſtant. There are three ſorts of ſquirrels in Canada; one of which is called the flying ſquirrel; it has, however, no wings; but on each ſide a looſe ſkin, extending from the fore to the hind feet, to which it is connected. This the creature can ſtretch out like a ſail, and the air which it contains, buoys him up in ſuch a manner, that he can leap from tree to tree forty paces aſunder. This little animal is eaſily tamed, and very lively, except when aſleep, which is often the caſe; and he puts up wherever he can find a a place, in one's ſleeve, pocket, or muff; he firſt pitches on his maſter, whom he will diſtinguiſh among twenty perſons. The Canadian roe-buck is a domeſtic animal; and the porcupine not ſo large as a middling ſized dog. We have been thus circumſtantial in our deſcription of theſe animals, becauſe in their furs conſiſt the chief commerce of the country, and to theſe we owe the materials for many of our manufactures.

The foreſts of Canada contain two kinds of eagles, the largeſt of which have a white head and neck, but the others are entirely grey. The falcons, goſhawks, and tercels, are exactly the ſame as in Europe. The partridges are red, grey, and black, with long tails, which they ſpread out like a fan, and make a fine appearance: wood-cocks are very ſcarce, but ſnipes and water-fowl are exceeding plentiful. Twenty-two different ſpecies of ducks are found in Canada, and a great number of ſwans, turkeys, geeſe, buſtards, teal, water-hens, cranes, and other large water-fowl; but they are always at a diſtance from the inhabited part of the country. A Canadian raven is by ſome writers affirmed to eat as well as a pullet, and an owl better. Thruſhes and goldfinches, reſembling thoſe of Europe, are found here; but the chief ſinging bird of Canada is the white bird, a ſpecies of ortolan, very ſhewy, and remarkable for proclaiming the return of ſpring. The wood-pecker is a beautiful bird, but far exceeded by the fly-bird, which is ſuppoſed to be equalled by none of the feathered tribe; with all his plumage he is not larger than a cock-chafer, and makes a noiſe with his wings like the humming of a large fly: his legs are not thicker than a ſmall needle; and from his bill, which is of the ſame ſize, a ſmall ſting proceeds, with which he pierces the flowers, and, by that means, nouriſhes himſelf with the juice: the head of the male is adorned with a beautiful black tuft; his breaſt is red, his belly white, his back, wings, and tail, green, while ſpecks of gold, ſcattered all over the plumage, add greatly to its beauty, and an almoſt imperceptible down produces the moſt delightful ſhades that can be imagined.

The vaſt rivers and lakes in this country, particularly that of St. Laurence, contain a prodigious variety of fiſh, among which are ſea-wolves, ſea-cows, porpoiſes, the lencornet, the goberque, ſalmon trouts, turtles, lobſters, the chaouraſou, the achigau, the gilt-head, and ſturgeon. The ſeal, or ſea-wolf, ſo called from its howling, is an amphibious creature, and very large; ſome of them are ſaid to weigh 2000 pounds: a deſcription of it has been given in our account of Greenland. The ſea-cow is larger than the ſea-wolf, but reſembles it in figure: it has two teeth of the thickneſs and length of a man's arm, which, when full grown, have the appearance of horns, and are very fine ivory. Some of the porpoiſes caught in the river St. Laurence are ſaid to yield an hogſhead of oil, and waiſtcoats are made of their ſkins, which, beſides the excellent property of being exceeding ſtrong, are muſket-proof. The lencornet is a ſpecies of cuttle-fiſh, of an oval figure: there are two ſorts of them, which differ only in ſize, ſome being as large as a hogſhead, and others only a foot long; but the latter only are caught, which is done by torch-light. The chaouraſou is an armed fiſh, reſembling a pike, and covered with ſcales proof againſt a dagger: ſome of them are above five feet long, and about the thickneſs of a man's thigh: the colour is a ſilver grey, and there grows under the mouth a long bony ſubſtance, ragged at the edges. This creature lives upon birds; to procure which, he conceals himſelf among the reeds, in ſuch a manner, that nothing of him can be ſeen but the above weapon, which he holds erect above the ſurface of the water. The fowls, miſtaking it for a withered reed, perch upon it; but they are no ſooner ſettled, than the fiſh opens his mouth, and darts ſo ſuddenly on the prey, that it ſeldom eſcapes. The goberque has the taſte and ſmell of a ſmall cod. The ſturgeon is from eight to twelve feet long, and proportionably thick; but there is a ſmall ſpecies, the fleſh of which is very delicate. Some of the rivers breed a kind of crocodile, that differs in no material reſpect from thoſe of the Nile. The achigau and the gilt-head are fiſh peculiar to the river St. Laurence.

Canada furniſhes a variety of reptiles, among which the rattle-ſnake is the moſt remarkable. Some of theſe are as big as a man's leg, and long in proportion: but the moſt remarkable part of this animal is the tail, conſiſting of ſeveral hollow joints, in each of which is a ſmall round bone, that makes a rattling noiſe as the creature moves, and ſeems deſigned by Providence to give notice of its approach: it is aſſerted by authors, that a joint is added to this rattle every year. The bite of this ſnake is mortal, if the root of the rattle-ſnake plant, or ſome other ſpecific, is not immediately applied to the wound. The above plant is a ſovereign antidote againſt the poiſon, and grows in all places where the ſnake is found: it is either pounded or chewed, and applied to the wound as a plaiſter. This creature, however, ſeldom bites paſſengers unleſs trod upon, or otherwiſe provoked. The Indians, who eſteem its fleſh a great delicacy, often hunt it; and, when thus purſued, if it has but a little time to recover, it folds itſelf round, placing its head in the centre, and then darts itſelf with the utmoſt violence againſt its antagoniſt, who receives the bite with the utmoſt calmneſs, aſſured of an immediate cure by the above root.

Such lands as have been properly cultivated in Canada, yield large and rich crops of Indian corn, barley, rye, and other grain. All kinds of fruits found in France, even melons and grapes, are produced here, and alſo the hop plant. The meadow grounds,

grounds, which are well watered, yield excellent graſs, and feed numbers of great and ſmall cattle.

The greateſt foreſts in the world are in the uncultivated parts of North America, which are a continued wood, not planted by the hands of men, and in all appearance as old as the world itſelf. Nothing can be more magnificent to the ſight: the trees loſe themſelves in the clouds, and their prodigious variety of ſpecies cannot be numbered. The foreſts of Canada, which are amazingly extenſive, contain alſo a vaſt variety of trees, among which are two ſorts of pines, the white and the red; three ſorts of aſh-trees, the free, the mungrel, and the baſtard; three ſorts of walnut-trees, the hard, the ſoft, and the ſmooth; the male and female maple; white and red elms and poplars. The Iroquois Indians hollow the red elms into canoes, ſome of which, made out of one piece, will contain twenty perſons. About November the bears and wild cats take up their habitations in the hollow elms, and remain there until April. Here are alſo found cherry-trees, plum-trees, the vinegar-tree, the fruit of which, infuſed in water, makes excellent vinegar; the white-thorn, the cotton-tree, the pod of which contains a very fine kind of cotton: ſeveral tufts of flowers are produced on the top of this tree, which, if ſhaken in a morning before the dew falls off, produce honey that may be boiled into ſugar; the ſun-plant, and an aquatic plant called atoca, the fruit of which is often made into an excellent confection.

The inhabitants on the banks of the river St. Laurence, above Quebec, were very numerous before the late war; but the number of French and Engliſh ſettled in this province cannot be preciſely aſcertained, though they are ſuppoſed to be on the decreaſe. Canada and Labrador were ſuppoſed, in the year 1783, to contain about 130,000 inhabitants. The different tribes of Indians in Canada are almoſt innumerable; the moſt conſiderable at preſent are, the Iroquois, the Hurons, Miamis, Nokes, Oumamis, Outagamis, Sakis, Illinois, Oubaches, Otters or Loutres, Savannois, Sioux, Aſſiniboils, and Chriſtinaux; but theſe people are obſerved to decreaſe in population where the Europeans are moſt numerous, owing chiefly to the immoderate uſe of ſpirituous liquors, of which they are exceſſively fond.

Canada does not contain any remarkable towns, though very conſiderable efforts have been made for peopling this extenſive country. The principal places are Quebec, Trois Rivieres, and Montreal.

Quebec, the capital of all Canada, and the ſee of a biſhop, is ſituated at the confluence of the rivers St. Laurence and St. Charles, or the Little River, about 320 miles from the ſea. It is built on a rock compoſed partly of marble and partly of ſlate. The town is divided into two parts, called the Upper and Lower Town. The fortifications, though not regular, are ſtrong. The fort, or citadel, in which the governor reſides, is a noble work; in the church of the Urſeline nuns is the tomb of Monſ. Montcalm, who commanded the French, and was killed at the battle of Quebec; in which alſo fell that young hero Wolfe, who commanded the Engliſh. The river, which from the ſea hither is four or five leagues broad, narrows on a ſudden to about a mile in width. The harbour is flanked by two baſtions, raiſed twenty-five feet from the ground, which is about the height of the tides at the time of the equinox: it is ſafe, commodious, and about five fathom deep. From Quebec to Montreal, in ſailing up the river St. Laurence, the eye is entertained with beautiful landſcapes, the banks being in many places bold and ſteep, and ſhaded with lofty trees, and in others crowded with villages, of which there are alſo many on the iſlands, wherewith the channel of the river is interſperſed. After paſſing the Richlieu-Iſlands, in the ſummer months, the air becomes ſo mild and temperate, that the traveller thinks himſelf tranſported into another climate.

The town called Trois Rivieres, or Three Rivers, is about half way between Quebec and Montreal, and takes its name from three rivers which join their ſtreams about a quarter of a mile below it, where they fall into the river St. Laurence. It is much frequented by ſeveral nations of Indians, who come hither with their furs and peltry. The adjacent country is pleaſant and fertile in corn, fruits, &c. A conſiderable number of handſome houſes ſtand on both ſides the rivers. It gives name to a diſtrict.

Montreal ſtands at the foot of a mountain, in an iſland ten leagues in length, and almoſt four in breadth, formed by the river St. Laurence. While the French poſſeſſed Canada, both the city and iſland of Montreal were private property, and were ſo well improved, that the whole iſland was a delightful ſpot, producing every thing neceſſary for the conveniences of life. Since the town has been in the hands of the Engliſh, it has ſuffered extremely by fire. When reduced by General Amherſt, it was of an oblong form, well peopled, and ſurrounded by a wall flanked by eleven redoubts, which ſerve inſtead of baſtions. The ſtreets were well laid out, and the houſes built in a very handſome manner. The ditch is about eight feet deep, and of a proportionable breadth, but dry. The fortifications have been much improved by the Engliſh. The governor's palace is a large fine building. The general hoſpital, and many elegant villas, decorate the adjacent country, which produces all the vegetables of Europe.

Reſpecting the government of Quebec, it will be neceſſary to obſerve, that the French, before the war of 1756, were very agreeably ſituated, being free from all taxes, and having full liberty to hunt, fiſh, fell timber, and to ſow and plant as much land as they could cultivate; and their rights and privileges were continued to them by the capitulation, when the country was reduced by the Engliſh. But by an act paſſed in 1774, his Majeſty was impowered to appoint a council, from ſeventeen to twenty-three perſons, reſident at Quebec, for managing the affairs of the province, who were veſted with authority to make ordinances for the peace, welfare, and good government thereof. By this act, all matters of controverſy relative to property and civil rights are to be determined by the French laws of Canada; and the inhabitants are not only allowed to profeſs the Romiſh religion, but the Popiſh clergy are inveſted with a right to claim and attain their accuſtomed dues from thoſe of the ſame religion. This law gave great offence to many perſons both in England and America, and is thought to have contributed in a great meaſure towards ſpreading a ſpirit of diſaffection to the Britiſh government in the colonies. The city of London objected in ſtrong terms to the paſſing of the bill into a law, declaring, that they conceived it to be entirely ſubverſive of the great fundamental principles of the Britiſh conſtitution, &c. and in one of the petitions of the American congreſs to the king, they remonſtrated, that by the Quebec act, the limits of that province were extended, the Engliſh laws aboliſhed, and the French laws reſtored, whereby great numbers of Britiſh freemen were ſubjected to the latter; and that an abſolute government, and the Roman Catholic religion, were alſo eſtabliſhed by that act, throughout thoſe vaſt regions that border on the weſterly and northerly boundaries of the free Proteſtant Engliſh ſettlements. But notwithſtanding every argument and petition brought in oppoſition to this obnoxious bill, it paſſed both houſes, received the royal aſſent, and now ſubſiſts as a law in full force throughout the province.

Our ſettlements in North-America were ſecured by expelling the French, and at the ſame time the inhabitants enabled to attend more cloſely to agriculture, and the improvement of that country. While

the important conqueſt of Canada removed a rival power from that part of North-America, it put us in the ſole poſſeſſion of the fur and peltry trade, the uſe and importance of which is well known to the manufacturers of Great-Britain, and enables us to extend the ſcale of a general commerce.

The nature of the climate is ſeverely cold in winter, and the people manufacturing nothing, points out what Canada principally wants from Europe; wine, or rather rum, cloth, chiefly of the coarſer kind, linen, and wrought iron. The Indian trade requires rum, tobacco, a ſpecies of duffil blankets, guns, powder, balls and flints, kettles, hatchets, toys, and trinkets of all kinds.

While the French were in poſſeſſion of this country, the Indians ſupplied them with peltry; and the French had traders, who, in the manner of the original inhabitants, traverſed the vaſt lakes and rivers in canoes, with incredible induſtry and patience, carrying their goods into the remoteſt parts of America, and trafficked with nations entirely unknown to any other Europeans. But their trade with theſe diſtant people was not the only ſervice they did their country, they habituated the Indians to commerce, and induced them to viſit the French in their ſettlements. Accordingly, people from all parts, even to the diſtance of a thouſand miles, repaired to the French fair at Montreal, which began in June, and laſted near three months. Many ſolemnities were obſerved on this occaſion, guards were placed, and the governor himſelf aſſiſted to preſerve order, in ſuch a concourſe of people, compoſed of ſo great a variety of ſavage nations. But it often happened that all attempts uſed to preſerve tranquillity were in vain.

The Indians are ſo remarkably fond of ſpirituous liquors, that they often give all their merchandize for a ſmall quantity of brandy; but, reflecting on their folly, are exaſperated, and foment riots and diſturbances. And what is very remarkable, many of the Indian nations actually paſſed by our ſettlement at Albany in the province of New-York, and continued their journey 250 miles further to Montreal, in order to purchaſe the very ſame commodities from the French, which they might have had from the Engliſh at Albany at a much cheaper rate; the French themſelves having before purchaſed thoſe goods from the Engliſh merchants ſettled in that country. So great an aſcendency had the French, by their polite behaviour and inſinuating addreſs, gained over the minds of the Indians.

Since we have been poſſeſſed of the whole country of Canada, our trade with that country employs thirty-four ſhips, and 400 ſeamen. The exports from thence, at an average of three years, in ſkins, furs, ginſeng, ſnake-root, capillaire, and wheat, amounted to 105,500l. and the imports from Great-Britain, conſiſting of a great variety of articles, are computed at nearly the ſame ſum. It is unneceſſary to make any remarks on the importance of this trade, which not only ſupplies us with unmanufactured materials, indiſpenſably neceſſary in many articles of our commerce, but alſo takes in exchange the manufactures of our own country, or the productions of our other ſettlements in the Eaſt and Weſt-Indies.

There are certain inconveniencies, proceeding from natural cauſes, which the trade and peopling of Canada are liable to, that no attention whatever will be ſufficient to overcome; one of theſe is, the ſeverity of the winter, which is ſo exceſſive from December to April, that the greateſt rivers are frozen over, and the ſnow often lies on the ground to the depth of four and ſix feet, even in thoſe parts of the country which are ſituated three degrees of London, and in the temperate latitude of Paris. The falls in the river St. Laurence, below Montreal, for another inconvenience; theſe render it difficult for very large ſhips to penetrate to that emporium of inland commerce; but veſſels from 300 to 400 tons arrive there every year. Hence it will evidently appear, that our communication with Canada, and the immenſe regions beyond it, will always be interrupted in winter, till roads are formed, that can be travelled on with ſafety from the Indians, who often commence hoſtilities againſt us without any previous notice; and theſe ſavage people, without any provocation, frequently commit the moſt horrid ravages for a long time with impunity. But when their barbarities and depredations have at length rouſed the reſentment of the Engliſh, they will then even ſue for a peace, which they know we always readily grant: this being obtained, they promiſe it ſhall endure as long as the ſun and moon: hereupon a temporary ceſſation of hoſtilities takes place, till ſome freſh incident, too often accompanied with ill treatment received from our traders, gives them a freſh pretence for renewing their cruelties and inſults in the neighbouring ſettlements.

CHAP. IV.

NOVA-SCOTIA, OR NEW-SCOTLAND.

Boundaries, Situation, Extent, Rivers, Lakes, Soil and Produce, Exports, &c.

THIS country, by the French called Acadia, has the bay of St. Laurence and the Atlantic ocean, on the eaſt; the ſame ocean, on the ſouth; the river St. Laurence, on the north; and Canada and New England, on the weſt. It is ſituated between the 66th and 67th degrees of eaſt long. and between the 43d and 49th of north latitude; being about 350 miles long, and 250 broad. This province was divided into two governments in 1784. That now ſtyled New Brunſwick, is bounded on the weſtward of the mouth of St. Croix river, by the ſame river to its ſource, and by a line drawn due north from thence to the ſouthern boundary of Quebec; to the northward, by the ſaid boundary as far as the weſtern extremity of the Bay of Chaleurs; to the eaſtward, by the ſaid bay to the gulf of St. Laurence to the bay called Bay Verte; to the ſouth, by a line in the centre of the bay of Fundy, from the ſaid river St. Croix, to the mouth of the Muſquat river, by the ſaid river to its ſource: and from thence by a due line acroſs the iſthmus into the Baya Verte, to join the eaſtern lot above deſcribed: all iſlands within ſix leagues of the coaſt being included in theſe limits. The rivers and lakes are very numerous. Of the former, the moſt conſiderable are thoſe of St. John, Paſſamagnadi, Penobſcot, and St. Croix, which run from north to ſouth, and fall into the Bay of Fundy; and thoſe of Riſgouche, and Nipiſiguit, which run from weſt to eaſt, and fall into the gulf of St. Laurence; and that of Chebucto, which falls into the Atlantic. Of the latter, thoſe called Keſeben and Freneuſe are very large; but there are many which have not yet received any particular names. The river St. Laurence forms the northern boundary.

A great part of this country conſiſts of the peninſula that is formed by the Bay of Fundy, Chenigto, and Green Bay; all the coaſt of which, from Cape Sable on the weſt, to Cape Canſo on the eaſt, is lined with ſhoals or ſands. Beſides the bays above mentioned, there is a great number of others all along the coaſt, particularly Gaſpé, Chaleurs, and Chedibucto, on the north-eaſt; the Bay of Iſlands, Chebucto, and La Here, on the ſouth; and the Bay of Annapolis, on the ſouth-ſide of the Bay of Fundy. In theſe bays, and other parts of the coaſt, are many fine roads and havens. The chief Capes are thoſe of Roſieres and Gaſpé on the north-eaſt; Capes Portage, Ecoumenac, Tourmentin, Port, Epis, Forgery, and Canſo, on

on the eaſt; Capes Blanco, Vert, Theodore, Dore, la Heve, and Negro, on the ſouth; Cape Sable, and Cape Fourche, on the ſouth-weſt.

Though this country is ſituated within the temperate zone, its climate is rather unwholeſome, which is generally aſcribed to the ſudden tranſition from heat to cold, which is found in this part of America; a ſeven months cold being ſometimes ſucceeded by inſupportable heat, without the intervening refreſhing ſeaſons of ſpring and autumn; beſides this, the air is frequently rendered inſufferably moiſt by fogs that come from off the ſea, and ſometimes in an inſtant invelope every object in an obſcure gloom.

The ſoil of Nova-Scotia is not more favourable to vegetation than the climate is to health, the whole country being almoſt a continued foreſt. The timber is extremely proper for ſhip-building, and produces pitch and tar. Great improvements are ſaid to be making in the new ſettlements and the Bay of Fundy: a great quantity of land hath been cleared, which abounds in timber, and ſhip-loads of excellent maſts and ſpars have been ſhipped for England. Agriculture, though attempted by the Engliſh ſettlers, has hitherto made little progreſs. As the ſoil is in general thin and barren, the corn it produces is of a ſhrivelled kind, like rye, and the graſs intermixed with a cold ſpongy moſs. There are, however, ſome tracts in the peninſula to the ſouthward, which are not inferior to the beſt land in New England; and the ſoil is for the moſt part adapted to the produce of hemp and flax.

The animals found here are in common the ſame with thoſe of the other American provinces, deer, beavers, otters, &c. wild fowl, and all ſpecies of game. European quadrupeds, and fowls, which have been ſent there at different times, likewiſe ſucceed, and multiply prodigiouſly. At the cloſe of March the fiſh begin to ſpawn, when they enter the rivers in ſuch ſhoals as are incredible. Herrings come up in April, and ſturgeon and ſalmon in May. But the moſt valuable appendage to Nova-Scotia is the coaſt of Cape Sables, along which is a ſeries of cod-fiſhing banks, and excellent harbours.

This country, unpromiſing as it is, and neglected for the more delightful tracts to the ſouthward, was one of the firſt European ſettlements on the continent of North America. The firſt grant of lands in it were made by James I. to his ſecretary Sir William Alexander, from whom it obtained the name of Nova-Scotia, or New Scotland. Since that period it has often changed maſters, from one private proprietor to another, and from the French to the Engliſh backwards and forwards. Before the French attempted any ſettlement in Canada, they had fixed themſelves in Nova-Scotia; and certainly their induſtry and vigour, while they were in poſſeſſion of this province, deſerve applauſe; for though they had infinitely more difficulties to ſtruggle with than the Engliſh have at preſent, they not only ſubſiſted with very little aſſiſtance from Europe, but alſo increaſed exceedingly. But the province being confirmed to the Engliſh by the treaty of Utrecht, and experience during a long war having convinced them of the impropriety of ſuffering a colony of the enemy to remain here, a reſolution was taken, in the year 1749, to form a ſettlement in this province at the expence of the government. Accordingly 3000 families were tranſported into Nova-Scotia. A town was erected on the bay of Chebucto, and called Halifax, in honour of the late Earl of that name, to whoſe wiſdom and care we owe this ſettlement. The town of Halifax is very commodiouſly ſituated for the fiſhery, and has a communication with moſt parts of the province, either by land-carriage, the ſea, or navigable rivers, with an excellent harbour, capable of receiving the largeſt ſhips of war, and where they may ride with the utmoſt ſafety in all winds. This town has a very flouriſhing appearance, when all the difficulties attending an infant ſettlement in this cold climate are conſidered. It is large and well built. It has a good entrenchment of timber, ſtrengthened with a fort of the ſame materials, ſo as to be in little danger, at leaſt from an Indian enemy. Three regiments are ſtationed here to protect the inhabitants from the inſults of the ſavages, whoſe reſentment, however excited, has been found implacable againſt the Engliſh. The number of inhabitants is ſaid to amount to fifteen or ſixteen thouſand, who live very comfortably by the trade they carry on in furs and naval ſtores, by their fiſheries, and its being the reſidence of the governor, and the garriſon.

Formerly the chief town in this province was called Annapolis-Royal; but, though once the capital, it is a ſmall place, wretchedly fortified, worſe built, and very thinly inhabited. There have been ſtationed here, ever ſince the reign of Queen Anne, the remains of a regiment very little recruited. But though this place never flouriſhed, it ſtands on one of the beſt harbours in North-America, capable of containing 1000 veſſels at anchor, in the utmoſt ſecurity; it is protected by a fort and garriſon. St. John's is a new ſettlement at the mouth of the river of that name that falls into the Bay of Fundy on the weſt ſide.

The emigration of loyaliſts from the United States to this province, ſince the concluſion of the American war, hath been very great. New towns have been erected by them; but particularly at Port Roſeway, where a city named Shelburne now ſtands, which extends two miles on the waterſide, and one mile back, having wide ſtreets, which croſs each other at right angles. We are told it contains above 9000 inhabitants, excluſive of what is ſtyled the Black Town, which ſtands about a mile from Shelburne, and is ſeparated from it by a ſmall freſh-water river; this town is inhabited by 1200 free blacks, who ſerved on the king's ſide during the war. The harbour is deep, capacious, and ſecure, and the tide hath a great riſe and fall.

Thoſe loyaliſts who apply for land, obtain it in proportion to the property they poſſeſſed before the troubles commenced, allowing for ſuch as have families to provide for. The governor lately appointed over New Brunſwick is empowered, it is ſaid, in his inſtructions, to "grant, without fee or reward, to ſuch reduced officers as ſerved in his provincial corps, during the late war in North America, and who ſhall perſonally apply for the ſame, the following quantities of lands, ſubject, at the expiration of ten years, to the ſame quit-rents as other lands are ſubject to in the province of Nova-Scotia, as alſo ſubject to the ſame conditions of cultivation and improvement; that is to ſay, To every perſon having the rank of a field officer, 3000 acres; to every captain, 2000 acres; and to every ſubaltern, 1000 acres." The ſame proportion of land is allotted to the reduced officers of the navy.

The principal exports from Great-Britain to this country, conſiſt of woollen and linen cloth, and other neceſſaries for wear, of fiſhing tackle, and rigging for ſhips. Our exports, at an average of three years, before the new ſettlements, amounted to about 26,500l. The only articles we can get in exchange are timber, and the produce of the fiſhery, which, at a like average, amount to about 38,000l. The late increaſe of inhabitants induces us to ſuppoſe that they will erect ſaw mills, and endeaver to ſupply the Weſt-India iſlands with lumber of every kind, and likewiſe the produce of the fiſhery, which will prove equally beneficial to both countries. The whole population of Nova-Scotia, with the iſlands adjoining, is computed at 50,000. This ſettlement being yet in its infancy, we can form no exact eſtimate of its real utility, which, with its own proſperity and increaſe in future, will in a great meaſure depend on the induſtry and wiſe conduct of the inhabitants.

CHAP. V.

THE UNITED STATES OF AMERICA.

Account of their Confederation.

OUR readers will find an account, in our review of the principal tranſactions in the hiſtory of Great-Britain, of the riſe, progreſs, and moſt remarkable events of that war, between Great-Britain and her American colonies, which at length terminated in the eſtabliſhment of the United States of America; and therefore need not repeat them in this place; but ſhall only mention, that on the 4th of July 1776, the Thirteen American provinces, by a ſolemn act and declaration, renounced their allegiance to the Britiſh crown, contracted a reciprocal treaty of alliance and friendſhip for their common defence, for the maintenance of their liberties, and for their general and mutual advantage, &c. and from that time conſidered themſelves as Free and Independent States, and have been recognized as ſuch by all the belligerent powers. Each of the colonies, however, reſerved to themſelves alone the excluſive right of regulating their internal government, and of framing laws in all matters not included in the articles of confederation; but every ſtate is to abide by the determinations of the United States in Congreſs aſſembled, in all queſtions which are ſubmitted to them by the confederation. Delegates from each ſtate are to meet in Congreſs on the firſt of November in every year; for managing the general intereſts. On the 30th of January 1778, the French king concluded a treaty of amity and commerce with the Thirteen United Colonies of America, as Independent States. On April 19th, 1782, Holland acknowledged them as ſuch; and on the 30th of November 1782, proviſional articles were ſigned at Paris, by the Britiſh and American commiſſioners, in which his Britannic Majeſty acknowledged the Thirteen Colonies to be Free, Sovereign, and Independent States; and theſe articles were afterwards ratified by a definitive treaty. On February 5th, 1783, Sweden acknowledged them as ſuch; on the 25th of the ſame month, Denmark; in March 1783, Spain; and Ruſſia, in July following.

By the report of the committee appointed by the Congreſs for that purpoſe, the foreign debt of the United States, incurred by the late war, in obtaining their Independence, amounted to 7,885,085 dollars; and the domeſtic debt to 34,115,290; the total of which, at 4s. 6d. each, is equal to 9,450,084l. ſterling; and the intereſt at ſix per cent, is 567,005l. On the other hand, the coſt of the war to Great-Britain is moderately computed at 115,654,914l. and the additional burthen by it, ſince January 1775, is 4,557,575l. During the war, the States of America, according to authentic eſtimates, loſt by the ſword and in priſon 80,000 men; and the number of Britiſh ſoldiers killed in the ſervice amounted to 43,633 men, according to the returns at New-York.

NEW ENGLAND.

Situation, Boundaries, Extent, Diviſions, Rivers, Climate, Produce, Mines, Animals, Natives, Laws, Religion, Towns, Commerce, Manufactures, and Government.

THIS country is ſituated between 41 and 49 deg. of north lat. and between 67 and 74 of weſt long. It is 550 miles in length, and 200 in breadth; and bounded on the north-eaſt by Nova-Scotia; on the ſouth, by New-York; on the eaſt, by the Atlantic Ocean; and on the weſt by Canada.

Diviſions.	Provinces.	Chief Towns.
The north diviſion, or government	New Hampſhire.	Portſmouth.
The middle diviſion	Maſſachuſet's colony	Boſton.
The ſouth diviſion	Rhode-Iſland, &c.	Newport.
The weſt diviſion.	Connecticut.	New London. Hertford.

The principal rivers in this country are Connecticut, Thames, Patuxet, Menimack, Piſcataqua, Saco, Caſco, Kennebeck, Penobſcot, or Pentagonet.

The moſt remarkable bays and harbours are thoſe formed by Plymouth, Rhode-Iſland, and Providence plantations; Monument-Bay, Weſt harbour, formed by the bending of Cape Cod; Boſton harbour, Piſcataqua, and Caſco-Bay.

The chief capes are, Cape Cod, Marble-Head, Cape Anne, Cape Nettick, Cape Porpus, Cape Elizabeth, and Cape Small-Point.

Notwithſtanding New England is ſituated near ten degrees nearer the equator than the mother-country, yet the winter begins ſooner, and continues longer, than with us. But the ſummer is extremely hot, and even more ſo than in places that lie under the ſame parallel in Europe: for the ſpace of two months, however, the ſky is perfectly clear, which renders the country ſo healthy, that it is reported to agree better with Engliſh conſtitutions, than any other of the American provinces. The length of their day at Boſton, in ſummer and winter, is pretty nearly the ſame as in London.

With reſpect to the ſoil, all the lands on the eaſtern ſhore of America are moſtly low, and in ſome parts ſwampy; but further back they riſe into hills. The north-eaſt parts of New-England are rocky and mountainous, and the earth ſhallow. Near Maſſachuſet's-Bay, the ſoil is black, and as rich as in any part of England; and here the firſt planters found the graſs above three feet high. The ſoil of the uplands is leſs fruitful, being a mixture of ſand and gravel, inclining to clay: the low grounds abound in meadows and paſtures: they commonly allot about two acres to the maintenance of a cow. The beſt meadows produce about a ton of hay to the acre; ſome produce two tons; but the hay is rank and ſour.

European grain has not been cultivated here with much ſucceſs. The wheat is very ſubject to be blaſted; the barley is a hungry grain, and the oats are lean and chaffy: but the Indian corn, which makes the food of the common people, flouriſhes here in high perfection. The New England people not only make bread of this grain, but malt, and brew it into beer, which is not contemptible, though their common drink is cyder and ſpruce-beer; the latter is made of the tops of the ſpruce fir, with the addition of a ſmall quantity of molaſſes. They alſo raiſe in New England a large quantity of flax and hemp: all the fruits of Old England come to great perfection here, particularly peaches and apples. It is not unuſual to ſee ſeven or eight hundred fine peaches on a ſingle tree; and ſeven barrels of cyder have, in one ſeaſon, been preſſed from the fruit of a ſingle apple-tree.

This country is chiefly diſtinguiſhed for the variety and excellence of its timber; particularly oak, aſh, pine, fir, cedar, elm, cypreſs, beech, walnut, cheſnut, hazel, ſaſſafras, ſumach, and other woods, uſed in dyeing or tanning leather, carpenters work, and ſhip-building. The oak is thought to be inferior to that of the mother-country; but the firs are of prodigious height and bulk, and furniſh the royal navy of England with maſts and yards: they alſo extract from them conſiderable quantities of pitch, tar, roſin, gums, and balm. The productions of their foreſts are of prodigious ſervice to this country, where ſhip-building makes a very conſiderable branch of trade.

The iron mines of New England are truly valuable: the metal is of an excellent temper, and, if improved, may

may become a great national benefit: copper and lead are alſo found, but in no great plenty.

All kinds of European animals thrive here, and multiply exceedingly. Horned cattle are very numerous, and ſome of them very large. Oxen have been killed of eighteen hundred weight. Hogs alſo are numerous, and particularly excellent; ſome are ſo large as to weigh eighteen ſcore. The horſes are ſmall, but extremely hardy. They have alſo a great number of ſheep, and of a very good kind; but the wool, though of a ſtaple ſufficiently long, is not near ſo fine as that of England: they however manufacture a great deal of it with ſucceſs. Elks, deer, hares, rabbits, ſquirrels, beavers, otters, bears, monkies, martins, racoons, ſubbs, wolves or wild dogs, foxes, ounces, and a variety of other wild and tame animals, are found in this province, moſt of them in great abundance: but one of the moſt ſingular animals of this and the neighbouring countries, is the moſe, or mooſe-deer. There are two ſpecies of this animal; the light grey mooſe, and the large black mooſe: the former often herd thirty or more together, is a very fine animal, and reſembles the ordinary deer: the latter, or black mooſe, is a very ſtately creature, about twelve feet high: his body about the ſize of a bull; his neck reſembles a ſtag, and his fleſh is extremely grateful; the horns, when full grown, are about four or five feet from the head to the tip, where they ſpread twelve feet, and have ſhoots or branches to each horn, which ſpread about ſix feet. When he traverſes a wood or thicket, he lays his horns on his back, in order to prevent their being entangled in the boughs. Theſe prodigious horns he ſheds every year. The black mooſe does not ſpring or riſe like the common deer in going; but one of the largeſt ſize has been ſeen, in his common walk, to ſtep over a gate five feet high: when unharboured, he will run a courſe of twenty or thirty miles, before he ſtands at bay; and, when cloſely purſued, generally takes to the water. The Indians hunt this creature, and generally with ſucceſs, notwithſtanding his great ſwiftneſs.

Few countries abound more with fowls, as turkies, geeſe, partridges, ducks, wigeons, dappers, ſwans, heathcocks, herons, ſtorks, black-birds, all ſorts of barn-door fowl, vaſt flights of pigeons, ravens, crows, &c. Among a vaſt variety of reptiles, rattle-ſnakes, toads, and frogs, abound in the uncleared parts of the province, where, with the owls, they make in the ſummer evenings a moſt hideous noiſe.

Nor are the New England ſeas and rivers leſs prolific than the land. They abound in fiſh; and even whales of ſeveral kinds are found here: the whale-bone, however, is ſaid to be leſs valuable than that of Greenland. A terrible fiſh, called the whale-killer, is alſo found in theſe ſeas: it is from twenty to thirty feet long, with remarkably ſtrong teeth and jaws. Ten or twelve of theſe fiſh will attack a large whale, and often deſtroy him; but they frequently pay dear for their temerity; a ſingle ſtroke from the tail of the whale being ſufficient to put an end to the conteſt; and therefore they are very careful not to come within the reach of that part. At the mouth of the river Penobſcot is a mackerel fiſhery; and vaſt quantities of cod are taken during the winter ſeaſon.

The moſt populous and flouriſhing parts of Great-Britain, do not make a much better appearance than the cultivated parts of New England, which reach above ſixty miles back: with reſpect to population, the number of conſiderable and trading towns, and the manufactures carried on in them, this country is greatly ſuperior to any other of the colonies. Here are many gentlemen of conſiderable landed eſtates, which they let to farmers, or manage by their ſtewards or overſeers; but the greater part of the people are compoſed of a ſubſtantial yeomanry, who cultivate their own freeholds, without a dependence on any but Providence, and their own induſtry. Theſe freeholds generally paſs to their children in the manner of gavel-kind, which prevents the far greater part of them from being able to emerge out of their original happy mediocrity. This manner of inheriting has remarkable good effects: it keeps the people within bounds of their original happy mediocrity, or, if neceſſity urges, makes them more ready to go backward into the uncultivated parts of the province, where land may be had at an eaſy rate, and in large portions. By this means, and from the form of their government, they acquire a very free, bold, and republican ſpirit. The common ſort of people in no part of the world are ſo independent, or poſſeſs ſo many of the conveniencies of life: they are uſed, from their infancy, to the exerciſe of arms; and they have a militia, which, conſidered as ſuch, is by no means contemptible, but their military ſtrength is now greatly augmented.

Dr. Douglaſs, a well-informed writer, who publiſhed at Boſton an account of the Britiſh colonies in America, about the year 1752, computes the number of inhabitants at 354,000; and proportions them in the following manner:

Maſſachuſet's Bay	200,000	: in 1783,	they were	350,000
Connecticut - -	100,000	——	——	206,000
Rhode Iſland - -	30,000	——	——	50,000
New Hampſhire	24,000	——	——	82,000
	354,000			688,000

So that, by this calculation, the number of inhabitants has ſo amazingly increaſed by new ſettlers from various parts of Europe, and by a very rapid population, that they at preſent amount to near 700,000, including Negroes, and a ſmall number of Indians.

Throughout the whole populous and fertile province of Connecticut, the greateſt care is taken of the limbs and bodies of infants, which are kept ſtreight by means of a board; a practice learnt of the Indian women, who abhor all crooked people; ſo that deformity is very uncommon here. The men are in general robuſt, ſtout, and tall. The women are fair, handſome, and genteel; and in their manners and behaviour, reſerved and modeſt. They are not deeply verſed in the laws or myſteries of whiſt or quadrille, nor have they any great acquaintance with plays and operas; but they will converſe freely upon matters relative to hiſtory, geography, and other literary ſubjects. They are extremely hoſpitable to ſtrangers and travellers in this country.

In this part of America, the church of England is far from being in a flouriſhing condition; in ſeveral places, the number of auditors do not amount to twelve perſons; and in the year 1768, the four provinces contained upwards of 700 religious aſſemblies, of which thirty-ſix only obſerved the forms of the church of England; but the form of its worſhip having lately undergone ſome material regulations in theſe parts, by reducing it to more moderate Anti-trinitarian principles, ſo as to make it more nearly reſemble that of the Preſbyterians, it is therefore thought that the profeſſors of that denomination will ſoon become more numerous. The Connecticut province hath alſo provided a biſhop for the Epiſcopalians among them, by ſending one of their number to Scotland, to be ordained by the non-juring biſhops of the Epiſcopal Church in that kingdom, which ceremony was performed at Aberdeen. Every particular ſociety or church of Diſſenters is independent of all other eccleſiaſtical juriſdiction; nor does there lie any appeal from their puniſhments or cenſures. The miniſters of Boſton depend entirely on the liberality of their hearers for ſupport, a voluntary contribution being made for them by the congregation, every time divine ſervice is celebrated. It is but lately that they ſuffered any member of the church of England to have a ſhare in the magiſtracy, or to be elected a member of the Commons, or Houſe of Repreſentatives.

Their

Their laws were formerly very ſevere againſt Quakers. To bring one in, was a forfeiture of 100l. to conceal one, 40s. an hour; to go to a Quaker's meeting, 10s. to preach there, 5s. A Quaker, not an inhabitant, was ſubject to baniſhment; and if he returned, death. Vagrant Quakers were ſentenced to be whipped, branded with the letter R on the left ſhoulder, and baniſhed; if they returned, death: but theſe, and ſome other ſevere eccleſiaſtical laws are now repealed, in conſequence of the diffuſion of more humane and equitable principles. Calviniſm, from the principles of the firſt ſettlers hath been very prevalent in New England, many of whoſe inhabitants obſerve the Sabbath with ſtrictneſs; but their obſervance of it hath of late been much diminiſhed. Since their independence, there is no eſtabliſhed religion in the province, but every ſect is allowed the free exerciſe of their religion, and is equally under the protection of the laws.

It is not improbable that this province will, in a courſe of years, make a conſiderable figure in the republic of letters; ſince we find, that on the 4th of May 1780, an act was paſſed by the Council and Houſe of Repreſentatives of Maſſachuſet's-Bay, for incorporating and eſtabliſhing a ſociety for the cultivation and promotion of the arts and ſciences; it is intitled, The American Academy of Arts and Sciences; the firſt members were named in the act; and they were never to exceed 200, nor to be fewer than forty. It was declared in the act, that the end and deſign of the inſtitution of the ſaid Academy, was, to promote and encourage the knowledge of the Antiquities of America, and of the Natural Hiſtory of the country, and to determine the uſes to which its various natural productions might be applied; to promote and encourage medicinal diſcoveries; in mathematical diſquiſitions, philoſophical inquiries and experiments; aſtronomical, meteorological, and geographical obſervations; improvements in agriculture, arts, manufactures, and commerce; and, in ſhort, to cultivate every art and ſcience which might tend to advance the intereſt, honour, dignity, and happineſs of a free, independent ſtate. This act, which was calculated for promoting the above-mentioned laudable purpoſes, was framed and eſtabliſhed as a law, ſince the commencement of the late war between Great-Britain and the colonies, and even while that war was carried on with great animoſity on both ſides.

No perſon can be arreſted in this province, if there are any means of ſatisfaction; nor impriſoned, unleſs there be a concealment of effects. Adultery was formerly death to both parties.

Boſton is the chief town of the county of Middleſex, and of all New England; it was formerly the chief of the Britiſh empire in America. It ſtands on a peninſula at the bottom of Maſſachuſet's-Bay, about eight miles from its mouth, and is well fortified. The approach to the harbour by ſhipping is narrow; but within it there is room enough for 500 ſail to lie at anchor, in a good depth of water. On one of the iſlands of the Bay ſtands Fort William, the moſt regular fortreſs in the Britiſh plantations: no ſhip can approach the town, without paſſing directly under the guns of the fort. About two leagues from the city is a light-houſe, erected on a rock, which, in time of war, makes ſignals to the caſtle, and the caſtle to the town. At the bottom of the bay, which is ſpacious enough to contain a numerous navy, is a pier, near 2000 feet in length, with a row of merchants' warehouſes on the north ſide. The city lies in the ſhape of a half-moon round the harbour, being in length about two miles, and in ſome places near three quarters of a mile broad. Here are ten churches of different denominations, a fine town-houſe, a printing-office, and ſeveral bookſellers ſhops. Here alſo the governor reſides, the general aſſembly and the chief courts of judicature are held, and here are tranſacted the affairs of the whole province. There is a market every Thurſday, and fairs for three days together, beginning on the firſt Tueſday in May, and the laſt Tueſday in October. Above 600 ſhips have been laden here in a year, for Europe and the Britiſh plantations, with lumber, beef, pork, fiſh, &c. The neck of land which joins the peninſula on which the city is built to the continent, is not above fifty yards wide. An adjoining diſtrict, called Charles-Town, was deſtroyed ſince the commencement of the late civil war.

Cambridge-Town, commonly called Newton, is ſituated on the northern branch of Charles River, about three miles from Boſton, in which are ſeveral good ſtreets; but is moſt conſiderable for its univerſity, conſiſting of three colleges. It is governed by a preſident, five fellows, and the treaſurer, who have each of them a competent revenue ſettled on them.

Salem, Portſmouth, Newhaven, Newport, and the other towns of New England, are in general neatly built, and commodiouſly ſituated on fine navigable rivers, with good harbours, but have nothing remarkable in them.

New England is remarkable for its commerce; its own productions furniſh a large quantity of goods for exportation; but this is far from forming the whole trade of this province, their ſhips are the chief carriers of all the colonies of North-America, eſpecially to and from the Weſt-India ſugar iſlands. The principal commodities of the country are pig and bar iron, which, under the Britiſh government, was imported into England duty free; maſts, yards, pitch, tar, and turpentine, for which they make large contracts for the royal navy; pot and pearl aſhes, pipe ſtaves, lumber, boards; all ſorts of proviſions, which they ſend to the French, Dutch, and Britiſh ſugar iſlands; as corn, biſcuit, meal, beef, pork, butter, cheeſe, apples, cyder, onions, dried mackerel and cod fiſh. They alſo ſend to thoſe iſlands, cattle, horſes, planks, hoops, ſhingles, pipe ſtaves, oil, tallow, turpentine, bark, calves ſkins, and tobacco. Their peltry trade, which was formerly very conſiderable, is now of ſmall account. They have very valuable fiſheries on their coaſt, in mackerel and cod, which employ a vaſt number of hands, and of which they are at great pains to reap the advantage. With the produce of theſe fiſheries, they trade to Spain, Italy, the Levant, and the Weſt-Indies, to a conſiderable amount annually.

The manufactures of this country are daily improving. They make coarſe linen and woollen cloth for home conſumption; hats are alſo made here, and ſold in a clandeſtine manner, in all the other colonies, where they are eagerly purchaſed. Sugar-baking, the diſtillery, paper-making, and ſalt-works are in an improving ſtate. The buſineſs of ſhip-building is one of the greateſt and moſt profitable employments of this country. Ships are often built here upon commiſſion; but the greateſt number on their own account. The merchants of New England, as ſoon as a ſhip is conſtructed, load her with the produce of the country, as naval ſtores, fiſh, and train oil, and ſend her out on a trading voyage to Spain, Portugal, or the Levant; where, after diſpoſing of the cargo, they engage with the merchants in carrying goods from one port to another, till an opportunity offers of ſelling the ſhip to advantage, which is generally done in a very ſhort time. This lucrative branch of commerce is now on the decline. In the year 1738, they built at Boſton forty-one large ſhips, burden in all 6,324 tons; in 1743 only thirty; in 1749 they were reduced to fifteen, making in the whole no more than 2,450 tons of ſhipping. Since which we had no exact account; but it is ſuppoſed to continue much in the ſame ſtate. The ſhips and veſſels built at the other towns in New England, are not included in this account.

†

Before

Before the late unhappy differences, the value of Britiſh manufactures and Indian commodities ſent to this province from the mother-country, on an average of three years, amounted to about 395,000l. and the imports to Great-Britain, about 370,500l. but both are greatly decreaſed, though the trade has been reviving for ſome time.

The hiſtory and government of New England next demand our attention. This part of North America is at preſent divided into the four provinces of New-Hampſhire, Maſſachuſet's, Rhode-Iſland, and Connecticut. In 1606, James I. had erected two companies by letters patent, with a power to ſend colonies into thoſe parts, then comprehended under the general name of Virginia, being the north-eaſt coaſt of America. However, as no ſettlements were made in conſequence of this authority, the companies contented themſelves with ſending out a few ſhips to trade with the Indians for their furs, and to fiſh on their coaſt. Things continued in this ſtate, till the acceſſion of Charles I. when they were far from mending. This prince, who gave himſelf up entirely to church and churchmen, finiſhed his ill conduct by placing Dr. Laud at the head of the church: this prelate, at the very time when religious diſſenſions, by which England was torn in pieces, had become warm and furious, perſecuted all ſects of nonconformiſts with unrelenting ſeverity; which, inſtead, of raiſing terror, produced a ſort of indignant hatred in the ſufferers, who became every day more averſe from liſtening to the leaſt terms of argeement with ſurplices, organs, common prayer, or communion tables at the eaſt end of the church; and there was no part of the known world whither they would not fly for liberty of conſcience.

A number of the ſame perſuaſion had taken refuge in Holland at the beginning of James's reign; but even in that country, where every ſect of religion is tolerated, they were equally unhappy. They were not perſecuted indeed, but narrowly watched. In this ſtate of indolent ſecurity, their zeal began to have dangerous languors for want of oppoſition; and, being deſtitute both of power and conſequence, they became tired of their aſylum, and deſirous of reſiding where they had no ſuperior. Accordingly, an agent was diſpatched to England, who agreed with the company who had obtained a charter for an excluſive trade to North America, under the title of the Plymouth Council, for a tract of land in the New World for forming a ſettlement. The royal permiſſion was alſo obtained, and a number of thoſe people embarked for America, then little better than a thick and gloomy foreſt.

This colony gave the name of New Plymouth to the place where they firſt ſettled. The number of adventurers was but ſmall, they landed at a bad ſeaſon of the year, and were ſupported only by their own private funds. The winter was dreadfully cold, and the country covered with wood, afforded very little for the refreſhment of perſons rendered ſickly by a tedious voyage, or for the ſuſtenance of an infant colony. The conſequences were ſuch as might have been expected; near half of them periſhed by the ſcurvy, by want, and the ſeverity of the climate. They who ſurvived, however, were not diſpirited either by the loſſes or the hardſhips they were ſtill doomed to endure. Supported by that vigour which then formed the character of Engliſhmen, and by the ſatisfaction of being beyond the reach of the arm of ſpiritual power, they reduced, by unremitted labour, the ſavage country to yield them a tolerable livelihood, and by degrees a comfortable ſubſiſtence. This eſtabliſhment was made in the year 1621. In the mean time, the ſame claſs of people in England being haraſſed by the arm of eccleſiaſtical authority, many of them retired to their brethren in America. The colony now began to wear the face of proſperity, and, by the end of the year, they had built four towns, Salem, Dorcheſter, Charles-Town, and Boſton, of which the latter has ſince become the capital of New England.

It might be naturally expected that the inhabitants of New England, who had themſelves ſo lately fled from perſecution, would have been diſpoſed to grant the greateſt freedom to others in ſimilar circumſtances. Many of them were bigotted; and, though they had felt the weight of perſecution themſelves, they had no charity for thoſe who profeſſed ſentiments different from their own. The very doctrine of any kind of toleration was ſo odious to the greateſt part, that one of the firſt perſecutions in this country was exerciſed on a ſmall party among themſelves, who were hardy enough to mention that the civil magiſtrate had no power to uſe compulſory methods in the affairs of religion. The fury of unbridled zeal was let looſe; and, after the people had been haraſſed by all the vexatious methods that could be deviſed, they were driven from their farms, and forced to fly for ſhelter to another diſtrict. They ſettled to the ſouthward of their brethren, near Cape Cod, where they formed a new government on their own principles, and built a town which they called Providence; and ſuch is the connection between juſtneſs of ſentiment and external proſperity, that the government of Rhode-Iſland, though ſmall, became extremely populous and flouriſhing. In a word, as perſecution gave riſe to the firſt ſettlement in New England, ſo ſubſequent perſecutions among themſelves gave riſe to new colonies, and thus facilitated the ſpreading of the people over the whole country; and, in proceſs of time, America became the main aſylum of all diſcontented and enterpriſing ſpirits; and ſuch were the numbers which embarked for it from England, that, in 1637, a proclamation was publiſhed, prohibiting any perſon from ſailing thither, without an expreſs licence from the government. It is ſaid, that, for want of ſuch a licence, Oliver Cromwell, and others of that party, were prevented from going to New England, after they had taken ſhipping with that intent.

Theſe provinces, namely, New Hampſhire, Maſſachuſet's, Rhode-Iſland, and Connecticut, were impowered by their charter to eſtabliſh ſuch order, and form ſuch laws as they thought requiſite, provided they were not contrary to the laws of England. Strangers to the qualifications neceſſary in legiſlators, and violent enthuſiaſts, the firſt ſettlers imitated the ancient Jewiſh polity in almoſt every reſpect; they adopted the books of Moſes as the laws of the land. Theſe were ill ſuited to the occaſion, and therefore were ſoon after laid aſide. Few charters were ever more ample than thoſe granted to the firſt ſettlers of New England. The coloniſts were indeed almoſt independent of their mother-country. Not only the power of making laws was veſted in them, but they alſo enjoyed the privilege of chooſing their own magiſtrates, the governor, the council, and the aſſembly. But it ſeems even theſe powers were not ſufficient; for, towards the end of Charles the Second's reign, the Maſſachuſets colony were accuſed of violating their charter, as was the city of London, and deprived of it by a judgment in the King's-Bench. From that time they continued without a charter till the Revolution; the bigotted reign of James the Second was a very improper ſeaſon for Diſſenters to apply for favours. But ſoon after his abdication, when Engliſh liberty was reſtored, the coloniſts of New England obtained a new charter, but much inferior in extenſive privileges to the former. The appointment of the governor, lieutenant-governor, ſecretary, and all the officers of the admiralty, were veſted in the crown; the command of the militia was placed in the hands of the governor, as captain-general of the province; all judges, juſtices, and ſheriffs, intruſted with the execution of the laws, were nominated by the governor, with the advice of the council; the governor had a negative in the

choice of counſellors, peremptory and unlimited. He was not obliged to give a reaſon for what he did in this particular, or reſtrained to any number; authentic copies of the ſeveral acts paſſed by the colony, as well as others, were to be tranſmitted to the court of England, for the royal approbation; but, if the laws of this colony were not repealed within three years after they were preſented, they were not afterwards repealable by the crown: no laws, ordinances, or elections of magiſtrates, or any acts of government whatever, were valid, without the governor's aſſent in writing; and appeals for ſums above 300l. ſterling were made to the king and council. But, notwithſtanding theſe reſtrictions, the Maſſachuſets colony ſtill enjoyed many valuable privileges: they not only choſe the members of the aſſembly, or lower houſe of parliament, but that aſſembly, with the governor's concurrence, choſe the council, which reſembled the Engliſh houſe of lords; and the governor himſelf depended upon the aſſembly for his annual ſupport. The ancient colony of Plymouth and territory called Main, are united to the Maſſachuſets government.

The colony of New Hampſhire, as a royal government, was more dependent on the mother-country; the council, as well as the governor, were appointed by the crown. In other reſpects, the government of New Hampſhire and that of Maſſachuſets-Bay were the ſame.

The colony of Connecticut never forfeited their charter; but enjoyed all the privileges granted at their firſt ſettlement.

There were originally three ſorts of governments eſtabliſhed by the Engliſh on the continent of America, viz. royal governments, charter governments, and proprietary governments. A royal government was properly ſo called, becauſe the colony was immediately dependent on the crown, and the king remained ſovereign of the colony. A charter government was ſo called, becauſe a company, incorporated by the king's charter, was in a manner veſted with ſovereign authority. A proprietary government was ſo denominated, becauſe the proprietor, either by purchaſe or gift, had a kind of regal authority.

In conſequence of the independence of the colonies on the legiſlative authority of Great-Britain, the government of New England has been entirely changed. By an order from the council at Boſton, the declaration of the American congreſs, abſolving the United Colonies from their allegiance to the crown of Great-Britain, and declaring them free and independent, was, on the 25th of July 1776, publicly proclaimed from the balcony of the ſtate-houſe in that town; and, in October 1780, a conſtitution, or form of government, for the commonwealth of Maſſachuſets, with a declaration of rights, was agreed to and eſtabliſhed by the inhabitants of that province; the preamble to which repreſented, that "the end of the inſtitution, maintenance, and adminiſtration of government, is, to ſecure the exiſtence of the body politic; to protect it, and to furniſh the individuals who compoſe it with the power of enjoying, in ſafety and tranquillity, their natural rights, and the bleſſings of life; and that whenever theſe great objects are not obtained, the people have a right to alter the government, and to take meaſures neceſſary for their proſperity and happineſs," &c. It was in this conſtitution provided, among other things, that no peaceable ſubject ſhould be hurt, moleſted, or reſtrained, in his perſon, liberty, or eſtates, for worſhipping God in the manner and ſeaſon moſt agreeable to the dictates of his own conſcience: it was alſo enacted, that all religious ſocieties, &c. ſhould at all times have the excluſive right of electing their public teachers, and of contracting with them for their ſupport and maintenance; that no ſubordination of any ſect or denomination to another ſhould ever be eſtabliſhed by law; and that every denomination of Chriſtians, demeaning themſelves peaceably, and as good ſubjects of the commonwealth, ſhould be equally entitled to its protection; it was likewiſe therein declared, that, as the liberty of the preſs is eſſential to the ſecurity of freedom in a ſtate, it ought not therefore to be reſtrained in that commonwealth.

The legiſlative department is to be formed by a ſenate, and a houſe of repreſentatives; each of which to have a negative on the other; the ſenators, and members of the houſe of repreſentatives, are to be elected annually; every male, of twenty-one years of age or upwards, reſident during one year in any particular town of the commonwealth, and poſſeſſed of a freehold eſtate in the ſaid town of the annual income of 3l. or any eſtate of 60l. value, is entitled to a vote for ſenators and repreſentatives of the diſtrict of which he is an inhabitant. The ſenators are forty, viz. for Suffolk ſix, Eſſex ſix, Middleſex five, Hampſhire four, Plymouth three, Barnſtable one, Briſtol three, York two, Duke's and Nantucket one, Worceſter five, Cumberland one, Lincoln one, Berkſhire two. The houſe of repreſentatives is alſo choſen in certain proportions, and paid by the conſtituent body.

A ſupreme executive magiſtrate, who ſhould be ſtyled the governor of the commonwealth of Maſſachuſets, and alſo a lieutenant-governor, were directed to be annually choſen by the whole body of electors: theſe were to be aſſiſted by nine counſellors, choſen by ballot, out of the ſenate. The ſecretary, treaſurer, receiver-general, notaries-republic, and naval officers, are elected annually by the ſenators and repreſentatives. The judiciary power is to be ſeptennial, and the delegates to congreſs are to be choſen each year by and out of the ſenate and houſe of repreſentatives, or general court. The governor has no control in the choice of officers, but has a negative on bills tranſmitted to him for aſſent from the general court.

New Hampſhire and Connecticut have not long finally ſettled their forms of government; for they at firſt, for the moſt part, adopted that of Maſſachuſets-Bay. The Sate of Rhode-Iſland adheres to their original charter as the rule of government, ſince it contains an ample grant of all legiſlative, judicial, and executive powers.

The inhabitants of New England are almoſt univerſally of Engliſh deſcent; and it is owing to this circumſtance, and to the great and general attention that has been paid to education, that the Engliſh language has been preſerved among them ſo free of corruption. It is true, that from lazineſs, inattention, and want of acquaintance with mankind, many of the people in the country have accuſtomed themſelves to uſe ſome peculiar phraſes, and to pronounce certain words in a flat, drawling manner. Hence foreigners pretend they know a New Englandman from his manner of ſpeaking. But the ſame may be ſaid with regard to a Pennſylvanian, a Virginian, or a Carolinian; for all have ſom phraſes and modes of pronunciation peculiar to themſelves, which diſtinguiſh them from their neighbours. Men of eminence in the ſeveral learned profeſſions and colleges, ought to be conſidered as forming the ſtandard of pronunciation for their reſpective ſtates; and not that claſs of people who have imbibed the habit of uſing a number of ſingular and ridiculous phraſes, and who pronounce badly.

The New Englanders are generally tall, ſtout, and well built. They glory, and perhaps with juſtice, in poſſeſſing that ſpirit of freedom, which induced their anceſtors to leave their native country, and to brave the dangers of the ocean, and the hardſhips of ſettling in a wilderneſs. Their education, laws, and ſituation, ſerve to inſpire them with high notions of liberty. Their jealouſy is awakened at the firſt motion towards an invaſion of their rights. They are indeed often jealous to exceſs; a circumſtance which is a fruitful ſource of imaginary grievances, and of innumerable groundleſs ſuſpicions, and unjuſt complaints againſt government. But theſe ebullitions of jealouſy,

jealouſy, though cenſurable, and productive of ſome political evils, ſhew that the eſſence of true liberty exiſts in New England; for jealouſy is the guardian of liberty, and a characteriſtic of free republicans. A law, reſpecting the deſcent of eſtates which are generally held in fee ſimple, which for ſubſtance is the ſame in all the New England ſtates, is the chief foundation and protection of this liberty. By this law, the poſſeſſions of the father are to be equally divided among all the children, excepting the eldeſt ſon, who has a double portion. In this way is preſerved that happy mediocrity among the people, which, by inducing œconomy and induſtry, removes from them temptations to luxury, and forms them to habits of ſobriety and temperance. At the ſame time, their induſtry and frugality exempt them from want, and from the neceſſity of ſubmitting to any encroachment on their liberties.

In New England learning is more generally diffuſed among all ranks of people than in any other part of the globe; ariſing from the excellent eſtabliſhment of ſchools in every townſhip.

Another very valuable ſource of information to the people is the newſpapers, of which not leſs than thirty thouſand are printed every week in New England, and circulated in almoſt every town and village in the country.

A perſon of mature age, who cannot both read and write, is rarely to be found. By means of this general eſtabliſhment of ſchools, the extenſive circulation of newſpapers, and the conſequent ſpread of learning, every townſhip throughout the country is furniſhed with men capable of conducting the affairs of their town with judgment and diſcretion. Theſe men are the channels of political information to the lower claſs of people; if ſuch a claſs may be ſaid to exiſt in New England, where every man thinks himſelf at leaſt as good as his neighbour, and believes that all mankind are, or ought to be, equal. The people from their childhood form habits of canvaſſing public affairs, and commence politicians. This naturally leads them to be very inquiſitive. It is with knowledge as with riches, the more a man has, the more he wiſhes to obtain; his deſire has no bound. This deſire after knowledge, in a greater or leſs degree, prevails throughout all claſſes of people in New England; and from their various modes of expreſſing it, ſome of which are blunt and familiar, bordering on impertinence, ſtrangers have been induced to mention *impertinent inquiſitiveneſs* as a diſtinguiſhing characteriſtic of New England people. But this is true only with regard to that claſs of people who have confined themſelves to domeſtic life, and have not had opportunity of mingling with the world; and ſuch people are not peculiar to New England—they compoſe a great part of the citizens of every ſtate. This claſs, it is true, is large in New England, where agriculture is the principal employment. But will not a candid and ingenious mind aſcribe this inquiſitiveneſs in theſe honeſt and well-meaning people to a *laudable* rather than to a cenſurable diſpoſition?

A very conſiderable part of the people have either too little or too much learning to make peaceable ſubjects. They know enough, however, to think they know a great deal, when in fact they know but little. "A little learning is a dangerous thing." Each man has his independent ſyſtem of politics; and each aſſumes a dictatorial office. Hence originates that reſtleſs, litigious, complaining ſpirit, which forms a dark ſhade in the character of New Englandmen.

This litigious temper is the genuine fruit of republicaniſm; but it denotes a corruption of virtue, which is one of its eſſential principles. Where a people have a great ſhare of freedom, an equal ſhare of virtue is neceſſary to the peaceable enjoyment of it. Freedom, without virtue or honour, is licentiouſneſs.

§

Before the late war, which introduced into New England a flood of corruptions, with many improvements, the ſabbath was obſerved with great ſtrictneſs; no unneceſſary travelling, no ſecular buſineſs, no viſiting, no diverſions were permitted on that ſacred day, They conſidered it as conſecrated to divine worſhip, and were generally punctual and ſerious in their attendance upon it. Their laws were ſtrict in guarding the ſabbath againſt every innovation. The ſuppoſed ſeverity with which theſe laws were compoſed and executed, together with ſome other traits in their religious character, have acquired, for the New Englanders, the name of a ſuperſtitious, bigotted people. But ſuperſtition and bigotry are ſo indefinite in their ſignifications, and ſo variouſly applied by perſons of different principles and educations, that it is not eaſy to determine whether they ever deſerved that character. Leaving every perſon to enjoy his own opinion in regard to this matter, we will only obſerve, that, ſince the war, a catholic, tolerant ſpirit, occaſioned by a more enlarged intercourſe with mankind, has greatly increaſed, and is becoming univerſal; and if they do not break the proper bound, and liberalize away all true religion, of which there is much danger, they will counteract that ſtrong propenſity in human nature, which leads men to vibrate from one extreme to its oppoſite.

There is one diſtinguiſhing characteriſtic in the religious character of this people, which we muſt not omit to mention; and that is, the cuſtom of annually celebrating faſts and thankſgivings. In the ſpring, the ſeveral governors iſſue their proclamations, appointing a day to be religiouſly obſerved in faſting, humiliation, and prayer, throughout their reſpective ſtates, in which the predominating vices, that particularly call for humiliation, are enumerated. In autumn, after harveſt, that gladſome æra in the huſbandman's life, the governors again iſſue their proclamations, appointing a day of public thankſgiving, enumerating the public bleſſings received in the courſe of the foregoing year.

This pious cuſtom originated with their venerable anceſtors, the firſt ſettlers in New England; and has been handed down as ſacred through the ſucceſſive generations of their poſterity. A cuſtom ſo rational, and ſo happily calculated to cheriſh in the minds of the people a ſenſe of their dependence on the Great Benefactor of the world for all their bleſſings, it is hoped will ever be ſacredly preſerved.

There is a claſs of people in New England of the baſer ſort, who, averſe to honeſt induſtry, have recourſe to knavery for ſubſiſtence. Skilled in all the arts of diſhoneſty, with the aſſumed face and frankneſs of integrity, they go about, like wolves in ſheep's clothing, with a deſign to defraud. Theſe people, enterpriſing, from neceſſity, have not confined their knaviſh tricks to New England. Other ſtates have felt the effects of their villainy. Hence they have characteriſed the New Englanders as a knaviſh, artful, and diſhoneſt people. But that conduct which diſtinguiſhes only a ſmall claſs of people in any nation or ſtate, ought not to be indiſcriminately aſcribed to all, or be ſuffered to ſtamp their national character. In New England there is as great a proportion of honeſt and induſtrious citizens as in any of the United States.

The people of New England generally obtain their eſtates by hard and perſevering labour: they of conſequence know their value, and ſpend with frugality. Yet in no country do the indigent and unfortunate fare better. Their laws oblige every town to provide a competent maintenance for their poor, and the neceſſitous ſtranger is protected, and relieved from their humane inſtitutions. It may in truth be ſaid, that in no part of the world are the people happier, better furniſhed with the neceſſaries and conveniences of life, or more independent than the farmers in New England. As the great body of the people are hardy, independent freeholders, their manners

are,

are, as they ought to be, congenial to their employment,—plain, ſimple, and unpoliſhed. Strangers are received and entertained among them with a great deal of artleſs ſincerity, friendly, and unformal hoſpitality. Their children, thoſe imitative creatures, to whoſe education particular attention is paid, early imbibe the manners and habits of thoſe around them; and the ſtranger, with pleaſure, notices the honeſt and decent reſpect that is paid him by the children as he paſſes through the country.

As the people, by repreſentation, make their own laws and appoint their own officers, they cannot be oppreſſed; and, living under governments which have few lucrative places, they have few motives to bribery, corrupt canvaſſings, or intrigue. Real abilities and a moral character unblemiſhed, are the qualifications requiſite in the view of moſt people for officers of public truſt. The expreſſion of a wiſh to be promoted, is the direct way to be diſappointed.

The inhabitants of New England are generally fond of the arts, and have cultivated them with great ſucceſs. Their colleges have flouriſhed beyond any others in the United States. The illuſtrious characters they have produced, who have diſtinguiſhed themſelves in politics, law, divinity, the mathematics and philoſophy, natural and civil hiſtory, and in the fine arts, particularly in poetry, evince the truth of theſe obſervations.

Many of the women in New England are handſome. They generally have fair, freſh, and healthful countenances, mingled with much female ſoftneſs and delicacy. Thoſe who have had the advantages of a good education (and they are conſiderably numerous) are genteel, eaſy, and agreeable in their manners, and are ſprightly and ſenſible in converſation. They are early taught to manage domeſtic concerns with neatneſs and œconomy. Ladies of the firſt rank and fortune make it a part of their daily buſineſs to ſuperintend the affairs of the family. Employment at the needle, in cookery, and at the ſpinning-wheel, with them is honourable. Idleneſs, even in thoſe of independent fortunes, is univerſally diſreputable. The women in the country manufacture the greateſt part of the clothing of their families. Their linen and woollen cloths are ſtrong and decent. Their butter and cheeſe is not inferior to any in the world.

Dancing is the principal and favourite amuſement in New England; and of this the young people of both ſexes are extremely fond. Gaming is practiſed by none but thoſe who cannot, or rather will not find a reputable employment. The gameſter, the horſe-jockey, and the knave, are equally deſpiſed, and their company is avoided by all who would ſuſtain fair and irreproachable characters. The odious and inhuman practices of duelling, gouging, cock-fighting, and horſe-racing, are ſcarcely known here.

The athletic and healthy diverſions of cricket, foot-ball, quoits, wreſtling, jumping, hopping, foot-races, and priſon-baſs, are univerſally practiſed in the country, and ſome of them in the moſt populous places, and by people of almoſt all ranks. Squirrel-hunting is a noted diverſion in country places, where this kind of game is plenty. Some divert themſelves with fox-hunting, and others with the more profitable ſports of fiſhing and duck-hunting: and in the frontier ſettlements, where deer and fur game abound, the inhabitants make a lucrative ſport of hunting them.

In the winter-ſeaſon, while the ground is covered with ſnow, which is commonly two or three months, ſleighing is the general diverſion. A great part of the families throught the country are furniſhed with horſes and ſleighs. The young people collect in parties, and with a great deal of ſociability reſort to a place of rendezvous, where they regale themſelves for a few hours with dancing and a ſocial ſupper, and then retire. Theſe diverſions, as well as all others, are many times carried to exceſs. To theſe exceſſes, and a ſudden expoſure to extreme cold after the exerciſe of dancing, phyſicians have aſcribed the conſumptions which are ſo frequent in New England among the young people.

CHAP. VI.

NEW YORK.

Situation, Extent and Boundaries, Rivers, Climate, Produce, Cities, Towns, and Government.

THIS province is ſituated between 40 and 46 deg. of north latitude, and between 72 and 76 deg. of weſt longitude. It is about 300 miles in length, and 150 in breadth, bounded on the North by New England, on the Weſt by Canada, on the South by Pennſylvania and New Jerſey, and on the Eaſt by New England and the Atlantic Ocean. It contans 24,000 ſquare miles.

New York, including the iſland of the ſame name, Long-Iſland, and Staten-Iſland, is divided into ten counties, as follows:

Counties.	Chief Towns.	
New York	New York.	
Albany	Albany.	
Ulſter	None.	
Ducheſs	None.	
Orange	Orange.	
Weſt-Cheſter	Weſt-Cheſter.	
King's	None.	
Queen's	Jamaica	Long Iſland
Suffolk	Southampton	Long Iſland
Richmond	Richmond	Long Iſland

The principal rivers in New York are Hudſon's and the Mohawks: the former has many excellent harbours, and is ſtored with a great variety of fiſh. Between Schenectady and the efflux of the Mohawks river, is the cataract or fall of Coſhoes, where the water ruſhes down a precipice near ſeventy feet high. The only remarkable lakes in this province, are lake George, and part of lake Champlain. The capes are, Sandy-Hook, near the entrance of the Raritan river; Montock Point, at the eaſt end of Long Iand; and Cape May, at the entrance of Delaware river.

The climate of this province is more temperate than that of New England, and the air is very healthy. The face of the country is low, flat, and marſhy, towards the ſea. The ſoil is remarkably fertile, and in general well cultivated. The vegetable productions are wheat, barley, rye, Indian corn, oats, hemp, flax, and a vaſt variety of fruits in great abundance and perfection. The timber is nearly the ſame with that of New England, and large quantities of pot and pearl aſhes are made from the refuſe of the woods. The iron here is excellent, and found in great plenty.

New York ſtands between 40 deg. 40 min. north lat. and 74 deg. weſt long. on the ſouth-weſt of York-Iſland; it is twelve miles long, and between two and three broad, extremely well ſituated for trade, at the mouth of Hudſon's or the Iroquois river. The city is a mile long, and about a quarter of a mile broad. Many of the houſes are very elegant; and the city, though irregularly built, affords a fine proſpect. The inhabitants, who are chiefly the deſcendants of Dutch families, are computed at about 5000, and the whole province contains near 200,000. They are in general endowed with a liberal, generous, and hoſpitable turn of mind. The city and harbour are defended by a fort and battery.

Kingſton is a pretty populous, well-built town, ninety miles up the river, where the Æſopus from New Jerſey falls into it. Albany is 143 miles up the river, and but five miles below which it is parted into two branches. It contains between 3 and 400 families, and has a ſtrong fort and garriſon.

There is not much eſſential difference between the commerce of New York and New England. The principal commodities of the trade are wheat, flour, Indian corn, oats, beef, pork, furs, and ſkins. They have a conſiderable ſhare in the logwood trade, and that which is carried on with the French and Spaniſh plantations. Their European trade is the ſame with that of New England, and they import the ſame ſpecies of commodities. From an average of three years, their exports amount to 526,000l. and their imports from Great-Britain to 531,000l. but whether they are the ſame ſince the late troubles in America, is not certainly known.

All religions were tolerated here, except the Jewiſh and Roman Catholic, and there profeſſors enjoyed equal privileges. There was originally no eſtabliſhed religion, except that of the Dutch, who followed the Preſbyterian diſcipline, which was granted the inhabitants when the province ſurrendered to the Engliſh, if it can be called ſuch. Here Proteſtants, according to the church of England, Dutch and Engliſh Preſbyterians, German Calviniſts, Lutherans, Baptiſts, Quakers, &c. have all their reſpective places of worſhip, and all live in harmony with one another, without diſcrimination or preference to any.

The ſynods of New York and Philadelphia, during their ſeſſion at Philadelphia, in May 1788, reſolved themſelves into four ſynods, viz. the ſynod of New York; the ſynod of Philadelphia; the ſynod of Virginia; and the ſynod of Carolina. Theſe ſynods are to meet annually in their reſpective ſtates, whence they take their names; and once a year, by their commiſſioners, in general council, at Philadelphia.

There are a number of Preſbyterian churches, commonly called SECEDERS, who have a ſeparate eccleſiaſtical juriſdiction. Theſe, as well as the other Preſbyterians, and the Dutch reformed churches, hold the doctrines of the goſpel upon the Calviniſtic plan, without any eſſential differences.

The Dutch reformed churches in this ſtate are divided into four claſſes, viz. the claſſis of New York, comprehending eighteen churches; the claſſis of Kingſton, twenty-three churches; the claſſis of Albany, twenty-three churches; part of the claſſis of Hackinſak, four churches. Theſe claſſes, together with the claſſes of Hackinſak and New Brunſwick, in New Jerſey, compoſe the Dutch reformed ſynod of New York and New Jerſey. The claſſes conſiſt of miniſters and ruling elders; each claſſis delegates two miniſters and an elder to repreſent them in ſynod. From the firſt planting of the Dutch churches in New York and New Jerſey, they have, under the claſſis of Amſterdam, been formed exactly upon the plan of the eſtabliſhed church of Holland, as far as that is eccleſiaſtical. A ſtrict correſpondence is maintained between the Dutch reformed ſynod of New York and New Jerſey, and the ſynod of North Holland and the claſſis of Amſterdam. The acts of their ſynods are mutually exchanged every year, and mutual advice is given and received in diſputes reſpecting doctrinal points and church diſcipline.

The principles and conſtitution of the Baptiſt churches are much the ſame as in Great-Britain.

The Epiſcopalian churches hold the ſame principles, have the ſame mode of worſhip and church government, and are in every other reſpect conſtituted upon the ſame plan with the church of the ſame denomination in England.

The Methodiſt intereſt, though ſmall in this ſtate, has greatly increaſed in the ſouthern ſtates ſince the revolution. They have eſtimated their number at 57,800. But their numbers are ſo various in different places, at different times, that it would be a matter of no ſmall difficulty to find out their exact amount. The late famous Mr. John Weſley has been called the father of this religious ſect. They warmly oppoſe the Calviniſtic doctrines of election and final perſeverance, and maintain that ſinleſs perfection is attainable in this life. Their mode of preaching is entirely extemporaneous. Their manner is very ſolemn, and their preaching is frequently attended with a ſurpriſing effect upon their audiences. Their churches are ſupplied by their preachers in rotation.

The Shakers are a ſect who ſprung up in Europe. A part of them came over from England to New York in 1774, and, being joined by others, they ſettled at Niſqueaunia, above Albany, whence they ſpread their doctrines, and increaſed to a conſiderable number; but their intereſt is now faſt declining. The late *Anna Leeſe*, whom they ſtyled the *Elect Lady*, was the head of this ſect. Her followers aſſerted, that ſhe was the woman ſpoken of in the twelfth of the Revelation, and that ſhe ſpoke ſeventy-two tongues: and although theſe tongues were unintelligible to the living, ſhe converſed with the dead, who underſtood her language. They alleged alſo that ſhe was the mother of all the *Elect:* that ſhe travailed for the whole world; that no bleſſing could deſcend to any perſon but only by and through her, and that in the way of her being poſſeſſed of their ſins, by their confeſſing and repenting of them, one by one, according to her direction. The Elect Lady uſed to aſſert that ſhe was immortal; that the day of judgment had commenced, and that ſhe and her followers were already ſet to judge the world. But her death has indiſputably proved that ſhe was not immortal as to bodily preſence; and this circumſtance, no doubt, has created ſuſpicions in the minds of ſome of her followers reſpecting ſome other of her aſſertions and doctrines, and occaſioned them to renounce the ſcheme.

Their worſhip, if ſuch extravagant conduct may be ſo called, conſiſts principally in dancing, ſinging, leaping, clapping their hands, falling on their knees, and uttering themſelves in groans and ſighs, in a ſound reſembling that of the roaring of water; turning round on their heels with aſtoniſhing ſwiftneſs, to ſhew, as they ſay, the power of God. All theſe geſticulations are performed in the moſt violent and boiſterous manner, and occaſion, at intervals, a ſhuddering not unlike that of a perſon in a ſtrong fit of the ague. Hence they are called, not improperly, *Shakers*.

Before we leave this head, we muſt mention, that, in April 1784, the legiſlature of this ſtate paſſed an act, enabling all religious denominations to appoint truſtees, not leſs than three, or more than nine, who ſhall be a body corporate, for the purpoſe of taking care of the temporalities of their reſpective congregations, and for the other purpoſes therein mentioned.

The miniſters of every denomination in the ſtate are ſupported by the voluntary contributions of the people, raiſed generally by ſubſcription, or by a tax upon the pews, except the Dutch churches in New York, Albany, Skenectady, and Kingſton, which have, except the two laſt, large eſtates confirmed by a charter. The Epiſcopal church alſo in New York poſſeſs a very large eſtate in and near the city.

This province was originally ſettled by the Dutch and Swedes, ſome time before the Diſſenters tranſported themſelves into New England. They called it the New Netherlands, continued in poſſeſſion of it till the reign of Charles II. when it was taken by the Engliſh in 1664. The Dutch, to balance this conqueſt, made themſelves maſters of Surinam, then belonging to the Engliſh. At the treaty of Breda, theſe reſpective acquiſitions were confirmed to the conquerors; the New Netherlands were ceded to the Engliſh, Surinam to the Dutch. This exchange produced a violent clamour among the political writers of thoſe times: it was ſaid, that the two provinces

were far from being equal; that Surinam was more than double the value of the New Netherlands; and, conſequently, that the miniſtry had made a very imprudent agreement: but time has ſufficiently ſhewn the miſtake, and the ſuperiority of the province of New York is univerſally allowed. The New Netherlands had not been long in our poſſeſſion before they were divided into provinces: and New York obtained its name from the King's brother, James, duke of York, to whom his majeſty granted it, with full powers of government, by letters patent, bearing date the 20th of March, 1664. On the acceſſion of James II. to the crown, this province became a royal government, and continued ſo till the Americans renounced their allegiance to the king of Great-Britain.

The government of New York was adminiſtered by a governor, who had his commiſſion from the crown. The legiſlative power was lodged in the governor, council, and houſe of repreſentatives. The council conſiſted of 12 members nominated by the king: the houſe of repreſentatives of 27 members elected by the people: in other reſpects, the government was as nearly conformable to the laws of England as poſſible. The houſe of repreſentatives were elected every ſeven years; but no laws were valid till the royal aſſent had been obtained.

The ſupreme legiſlative power of this province has, however, ſince 1777, been veſted in two ſeparate and diſtinct bodies of men; viz. 1. The aſſembly of the ſtates of New York, to conſiſt of 70 members: and, 2. The ſenate of the ſtate of New York, to conſiſt of 24 for four years; they are to meet once in each year for the diſpatch of public buſineſs. Delegates to the congreſs, judges, &c. are choſen by ballot out of the ſenate and aſſembly. A governor is appointed to the ſupreme executive power, and to be aſſiſted by four counſellors, choſen by and from the ſenate: he is to continue in office three years.

A want of good water is a great inconvenience to the citizens, there being few wells in the city. Moſt of the people are ſupplied every day with freſh water, conveyed to their doors in caſks, from a pump near the head of Queen-Street, which receives it from a ſpring, almoſt a mile from the city. Several propoſals have been made by individuals to ſupply the citizens by pipes, but none has yet been accepted.

New York is the gayeſt place in America. The ladies, in the richneſs and brilliancy of their dreſs, are not equalled in any city of the United States; not even in Charleſton, which has heretofore been called the centre of the *beau monde*. The ladies, however, are not ſolely employed in attentions to dreſs. There are many who are ſtudious to add to their brilliant external accompliſhments, the more valuable and laſting accompliſhments of the mind. Nor have they been unſucceſsful; for New York can boaſt of great numbers of refined taſte, whoſe minds are highly improved, and whoſe converſation is as inviting as their perſonal charms. Tinctured with a Dutch education, they manage their families with good œconomy and ſingular neatneſs.

In point of ſociability and hoſpitality, New York is hardly exceeded by any town in the United States. If, however, in regard to theſe agreeable characteriſtics, the preference muſt be given to any one place, it decidedly belongs to Charleſton. Some travellers have, in theſe reſpects, given Boſton and Newport the preference to New York. Several cauſes have operated to diminiſh the ſociability of the citizens of New York—particularly the change of inhabitants, by emigrations from Europe—the loſs of property during the ravages of the war—and the unfavourable ſtate of buſineſs a great part of the time ſince the peace. Theſe cauſes have operated no leſs unfavourably in ſome other parts of the union.

An inquirer, who would wiſh to acquaint himſelf with the true ſtate of the people of New York, their manners and government, would naturally aſk the citizens for their ſocieties for the encouragement of ſciences, arts, manufactures, &c.? for their public libraries? for the patrons of literature? their well-regulated academies? for their female academy for inſtructing young ladies in geography, hiſtory, belles lettres, &c.? Such inquiries might be made with propriety, but could not, at preſent, be anſwered ſatisfactorily.

On a general view of this city, as deſcribed thirty years ago, and in its exiſting ſtate, the compariſon is flattering to the preſent age; particularly the improvements in taſte, elegance of manners, and that eaſy unaffected civility and politeneſs, which form the happineſs of ſocial intercourſe.

CHAP. VII.

NEW JERSEY.

Situation, &c. Diviſions, Rivers, Towns, Trade, Religion, and government.

THIS province is ſituated between 39 and 43 deg. of north lat. and between 74 and 76 deg. of weſt long. It is about 160 miles in length, and 60 in breadth; bounded by the Sound which ſeparates Staten-Iſland from the Continent, and Hudſon's river, on the north; by Delaware river and bay on the weſt and ſouth-weſt; and on the ſouth-eaſt and eaſt by the Atlantic Ocean.

It is divided into thirteen counties, as in the following table:

Diviſions.	Counties.	Chief Towns.
Eaſt diviſion, or Eaſt Jerſey, contains.	Middleſex	Perth-Amboy, New-Britain.
	Monmouth	Shrewſbury and Freehold.
	Eſſex	Elizabeth, Newark.
	Somerſet	Boundbrook.
	Bergen	Hackinſak
Weſt diviſion, or Weſt Jerſey, contains.	Burlington	Burlington.
	Glouceſter	Glouceſter.
	Salem	Salem.
	Cumberland	Hopewell, Bridgetown.
	Cape May	None.
	Huntingdon	Trenton.
	Morris	Morriſtown.
	Suſſex	Newtown.

The air is healthy, and the climate nearly the ſame with that of New York; the ſoil is various; one part in four, at leaſt, of the province, is barren, ſandy land, but produces excellent pines and cedars; and the arable lands large crops of fine wheat, barley, rye, Indian corn, &c. together with a great variety of delicious fruits. There is a valuable copper mine in the county of Bergen, and excellent iron ore is found in other parts.

The principal rivers are Delaware, Raritan, and Paſſaick; on the latter is a remarkable cataract; the height of the rock, over which the water falls, is near 70 feet perpendicular, and the breadth of the river 80 yards.

Perth-Amboy and Burlington are the chief towns; the former is ſituated at the mouth of the Raritan, near its efflux into Sandy-Hook Bay; the latter is pleaſantly ſituated in a ſmall iſland formed by the river Delaware, about 20 miles from Philadelphia. Theſe towns were the ſeats of government; the governor generally reſided in the latter. Perth-Amboy is as good a port as moſt on the continent; the harbour is ſafe, and will contain many large ſhips. Both have been lately made free ports for 25 years.

The foreign trade of this province is very ſmall, owing principally to its vicinity to the large trading towns of New York and Philadelphia. The province is however in a very flouriſhing condition, and their paper currency, which ſome years ago amounted to upwards of ſixty thouſand pounds, has more credit than

than that of either Pennſylvania or New York; for the Pennſylvania bills are not received in payment in New York, nor the New York bills in Pennſylvania, whereas the New Jerſey bills circulate through both theſe provinces.

The eſtabliſhed religion is that of the church of England, but all religious ſects are tolerated, and enjoy their reſpective places of worſhip without the leaſt moleſtation. From a liſt of the houſes appropriated to divine ſervice, made by a member of the council in 1765, it appears, that there are in the province of New Jerſey, twenty-two epiſcopalian churches; fifty-ſeven meeting-houſes belonging to the Scotch Preſbyterians; thirty-nine to the Quakers; twenty-two to the Dutch Preſbyterians; twenty-two to the Baptiſts: ſeven to the Lutherans; one to the Moravians; one to the Separatiſts; and one to the Rogereens; in all 172. There is to be no eſtabliſhment of any one religious ſect in this province, in preference to another.

In 1746, Governor Belcher founded a college at Prince-Town, and procured it the privilege of conferring degrees, in the ſame manner as at Oxford and Cambridge. Before the late war, there were generally 80 and 100 ſtudents here, who came from all parts of the continent for the benefit of purſuing their ſtudies.

The government of New Jerſey is now veſted in a governor, legiſlative council, and general aſſembly, which are to be annually elected. The governor and lieutenant-governor are to be choſen out of and by the general aſſembly and council. The judges of the ſupreme court are choſen for ſeven years, and the officers of the executive power for five years. The members of the legiſlative council muſt be freeholders, worth 1000l. real and perſonal eſtate; and and thoſe of the general aſſembly 500l. Fifty pounds is a qualification to vote for repreſentatives, and all public officers.

This province was originally part of the New Netherlands, and given by Charles II. to his brother James, duke of York, who ſold it, for a valuable conſideration, to Lord Berkeley, and Sir George Carteret: theſe ſold it again to others, who, in the year 1702, ſurrendered the government to Queen Anne. The number of inhabitants, by a liſt publiſhed in 1765, were about 100,000, but are ſuppoſed, ſince that time, to have increaſed to 130,000.

Many circumſtances concur to render the character, manners, and cuſtoms of the people various in different parts of the ſtate. The inhabitants are a collection of Low Dutch, Germans, Engliſh, Scotch, Iriſh, and New Englanders, or their deſcendants National attachment and mutual convenience have generally induced theſe ſeveral kinds of people to ſettle together in a body; and in this way their peculiar national manners, cuſtoms, and character, are ſtill preſerved, eſpecially among the lower claſs of people, who have little intercourſe with any but thoſe of their own nation. Religion, although its tendency is to unite people in thoſe things that are eſſential to the happineſs, occaſions wide differences as to manners, cuſtoms, and even character. The Preſbyterian, the Quaker, the Epiſcopalian, the Baptiſt, the German and Low Dutch Calviniſt, the Methodiſt, and the Moravian, have each their diſtinguiſhing characteriſtics, either in their worſhip their diſcipline, or their dreſs. There is ſtill another very perceptible characteriſtical difference, diſtinct from either of the others, which ariſes from the intercourſe of the inhabitants with different ſtates. The people in Weſt Jerſey trade to Philadelphia, and of courſe imitate their faſhions, and imbibe the manners. The inhabitants of Eaſt Jerſey trade to New York, and regulate their faſhions and manners according to thoſe of New York. So that the difference in regard to faſhions and manners between Eaſt and Weſt Jerſey, is nearly as great as between New York and Philadelphia. Add to all theſe, the differences common in all countries, ariſing from the various occupations of men, ſuch as the civilian, the divine, the lawyer, the phyſician, the mechanic, the clowniſh, the decent, and the reſpectable farmer, all of whom have different purſuits, or purſue the ſame thing differently, and of courſe muſt have a different ſet of ideas and manners: when we take into view all theſe differences (and all theſe differences exiſt in New Jerſey, and many of them in all the other ſtates) it cannot be expected that many general obſervations will apply. It may, however, in truth, be ſaid, that the people of New Jerſey are generally induſtrious, frugal, and hoſpitable. There are comparatively but few men of learning in the ſtate, nor can it be ſaid that the people in general have taſte for the ſciences. The lower claſs, in which may be included three-fifths of the inhabitants of the whole ſtate, are ignorant, and are criminally neglectful in the education of their children. There are, however, a number of gentlemen of the firſt rank and abilities and learning in the civil offices of the ſtate, and in the ſeveral learned profeſſions.

There is at leaſt as great a number of induſtrious, diſcreet, amiable, genteel, and handſome women in New Jerſey, in proportion to the number of inhabitants, as in any of the thirteen ſtates. Whether an adequate degree of ſolid mental improvement, anſwering to the perſonal and other uſeful qualities we have mentioned, is to be found among the fair of this ſtate, is a more weighty concern. Perhaps it may be ſaid with juſtice, that in general, though there is not the ſame univerſal taſte for knowledge diſcernible among the ladies here, as in ſome other of the ſtates, owing, in a great meaſure, to the ſtate of ſociety, and the means of improvement, there are, however, many ſignal inſtances of improved talents among them, not ſurpaſſed by thoſe of their ſiſters in any of the other ſtates.

Among the ſeveral religious ſects in America, that of the Dumplers, or Dunkards, is one of the moſt harmleſs, and perhaps the moſt extraordinary, that has ever appeared ſince the eſtabliſhment of Chriſtianity. They reſide at a ſmall town called Ephrata, ſituated on the frontiers of the province, between two little hills, in the moſt delightful ſituation that can well be imagined, as if nature had created it for the indulgence of contemplation. A German hermit, who ſettled on the ſpot where Ephrata is now built, was the founder of this extraordinary ſect. The Germans of both ſexes, who joined the hermit, ſoon accuſtomed themſelves to his way of thinking, and conſequently to his manner of living; induſtry became part of their duty, and divided their time with devotion. Their gains they throw into one common ſtock, which ſupplies all their exigencies, private as well as public. Their females are cloiſtered by themſelves in a ſeparate part of the town, the ſituation of which is delightful, and ſcreens them from the north wind. Both their dreſs and diet are very ſimple. They hold free-will; deny the doctrine of original ſin; diſclaim all violence; obſerve the Sabbath very ſtrictly; their prayers and ſermons are extempore; the Chriſtian virtues are the ſubjects of their diſcourſes; they imagine the ſouls of departed Chriſtians are employed in converting others who had been ignorant of the goſpel; and, laſtly, they deny the eternity of hell torments. Theſe people live in harmony and mutual affection, and their hoſpitality to ſtrangers is unbounded, but they never accept any recompence.

There are, in this ſtate, about fifty Preſbyterian congregations, ſubject to the care of three preſbyteries, viz. that of New York, of New Brunſwick, and Philadelphia. A part of the charge of New York and Philadelphia preſbyteries lies in New Jerſey, and part in their own reſpective ſtates. To ſupply theſe congregations, there are at preſent about twenty-five miniſters.

There

There are upwards of forty congregations of Friends, commonly called Quakers; who are in general ſober, plain, induſtrious good citizens.

There are thirty aſſociated congregations of Baptiſts in New Jerſey, whoſe religious tenets are ſimilar to thoſe already mentioned under Connecticut.

The Epiſcopalian intereſt conſiſts of twenty-five congregations.

There are, in this ſtate, two claſſes belonging to the Dutch Reformed Synod of New York and New Jerſey. The claſſis of Hackinſak, to which belong thirteen congregations; and the claſſis of New Brunſwick, to which belong fifteen congregations. We have already given an account of their church government, diſcipline, &c.

The Moravians have a flouriſhing ſettlement at Hope, in Suſſex county. This ſettlement was begun in 1771, and now conſiſts of upwards of 100 ſouls.

The Methodiſt intereſt is ſmall in this ſtate. The Swedes have a church in Glouceſter county: and there are three congregations of the Seventh-Day Baptiſts. All theſe religious denominations live together in peace and harmony; and are allowed, by the conſtitution of the ſtate, to worſhip Almighty God agreeably to the dictates of their own conſciences; and are not compelled to attend or ſupport any worſhip contrary to their own faith and judgment. All Proteſtant inhabitants, of peaceable behaviour, are eligible to the civil offices of the ſtate.

There are two colleges in New Jerſey; one at Princeton, called Naſſau-Hall, the other at Brunſwick, called Queen's College. The college at Pinceton was firſt founded by charter from John Hamilton, Eſq. Preſident of the Council, about the year 1738, and enlarged by Governor Belcher in 1747. The charter delegates a power of granting to "the ſtudents of the ſaid college, or to any others thought worthy of them, all ſuch degrees as are granted in either of our univerſities, or any other college in Great-Britain." It has twenty-three truſtees. The governor of the ſtate, and the preſident of the college, are, *ex officiis*, two of them. It has an annual income of about 900l. currency; of which 200l. ariſes from funded public ſecurities and lands, and the reſt from the fees of the ſtudents. The preſident of the college is likewiſe profeſſor of eloquence, criticiſm, and chronology. The vice-preſident is alſo profeſſor of divinity and moral philoſophy. There is beſides a profeſſor of mathematics and natural philoſophy, and two maſters of languages. The four claſſes in college contain about ſeventy ſtudents. There is a grammar ſchool, of about thirty ſcholars, connected with the college, under the ſuperintendance of the preſident, and taught by two maſters.

Before the war, this college was furniſhed with a philoſophical apparatus, worth 500l. which (except the elegant orrery conſtructed by Mr. Rittenhouſe) was almoſt entirely deſtroyed by the Britiſh army in the late war, as was alſo the library, which now conſiſts of between 2 and 3000 volumes.

The college edifice is handſomely built with ſtone, and is 180 feet in length, fifty-four in breadth, and four ſtories high; and is divided into forty-two convenient chambers for the accommodation of the ſtudents, beſides a dining-hall, chapel-room, and a room for the library. Its ſituation is exceedingly pleaſant and healthful. The view from the college balcony is extenſive and charming.

This college has been under the care of a ſucceſſion of preſidents eminent for piety and learning; and has furniſhed a number of civilians, divines, and phyſicians, of the firſt rank in America. It is remarable, that all the preſidents of this college, except Dr. Witherſpoon, were removed by death very ſoon after their election into office.

The charter for Queen's College, at Brunſwick, was granted juſt before the war, in conſequence of an application from a body of the Dutch church. Its funds, raiſed wholly by free donations, amounted, ſoon after its eſtabliſhment, to 4000l.; but they were conſiderably diminiſhed by the war. The ſtudents are under the care of the Preſident. The grammar ſchool, which is connected with the college, conſiſts of between thirty and forty ſtudents, under the care of the truſtees. This college has lately increaſed both in numbers and reputation.

There are a number of flouriſhing academies in this ſtate. One at Trenton, in which are about eighty ſtudents in the different branches. It has a fund of about 150l. per annum, ariſing from the intereſt on public ſecurities. Another in Hackinſak, in the county of Bergen, of upwards of 100 ſcholars. Inſtruction and board are ſaid to be cheaper here than in any part of the ſtate. There is another flouriſhing academy at Orangedale, in the county of Eſſex, conſiſting of nearly as many ſcholars as either of the others, furniſhed with able inſtructors, and good accommodations. Another has lately been opened at Elizabeth Town, and conſiſts of upwards of twenty ſtudents in the languages, and is increaſing. There is alſo an academy in Burlington, in which young ladies and gentlemen are taught the Engliſh language grammatically, geography, and the learned languages. Beſides theſe, there are grammar ſchools at Newark, Springfield, Morriſtown, Bordentown, and Amboy. There are no regular eſtabliſhments for common ſchools in the ſtate. The uſual mode of education is, for the inhabitants of a village or neigebourhood to join in affording a temporary ſupport for a ſchoolmaſter, upon ſuch terms as is mutually agreeable. But the encouragement which theſe occaſional teachers meet with, is generally ſuch, as that no perſon of abilities adequate to the buſineſs will undertake it; and, of courſe, little advantage is derived from theſe ſchools. The improvement in theſe common ſchools is generally in proportion to the wages of the teacher.

M. Briſſot de Warville, in his "New Travels in the United States of America," has given us the following intereſting account of the ſchool of negroes at Philadelphia:

"There exiſts, a country (ſays he) where the negroes are allowed to have ſouls, and to be endowed with underſtanding capable of being formed to virtue and uſeful knowledge; where they are not regarded as beaſts of burden, in order that we may have the privilege of treating them as ſuch.—There exiſts a country where the blacks, by their virtue and their induſtry, belie the calumnies which their tyrants elſewhere laviſh againſt them; where no difference is perceived between the memory of a black head whoſe hair is craped by nature, and that of a white one craped by art. I have had a proof of this to-day. I have ſeen, heard, and examined theſe black children. They read well, repeat from memory, and calculate with rapidity. I have ſeen a picture painted by a young negro, who never had a maſter: it was ſurpriſingly well done.

"I ſaw in this ſchool, a mulatto, one-eighth negro; it is impoſſible to diſtinguiſh him from a white boy. His eyes diſcovered an extraordinary vivacity; and this is a general characteriſtic of people of that origin.

"The black girls, beſides reading, writing, and the principles of religion, are taught ſpinning, needlework, &c. and their miſtreſſes aſſure me, that they diſcover much ingenuity. They have the appearance of decency, attention, and ſubmiſſion. It is a nurſery of good ſervants and virtuous houſekeepers. How criminal are the planters of the iſlands, who form but to debauchery and ignominy creatures ſo capable of being faſhioned to virtue!

"It is to Benezet that humanity owes this uſeful eſtabliſhment—to that Benezet whom Chaſtelleux has not bluſhed to ridicule, for the ſake of gaining the infamous applauſes of the paraſites of deſpotiſm.

"The life of this extraordinary man merits to be known to ſuch men as dare to think, who eſteem more

more the benefactors of their fellow-creatures, than their oppreſſors, ſo baſely idolized by many during their life.

" Anthony Benezet was born at St. Quintin, in Picardy, in 1712. Fanaticiſm, under the protection of a bigot king, directed by an infamous confeſſor, and an infamous woman, ſpread at that time its ravages in France. The parents of Benezet were warm Calviniſts; they fled to England, and he embraced the doctrines of the Quakers. He went to America, in 1731, and eſtabliſhed himſelf in Philadelphia in commerce, the buſineſs to which he had been educated. But the rigidity of his principles and his taſte not agreeing with the ſpirit of commerce, he quitted that buſineſs in 1736, and accepted a place in the academy of that ſociety. From that time all his moments were conſecrated to public inſtruction, the relief of the poor, and the defence of the unhappy negroes. Benezet poſſeſſed an univerſal philanthropy, which was not common at that time; he regarded, as his brothers, all men, of all countries, and of all colours; he compoſed many works, in which he collected all the authorities from Scripture, and from other writings, to diſcourage and condemn the ſlave trade and ſlavery. His works had very much influence in determining the Quakers to emancipate their ſlaves.

" It was not enough to ſet at liberty the unhappy blacks; it was neceſſary to inſtruct them—to find them ſchool-maſters. And where ſhould he find men willing to devote themſelves to a taſk which prejudice had rendered painful and diſguſting? No obſtacle could arreſt the zeal of Benezet; he ſet the firſt example himſelf: he conſecrated his little fortune to the foundation of this ſchool; his brethren lent ſome aſſiſtance; and by the help of the donations of the ſociety of London, the ſchool for blacks at Philadelphia enjoys a revenue of 200l. ſterling.

" He conſecrated his fortune and his talents to their inſtruction; and in 1784, death removed him from his holy occupation, to receive his reward. The tears of the blacks, which watered his tomb, the ſighs of his fraternity, and of every friend of humanity which attended his departing ſpirit, muſt be a prize more conſoling than the laurels of a conqueror.

" Benezet carried always in his pocket a copy of his works on the ſlavery of the blacks, which he gave and recommended to every one he met, who had not ſeen them. It is a method generally followed by the ſociety of friends. They extend the works of utility; and it is the true way of gaining proſelytes.

" This philanthropic Quaker was preceded in the ſame career, by many others, whom I ought to mention. The celebrated George Fox, founder of this ſect, went from England to Barbadoes in the year 1671, not to preach againſt ſlavery, but to inſtruct the blacks in the knowledge of God, and to engage maſters to treat them with mildneſs.

" The minds of men were not yet ripe for this reform; neither were they when William Burling, of Long-Iſland, in 1718, publiſhed a Treatiſe againſt Slavery. He was a reſpectable Quaker: he preached, but in vain; the hour was not yet come.

" Ought not this circumſtance to encourage the friends of the blacks in France? Sixty years of combat were neceſſary to conquer the prejudice of avarice in America. One year is ſcarcely paſſed ſince the foundation of the ſociety at Paris; and ſome apoſtates already appear, becauſe ſucceſs has not crowned their firſt endeavours.

" Burling was followed by Judge Sewal, a Preſbyterian of Maſſachuſets. He preſented to the General Aſſembly a Treatiſe entitled, " Joſeph ſold by his Brethren." He diſcovers the pureſt principles, and completely overturns the hackneyed arguments of the traders, reſpecting the pretended wars of the African princes.

" It is often ſaid againſt the writings of the friends of the blacks, that they have not been witneſſes of the ſufferings which they deſcribe. This reproach cannot be made againſt Benjamin Lay, an Engliſhman, who, brought up in the African trade, afterwards a planter at Barbadoes, abandoned his plantation, on account of the horror inſpired by the frightful terrors of ſlavery endured by the negroes. He retired to Philadelphia, became a Quaker, and ceaſed not the remainder of his life to preach and write for the abolition of ſlavery. His principal treatiſe on this ſubject appeared in 1737. He was thought to have too much zeal, and to have exaggerated in his deſcriptions. But theſe defects were expiated by a life without a ſtain, by an indefatigable zeal for humanity, and by profound meditations. Lay was ſimple in his dreſs, and animated in his ſpeech; he was all on fire when he ſpoke on ſlavery. He died in 1760, in the 80th year of his age.

" One of the men moſt diſtinguiſhed in this career of humanity, was a Quaker, named John Woolman. He was born in 1720. Early formed to meditation, he was judged by the Friends worthy of being a miniſter at the age of twenty-two. He travelled much to extend the doctrines of the ſect; but was always on foot, and without money or proviſions, becauſe he would imitate the apoſtles, and be in a ſituation to be more uſeful to the poor people, and to the blacks. He abhorred ſlavery ſo much, that he would not taſte any food that was produced by the labour of ſlaves. The laſt diſcourſe that he pronounced, was on this ſubject. In 1772, he undertook a voyage to England, to concert meaſures with the Friends there, on the ſame ſubject; where he died of the ſmall-pox. He left ſeveral uſeful works, one of which has been through many editions, entitled " Conſiderations on the Slavery of the Blacks."

An Account of the Methods uſed to aboliſh Slavery in America.

" WOOLMAN and Benezet had in vain employed all their efforts to effect the abolition of this traffic under the Engliſh government. The miſtaken intereſt of the mother-country cauſed all the petitions to be rejected in the year 1772; yet the minds of men were prepared in ſome of the colonies; and ſcarcely was independence declared, when a general cry aroſe againſt this commerce. It appeared abſurd for men defending their own liberty, to deny liberty to others. A pamphlet was printed, in which the principles on which ſlavery is founded, were held up in contraſt with thoſe which laid the foundation of the new conſtitution.

" This palpable method of ſtating the ſubject was attended with a happy ſucceſs; and the Congreſs, in 1774, declared the ſlavery of the blacks to be incompatible with the baſis of republican governments. Different legiſlatures haſtened to conſecrate this principle of Congreſs.

" Three diſtinct epochs, mark the conduct of the Americans in this buſineſs—the prohibition of the importation of ſlaves—their manumiſſion—and the proviſion made for their inſtruction. All the different ſtates are not equally advanced in theſe three objects.

" In the northern and middle ſtates, they have proſcribed for ever the importation of ſlaves; in others, this prohibition is limited to a certain time. In South Carolina, where it was limited to three years, it has lately been extended to three years more. Georgia is the only ſtate that continues to receive tranſported ſlaves. Yet, when General Oglethorpe laid the foundation of this colony, he ordained, that neither rum nor ſlaves ſhould ever be imported into it. This law, in both its articles, was very ſoon violated.

"We muſt acknowledge however, that the Americans, more than any other people, are convinced that all men are born free and equal: we muſt acknowledge, that they direct themſelves generally by this principle of equality; that the Quakers, who have begun, who have propagated, and who ſtill propagate this revolution of ſentiment, have been guided by a principle of religion, and that they have ſacrificed to it their perſonal intereſt.

"Unhappily their opinion on this ſubject has not yet become univerſal, intereſt ſtill combats it with ſome ſucceſs in the ſouthern ſtates. A numerous party ſtill argues the impoſſibility of cultivating their ſoil without the hands of ſlaves, and the impoſſibility of augmenting their number without recruiting them in Africa. It is to the influence of this party, in the late General Convention, that is to be attributed the only article which tarniſhes that glorious monument of human reaſon, the new federal ſyſtem of the United States. It was this party that propoſed to bind the hands of the new Congreſs, and to put it out of their power for twenty years to prohibit the importation of ſlaves. It was ſaid to this auguſt aſſembly, *Sign this article, or we will withdraw from the union.* To avoid the evils, which, without meliorating the fate of the blacks, would attend a political ſchiſm, the Convention was forced to wander from the grand principle of univerſal liberty, and the preceding declaration of Congreſs. They thought it their duty to imitate Solon, to make, not the beſt law poſſible, but the beſt circumſtances would bear.

"But, though this article has ſurpriſed the friends of liberty in Europe, where the ſecret cauſes of it were not known; though it has grieved the ſociety in England, who are ready to accuſe the new legiſlators of a cowardly defection from their principles; yet we may regard the general and irrevocable proſcription of the ſlave-trade in the United States, as very near at hand. This concluſion reſults from the nature of things, and even from the article itſelf of the new conſtitution now cited. Indeed, nine ſtates have already done it; the blacks, which there abound, are conſidered as free. There are then nine aſylums for thoſe to eſcape to from Georgia; not to ſpeak of the neighbourhood of the Floridas, where the ſlaves from Georgia take refuge, in hopes to find better treatment from the Spaniards; and not to ſpeak of thoſe vaſt foreſts and inacceſſible mountains which make part of the Southern States, and where the perſecuted negro may eaſily find a retreat from ſlavery. The communications with the back country are ſo eaſy, that it is impoſſible to ſtop the fugitives; and the expence of reclaiming is diſproportioned to their value. And though the free ſtates do not in appearance oppoſe theſe reclamations, yet the people there hold ſlavery in ſuch horror, that the maſter who runs after his human property, meets little reſpect, and finds little aſſiſtance. Thus the poſſibility of flight creates a new diſcouragement to the importation, as it muſt leſſen the value of the ſlave, induce to a milder treatment, and finally tend, with the concurrence of other circumſtances, to convince the Georgian planter, that it is more ſimple, more reaſonable, and leſs expenſive, to cultivate by the hands of freemen. We are right then in ſaying, that the nature of things in America is againſt the importation of ſlaves.

"Beſides, the Congreſs will be authoriſed in twenty years to pronounce definitively on this article. By that time, the ſentiments of humanity, and the calculations of reaſon, will prevail; they will no longer be forced to ſacrifice equity to convenience, or have any thing to fear from oppoſition or ſchiſm."

†

CHAP. VIII.

PENNSYLVANIA.

Situation, &c. Diviſions, Climate, Produce, Rivers, Towns, Inhabitants, Penn's Settlement and Government.

THE province of Pennſylvania is ſituated between 39 and 44 deg. of north lat. and between 74 and 81 of weſt long. It is about 300 miles in length, and 240 in breadth; bounded, on the north, by the country of the Iroquois, or five nations; on the ſouth, by Maryland; on the eaſt, by the Delaware river, which ſeparates it from New Jerſey; and on the weſt by the Ohio. It is divided as in the following table:

Counties.	Chief Towns.
Philadelphia	Philadelphia.
Cheſter	Cheſter.
Bucks	Newtown.
Berks.....	Reading.
Northampton	Eaſton.
Lancaſter	Lancaſter.
York	York.
Cumberland.....	Carliſle.

To theſe we may add Bedford, a county weſtward of the mountains upon the Ohio, purchaſed by Mr. Penn, from the Indians, in 1768, and eſtabliſhed in 1771.

Beſides theſe, the three following counties, ſituated on the Delaware, formed, in ſome meaſure, a ſeparate government, having an aſſembly of their own, though the ſame governor with the province of Pennſylvania. But it is now diſtinct, and called the Delaware ſtate, having a preſident, council, and houſe of aſſembly; with judges, and other officers of ſtate, civil and military.

Counties.	Chief Towns.
Newcaſtle.....	Newcaſtle, Wilmington.
Kent.....	Dover
Suſſex	Leweſtown, Milford.

The air of Pennſylvania is clear, ſweet, and healthy. The fall, or autumn, begins about the 20th of October, and laſts till the beginning of December, when the winter ſets in and continues till March; during which the weather is often ſo very ſevere, that the river Delaware, though very broad at Philadelphia, is frozen over. The ſpring commences in March, and continues till June, when the weather is more unſettled than in the other ſeaſons. The months of July, Auguſt, and September, are the ſummer months, when the heat would be intolerable were it not mitigated by frequent cool breezes. During the ſummer the wind is generally at ſouth-weſt, but in the winter at north-weſt, which by paſſing over the frozen mountains and lakes of Canada, renders the cold ſo exceſſive at that ſeaſon. The ſoil is not greatly different from that of New York, but ſomething more fertile; nor is there ſo much ſandy and uſeleſs land in Pennſylvania as in New York. Some rice, but no great quanity, is cultivated here; and there are ſome tobacco plantations, but the produce is not equal to that of Virginia. In all parts of our plantations, from New York to the extremity of Florida, the woods are full of vines of different ſpecies. They are very thick at the bottom, and bear great plenty of grapes, but very ſmall. From theſe the Indians procure a ſort of wine, with which they often regale themſelves

ſelves. The timber produced in Pennſylvania is of the ſame ſpecies as that of New England; but here, and in all the ſouthern colonies, it is not ſo proper for ſhipping as that of the northern colonies; it is compact, and ſplits with a much ſmaller force. Theſe properties render it leſs valuable in ſhip-building, but more uſeful for pipe-ſtaves, and wainſcoting.

The principal rivers in this province are the Delaware, the Suſquehanna, and the Schuylkill. The Delaware is navigable more than 200 miles above the city of Philadelphia. The Suſquehanna is alſo navigable a great way up the country. The Schuylkill is navigable for boats above 100 miles. Theſe rivers, with the numerous creeks and harbours in Delaware bay, are extremely favourable both to the foreign and inland trade of Pennſylvania.

This province has many towns that deſerve particular notice; but the city of Philadelphia ſtands unrivalled in Britiſh America, and when completed will, in point of plan and regularity, exceed any in Europe. The city forms a parallelogram, or long ſquare, two miles in length, and one in breadth; extending from the river Delaware to the Schuylkill, forming, as it were, a connection between theſe two navigable rivers. The plan of this elegant city was drawn by William Penn, at once the founder and legiſlator of this flouriſhing colony. Part of the plan is already executed, and will in all probability ſoon be completed. Every quarter of the city will then form a ſquare of eight acres; having in the centre a ſquare of ten acres, ſurrounded by the town-houſe, and other public buildings. The high-ſtreet is an hundred feet wide, and extends the whole breadth of the town, from one of the above rivers to the other. Parallel to the high-ſtreet run nineteen others, which are croſſed by eight more at right angles, all of them thirty feet wide, and communicate by canals with the two rivers; which add at once to the beauty and wholeſomeneſs of the city. According to the original plan, every perſon who poſſeſſed 1000 acres in any part of the province, was to have his houſe either in one of the fronts facing the river, or in the high-ſtreet, running from the middle of one front to the middle of the other. Beſides the above privilege, every owner of 5000 acres, was entitled to an acre of ground in the front of his houſe, and all others half an acre for gardens and court-yards. The town-houſe is a ſtately, ſpacious, and regular building, and would be an ornament to any capital in Europe. The other public buildings, which conſiſt chiefly of ſtructures dedicated to religion, beſides the military barracks, markets, and alms-houſes, are proportionably grand. The quays are ſpacious and noble; the principal quay is 200 feet wide, furniſhed with cranes, and other conveniences for loading and unloading ſhips; and the water is ſo deep, that a ſhip of 500 tons burden, may lay her broadſide to the quay. The proprietor's ſeat, where the governor uſually reſides, is ſituated about a mile above the town, and is the firſt private building both for magnificence and ſituation in all Britiſh America. But the nobleſt inſtitution in Pennſylvania, is the academy eſtabliſhed ſome years ſince in Philadelphia. Very conſiderable ſubſcriptions were raiſed both in England and Scotland for completing this noble deſign, and it bids fair in time to rival the moſt celebrated ſeminaries of learning in the mother country. The number of inhabitants in Philadelphia is computed at 30,000. The meetings of the general congreſs of America were held in this city from the year 1774 till 1777, when the Britiſh troops took poſſeſſion of it, but the king's forces retreating to New York in 1778, the congreſs again made Philadelphia their reſidence.

There are ſeveral towns beſides the capital in the county of Philadelphia; the moſt conſiderable are, German-Town, ſo called from being inhabited wholly by Germans; Frankfort, Abingdon, Dublin, Radnor, and Amerſland. In the county of Bucks, are Briſtol, Falls-Town, and Penſbury. In the county of Cheſter, are Cheſter, Chicheſter, and Marcus Hook. Newcaſtle, Haverfordweſt, Merioneth, and St. George, are found in the county of Newcaſtle; Dover, Cranebrook, Marden, and Meſpelliven plantations, in the county of Kent; Lewis in the county of Suſſex; and Lancaſter in the county of that name.

The inhabitants in the province of Pennſylvania, are not leſs than 350,000, half of whom are Germans, Swedes, or Dutch. It is certainly very right policy to encourage the importation of foreigners into Pennſylvania, as well as into our other colonies. By this we are gainers, without diminiſhing the inhabitants of Great-Britain. But it has been frequently lamented, that theſe people are ſuffered to remain foreigners, and likely to continue ſo for many generations; they have erected ſchools of their own, printed books, and even the common newſpapers in their own language; by which means, together with their poſſeſſing large tracts of land, without any intermixture of Engliſh, they continue, as it were, a ſeparate people. At the ſame time, their remarkable induſtry, frugality, and abſtemious method of living, enable them to encreaſe their tract of country to the ruin of the Americans; ſo that there is ſome danger of the whole colony becoming in time wholly foreign in language, in manners, and perhaps in inclinations. It ſeems therefore neceſſary that ſome regulations ſhould take place with regard to their ſettlement, and ſome means be purſued in order to naturalize them effectually. But it muſt, however, be acknowledged, that the inhabitants of Pennſylvania, are an induſtrious and hardy people; moſt of them are ſubſtantial, though few of the perſons poſſeſſed of landed property are rich. They are all well lodged, well fed, and, when their circumſtances are conſidered, well clothed; and at a more reaſonable rate than can be well imagined, as the inferior people manufacture moſt of their wearing apparel, both linen and woollen.

A great number of wealthy merchants inhabit the city of Philadelphia. Nor will this appear ſurpriſing when the great trade they carry on is conſidered. Their commerce is not confined to the provinces in America, it is extended to the French, Dutch, and Spaniſh colonies; to the Azores, the Canaries, and the Madeira iſlands; to Great-Britain, and Ireland; and to Spain, Portugal, and Holland. Many of theſe branches of trade are very profitable, and cannot fail of enriching a frugal and induſtrious people. Beſides the quantity of commodities produced by this province, and brought down the rivers Delaware and Schuylkill, the Dutch employ ſeveral hundred waggons, each drawn by four horſes, in bringing the produce of their farms to the markets of Philadelphia. In the year 1749, 303 veſſels entered at this port, and 291 cleared outwards. The commodities formerly exported into Pennſylvania, at an average of three years, amounted to the value of 611,000l. Thoſe exported to Great-Britain, and other markets, beſides timber, ſhips built for ſale, copper ore, and iron in pigs and bars, conſiſted of grain, flour, and many ſorts of animal food; and at an average of three years, were calculated at 705,500l. But after the concluſion of the late war, trade had ſo greatly increaſed, that the duty in Philadelphia upon imported goods of $2\frac{1}{2}$ per cent. *ad valorum*, produced from the 1ſt of March 1784, to the 1ſt of December, 132,000l. which, ſuppoſing their value not under-rated, nor any indirect methods uſed to ſave the duty, makes their value amount to the amazing ſum of 3,168,000l.

This province, together with New Jerſey and New York, compoſed what was formerly called the New Netherlands, and was originally poſſeſſed by the Dutch and Swedes. After the country was taken by the Engliſh, Admiral Penn, who in conjunction with Venables, had ſome years before taken the iſland of Jamaica, being greatly in favour with Charles II. obtained a promiſe of a grant of the tract of country now called

called Pennſylvania, from that monarch. Upon the Admiral's death, his ſon, the celebrated founder and legiſlator of Pennſylvania, claimed the royal promiſe, and after a tedious court ſolicitation, obtained the patent in right of his father. Conſcious that the only method of rendering the grant he had obtained from his majeſty valuable to himſelf, was to make both the country and its government as agreeable as poſſible to the ſettlers, he began with purchaſing the ſoil, at a low rate indeed from the Indians, as the original poſſeſſors, to whom it was of very little value. By this cheap act of juſtice at the beginning, he rendered all his future dealings with theſe people ſucceſsful. Prepoſſeſſed with a favourable opinion of him as to his deſigns, they were ſo far from giving any diſturbance to the ſettlers, that they were ready to give them aſſiſtance whenever it was wanted.

Having thus wiſely ſecured the Indians, he applied himſelf to execute the other part of his plan, that of peopling the country. This he found greatly facilitated by the uneaſineſs of his brethren the Quakers in England, who, by refuſing to pay tythes and other church dues, ſuffered a kind of perſecution from the clergy. Their high opinion and regard for Penn, who was indeed an honour to their new church, made them the more ready to follow him over a wide and pathleſs ocean, to ſettle in a country then little better than a howling wilderneſs, and in a climate whoſe properties were unknown. Nor was he himſelf wanting in any thing that had the leaſt tendency to encourage and ſupport the reſolution they had formed. He expended large ſums of money in tranſporting, and finding them in all neceſſaries; and not aiming at a ſudden profit, that great man diſpoſed of his lands at a very ſmall purchaſe; 20l. for 1000 acres, and 1s. quit-rent for every 100, were the reaſonable terms on which he beſtowed eſtates. At this time land is granted at 12l. for every 100 acres, with a quit-rent of 4s. reſerved. Near Philadelphia land lets at 20s. the acre, and even at ſeveral miles diſtance from that city, ſells at 20 years purchaſe. By purſuing ſuch a generous plan, the colony of Pennſylvania was ſoon eſtabliſhed, and has every ſince been rapidly increaſing.

But what crowned all his proceedings, was the noble charter of privileges, by which he made them as free as any people in the world; and which has ſince induced ſuch vaſt numbers of people of different perſuaſions and different countries to abandon their native ſoil, and put themſelves under the protection of his laws. All his inſtitutions were founded on the ſolid baſis of civil and religious liberty, conſidered in its full extent. No laws can be made without the conſent of the people given by the ſuffrages of their repreſentatives in the general aſſembly. Even matters of benevolence, to which the laws of few nations have extended, were by Penn ſubjected to regulations. The affairs of widows and orphans were to be inquired into by a court conſtituted for that purpoſe. The cauſes between man and man were not to be ſubjected to the delay and chicanery of the law, but to be decided by wiſe and honeſt arbitrators. In ſhort, ſuch was the excellent ſpirit of the laws framed by William Penn, that had he been a native of Greece, his ſtatue would have been placed next to thoſe of Solon and Lycurgus.

Religious liberty was founded on the ſame ample baſis. Chriſtians of all denominations might not only live unmoleſted in the colony, but even have a ſhare in the government. In a word, the diverſity of people, religions, nations, and languages here, is prodigious; and what is ſtill more wonderful, they live together in harmony.

In conſequence of the plan for a new conſtitution agreed on at the Convention of Philadelphia in 1776, the commonwealth, or ſtate of Pennſylvania is now governed by an aſſembly of the repreſentatives of the freemen of the ſame, and a preſident and council; the ſupreme legiſlative power is veſted in a houſe of repreſentatives of the freemen of the ſtate; and the ſupreme executive power is veſted in a preſident and council of twelve. It was likewiſe agreed, that the houſe of repreſentatives ſhould conſiſt of perſons moſt noted for wiſdom and virtue, to be choſen annually by the freemen of every city and county. The preſident of the ſupreme executive council may appoint and commiſſion judges, naval officers, a judge of the admiralty, attorney general, and other officers, civil and military; he is likewiſe impowered to hold the office of commander in chief of the forces of the ſtate, but ſhall not command in perſon, except adviſed thereto by the council, and then only ſo long as they ſhall approve. All trials to be by jury; and that freedom of ſpeech, and of the preſs, to be allowed. All perſons in public offices are required to declare their belief in one God, the creator and governor of the univerſe, the rewarder of the good, and the puniſher of the wicked; and are alſo to acknowledge the Scriptures of the Old and New Teſtament to be given by divine inſpiration. This plan of government contained a variety of other particulars; amongſt which, we ſhall only mention the following; viz. that the freemen are to elect annually, by ballot, for each city and county, two perſons, to be called the council of cenſors, whoſe buſineſs it is to examine into the conduct of the legiſlative and executive powers. The other is, the training and arming the freemen and their ſons for the defence of the commonwealth, under ſuch regulations, reſtrictions, and exceptions, as the general aſſembly ſhould by law direct, with liberty for the people to chooſe their own officers, &c.

In a plan for the eſtabliſhment of public ſchools, and the diffuſion of knowledge in Pennſylvania, by Dr. Benjamin Ruſh, profeſſor of chemiſtry in the Univerſity of Philadelphia, lately publiſhed, there is this obſervation in a note, "There are 600 ſchools in the ſmall ſtate of Connecticut, which have in them 25,000 ſcholars;" and mark the good effects of education! "only two natives of this ſtate have been condemned in the courſe of the laſt 25 years: is there any county in England, either great or ſmall, can make ſuch a glorious boaſt? The German Lutherans in Pennſylvania take uncommon pains in the education of their youth; not one of this ſociety has ſubmitted to the ignominy of a legal puniſhment of any kind in the courſe of the laſt 17 years." The writer of the above intelligence hereupon very pertinently remarks, that, "in all caſes whatever, no argument can poſſibly overthrow or exceed real matter of fact. What can we think then of thoſe perſons (continues he) who, ſo far from contributing to the ſupport and encouraging of Sunday Schools, have been weak or wicked enough to write againſt them? If ever a reformation can be effected on the morals of the people, it muſt be done by inſtilling better principles into, and inuring to better habits, the riſing generation. And how can this be better done for the poor than in Sunday Schools?"

Of the great variety of religious denominations in Pennſylvania, the Friends, or Quakers, are the moſt numerous. George Fox is called the father of this religious ſect, becauſe he firſt collected them into a ſociety in England, about the middle of the 17th century. The true appellation of theſe people is Friends; that of Quakers was early and invidiouſly given them by way of contempt. They came over to America as early as 1656, but were not indulged the free exerciſe of their religion in New England.

They were the firſt ſettlers of Pennſylvania in 1682, under William Penn, and have ever ſince flouriſhed in the free enjoyment of their religion. They believe that God has given to all men ſufficient light to work their ſalvation, unleſs it be reſiſted: that this light is as extenſive as the ſeed of ſin, and ſaves thoſe who have not the outward means of ſalvation; that this light is a divine principle, in which dwells God, the Father,

Father, Son and Holy Ghoſt. They maintain that the Scriptures are not the principal ground of all truth and knowledge: nor yet the primary rule of faith and manners; but becauſe they give a true teſtimony of the firſt foundation, they are and may be eſteemed a ſecondary rule, ſubordinate to the Spirit, from whom they derive all their excellence. They believe that immediate revelation has not ceaſed, but that a meaſure of the Spirit is given to every perſon. That as, by the light or gift of God, all ſpiritual knowledge is received, thoſe who have this gift, whether male or female, though without human commiſſion or learning, ought to preach; and to preach freely, as they have freely received the gift. All true and acceptable worſhip of God, they maintain, is by the inward and immediate moving of his Spirit; and that water baptiſm and the Lord's ſupper were commanded only for a time. They neither give titles, nor uſe compliments in their converſation, or writings, believing that *whatſoever is more than yea, yea, and nay, nay, cometh of evil.* They conſcientiouſly avoid, as unlawful, kneeling, bowing, or uncovering the head to any perſon. They diſcard all ſuperfluities in dreſs or equipage; all games, ſports, and plays, as unbecoming the Chriſtian. "Swear not at all" is an article of their creed, literally obſerved in its utmoſt extent. They believe it unlawful to fight in any caſe whatever; and think that if their enemy *ſmite them on the one cheek, they ought to turn to him the other alſo.* They are generally honeſt, punctual, and even punctilious, in their dealings; provident for the neceſſities of their poor; friends to humanity, and of courſe enemies to ſlavery; ſtrict in their diſcipline; careful in the obſervance even of the punctilios in dreſs, ſpeech, and manners, which their religion enjoins; faithful in the education of their children; induſtrious in their ſeveral occupations. In ſhort, whatever peculiarities and miſtakes thoſe of other denominations have ſuppoſed they have fallen into, in point of religious doctrines, they have proved themſelves to be good citizens. Next to the Quakers, the Preſbyterians are the moſt numerous, concerning whom we have nothing to add to what we have already ſaid under New York.

The Proteſtant epiſcopal church of New York, New Jerſey, Pennſylvania, Delaware, Maryland, Virginia, and South-Carolina, met in convention at Philadelphia, October 1785, and reviſed the book of common prayer, and adminiſtration of the ſacraments, and other rites and ceremonies, and publiſhed and propoſed the book, thus reviſed, for the uſe of the church. This reviſion was made in part, in order to render the liturgy conſiſtent with the American revolution, and the conſtitutions of the ſeveral ſtates. In this they have diſcovered their liberality and their patriotiſm. In Pennſylvania and the ſouthern ſtates this reviſed book is pretty generally uſed by the epiſcopal churches. In New York and New Jerſey it has not been adopted.

There are upwards of ſixty miniſters of the Lutheran and Calviniſt religion, who are of German extraction, now in this ſtate; all of whom have one or more congregations under their care; and many of them preach in ſplendid and expenſive churches; and yet the firſt Lutheran miniſter, who arrived in Pennſylvania near fifty years ago, was alive in 1787, and probably is ſtill, as was alſo the ſecond Calviniſtical miniſter.

CHAP. IX.

DELAWARE.

Situation, Extent, Boundaries, Climate, Diviſions, Soil, Rivers, Productions, Chief Towns, &c.

THIS province is ſituated between 38 deg. 30 min. and 40 deg. north lat. and 1 deg. 45 min. weſt long. is 92 miles in length, and 16 in breadth. It is bounded, on the north, by the territorial or boundary line, which divides it from Pennſylvania; eaſt, by Delaware river and bay; ſouth, by a due eaſt and weſt line, from Cape Henlopen, in lat. 38 deg. 30 min. to the middle of the peninſula, which line divides the ſtate from Worceſter county in Maryland; weſt, by Maryland, from which it is divided by a line drawn from the weſtern termination of the ſouthern boundary line, northwards up the ſaid peninſula, till it touches or forms a tangent to the weſtern part of the periphery of the above-mentioned territorial circle: containing about 1400 ſquare miles.

The climate is in many parts unhealthy. The land is generally low and flat, which occaſions the waters to ſtagnate, and the conſequence is, the inhabitants are ſubject to intermittents.

The Delaware ſtate is divided into three counties, viz. Newcaſtle, Kent, and Suſſex; its chief towns are, Wilmington and Newcaſtle, Dover, Milford, and Lewiſtown.

The rivers are, Choptank, Nanticok, and Pocomoke; all have their ſources in this ſtate, and are navigable for veſſels of 50 or 60 tons, 20 or 30 miles into the country. They all run a weſtwardly courſe into Cheſapeak Bay. The eaſtern ſide of the ſtate, along Delaware bay and river, is indented with a great number of ſmall creeks, but none conſiderable enough to merit a deſcription.

With reſpect to ſoil and productions, the ſouth part of the ſtate is a low flat country, and a conſiderable portion of it lies in foreſt. What is under cultivation is chiefly barren, except in Indian corn, of which it produces fine crops. In ſome places rye and flax may be raiſed, but wheat is a ſtranger in theſe parts. Where nature is deficient in one reſource, ſhe is generally bountiful in another. This is verified in the tall, thick foreſts of pines, which are manufactured into boards, and exported in large quantities into every ſea-port in the three adjoining ſtates.—As you proceed north the ſoil is more fertile, and produces wheat in large quantities, which is the ſtaple commodity of the ſtate. They raiſe all the other kinds of grain common to Pennſylvania. The ſtate has no mountain in it, except Thunder Hill, in the weſtern part of Newcaſtle county, and is generally level, except ſome ſmall parts, which are ſtony and uneven.

The chief towns are the following: DOVER, in the county of Kent, is the ſeat of government. It ſtands on Jones' creek, a few miles from the Delaware river, and conſiſts of about 100 houſes, principally of brick. Four ſtreets interſect each other at right angles, in the centre of the town, whoſe incidencies form a ſpacious parade, on the eaſt ſide of which is an elegant ſtate-houſe of brick. The town has a lively appearance, and drives on a conſiderable trade with Philadelphia. Wheat is the principal article of export. The landing is five or ſix miles from the town of Dover.

NEWCASTLE is thirty-five miles below Philadelphia, on the weſt bank of Delaware river. It was firſt ſettled by the Swedes, about the year 1627, and called Stockholm. It was afterwards taken by the Dutch, and called New Amſterdam. When it fell into the hands of the Engliſh, it was called by its preſent name. It contains about ſixty houſes, which have the aſpect of decay, and was formerly the ſeat of government.—This is the firſt town that was ſettled on Delaware river.

WILMINGTON is ſituated a mile and a half weſt of Delaware river, on Chriſtiana creek, twenty-eight miles ſouthward from Philadelphia. It is much the largeſt and pleaſanteſt town in the ſtate, containing about 400 houſes, which are handſomely built upon a gentle aſcent of an eminence, and ſhew to great advantage as you ſail up the Delaware.

Beſides other public buildings, there is a flouriſhing academy of about forty or fifty ſcholars, who are taught the languages, and ſome of the ſciences, by an

able inſtructor. This academy, in proper time, is intended to be erected into a college. There is another academy at Newark, in this county, which was incorporated in 1769, and then had fourteen Truſtees.

MILFORD, the little emporium of Suſſex county, is ſituated at the ſource of a ſmall river, fifteen miles from Delaware bay, and 150 ſouthward of Philadelphia. This town, which contains about eighty houſes, has been built, except one houſe, ſince the revolution. It is laid out with much taſte, and is by no means diſagreeable. The inhabitants are Epiſcopalians, Quakers, and Methodiſts.

DUCK CREEK, is twelve miles north-weſt from Dover, and has about ſixty houſes, which ſtand on one ſtreet. It carries on a conſiderable trade with Philadelphia—and certainly merits a more pompous name. A mile ſouth from this is ſituated Governor Collins's plantation. His houſe, which is large and elegant, ſtands a quarter of a mile from the road, and has a pleaſing effect upon the eye of the traveller.

The trade of this ſtate, which is inconſiderable, is carried on principally with Philadelphia, in boats and ſhallops. The articles exported are principally wheat, corn, lumber, and hay.

With reſpect to religion, there are, in this ſtate, twenty-one Preſbyterian congregations, belonging to the Synod of Philadelphia—Seven Epiſcopal churches —Six congregations of Baptiſts, containing about 218 ſouls——Four congregations of the people called Quakers; beſides a Swediſh church at Wilmington, which is one of the oldeſt churches in the United States, and a number of Methodiſts. All theſe denominations have free toleration by the conſtitution, and live together in harmony.

In the convention held at Philadelphia, in the ſummer of 1787, the inhabitants of this ſtate were reckoned at 37,000, which is about twenty-ſix for every ſquare mile. There is no obvious characteriſtical difference between the inhabitants of this ſtate and the Pennſylvanians.

At the revolution, the three lower counties on Delaware became independent by the name of *The Delaware State*. Under their preſent conſtitution, which was eſtabliſhed in September 1776, the legiſlature is divided into two diſtinct branches, which together are ſtiled *The General Aſſembly of Delaware*. One branch, called the *Houſe of Aſſembly*, conſiſts of ſeven repreſentatives from each of the three counties, choſen annually by the freeholders. The other branch, called the *Council*, conſiſts of nine members, three for a county, who muſt be more than twenty-five years of age, choſen likewiſe by the freeholders. A rotation of members is eſtabliſhed by diſplacing one member for a county at the end of every year.

All money bills muſt originate in the houſe of aſſembly, but they may be altered, amended, or rejected by the legiſlative council.

A preſident or chief magiſtrate is choſen by the joint ballot of both houſes, and continues in office three years; at the expiration of which period, he is ineligible the three ſucceeding years. If his office becomes vacant during the receſs of the legiſlature, or he is unable to attend to buſineſs, the ſpeaker of the legiſlative council is vice-preſident for the time; and in *his* abſence, the powers of the preſident devolve upon the ſpeaker of the aſſembly.

A privy council, conſiſting of four members, two from each houſe, choſen by ballot, is conſtituted to aſſiſt the chief magiſtrate in the adminiſtration of the government.

The three juſtices of the ſupreme court, a judge of admiralty, and four juſtices of the common pleas and orphans courts, are appointed by the joint ballot of the preſident and general aſſembly, and commiſſioned by the preſident—to hold their offices during good behaviour. The preſident and privy council appoint the ſecretary, the attorney-general, regiſters for the probate of wills, regiſters in chancery, clerks of the common pleas, and orphans courts, and clerks of the peace, who hold their offices during five years, unleſs ſooner removed for mal-conduct.

The houſe of aſſembly name twenty-four perſons in each county for juſtices of peace, from which number the preſident, with the advice of his council, appoints and commiſſions twelve, who ſerve for ſeven years, unleſs ſooner diſmiſſed for mal-admiſtration. The members of the legiſlative and privy councils are juſtices of the peace for the whole ſtate.

The courts of common pleas and orphans courts have power to hold chancery courts in certain caſes.

The clerk of the ſupreme court is appointed by the chief juſtice; and the recorder of deeds, by the juſtices of the common pleas; for five years, unleſs ſooner diſmiſſed.

All the military and marine officers are appointed by the general aſſembly.

The court of appeals conſiſts of ſeven perſons—the preſident, who is member, and preſides by virtue of his office, and ſix others, three to be choſen by the legiſlative council, and three by the houſe of aſſembly. To this court appeals lie from the ſupreme court, in all matters of law and equity. The judges hold their office during their good behaviour.

The juſtices of the ſeveral courts, the members of the privy council, ſecretary, truſtees of the loan office, clerks of the common pleas, and all perſons concerned in army or navy contracts, are ineligible to either houſe of aſſembly. Every member, before taking his ſeat, muſt take the oath of allegiance, and ſubſcribe a religious teſt, declaring his belief in God the Father, in Jeſus Chriſt, and the Holy Ghoſt; and in the inſpiration of the Scriptures.

The houſe of aſſembly have the privilege of impeaching delinquent officers of government, and impeachments are to be proſecuted by the attorney-general, or other perſon appointed by the aſſembly, and tried before the legiſlative council. The puniſhment may extend to temporary or perpetual diſability to hold offices under government, or to ſuch other penalties as the laws ſhall direct.

There is, in Delaware, no eſtabliſhment of one religious ſect in preference to another, nor can any preacher or clergyman, while in his paſtoral employment, hold any civil office in the ſtate.

In treating of the Hiſtory of this province, it will be proper to obſerve, that the Dutch, under the pretended purchaſe made of Henry Hudſon, took poſſeſſion of the lands on both ſides the river Delaware; and as early as the year 1623, built a fort at the place, which has ſince been called Glouceſter.

In 1627, by the influence of William Uſeling, a reſpectable merchant in Sweden, a colony of Swedes and Finns came over, furniſhed with all the neceſſaries for beginning a new ſettlement, and landed at Cape Henlopen; at which time the Dutch had wholly quitted the country. The Dutch, however, returned in 1630, and built a fort at Lewiſtown, by them named Hoarkill. The year following the Swedes built a fort near Wilmington, which they called Chriſtein or Chriſtiana. Here alſo they laid out a ſmall town, which was afterwards demoliſhed by the Dutch. The ſame year they erected a fort higher up the river, upon Tenecum iſland, which they called New Gottenburgh; they alſo, about the ſame time, built forts at Cheſter, Elſinburgh, and other places. John Printz then governed the Swedes, who, in 1654, deputed his ſon-in-law, John Papgoia, and returned to Sweden. Papgoia ſoon followed his father-in-law to his native country, and John Ryſing ſucceeded to the government.

In 1655, the Dutch, under the command of Peter Stuyveſant, arrived in Delaware river, from New Amſterdam (now New York) in ſeven veſſels, with 6 or 700 men. They diſpoſſeſſed the Swedes of their forts on the river, and carried the officers and principal

cipal inhabitants priſoners to New Amſterdam, and from thence to Holland. The common people ſubmitted to the conquerors and remained in the country.

On the firſt of October 1664, Sir Robert Carr obtained the ſubmiſſion of the Swedes on Delaware river. Four years after, Colonel Nicolls, Governor of New-York, with his Council, on the 21ſt of April, appointed a *ſcout* and five other perſons, to aſſiſt Captain Carr in the government of the country.

In 1672, the town of Newcaſtle was incorporated by the government of New-York, to be governed by a bailiff and ſix aſſiſtants; after the firſt year, the four oldeſt were to leave their office, and four others to be choſen. The bailiff was preſident, with a double vote; the conſtable was choſen by the bench. They had power to try cauſes not exceeding ten pounds, without appeal. The office of *ſcout* was converted into that of ſheriff, who had juriſdiction in the corporation and along the river, and was annually choſen. They were to have a free trade, without being obliged to make entry at New York, as had formerly been the practice.

Wampum was, at this time, the principal currency of the country. Governor Lovelace, of New York, by proclamation, ordered that four white grains and three black ones, ſhould paſs for the value of a ſtiver or penny. This proclamation was publiſhed at Albany, Eſopus, Delaware, Long-Iſland, and the parts adjacent.

In 1674, Charles II. by a ſecond patent, dated June 29, granted to his brother, Duke of York, all that country called by the Dutch *New Netherlands*, of which the three counties of Newcaſtle, Kent, and Suſſex were a part.

In 1683, the Duke of York, by deed, dated Auguſt 24th, ſold to William Penn, the town of Newcaſtle, with the diſtrict of twelve miles round the ſame; and by another deed, of the ſame date, granted to him the remainder of the territory, which, till the Revolution, was called the Three Lower Counties, and has ſince been called the Delaware State. Till 1776, theſe three counties were conſidered as a part of Pennſylvania, in matters of government. The ſame governor preſided over both, but the aſſembly and courts of judicature were different: different as to their conſtituent members, but in form nearly the ſame.

CHAP. X.

MARYLAND.

Situation, &c. Diviſions, Climate, Produce, Rivers, Inhabitants, Diſcovery of it, Former and Preſent Government.

THIS province is ſituated between the 75th and 80th deg. of weſt long, and between the 37th and 40th of north lat. It is about 140 miles in length, and 135 in breadth; being bounded by Virginia, on the ſouth; by the Apalachian mountains, on the weſt; by Pennſylvania, on the north; and by the Atlantic Ocean, and another part of Pennſylvania, on the eaſt.

The Bay of Cheſapeak divides Maryland into two parts, viz. the eaſtern and weſtern.

Diviſions.	Counties.	Chief Towns.
The eaſtern diviſion contains the counties of	Somerſet.....	Somerſet.
	Dorcheſter	Dorcheſter.
	Talbot.....	Oxford.
	Cecil.	
The weſt diviſion contains the counties of.....	St. Mary's.....	St. Mary's
	Charles.....	Briſtol.
	Prince George	Maſterkout.
	Calvert.....	Abington.
	Ann Arundel.	Annapolis.
	Baltimore.....	Baltimore.

Maryland is a healthy country, and enjoys a clear air; the ſummers are exceſſively hot, and the winters are equally cold, but ſhort. The ſoil is extremely good, when cultivated. The chief vegetable production is tobacco, but great quantities of hemp and flax, Indian corn and grain, with moſt kind of fruits, are now produced here. The trees are oaks, black walnuts, poplars, cedars, and cheſnuts. The hills are in general of eaſy aſcent, and yield iron ore. The woods contain prodigious herds of wild ſwine.

The chief rivers are, Potomack, Pocomac, Patuxent, Severn, Cheptouk, Saſſafras, Wicomoca, and St. George. Theſe and ſeveral others are navigable for large ſhips, and add greatly to the fertility of the ſoil. The chief bays are thoſe of Cheſapeak and Delaware, and the moſt noted cape that of Henlopen, at the entrance of Delaware-Bay.

The inhabitants of Maryland were ſome years ago computed at 80,000, but are now ſuppoſed to amount to 220,700. Its commerce pretty nearly reſembles that of Virginia, and will therefore be conſidered under that head. We ſhall only mention here, that, beſides tobacco, their exports are, ſalted pork, iron, flax, and hemp. In 1782, a college was founded at Cheſter-Town, in this province, under the name of Waſhington-College, in honour of General Waſhington, Commander in Chief of the American forces, during the late war.

Maryland was diſcovered in the year 1606, when Virginia was firſt planted, and for ſome time was eſteemed a part of Virginia, till King Charles I. in 1632, granted all that part of Virginia which lay north of Potomack river to the Lord Baltimore, of the kingdom of Ireland, and his heirs. The year following about 200 Popiſh families, ſome of conſiderable diſtinction, embarked with his lordſhip, to enter into poſſeſſion of this new territory. Theſe ſettlers, who had that liberality and good breeding which diſtinguiſhes gentlemen of every religion, bought their land at an eaſy price of the native Indians, and for ſome time lived with them in the greateſt harmony and friendſhip. Their generous method of proceeding gained the confidence of the natives; they ceded to them one half of their principal town, and ſoon after gave up the whole to theſe ſtrangers. The Indian women taught the Engliſh the manner of making bread of their corn; the men took the Engliſh with them when they went either to hunt or fiſh; they aſſiſted them in the chace, and ſold them the game they took themſelves for a trifling conſideration; ſo that the new ſettlers had a ſort of town ready built, ground ready cleared for their ſubſiſtence, and no enemy to diſturb them in the quiet poſſeſſion of the country: but envy, the growth of every clime, inſtigated the neighbouring planters in Virginia to deſtroy the happineſs of the Baltimore colony. They ſpread ill-grounded reports among the Indians, in order to render them jealous of their new friends. Alarmed at the conſequences of a war with the ſavages, the Popiſh ſettlers erected a fort with the greateſt expedition, and took every other method in their power to ſecure themſelves from the brutal fury of the Indians, but at the ſame time treated them with every act of kindneſs in their power. Theſe precautions and friendly diſpoſitions had the deſired effect; the Indians, awed by their preparations, and ſoothed by the generous treatment they received, laid aſide their hoſtile intentions, and the malicious deſigns of the Virginian planters were rendered abortive.

The flouriſhing ſtate of this infant colony, and the uninterrupted peace they had enjoyed in their new ſettlement, induced many of the Roman Catholic families in England, to leave their native ſoil, and join their brethren in Maryland. They were encouraged and ſupported by the governor, and the colony continued to receive freſh reinforcements, till the Engliſh conſtitution was overturned, and Cromwell

ſeized the reins of government. Baltimore had nothing to hope from the protector; he had always been a warm friend to the royal party, and therefore expected to fall with the cauſe of his maſter. He was not deceived; he was deprived of his rights, and a new governor ſubſtituted in his room. Under this government Maryland continued till the Reſtoration, when Lord Baltimore was re-inſtated in his lawful poſſeſſions, which he cultivated with his former wiſdom, care, and moderation.

Not ſatisfied with procuring eaſe and ſecurity for his own ſect, he was deſirous of extending the benefits of his mild and equitable adminiſtration to others. Accordingly, he procured an act of aſſembly to be paſſed, for allowing a free and unlimited toleration for all who profeſſed the Chriſtian religion, of whatever denomination. This liberty, which was never violated, encouraged a great number, not only of the church of England, but Preſbyterians, Quakers, and all kinds of Diſſenters, to ſettle in Maryland. But though Lord Baltimore had received his patent from Charles I. though he had always been firmly attached to the royal cauſe, though he was guilty of no mal-adminiſtration, yet the bigoted and tyrannical council of James the Second, who wanted diſcernment to diſtinguiſh friends from enemies, deprived this noble family of their rights and poſſeſſions. At the Revolution, however, Lord Baltimore was again put in poſſeſſion of the profits of his province, which were not inconſiderable, though he was not reſtored to the right of government, which could not conſiſtently be conferred on a Roman Catholic. But as ſoon as his deſcendents had conformed to the church of England, they were re-inſtated in all their rights as fully as the legiſlature thought fit for them to be enjoyed by any proprietor.

The government of Maryland exactly reſembled that of Virginia, except with regard to the appointment of the governor, which belonged to the proprietors; but he was confirmed by the king. The cuſtoms alſo belonged to the crown, and the officers appointed to collect them were independent of the government of the province. The Roman Catholic religion was at firſt the only one profeſſed in this country. At the Revolution, the original conſtitution was reverſed, the Proteſtant religion was eſtabliſhed, and the Papiſts excluded from all offices and truſt and power, and even the penal laws of England were adopted againſt them. The church of England was eſtabliſhed by law, and the clergy were paid in tobacco; every Chriſtian male ſixteen years old, and negroes male and female, above that age, was obliged to pay forty pounds of tobacco, or pay the value in caſh, if he raiſed no tobacco; it was levied by the ſheriff, among other public burdens, and yielded about 100l. ſterling, as a medium, to each; and diſſenting clergy were not exempted.

But by the declaration of rights, and the conſtitution eſtabliſhed and agreed to in the convention of delegates at Annapolis, in Auguſt 1746, the legiſlature is now to conſiſt of the ſenate and the houſe of delegates; the latter to be annually choſen, viva voce, by the freeholders in every reſpective county, four delegates each; Baltimore town and the city of Annapolis, two each; the delegates for the ſenate are to be elected in like manner every five years, two for each county, out of whom fifteen ſenators are to be choſen by ballot; nine for the weſtern, and ſix for the eaſtern ſhire. The executive power is lodged in a governor and five council, choſen annually by the joint ballot of the general aſſembly, who may appoint the chancellor, judges, field officers, &c. but the ſheriffs and juſtices of the peace are choſen by the freeholders in each county. A freehold of fifty acres, or property to the value of 30l. gives a right of ſuffrage in the election of delegates, to all freemen above twenty-one years of age. Before any perſon can be appointed to any office of profit or truſt, a declaration of his belief in the Chriſtian religion muſt be ſubſcribed by him.

CHAP. XI.

VIRGINIA.

Situation, &c. Diviſions, Population, Climate, Produce, Animals, Birds, Fiſh, Vegetables, Rivers, Trade, Inhabitants, Buildings, and Government.

VIRGINIA is ſituated between the 75th and 90th deg. of weſt long. and between the 36th and 40th of north lat. It is about 750 miles in length, and 240 in breadth; bounded by Carolina, on the ſouth; by the river Potomack, which divides it from Maryland, on the north-eaſt; by the Atlantic Ocean, on the eaſt; and by the Apalachian mountains, on the weſt.

It is properly divided into four parts: the north, the middle, the ſouth, and eaſt.

In the north diviſion are the counties of Northumberland, Lancaſhire, Weſtmoreland, Richmond, Stafford, containing the pariſhes of Wincomoca, Chriſt-Church, and St. Paul's.

In the middle diviſion are the counties of Eſſex, Middleſex, Glouceſter, King and Queen, King William, New Kent, Elizabeth, Warwick, York, Princeſs Ann; containing the pariſhes of Farnham, Chriſt-Church, Abingdon, Stratton, St. John's, St. Peter's, Elizabeth, Denby, York, and Lynhaven.

In the ſouth diviſion are the counties of Norfolk, Nantamund, Iſle of Wight, Surry, Prince George, Charles, Henrico, James; containing the pariſhes of Elizabeth, Chutakuk, Newport, Southwark, Wyanoke, Weſtover, Briſtol, James Town, and Williamſburg.

In the eaſt diviſion, between Cheſapeak-Bay and the Ocean, is the county of Acomac; with its pariſh of the ſame name.

With reſpect to population, Mr. Jefferſon, in his notes on Virginia, allows a duplication of ſouls here once in twenty-ſeven years and a quarter. He takes the ſpace of 118 years incluſive, from 1654 until the year 1772, when the tythes of Virginia had increaſed from 7,209 to 153,000; which eſtimate, he ſays, is corroborated by the particular uniformity of the intermediate enumeration taken in 1700, 1748, and 1759. According to this increaſe, he ſuppoſes the inhabitants of Virginia alone will amount to between 6 and 7,000,000 within ninety-ſix years.

The climate of this province is ſubject to violent and ſudden changes, in conſequence of the air and ſeaſons depending greatly on the wind as to heat and cold, dryneſs and moiſture. The north and north-weſt winds are piercing cold, and either clear or ſtormy; the ſouth-eaſt and ſouth, hazy and ſultry hot, but in winter the air is clear and dry. The froſts are ſhort, but ſo ſevere, that rivers, three miles in breadth, are frequently frozen entirely over. The ſpring is about a month earlier than in England: in April the rains are frequent; in May and June the heat increaſes; and the ſummer nearly reſembles ours, the heat being mitigated with gentle ſea-breezes that begin to blow about nine in the morning, increaſing and decreaſing as the ſun riſes or falls. In July and Auguſt theſe breezes ceaſe, when the air becomes ſtagnant and ſultry hot: in September the weather generally changes ſuddenly, and heavy rains fall, which produce a terrible effect on the health of the inhabitants. Storms of thunder and lightning are very frequent here, but they ſeldom are attended by any miſchief. It is a general obſervation in regard to all theſe colonies, that as they become inhabited, and the lands cleared, the air is improved, and rendered more ſalutary; for the whole country, before it was planted, was one continued foreſt, interſperſed with ſwamps or marſhes.

As to the face of this country, it is generally low, and flat towards the ſea, and for 100 miles within, ſo that there is ſcarce a hill or ſtone to be ſeen, except here and there ſome rocks of iron ore, and ſome banks of a kind of petrified oyſter ſhells. In the inland parts the ſoil is light and ſandy; but towards the ſea-coaſt, and on the banks of rivers, it is generally very rich, yielding very good corn, and tobacco.

Virginia has, in common with the chief parts of the American provinces, elks, bears, wolves, foxes, a ſpecies of panther, or tyger, red deer, muſk rats, racoons, beavers, and wolves; but the moſt curious animal found in that country is the opoſſum, which is about the ſize of a cat, and, beſides the belly common to it with other animals, it has another peculiar to itſelf, hanging beneath the former. This additional belly has a large aperture towards the hinder legs, which diſcovers a number of teats on the uſual part of the common belly. Upon theſe, when the female of this animal conceives, the young are formed, and, when arrived at their appointed ſize, drop from thence into the ſecond belly, from whence they go out at pleaſure, and into which they are received whenever there is the leaſt appearance of danger. Horſes, cows, ſheep, and hogs, were animals unknown in America, till introduced from Europe, and now, particularly in Virginia and the ſouthern colonies, they run wild in prodigious numbers.

In this province, are ſeveral ſorts of eagles, hawks, and owls. The white owl is eſteemed a great curioſity, all the feathers of the back and breaſt being perfectly white except a black ſpot underneath the throat. Their turkeys are exceeding large, ſome of them weighing forty pounds. The partridges are not ſo big as thoſe of England, but their fleſh finely flavoured, as are every other ſort of wild fowl. The Virginian nightingale, which takes its diſtinguiſhing epithet from this province, is adorned with a plumage of bright crimſon and blue, and ſings moſt delightfully; but his note is thought to be exceeded by the mocking bird, which is likewiſe an inhabitant of Virginia. The natural note of this bird is prodigiouſly fine, beſides which, as its appellation implies, it attains that of the linnet, lark, nightingale, &c.

Fiſh of all ſorts are found here in vaſt quantities, and three ſpecies of them are remarkable, viz. the ſting-graſs, the toad-fiſh, and tobacco-pipe-fiſh. The firſt takes its name from a ſting in its tail; the ſecond, from its ſwelling to a monſtrous ſize when taken out of the water; and the third, from its reſemblance to a tobacco-pipe. In February, March, April, and May, ſhoals of herrings come up, even into the brooks, ſome of which are about the ſize of ours, but, in general, they are much larger.

Snakes, particularly the rattle-ſnake, and lizards, abound here; and in ſummer great numbers of worms are found in the waters, which having a ſort of horn or ſcrew on their heads, force their paſſage into the bottoms and ſides of ſhips, whenever they find the coat of pitch, tar, or lime worn off.
